Notes:
Correlations based on n = 8

Significance

- Positive correlations (≥ 95 % significant where $0.738 \leq r_s \leq 0.881$)
- Strong positive correlations (≥ 99 % significant where $r_s \geq 0.881$)
- Negative correlations (≥ 95 % significant where $-0.738 \geq r_s \geq -0.881$)
- Strong negative correlations (≥ 99 % significant where $r_s \leq -0.881$)

Volume 4: Environmental Baseline Field Report
Continental Slope AUV Survey
Hammerhead Development, Offshore Guyana

As a subcontractor to Fugro Canada Corp., Fugro GB Marine Limited has the pleasure of submitting the Shallow Sampling Program - Environmental Baseline Field Report for the integrated site investigation programme within the Hammerhead Development survey area, offshore Guyana. This report presents a summary of the survey operations and the preliminary results from the environmental survey. These results are subject to change after full interpretation and analysis undertaken in the office has been completed.

This work was carried out as authorised by Master Marine Survey Order A4000457, dated 16 August 2018 and under Master Marine Survey Agreement A4001077 dated 8 November 2018, and under Master Marine Survey Agreement A1998840 and Marine Survey SubAgreement A2002836 with EEPGL, both dated effective as of 14 February 2006 (contract reference Schedule E—Onshore Reporting, item 5.3). Work was done in general accordance with EEPGL's project work scope, Fugro proposal PL18-036 dated 8 June 2018, and as otherwise agreed with the EEPGL representative, Patrick Lee. This report is also in general accordance with "ExxonMobil, Geophysical Operations - Shallow Seabed Group, Generic Specification, Field Development Project, Site Investigation Reports, GS.93, REV 03" dated October 2012.

We hope that you find this report to your satisfaction; should you have any queries, please do not hesitate to contact us.

Yours faithfully
Fugro GB Marine Limited

GENERAL LOCATION MAP

EXECUTIVE SUMMARY

Introduction

On the instruction of Esso Exploration and Production Guyana Limited (EEPGL), Fugro performed an integrated site investigation program within the Hammerhead Field, offshore Guyana. The integrated program consisted of geophysical, geotechnical and environmental surveys. This field report describes the field operations of the environmental baseline survey (EBS), which was undertaken between 22 April and 24 May 2019.

Environmental Survey

Seabed video and photographic data collection was performed at fifteen locations to establish and identify the seabed habitat and epifaunal species within the survey area. Sediment box core sampling was performed at eight pre-determined locations to establish the physico-chemical and biological properties of the sediment. Water quality was assessed through in-situ collection of water column profiles and acquisition of water samples at eight locations.

Seabed Habitats and Epifauna

Box core sampling identified similar sediments across the Hammerhead field, with the sediment type described as mud with minimal shell material. Large irregular bedrock or possible carbonate reef structures were observed on the shelf area in water depths of between approximately 95 m and 112 m.

Benthic epifauna was generally sparse associated with the soft sediment with fauna including bryozoans (Bryozoa) and sponges (Porifera) present. Faunal tubes and burrows were also recorded. The faunal and floral community associated with the hard substrate in the shallower waters was dominated by crustose coralline algae (Corallinaceae), black corals (Antipatharia), and sponges (Porifera), faunal turf (Hydrozoa/Bryozoa), shrimps (Caridea), brittlestars (Ophiuroidea) and various fish species.

Potentially Sensitive Habitats

The reef areas observed with the Hammerhead shelf area may constitute a potentially sensitive habitat, due to the associated epifauna.

Water Column Profiles

Water column profiles obtained within the Hammerhead field were typical of the oceanic water column within the region. There was a distinct thermocline, extending between approximately 20 m and 200 m depth below surface, over which the majority of the parameters measured exhibited rapid change. The exception to this was turbidity, which remained constantly low throughout the water column.

1. INTRODUCTION

1.1 Background

On the instruction of Esso Exploration and Production Guyana Limited (EEPGL), Fugro performed an integrated site investigation programme in support of the Hammerhead Development, offshore Guyana. Geophysical operations, comprising automated underwater vehicle (AUV) based multibeam echosounder (MBES), sidescan sonar (SSS), and sub-bottom profiler (SBP) data collection, were undertaken during the first phase of survey operations. The second phase of the site investigation comprised over the side mounted (OTSM) multibeam echosounder (MBES) and hull-mounted sub-bottom profiler (SBP) data collection upslope of the AUV survey area, geotechnical sampling and an environmental baseline survey (EBS).

This report details the field operations undertaken as part of the Hammerhead Field EBS, which was conducted onboard the RV Fugro Brasilis during the survey period 22 April to 25 May 2019.

Appendix A outlines the guidelines for use of this report.

1.2 Coordinate Reference System

All coordinates detailed in this report are referenced to World Geodetic System 1984 (WGS84) datum, Universal Transverse Mercator (UTM) projection Zone 21 N . Table 1.1 provided the detailed geodetic and projection parameters.

Table 1.1: Project Geodetic and Projection Parameters

Global Positioning System Geodetic Parameters *	
Datum:	World Geodetic System 1984 (WGS84)
Spheroid:	World Geodetic System 1984

False Easting:	500 000 m
False Northing:	0 m
Scale factor on Central Meridian:	0.9996
Units:	Metre
Notes: * = Fugro Starfix navigation software always uses WGS84 geodetic parameters as a primary datum for any geodetic calculations. † = This is the right-hand coordinate frame rotation used by the Fugro Starfix navigation software	

2. SURVEY STRATEGY

The objectives of the EBS were to provide data to establish the baseline physico-chemical and biological characteristics of the seabed and water column environment, by undertaking water column and seabed sampling. Seabed photographic data were also collected to identify the habitats and epifaunal communities present within the survey area.

The EBS sampling stations were pre-determined by the client. Following the acquisition of the shelf and shelf break geophysical data, camera transects were selected to investigate areas of elevated rough hard substrate which had reduced or near zero signal penetration on the SBP data.

Table 2.1 provide the coordinates, data to be acquired and rationale for each location. The orientation of the camera transects was subject to change to accommodate vessel manoeuvrability at the time of survey operations. provides a spatial display of the proposed camera transects within the OTSM data acquisition area. Figure 2.2 provides a spatial display of the proposed environmental sampling and drop-down camera locations.

3. METHODS

3.1 Survey Methods

3.1.1 Seabed Video/Photography

Seabed photography was acquired using a Sonar Equipment Services deep-sea camera system mounted within a purpose-built camera frame complete with one high resolution video camera, one stills camera, a separate strobe and four light emitting diode lights.

Seabed video footage was displayed on a computer monitor and recorded directly onto a hard drive. A video overlay was used to overlay a navigation string from an attached ultra short baseline (USBL) beacon, including the time, date, depth and location (easting and northing). The survey location and station number were also displayed (manually updated). The stills camera imagery was visible on a second window of the computer. Footage was viewed in real time via a co-axial cable, assisting in the control of the camera in the water. Two lasers were set up 9 cm apart to provide image scaling.

Operational procedures for seabed photography were as follows:

- The camera was setup on deck prior to deployment and a test photograph taken;
- The camera was deployed into the water just below the sea surface, at which point the system was switched on;
- The camera was lowered to the seabed using the SSS winch and when the seabed was visible recording started;
- At each drop-down station the camera was lowered to the seabed outside a 50 m diameter circle centred on the target location. The vessel was then manoeuvred across the circle so that a minimum of 5 minutes of good quality video and a minimum of 5 good quality camera stills were acquired;
- If a transect was required, the vessel manoeuvred along the line with the winch adjusted to keep the seabed visible on the live feed;
- Still photography commenced with the environmental scientist manually triggering the camera while the camera moved over the seabed. Whenever a photograph was taken the surveyor captured a positional fix;
- The camera system was switched off just beneath the surface and then recovered to the deck;
- On completion, photographs were downloaded and backed up onto the ships system and an external hard drive.

3.1.2 Sediment Grab Sampling

Seabed samples were acquired using a United States Naval Electronics Laboratory (USNEL) 0.25 m^2 box corer.

Operational procedures for grab sampling were as follows:

- The USNEL box corer was prepared for operations prior to arrival on station. A USBL beacon was attached to the box core frame. The Bridge communicated to the deck via an ultra high frequency (UHF) radio when the vessel was steady and on location, and the box core was deployed from the stern A-frame and lowered to the seabed using the coring winch;

- When the engineer operating the winch observed that the box core had reached the seabed (evidenced through a distinct slackening of the lifting rope and snatch block), the on-line surveyor was informed (via UHF radio) and a fix was taken;
- On recovery to the deck, the sample was inspected and judged acceptable or otherwise (see below for rejection criteria);
- The sample was subsampled into two 0.1 m^2 macrofauna samples, with the remaining material subsampled for physico-chemical analysis;
- Deck logs were completed for each sample acquired (including no samples) recording: date, time, sample number, fix number, sediment type, depth and colour of strata in the sediment (if any) using Munsell colour codes, odour (i.e. hydrogen sulphide), bioturbation or debris.

Samples were considered unacceptable in the following instances:

- Evidence of sediment washout caused through improperly closed scoop or inspection hatch;
- Sediment sample taken on an angle; where the box was not parallel to the seabed when it fired;
- Disruption of the sample through striking the side of the vessel;
- Sample represented less than 20 % of the box corer's capacity (unless deemed acceptable by the client representative);
- Sample was more than 50 m from the target location, unless deemed acceptable by the client representative, particularly in deeper waters;
- Presence of hagfish within the sample, as this species of fish produces mucilaginous slime which renders a sample unusable. Presence of other sessile organisms or fish would not lead to discarding a sample unless exhibiting similar characteristics;
- Deemed unacceptable by the client representative for any other reason.

3.1.2.1 Physico-chemical Sample Processing

Sub-samples were taken from the surface of the sample while retained in the box core as follows:

- Prior to any subsampling metal scoops was pre-cleaned using acetone;
- Hydrocarbon samples were collected using a metal scoop to a nominal depth of 3 cm. Samples collected were HCA1 and HCA2. The samples were preserved in glass jars at - 20 ºC;
- Heavy metal samples were collected using a plastic scoop to a nominal depth of 3 cm. Samples collected were HMA1 and HMA2. The samples were preserved in polythene bags at – 20 ºC;
- Particle size samples were collected using a plastic scoop to a nominal depth of 3 cm. Samples collected were PSDA1 and PSDA2. The samples were preserved in polythene bags at -20 ºC;
- Biodiversity DNA samples were collected using a sterile plastic spatula to collect approximately 5 g of sediment in six Whirl-pak(R) bags to collect BIOA1, BIOA2, BIOB1, BIOB2, BIOC1 and BIOC2.

3.1.2.2 Macrofauna Sample Processing

Macrofauna samples were processed as follows:

- After the sediment had been described and photographed the top 10 cm to 20 cm was transferred into a 0.5 mm mesh sieve along with the remaining supernatant water;
- The sample was then transferred to the Wilson autosiever for washing;

- Once the sediment had been removed the sample was transferred to containers labelled with the job number, station code, and fauna code (FA or FB depending on replicate) and fixed in 10 % formal saline (a buffered 4 % formaldehyde solution in seawater). The sample containers were then sealed, hazard labelled and stored securely on deck.

3.1.3 Combined Water Sampling and Profiling

The following procedure describes the deployment and recovery of the Valeport 606+ deepwater conductivity temperature depth (CTD) and simultaneous deployment and recovery of 5 litre Niskin water samplers. The CTD profiles were acquired simultaneously with the collection of near-seabed (bottom) water samples. Mid-depth and near-surface samples were then acquired in two subsequent deployments of Niskin sampler only. This section also describes the subsequent uploading and processing of water profile data and handling of water samples.

3.1.3.1 Deployment and Recovery

The CTD and Niskin water samplers were deployed using the following methodology:

- The CTD was set up to record conductivity, temperature, depth, turbidity, pH and dissolved oxygen (DO). Both the pH and DO sensors were calibrated onboard prior to survey operations;
- After calibration the data output from the CTD underwent a visual check to ensure that the readings were accurate and the pH and DO sensors had not drifted after calibration;
- At each station the initial drop had a clump weight, beacon, CTD and two 5 litre Niskin water samplers attached to the lifting wire 1 m apart.
- The Niskin bottles were armed and a messenger weight suspended under the top sampler. The messenger weights were rigged so that once the first Niskin was triggered a domino effect would take place triggering that suspended below;
- The equipment was deployed over the starboard side using the A-frame;
- Once deployed the CTD was held at the surface for a period of approximately five minutes to allow the profiler to acclimatise to environmental conditions;
- The equipment was then lowered to the desired depth at a rate of 0.5 m/s to 1.0 m/s. When at the desired depth deployment stopped and a messenger weight was attached to the lift wire. The weight was then released to trigger the samplers;
- A conservative fall rate was used to determine release time after which a positional fix for the bottom sample was taken by the surveyor;
- The equipment was then recovered to deck with each item of equipment being removed from the wire as it paid in;
- The Niskin samplers were set to sample at three depths the surface (5 m), below the thermocline and 10 m above the seabed.

3.1.3.2 Water Profile Processing

The CTD was rinsed with clean water immediately after deployment – the plug area was dried after rinsing. Data were uploaded from the unit (.dat format) and translated into a text file (.000 format) with the pressure tare applied. These raw data were backed up to hard drive immediately.

The translated data were copied into Water Profile QA.xls and data quality checked. The following acceptance criteria applied:

- All data must be within expected values for seawater (e.g. pH = 7.8 to 8.5; DO = approximately 100 % at surface and declines with depth);
- Data should be collected for the duration of both the down and up casts;
- Data should be consistent between down and up casts.

Occasional spikes in data (due to sensor interference) are acceptable as is some variation in readings at depths where profiler is stationary (i.e. where Niskin water samplers fitted or samples taken); this occurs due to mixing effects, which the fast response DO meter is particularly susceptible to.

3.1.3.3 Water Sample Processing

The Niskin water samplers were cleaned after each deployment, after the following subsamples were collected:

- One heavy and trace metal sample (HMA1) was collected at each depth and stored in 500 mL plastic bottle at between 4 ºC and 6 ºC;
- One total suspended solid (TSSA1) sample was collected at each depth and stored in 1 L plastic bottle between 4 ºC and 6 ºC;
- One total organic carbon (TOCA1) sample was collected at each depth and stored in glass vials at between 4 ºC and 6 ºC;
- Two hydrocarbon samples (HCA1 and HCA2) were collected at each depth and stored in amber glass bottles at -20 ºC;
- Six biodiversity DNA samples (BIOA1, BIOA2, BIOB1, BIOB2, BIOC1 and BIOC2) were collected at each depth, filtered and stored in Whirl-pak® bags at -20 ºC;
- One spare sample was collected at each depth and stored in 1 L plastic bottle.

Figure 3.1 presents operational photographs of the equipment used during the environmental survey.

4.1.2 Seabed Video/Photography

Photographic stills and video data were successfully acquired at all nine proposed drop-down camera stations and at the six proposed camera transects. Stations EBSHH03 and EBSHH06 were repeated due to technical issues. Acquisition of video and photographic data was successful on the second attempt at station EBSHH05DD, due to marginal sea conditions affected the vessel manoeuvrability on the first attempt. Poor sea conditions prevented acquisition of good quality stills at station EBSHH01DD, this station was repeated and on the fourth attempt, stills images were accepted by the onboard client representative. Table 4.2 presents the acquired video and photographic data.

4.1.3 Water Sampling and Profiling

A complete suite of water samples was successfully collected at all the eight water stations. Two water profiles were collected at all stations except stations EBSHHW04 and EBSHHW07. At station EBSHHW04 the Valeport CTD failed during the first deployment. At station EBSHHW07 one profile was accepted by the onboard client representative. Table 4.3 provides details of sample and water profile data acquisition. Appendix D presents the water profile data.

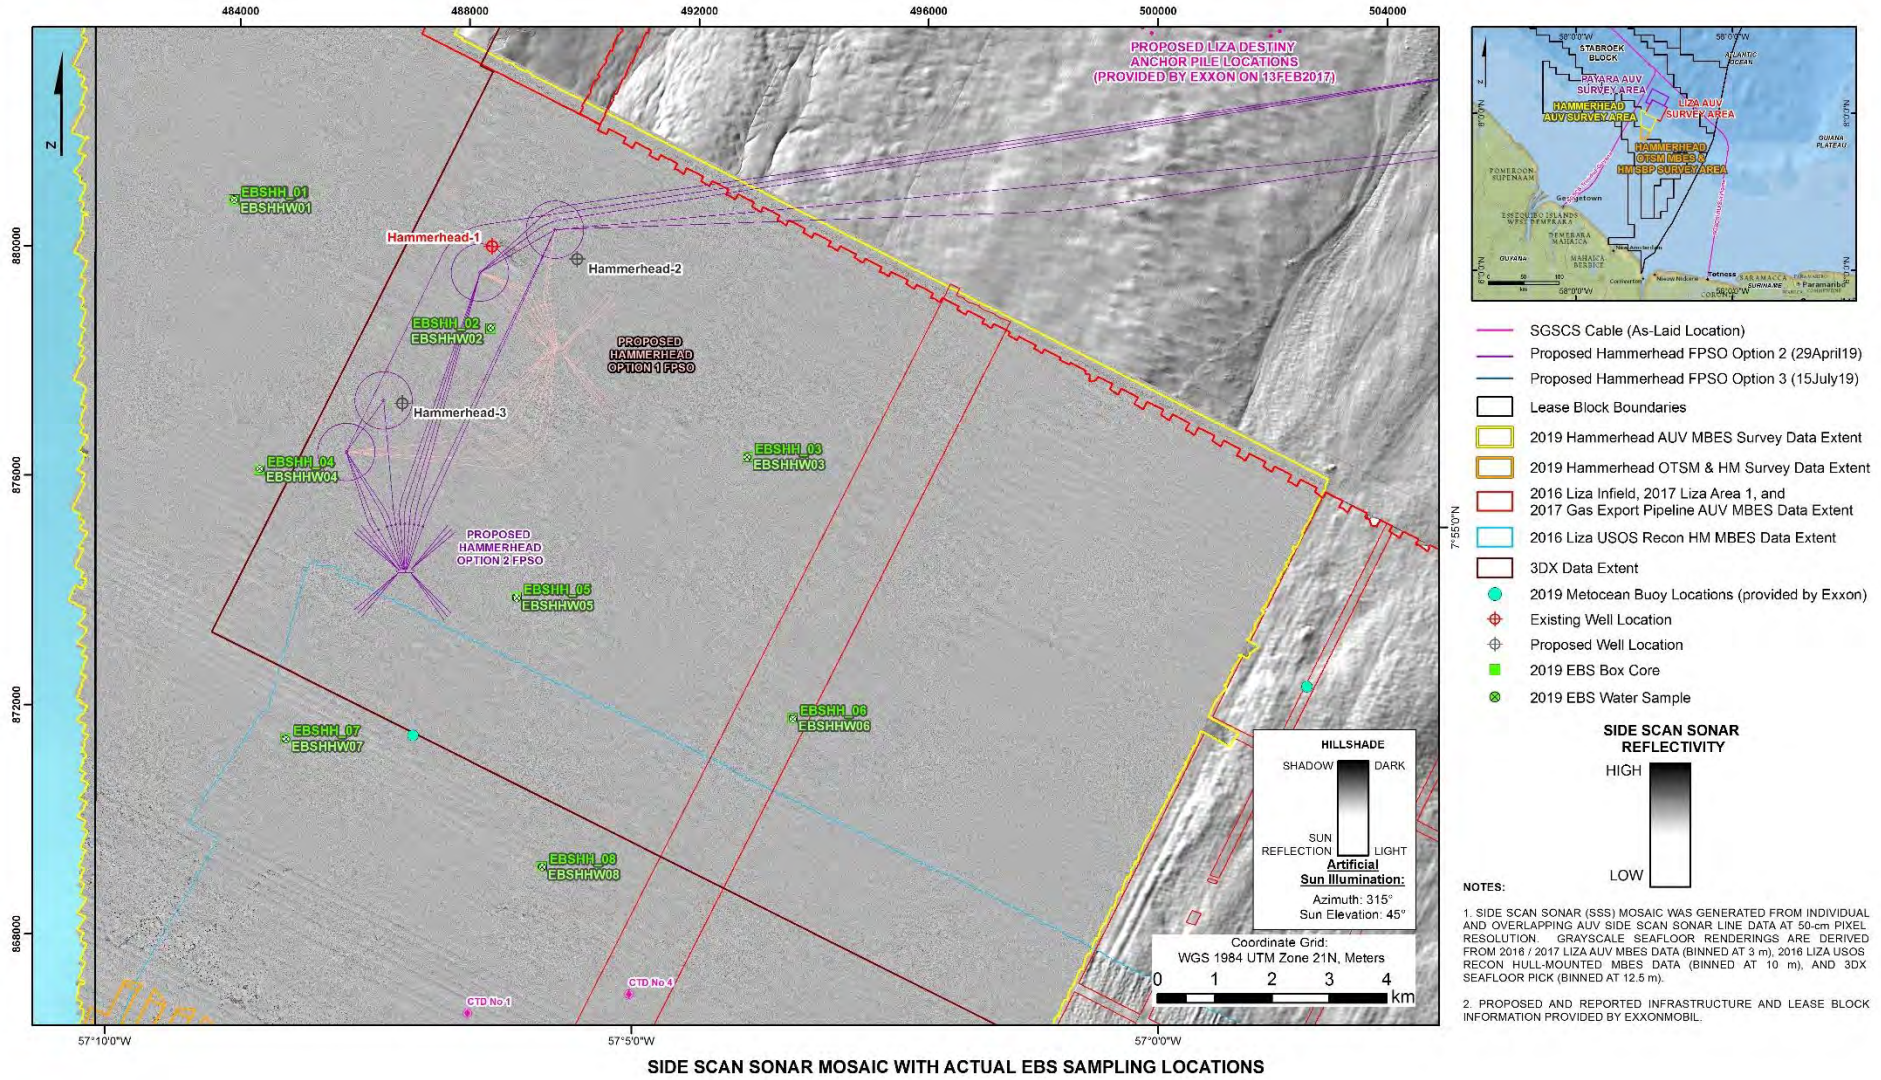

Figure 4.1: AUV survey area actual environmental sampling locations overlain on side scan sonar mosaic

4.2 Seabed Habitats and Fauna

These results are preliminary and subject to change following a full analysis completed in the office.

4.2.1 Seabed Sediments

Seabed sediment within the AUV survey area consisted of fine mud with a minimal amount of shell material. Higher relief structures were recorded on the upper shelf slope in water depths ranging between approximately 95 m and 112 m. These structures were seen across the whole survey area running parallel to the shelf break. They comprised of widely spaced irregular patches with lengths varying from 20 m to more than 100 m, with heights of up to 6 m. The general bedrock or possible carbonate reef morphology appeared to consist of two types; ridge-like features (in general 5 m in height) orientated perpendicular to the shelf break interspersed by patches of sandy mud, and low relief patch reefs.

4.2.2 Benthic Fauna

Benthic fauna was sparse within the AUV survey area, with fauna including bryozoans (Bryozoa) and sponges (Porifera). Faunal tubes and burrows were also recorded.

The faunal and floral community associated with the hard substrate in the shallower waters was dominated by crustose coralline algae (Corallinaceae), black corals (Antipatharia), and sponges (Porifera), faunal turf (Hydrozoa/Bryozoa), shrimps (Caridea), brittlestars (Ophiuroidea) and various fish species.

Figure 4.2 presents example photographs of observed benthic communities.

4.2.3 Potentially Sensitive Habitats or Species

The bedrock or possible carbonate reef areas observed with the Hammerhead shelf area may constitute a potentially sensitive habitat due to the presence of possible sensitive species. These areas will be further assessed in the Environmental Baseline Results report (Volume 8).

4.3 Water Profile Data

The water profiles obtained at all stations (Appendix D) were typical of the oceanic water column within the region. There was an upper layer of wave-mixed water, extending to approximately 20 m depth, where all parameters remained relatively constant. Beyond this there was a distinct thermocline, extending to approximately 200 m depth, over which temperature and dissolved oxygen concentration decreased rapidly, salinity and conductivity showed an initial trend of increase, followed by decrease and pH decreased slightly. Turbidity was consistently low throughout the water column.

These results will be discussed in detail in the Environmental Baseline Results Report (Volume 8).

A. GUIDELINES ON USE OF REPORT

This report (the "Report") was prepared as part of the services (the "Services") provided by Fugro GB Marine Limited ("Fugro") for its client (the "Client") under terms of the relevant contract between the two parties (the "Contract"). The Services were performed by Fugro based on requirements of the Client set out in the Contract or otherwise made known by the Client to Fugro at the time.

Fugro's obligations and liabilities to the Client or any other party in respect of the Services and this Report are limited in time and value as defined in Contract (or in the absence of any express provision in the Contract as implied by the law of the Contract) and Fugro provides no other representation or warranty whether express or implied, in relation to the Services or for the use of this Report for any other purpose. Furthermore, Fugro has no obligation to update or revise this Report based on changes in conditions or information which emerge following issue of this Report unless expressly required by the Contract.

The Services were performed by Fugro exclusively for the Client and any other party identified in the Contract for the purpose set out therein. Any use and/or reliance on the Report or the Services for purposes not expressly stated in the Contract, by the Client or any other party is that party's risk and Fugro accepts no liability whatsoever for any such use and/or reliance.

B. WORK INSTRUCTIONS

B.1 SES DEEPWATER CAMERA

B.1.1 Purpose, Definitions and References

This procedure has been prepared in order to provide for the safe deployment and recovery of the SES camera system.

NB: The procedure for all lifting operations on the vessel remain the responsibility of the Party Chief and Technical Coordinator (if present) or Master.

B.1.2 Instructions

B.1.2.1 General

Seabed photography (digital stills) and video footage are routinely conducted as part of ecology surveys and/or to investigate selected anomalous seabed features, identified from geophysical data.

Seabed photography is undertaken using a frame mounted, Mulitport Subsea Unit attached to an STR underwater camera, and separate STR flash unit and LED lamps. The seabed video footage is displayed through the topside unit onto monitors and recorded. A navigational data string from a USBL beacon attached to the camera frame prior to deployment is overlain onto the video footage, supplying the following information; time, date, easting, northing and depth. The client name, contractor name, job number and job description are also displayed in addition to station transect number (manually updated).

B.1.2.2 Personnel

A minimum team of four personnel is required during the launch and recovery of the camera system. All team members shall be appropriately qualified and adequately trained to carry out their delegated tasks and responsibilities safely. The camera system handlers will be responsible for deployment as normal practice, assisted by a winch/A frame operator. At least two persons will be required for manual handling of the video during the deployment and recovery phase.

The team will comprise:

- 1 × operator: will be clearly identified and will be in charge of the winch and A-frame or controls when deploying and recovering the system;
- 2 × camera system handlers: assisting with recovery and deployment of the video and monitoring of the video footage;
- 1 × surveyor: recording date, time, depth, position and other data during deployment, sampling and retrieval.

B.1.2.3 General Handling and Set Up

- The vessel will set up at the proposed deployment location, as advised by the online surveyor, on an appropriate heading with respect to prevailing environmental conditions;
- The shift engineer will ensure that hydraulic power is available to the deck equipment to be used;
- The online surveyor will ensure the HiPAP pole is deployed and the correct beacon code selected on the HiPAP console;

- Prepare the STR camera for deployment;
- Ensure electrical power to the camera is switched off before deployment;
- Manually move the camera from its stowage position to the deployment position. Four people will be required for this task and manual handling procedures are to be adhered to;
- If not already installed, spool out sufficient wire from the winch to connect the cable counter block;
- A safety rope should be fitted between the winch cable and the camera; this is to prevent loss of the equipment;
- Ensure a beacon is attached to the camera frame and check the correct channel is set;
- Reset the cable counter to zero.

B.1.2.4 Deployment

- The surveyor will communicate to the deployment team that the vessel is in position and that they are clear to deploy the camera;
- The winch is carefully hauled in, raising the camera above the deck and positioned over the stern of the vessel. If deemed necessary, a tag line can be attached to help stabilise the deployment and recovery operation;
- The camera will be manoeuvred clear of the vessel and lowered until fully submerged;
- One of the video handlers should return to the video system monitor. The camera lamps and laser scaling lights are then switched on, the video overlay unit checked for correct operation (i.e. ensure it is updating regularly) and the video recording software set to record;
- The winch control will be switched to remote and spooling gear confirmed as operating correctly;
- The online surveyor will check that the beacon position is being received;
- Ensure the instrument room observation monitors are configured to observe the block and winch spooling. This is a safety requirement and must be observed at all times when the winch is being remotely operated.

B.1.2.5 Recovery

- When photographic/video sampling has been completed, the online surveyor should be informed that the system will be raised to the sea surface;
- The lamps and recording systems should be switched off;
- The video handlers should prepare on deck for recovery of the video system. The winch operator will switch control to local and start to recover the camera. The video handlers will indicate when the camera is just below the sea surface;
- Once at the sea surface, the online surveyor and bridge will be informed;
- When recovering the system to the deck, care must be taken to avoid the equipment striking the ship's hull and from swinging out of control;
- The A-frame/winch operator will then slowly raise the camera clear of the water until it is just above the gunwhale;
- It is important the camera is steadied as soon as possible;
- With the camera inboard, carefully pay out winch cable to lower the camera onto the deck;

- At the end of all video operations, four people should then manually lift the camera frame to its stowed position where it will be secured;
- The beacon should be switched off;
- When recovery has been completed and all personnel are clear of the deck, inform bridge crew and stop hydraulic pumps locally on the back deck.

B.1.3 Records

Documents and files generated by this work instruction are:

Title	Document No.	Holder	Retention Period
Field logbook	TP25_006	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Video log	FM25_011	Project Manager	4 years from job close out date unless otherwise stated within the client contract

B.2 BOX CORING

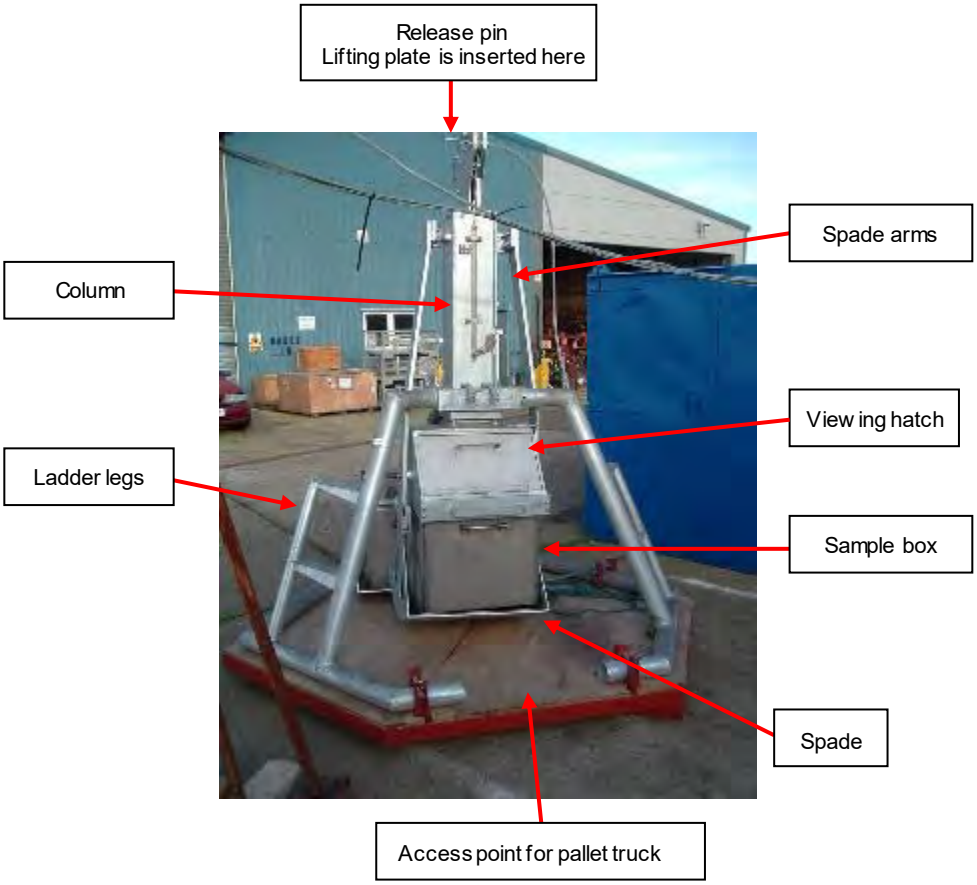
The purpose of this work instruction is to describe the safe deployment and recovery of USNEL type box corers, when used for acquisition of biological and chemical sediment samples, and who shall be responsible for the process.

NB: The procedure for all lifting operations on the vessel remain the responsibility of the Technical Coordinator (if present) or Master.

B.2.1 Background

USNEL box corers are routinely used as part of deepwater environmental surveys and in shallower water surveys where investigation of subsurface strata is required (e.g. cuttings piles surveys).

The diagram below shows the key parts of the 0.25 m^2 USNEL corer.



B.2.2 Personnel

A minimum team of four personnel is required during the launch and recovery of the USNEL box corer. All team members shall be appropriately qualified and adequately trained to carry out their delegated tasks and responsibilities safely. At least two persons will be required for manual handling of the corer during the deployment and recovery phase. They will be assisted by one winch/A frame operator.

The team will comprise:

- 1 × operator: will be in charge of the winch and A-frame controls when deploying and recovering the corer;
- 2 × deck handlers: assisting with recovery and deployment of the corer At least one of these must be an environmental scientist/ecologist, who will be responsible for subsequent sample processing;
- 1 × surveyor: recording date, time, depth, position and other data during deployment, sampling and retrieval. These details will be logged in either the field logbook (TP25_006).

B.2.3 Operational Protocol

B.2.3.1 General Handling

- Due to the box corer's size and weight, lift the box corer with a mechanical lifting device;
- Check that the safety pin is in place to avoid incidental firing;

- During mobilisation, and lifting operations, heavy duty gloves, safety footwear and hard hats must be worn;
- Check the corer deployment/landing position to ensure that handlers can move freely around the corer, and if necessary be able to move out of the way in case it swings;
- Ensure the corer deployment/landing position is within clear line of site of the winch and A-frame operator;
- Check there are adequate fixed points to secure the corer while not in use must also be present adjacent to the landing position. When not in use, secure the corer to the deck/gunwale by means of an appropriately rated ratchet strap.

B.2.3.2 Set Up

- If a beacon is to be used (as defined within the Scope of Works), secure to the corer by means of jubilee clips. House the beacon within a protective tube to prevent damage if the corer swings against the vessel.

B.2.3.3 Loading/Arming the Corer

- The main lifting wire will pass over a suitable diameter, suitably load tested block (minimum SWL of 5 t);
- Manoeuvre the corer into its deployment position with the safety pins in place;
- Attach the main lift wire to the corer wire;
- Lock the lifting plate in the corer head by the release pin (release the trigger column locking mechanism during this process);
- Swing the spade open;
- Lodge the inspection hatches open by securing the lugs in the hatch closure mechanism, rotating to the open position;
- Inform the bridge and the surveyor that the corer is ready to deploy.

B.2.3.4 Deploying

- Loop two 5 m to 10 m tag lines around the corer legs. Secure the end of each tag line, and pass the other end through a pad eye / shackle to be handled by the deck personnel;
- The surveyor: check the proximity of the vessel to the intended sampling location. When satisfied that the vessel is in the correct position, request permission from the bridge to deploy the corer. If the vessel is a distance from the intended sampling location, inform the deck to standby;
- Once permission is given from the bridge, inform the deck to deploy the corer;
- The winch and A-frame operator: manoeuvre the block so it is directly over the corer. Lift up on the winch wire so that the weight of the corer is taken off the safety pins. Remove the safety pin;
- Deploy the corer by simultaneously extending the A-frame or manoeuvring the crane and paying out from the winch. The base of the corer should not be lifted above knee height;
- Once outboard, lower the corer to the surface, and remove the tag lines;
- Lower the corer at maximum speed until the corer is approximately 20 m from the seabed (as defined by the beacon or winch wire markings);

- Once the corer is 20 m above the seabed, pause the descent to allow the beacon to steady. Once the depth indicated by the beacon is steady and the corer is seen to be within acceptable proximity to the target position, slowly lower the corer to the seabed. Monitor the beacon depth during the final stage of deployment to ensure that deployment is slow to prevent 'bow wave' displacement of superficial sediment;
- Surveyor: notify the deck personnel when the corer has stopped descending;
- Stop the winch. Take a positional fix of the sampling location, before the corer is recovered.

B.2.3.5 Retrieval

- Recover the corer at a speed of approximately 1 ms^{-1} or less;
- When the corer reaches the surface, stop the recovery. Retract the A-frame so that the corer rests against the stern of the vessel. Slowly winch up so that the landing frame is just above the deck level;
- Loop the tag lines around the landing frame legs and run the end back through the pad eye/shackle;
- Recover the corer to the deck by simultaneously using the winch and A-frame.
- The two deck handlers: steady the corer on retrieval using the tag lines;
- Place the corer on deck with the spade resting on the deck;
- Lift the corer until just a few centimetres above deck level and rotate so that the access point in its base faces forward. Lower the corer so it is just on deck. Place chocks under the edges of the spade;
- Release the spade by undoing the two clamps on each side and free the box by removing the front plate;
- Remove the box and spade and secure out of the deployment area for subsequent sample processing;
- Fit the replacement box and spade to the corer so that it is ready for redeployment;
- A pallet truck can be used to assist in moving the sample and fitting the replacement box and spade;
- Inform the bridge that sampling has been completed.

Sample acceptance and processing (WI25_007) should be referred to for the subsequent process.

B.2.4 Records

Documents and files generated by this work instruction are:

Title	Document No.	Holder	Retention Period
Field logbook	TP25_006	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Sediment sample log	FM25_008	Project Manager	4 years from job close out date unless otherwise stated within the client contract

B.3 SEDIMENT SAMPLE ACCEPTANCE AND PROCESSING

B.3.1 Acceptance

Once the box corer has been recovered and is secure, the inspection doors can be lifted, (if present), or the sampler contents otherwise inspected and a decision made by the environmental scientist/ecologist as to whether to accept or reject the sample. The sample is considered unacceptable in the following instances (and is classified as a no sample):

- Evidence of surface sediment washout caused through the jaws not closing properly;
- Inspection hatches open or not closed properly allowing sediment washout;
- Sediment sample taken on an angle i.e. where the corer has not struck the seabed true;
- Disruption of the sample through striking the side of the vessel;
- All box core samples to be a minimum of approximately 10 cm deep. Sample depth is measured by a steel ruler;
- Sample is more than the accepted range from the target location (the sample tolerance for each project should be defined by the Scope of Works);
- The presence of a Hag Fish (*Myxine glutinosa*) and/or other mucous coagulants;
- The sample is unacceptable to the environmental scientist/ecologist or client representative for any other reason.

If the sample is deemed acceptable, it is retained for either macrofaunal analysis or physico-chemical analysis.

Under exceptional circumstances, where sampling success is limited by substrate type, samples that do not meet the acceptance requirements may be retained for analysis. This must be recorded in the field logbook (Template TP25_006), or sample log (Form FM25_008) or deck sample details (Template TP25_011) and a client concession form (Form FM25_007) completed and signed off by the client representative.

B.3.2 Sample Logging

- Ensure all samples are logged to client specifications;
- Sample details should be recorded within the field logbook (Template TP25_006). Details which must be recorded for all samples acquired are:
  - Date and time of collection;
  - Personnel undertaking sample processing;
  - Site/station code and individual sample identifier (describing analysis and replicate);
  - Sampling equipment;
  - Sieve aperture (for screening of faunal samples only);
  - Number and type of container(s) used;
  - Acquisition coordinates;
  - Water depth;
  - Approximate sample volume (litres) or bite depth (cm);

- Visual sediment description, including stratification, if applicable (see Section B.3.3);
- Colour, including stratification, if applicable (see Section B.3.4);
- Presence of conspicuous fauna/bioturbation;
- Other sediment characteristics (e.g. smell of H_2S, anthropogenic debris, indicators of sewage contamination etc.);
- Weather conditions and sea state at time of sampling. As a minimum this should be recorded for each day of operations, with significant changes over the course of a day also recorded.

- In box core samples sample depth is determined by measuring from the top of the corer's box to the sediment surface and subtracting this measurement from the total box depth. As a minimum the rulers used must be cleaned with seawater between samples; if samples are to be subsampled for chemical analyses, only acetone cleaned etched stainless steel rulers may be used;
- Where clients require sample size to be determined in litres, graduated sample collection hoppers are to be used. The sediment should be levelled within the hopper, and the sample size ascertained from the graduations (I litre increments) from the side of the hopper;
- Where pH, temperature or redox data are required these data must be obtained as specified in WI25_017 Calibration and Use of Hanna HI98121 Redox Probes and recorded within the field logbook (Template TP25_006);
- As a minimum a sample from each location should be photographed with a label or site card clearly showing the job number, station number, and a scale bar (ruler). A macro (close-up) photograph of the sample may also be required within the scope of works. Photographs must be in focus and well-lit, with the camera lens kept free of dirt and water droplets. To allow consistent presentation of reports and electronic deliverables the label or site card should always be located in the top left corner of the photograph;
- Photographs of the residues retained on the sieve from the biological samples may be required within the scope of works. Care must be taken to ensure that the macro (close-up) photographs are in focus.

B.3.3 Sediment Composition Description

The sediment composition of samples needs to be described and recorded on the field logbook (Template TP25_007).

Sediments be visually classified in accordance with the Folk (1954) sediment classification. The particle size classes within this are shown in Table B.1 and the means by which the proportions of these classes are combined to create a sediment description is shown Figure B.1.

If cobbles or boulders are present within the samples, these should be noted, but will not form part of the Folk classification. The description will be subjective and will only be used to inform preliminary project reporting and interpretation; these descriptions will be superseded by quantitative data provided by particle size distribution (PSD) analysis.

It is important to mention the shell content of the sample, if present, as this is not differentiated from gravel in the PSD analysis. Any cobbles or boulders (>64 mm on any axis) present in the sample should be measured along both axes (to the nearest cm rounded up or down) and should not be included in the sample for PSD analysis.

Table B.1: Sediment Particle Sizes and Classification Terms

Particle Size	Wentworth (1922) Classification	Corresponding Folk Class Used in Long (2006) Classification
> 256 mm	Boulder	NA
> 64 to 256 mm	Cobble	
> 2 to 64 mm	Gravel/pebble	Gravel
> 62.5 µm to 2 mm	Sand	Sand
> 4 to 62.5 µm	Silt	Mud
> 1 to 4 µm	Clay	

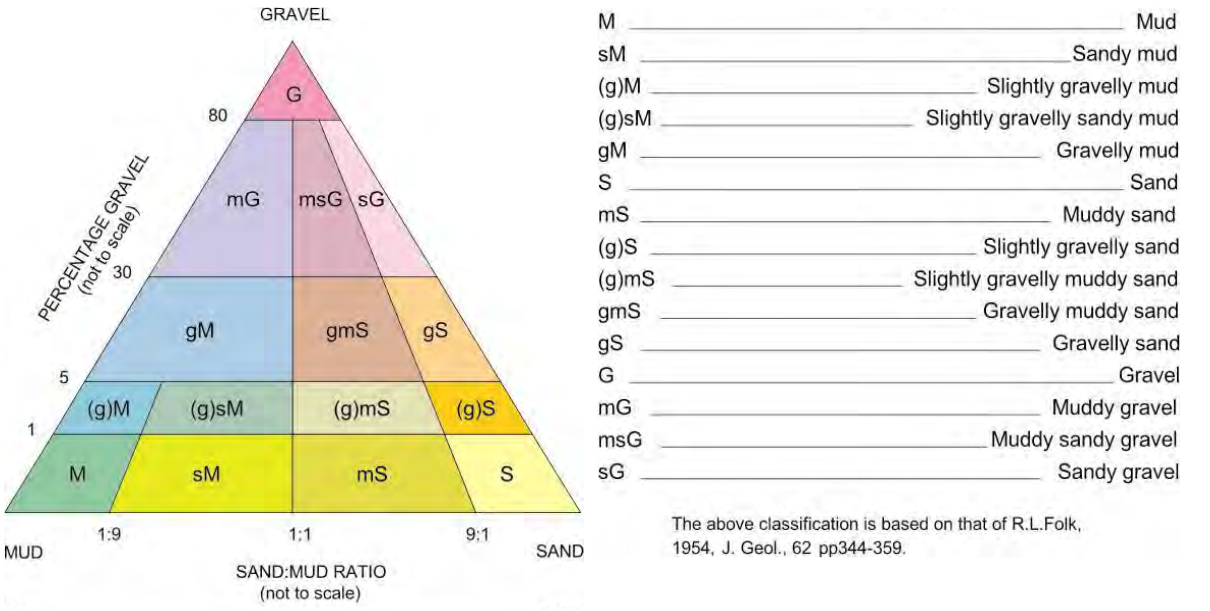


Figure B.1: The BGS modified Folk classification (source: Long, 2006)

Example sample photographs are presented in Figure B.2 along with descriptions and actual proportions of sediment fractions (quantified from PSD data).

<table>
<tr><td> </td><td> </td></tr>
<tr><td>Sandy (22 %) gravel (71 %) with shell and cobble -sG</td><td>Sandy (47 %) gravel (50 %) with shell</td></tr>
<tr><td> </td><td> </td></tr>
<tr><td>Sand (99 %) - S</td><td>Gravelly (17 %) sand (79 %) - gS</td></tr>
<tr><td>
</td><td>  </td></tr>
<tr><td>Mud (100 %) - M</td><td>Sandy (21 %) mud (79 %) - sM</td></tr>
</table>

Figure B.2: Example photographs of different sediment types with accompanying descriptions and PSD data

B.3.4 Munsell Colour Classification

Munsell colour charts should be used to describe sediment colour. It may not be appropriate to use Munsell colour to describe particularly heterogeneously coloured samples (e.g. gravels, shell hash) but the sediment matrix of muddy/sandy mixed sediments can be described.

The description of colour using Munsell colour charts should be undertaken after any physico-chemical subsamples have been taken, or before processing of macrofaunal samples.

Before using the charts the environmental scientist/ecologist must ensure that they are intact, with no missing pages or colour panels and are in a legible state (the charts are waterproof and can be gently washed if they are excessively dirty). A brief procedure of the use of Munsell colour charts follows; further details of their use are also provided within the books of charts themselves.

- Assessment of sediment colour at the samples surface must be made for all samples. If differently colour underlying strata are present the colour of these, and their depth below surface, must also be recorded. While description of the sediment surface must be conducted immediately after sample collection, it will generally be better to characterise underlying layers after all subsampling has been completed (to minimise disturbance of the sample);
- Allow water film to drain away from the sample;
- Collect a small amount of the sediment to be assessed;
- Flatten the sediment onto a clean fingertip or onto a small piece of paper. Accurate classification can be made easier by putting a dark sample on black background or light sample on a white background;
- Place the sample as close to the colour chart as possible and ensure they are under an adequate light source. Daylight or fluorescent artificial light sources are preferable to incandescent light sources;
- Compare the sample to the colour chart by first selecting the chart of appropriate hue and then selecting the colour chip that most closely matches the sediment colour;
- The selected colour should be recorded using the following notation: 'Hue Value/Chroma', with the colour description also noted e.g. sediment of hue 2.5YR, value 5 and chroma 3, should be recorded as '2.5YR 5/3 Reddish Brown'.

B.3.5 Box Core Sample Processing

After sample logging and photography (using standard procedures from WI25_007), each of the box core samples will be subdivided, processed and stored as detailed in Table B.2.

Table B.2: Sediment Sample Processing and Storage

Subsample (subsample Code(s))	Sample Codes	Treatment	Storage
Temperature; Redox/ORP	NA	In situ testing with sensor inserted to 2 cm, 5 cm and 10 cm depth (3 measurements per sample). Record on logbook TP25_006.	NA
Grain size Distribution, TOM	PSDA1, PSDA2	Collect 250 g sample from 0-3 cm sediment surface using plastic scoop and place into bag.	Ziplock bag (double bagged). Freeze at -20 ºC (±5 ºC)
Hydrocarbons	HCA1, HCA2	Collect 250 g sample from 0-3 cm from surface of sediment using stainless steel scoop, place into glass jar.	500 ml glass jar, Freeze at -20 ºC (±5 ºC)
Metals, TOC	HMA1, HMA2	Collect 250 g sample from 0-3 cm from sediment surface using plastic scoop, place into bag.	Ziplock bag (double bagged). Freeze at -20 ºC (±5 ºC)
Macrofauna	FA1, FB1	Subdivide 0.1 m^2 of the sample, sieve over 0.5 mm mesh and decant to 1 litre plastic pot, add 10 % formalin/seawater solution.	1 litre plastic pot (5 litre buckets available if required). Ambient temperature
Biodiversity	BIOA1, BIOB1, BIOC1, BIOA2, BIOB2, BIOC2	Sample an aliquot (approximately 5 g) of sediment into a ziplock bag using a sterile, single use spatula.	Ziplock bag (3 samples placed into ziplock bag). Freeze at -20 ºC (±5 ºC)

Notes:

i. All sampling must be undertaken while wearing **clean** nitrile gloves. Equipment will be appropriately cleaned prior to use (metal scoops cleaned with acetone, plastic scoops with fresh seawater); single use sterile spatulas will be used for biodiversity samples;
ii. The sample may be left to drain naturally or drained using a siphon. The siphon must be rinsed with seawater after use and decontaminated with DNAse Displace and rinsed with deionized water immediately before use;
iii. The redox potential of each physicochemical sample will be measured using a Hanna HI 98121 handheld sensor; this will be tested prior to the sample being fully drained. Redox potential will be measured at depths of 2 cm, 5 cm and 10 cm below the sediment surface from an area of the sample where macrofauna samples will be extracted (not area used for physico-chemical/DNA sampling). The sensor must be cleaned with seawater after use and decontaminated with DNAse Displace and rinsed with deionized water immediately before use. Accompanying temperature measurement will also be taken to allow standardization to the potential of a hydrogen electrode (Eh). Results will be recorded on form TP25_006;
iv. To minimize the risk of sample contamination, biodiversity (DNA) samples will be extracted before other sample types (immediately after sample fully drained);
v. Macrofauna inserts can then be inserted into the core and the physico-chemical samples taken;
vi. Finally, macrofauna samples should be extracted (to 10 cm depth) and processed.

B.3.5.1 Macrofaunal Processing

Samples retained for macrofaunal analysis are thoroughly washed from the box corer insert into a sediment collection tray. All collection trays, sieves and sieving apparatus must be thoroughly cleaned with a seawater hose (and nylon brush, if necessary) between samples to minimise likelihood of cross-sample contamination.

Samples will be sieved using a 0.5 mm mesh sieve in a Wilson autosiever (WAS) as follows:

- The WAS is connected to a seawater hose (often the ships fire pumps via a standard UK sector fire hose). The Bridge is then requested to turn the pumps on. Due to the intermittent use of the

WAS an additional hose may have to be run off in order to alleviate the pressure built up in the pump system, check if this is required with the bridge and the technical coordinator;

- Ensure that the main valve to the WAS is turned off. The sediment collection tray should then be washed into the WAS sieve using a gentle spray of water from the attached seawater hose. Care should be taken to ensure the entire sample is transferred as some of the animals may be too small to be obvious at this stage;
- If the sieve clogs before the entire sample has been transferred, the sample should be transferred in stages;
- Securely place the lid on the WAS sieve and turn on the main valve on the WAS to start the flow of water. Ensure that water flow is sufficient to remove sediment, but not so high as to displace/damage any animals;
- Once sieving has been completed the WAS main valve should be turned off and the sieving residue (which will include retained fauna) washed to one side of the sieve;
- The animals and remaining sediment are then back-washed into an appropriately labelled container using the seawater hose;
- The samples are fixed by adding an approximately 1:1 ratio mixture of ~20 to 25 % formal saline stock solution and seawater to the samples. Mixing instructions to make these stock solutions are detailed in WI25_018 Formalin Mixing Instructions;
- If undissolved lumps of clay are evident after sieving sodium hexametaphospahate can be added at an approximate concentration of 0.2 % w/v. As over addition of sodium hexametaphospahate will not have detrimental effect on samples, this can be added in approximate quantities of 0.5 level teaspoons per litre of sample/fixative.

B.3.5.2 Sieve Types, Certification and Inspection

All sieves used for macrofauna processing must hold certificates of conformity to BS410 or ISO 3310-1 (woven wire sieves) or ISO 3310-2 (perforated plate sieves). Sieves with a diameter of 30 cm or less will be calibrated in house, in accordance with Fugro GB Marine's sediment laboratory test method (TM08_004 – Calibration of test sieves). Sieves of a diameter of greater than 30 cm will be calibrated by an accredited subcontractor. Copies of the performance check record must be kept, and relevant certificates are to be saved in the job folder. Compiled records of manufacture/performance check dates will also be maintained.

All sieves must be visually inspected before use and if any of the following is noted their use must be discontinued, with the equipment 'red tagged' to indicate that it is faulty:

- Broken wire mesh/visibly damaged perforations;
- Bent wire mesh/perforated plate – this may distort sieve apertures;
- Distorted sieve frames – this may prevent correct sealing of lids in the WAS;
- Damaged/detached seals between the mesh and frame – this may lead to fauna being trapped under seals.

The visual inspection of each sieve when in use must be carried out at least weekly (during extended periods of use) or once per project (for projects of less than 1 week duration). The results of this inspection must be documented in Form FM25_017 Macrofaunal Sieves Visual Examination. The completed forms should be saved on the network in the appropriate job folder.

B.3.6 Sample Labelling

All samples must be at least double labelled in the following way:

- Glass jars/plastic pots used for physico-chemical analysis – labelled on side and lid;
- Glass vials (BTEX) – labelled on side, station and sample identifier written on lid;
- Plastic bags – labelled both inner and outer bag;
- Faunal sample pots and buckets – labelled on side/lid and internal label (waterproof paper).

Each sample's label(s) must include the following information:

- Project number;
- Site/station number;
- Sample identifier;
- Date sampling undertaken;
- Positional fix number (which is a digital log of date, time and position);
- If single macrofaunal samples have been stored in multiple containers, the container number and total number of containers should be noted (e.g. 1 of 2).

B.3.7 Sample Storage

B.3.7.1 Fridge/Freezer Temperature Monitoring

Monitoring of the temperature of fridges and freezers (onboard survey vessels) used to store samples for physico-chemical analysis is key in control of deviating samples.

All sample storage fridges/freezers will be monitored during their period of use by dedicated verified thermometers. These will be identifiable by unique asset numbers and will have labels showing the expanded uncertainty of measurement range for the fridge/freezer temperature required. Thermometers will be verified against a UKAS accredited (NPL) thermometer annually; this verification will be undertaken by Fugro GB Marine's Sediment Laboratory. Verification expiry dates will be recorded on the thermometer label and tracked centrally.

Daily temperature checks of all fridges/freezers will be undertaken while they are being used to store samples. Temperature recording forms (Form FM25_018) will be attached to each fridge/freezer and filled out by hand. Hard copies of the forms will remain with the fridges/freezers in question, but scans or photocopies of the records pertinent to individual projects should be made as proof of adequate performance for the duration of the project. These records should then be saved on the network in the appropriate job folder.

USB temperature loggers are to be used to monitor the temperature within the coolboxes during transit to the laboratories. USB temperature loggers should be placed in a plastic bag labelled with the job number and job title. Once these have been received at the laboratories, the USB temperature loggers should be returned to the Environmental Technician at Portchester. The data will then be downloaded and saved on the network in the appropriate job folder.

B.3.8 Records

Documents and files generated by this work instruction are:

Title	Document No.	Holder	Retention Period
Sample details	FM25_005	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Field logbook (multiple OPCO)	TP25_006	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Field logbook (single OPCO)	TP25_007	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Client concession	FM25_007	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Grab sample log	FM25_008	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Sediment chemistry log	FM25_009	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Deck sample details form	TP25_011	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Macrofaunal sieves visual examination	FM25_017	Project Manager	4 years from job close out date unless otherwise stated within the client contract
Fridge/freezer temperature recording form	FM25_018	Original maintained with equipment/copies passed to Project Manager	4 years from job close out date unless otherwise stated within the client contract

B.4 WATER SAMPLING AND PROFILING

B.4.1 Purpose

The purpose of this work instruction is to describe the process of environmental water sampling and profiling using Valeport Midas CTD+ and Niskin water samplers.

B.4.2 Responsibilities

The master retains overall responsibility for the safety of the vessel. The senior shift engineer and senior environmental scientist (from here on referred to as shift supervisor) will be responsible for the safe deployment and recovery of the equipment. Operation of the water samplers and profilers and processing of water samples is the responsibility of the onboard environmental scientists.

B.4.3 Operational Protocol

It will be necessary to deploy the water profiler twice at each station, to ensure consistency in the water column data collected. As three samples (at surface, mid-depth and near bottom) are required at each station, the mid-depth and bottom samples will be collected individually on each of the two profiler

deployments. The surface samples will be acquired by briefly redeploying the system so that the sampler is approximately 1 m below the surface (or deeper if sea conditions are marginal).

B.4.3.1 Predeployment

- The water profiler will be checked against calibration standards (pH probe) and in oxygen saturated water (DO probe) prior to deployment;
- Logging will be initiated in the profiler and the blanking plug attached. The water profiler will be set up to record as per Manual;
- The profiler will be shackled to the end of the lift wire, with a beacon above it;
- The water samplers will be fitted (using large diameter cable clamps) a few metres above the beacon.

B.4.3.2 Deployment and Recovery

- The vessel will settle on location and the equipment will be deployed;
- The equipment will be lowered to the desired sampling depth at a low speed (0.5 $m.s^{-1}$ to 1 $m.s^{1}$);
- For mid depth and near-bottom samples depth will be determined by the beacon;
- When the equipment is at the desired depth a messenger weight is attached to the lift wire and sent to trip the sampler. Sufficient time should be allowed for this to travel to the sampler. Winch speed for continuation of deployment or recovery should again be slow (0.5 $m.s^{-1}$ to 1 $m.s^{-1}$);
- When the equipment is at the surface it should be recovered to deck and the sampler removed, with water decanted into various laboratory sample containers.

B.4.3.3 Post Recovery

- The vessel should not leave the site until the quality of the water profile data has been checked;
- Data will be uploaded from the water profiler using the Valeport Datalog Pro software. Data will be exported in a '000' file format which can be pasted into an excel QC spreadsheet.

B.4.4 Water Sample Processing

Each of the 10 litre samples will be pre-treated (if necessary), packaged and stored as detailed below. Sufficient spare samples will be acquired to allow analysis of all target analytes, should primary samples be lost/damaged during transit.

Table B.3: Water Sample Processing and Storage

Subsample (Subsample Code)	Sample Codes	Treatment	Storage
Metals	HMA1	Fill 500 ml plastic bottle to neck and add nitric acid (quantity tbc)	Refrigerate at 4 ºC (±2 ºC)
Total suspended solids	TSS1	Fill 1000 ml plastic bottle to neck	Refrigerate at 4 ºC (±2 ºC)
TOC	TOCA1, TOCA2	Fill 2 × 40 ml glass vials to shoulder and add dihydrogen phosphate	Refrigerate at 4 ºC (±2 ºC)
Hydrocarbons A - THC, n-alkanes, PAH	HCA1, HCA2	Fill 1 litre amber glass bottle to shoulder	Freeze at -20 ºC (±5 ºC)
Spare (SPARE)	SPAREA1	Fill with remaining water	Freeze at -20 ºC (±5 ºC)
Total Sample Volume required from each depth			**10 litres**

Notes:

i. All sampling must be undertaken while wearing **clean** nitrile gloves. Prior to sampling the Niskin bottles and any reusable components associated with biodiversity sampling will be cleaned with Fisherbrand DNAse Displace decontaminant and rinsed with deionized water;
ii. To minimize the risk of sample contamination, biodiversity (DNA) samples will be taken before other sample types;
iii. Collect all other sample types before collecting spare sample – it is not anticipated that 1 litre of sample water will remain after all other samples collected;
iv. Add fixates to metals and TOC samples after filling with water (to prevent splashing of neat fixative). Do this in a safe environment (isolate other personnel) as soon as possible after collection;
v. Filter DNA samples as soon as possible after collection. Following instructions provided by CEGA.

Executive Summary

CSA Ocean Sciences Inc. (CSA) was contracted by BENTHIC Geotec Pty Ltd (BENTHIC) to provide Environmental Baseline Survey (EBS) services associated with the Hammerhead Development offshore Guyana. The Hammerhead Development is operated by Esso Exploration and Production Guyana Limited (Esso) an affiliate of ExxonMobil. During the EBS, physicochemical and biological data were collected within the study area to meet the following objectives:

- Determine and document environmental baseline conditions (i.e. physicochemical and biological) against which effects from proposed future oil and gas operations can be compared; and
- Identify parameters within the local ecosystem that may be sensitive to change and provide a reference point to evaluate future claims of impacts.

This EBS report includes content in support of data results and discussion, as briefly described below.

- **Survey Design**: describes the attributes (e.g. number, location) of sampling stations.
- **Field Methods**: describes survey equipment, personnel, sampling methods specific to collection and on-board processing, and quality assurance measures.
- **Laboratory Methods and Data Processing**: summarizes aspects of sampling parameters, identifies analytical laboratories, and describes aspects of data analysis and laboratory techniques specific to sampling parameters.
- **Literature Cited**: provides bibliographic information for referenced journal articles, books, or grey literature.
- **Appendices**: provides information in support of the EBS findings including analytical laboratory datasheets, infauna data, hydrographic profiles, and sediment metals regression plots.

This EBS describes characteristics of the seabed sediments, with specific reference to redox potential depth gradient, particle size distribution/grain size, total organic carbon (TOC), hydrocarbon content, metals, and infauna analysis.

- Redox potential (Eh) values were all positive ranging from a low of 100 to 233 mV that are indicative of aerobic conditions. As expected, there was a general trend of indirect correlation between Eh values and sediment depth with decreasing values with increasing depth.
- Overall, sediment grain size was mainly silty clay, based on Shepard's classification. Stations were characterized by sediment with less than 30% sand and high proportions of silt and clay fractions with the exception of Station HH-8 that had relatively even proportions of sand, silt, and clay.
- The sediment TOC concentrations in the study area are relatively low ranging from 0.17% to 0.65%.
- TPH concentrations in sediment ranged from 3 to 1,233 $\mu g\ g^{-1}$ and were generally similar among all stations except Station HH-2. TPH concentrations exceeding 1,100 $\mu g\ g^{-1}$ were considerably elevated at Station HH-2 with levels hundredfold over the other EBS stations. The presence of synthetic based fluids in the sediment could be a possible reason for the observed elevated TPH at Station HH-2.
- PAH concentrations in sediment ranged from 37.2 to 319 ng g^{-1} and like TPH were generally similar among all stations except Station HH-2. Station HH-2 total PAH concentration (319 ng g^{-1}) was considerably elevated but well below the effects range low (ERL) (4,022 ng g^{-1}) value for total PAHs in marine sediment. Fossil Fuel Pollution Index ratio for sediments from the Hammerhead Development EBS study area range from 0.14 to 0.23 indicating that PAHs in sediments are predominantly from pyrogenic sources.

- There were some notable elevated levels of sediment metals. In particular, the levels of barium were extremely elevated at Station HH-2 and elevated to lesser extents at Stations HH-3 and HH-1. Barium in sediment samples from stations HH-1, HH-2, and HH-3 with concentrations greater than 1,000 ppm (mg kg^{-1}) may be indicative of drilling activities with discharge of drilling muds. Arsenic and nickel concentrations exceeded the ERL at 6 of 8 stations but did not the effects range median (ERM). All other metals concentrations for the survey were below their respective ERL benchmarks, where applicable.
- There was an approximate sevenfold increase in the mean aluminum concentration between this EBS (7.24%) and the 2018 Liza 2 Field Development EBS (1.15%). There is variability in the observed sediment aluminum concentrations ranging from 3.85% to 8.46% during this EBS that well exceeds the aluminum concentration range of 1.04% to 1.27% observed during the 2018 Liza 2 Field Development EBS. The observed aluminum concentration during this Hammerhead Development EBS are typically expected for deep water clay sediments. The sources for the stark differences between this EBS and the 2018 EBS sediment aluminum concentrations are uncertain but could be influenced by analytical laboratories and associated methods between surveys, natural influx of aluminosilicate terrigenous sediments, and/or anthropogenic activities.
- The 8 box core samples collected from the survey area yielded 204 individuals and 37 total taxa from eight phyla. Most of the individuals (60.3%) were contributed by the annelids followed by arthropods (19.6%), and nematodes (17.2%). Annelids were also represented by the most infaunal taxa (24) followed by arthropods (6), and echinoderms (2). The overall infauna density ranged from 98.0 to 359.2 individuals per m^2 with a mean of 208.2 ± 79.3 individuals per m^2 across all stations.
- The diversity indices indicated that the assemblage has generally low species richness and diversity but high evenness across all stations indicating similar relative abundances among taxa and correspondingly low numerical dominance.
- Cluster analysis and the multidimensional scaling ordination do not reveal any discrete groups of infauna samples that would indicate spatial aggregation or other assemblage patterns.

This EBS describes water column characteristics through the collection of hydrographic profiling data and water samples for analyses of total suspended solids (TSS), TOC, hydrocarbon content, and metals at depth within the study area.

- Overall, hydrographic data at all EBS stations appeared typical of the offshore open ocean environment for the region. Seawater temperature ranged from 4.07°C to 28.19°C. Temperature changed very little in the upper 60 to 70 m of the water column which marked the top of the thermocline observed below the well-mixed surface portion of the water column. Salinity ranged from 34.54 to 37.20 practical salinity units (PSU). There was a distinctive surface lens of low salinity water above the high salinity layer with maximum of about 37 PSU that delineated the halocline depth at about 170 m. The pH was generally stable throughout the water column ranging from 8.07 to 9.62. Turbidity was low at all stations with an overall mean of 0.25 nephelometric turbidity units (NTU). DO concentration ranged from 3.90 to 8.47 mg L^{-1} during the survey and DO saturation ranged from 40.78% to 105.49%.
- TOC concentrations were very low at all EBS stations and was detectable in the surface water at Station HH-1 with a level of 0.3 mg L^{-1}; all other sampling locations were below the detection limit of 0.2 mg L^{-1}.
- TSS levels were low in the EBS study area with most samples below the analytical laboratory reporting limits of 5 mg L^{-1}.

- Concentrations of hydrocarbons in the water column of the EBS study were very low with TPH levels at all sampling stations and depths being below the analytical detection limit of 13 µg L^{-1}. PAH concentrations in seawater ranged from 0 to 24.1 ng L^{-1} with highest total PAH concentration observed in the surface waters at Station HH-2 that has sediments characterized by highly elevated TPH and PAHs levels. All PAH levels were well below Criterion Continuous Concentration (CCC) values, when applicable, indicating PAHs present in the water column do not represent a hazard to marine organisms and the general offshore marine ecosystem.
- Total metal concentrations within the water column were low except for strontium and molybdenum. All metal concentrations are reported as lower than the CCC toxicity reference values with a few exceptions of molybdenum. The source of the elevated levels of molybdenum are uncertain but could be influenced by regional mining activities.

This EBS documents the existing state of the seafloor marine environment with high definition videographic data. All visually documented habitat was soft bottom substrate that supported a relatively depauperate biological assemblage as based on the sampling area viewed from the imagery Representative seafloor image at Station HH-02 likely indicated that the content of the surficial sediments were strongly influenced by discharges of drilling muds and cuttings.

The report includes a Conclusion and Recommendations section that presents primary data analytical results relevant to understanding potential impacts to the various aspects of the environment from ongoing and future offshore oil and gas activities. These findings provide the basis for recommendations to address informational data gaps and parameters most informative to understanding and detecting impacts. For example, there were high sediment hydrocarbon and metal locations within the Hammerhead Development EBS study area that could facilitate appropriate monitoring initially to understand the hydrocarbon source by using “fingerprint” sampling for operator-utilized non-aqueous drilling fluids and secondarily to evaluate chemical persistence in the environment and recovery to ambient conditions. Another example specific to infauna, the level of EBS infauna sampling appears to be adequate for generally characterizing the regional assemblage. However, a more comprehensive characterization of the assemblage may be required for infauna data to detect potential effects of offshore activities within the study area. More infauna samples within the EBS study area with a random positioning for stations stratified based on water depth would greatly enhance the ability to characterize the assemblage relative to local variability (e.g. depth gradient), species diversity, and spatial patterns (i.e., distinct assemblage groupings). The provided recommendations are intended to provide data for resources at risk to better facilitate assessing effects from oil and gas activities.

1.0 Introduction

CSA Ocean Sciences Inc. (CSA) was contracted by BENTHIC Geotec Pty Ltd (BENTHIC) to provide Environmental Baseline Survey (EBS) services associated with the Hammerhead Development offshore Guyana. The Hammerhead Development is operated by Esso Exploration and Production Guyana Limited (Esso) an affiliate of ExxonMobil. The Hammerhead Field is located, approximately 170 km offshore Georgetown, Guyana, in the Stabroek Block (**Figure 1**). Water depths within the EBS study area, located within and extended outside the boundaries of the Hammerhead Field, ranged from approximately 800 to 1,900 m.

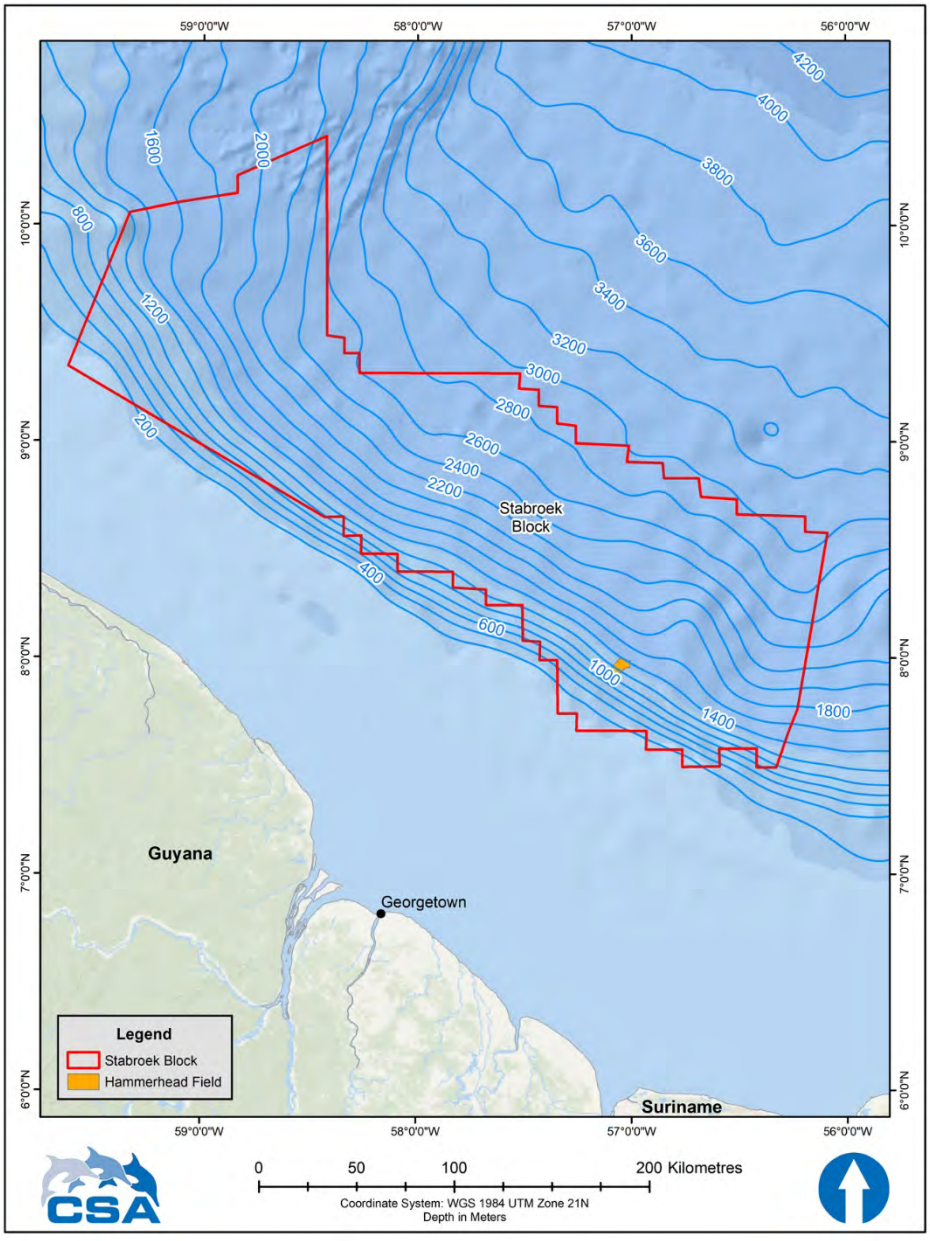

Figure 1. The Environmental Baseline Survey study area is located within and extends outside the boundaries of the Hammerhead Field within the Stabroek Block offshore Guyana.

1.1 OBJECTIVES

Based on the ExxonMobil general specifications, an offshore Initial Environmental Survey (IES) considered synonymous with an EBS, should be conducted to provide information on existing environmental conditions as a precursor to project or operational activities having potential influences on the environmental. The findings of the EBS are typically used in the support of the programmatic Environment, Socioeconomic, and Health Impact Assessment (ESHIA) process specific to understanding potential impacts to the various aspects of the environment. Other applications of the EBS findings are relevant to understanding potential engineering constraints based on sediment physical and chemical properties and oil spill response (i.e., presence of environmentally sensitive biomes).

During the EBS, physicochemical and biological data were collected within the study area to meet the following objectives:

- Determine and document environmental baseline conditions (i.e. physicochemical and biological) against which effects from proposed future oil and gas operations can be compared; and
- Identify parameters within the local ecosystem that may be sensitive to change and provide a reference point to evaluate future claims of impacts.

The specific EBS tasks to meet with the programmatic objectives were as follows:

- Determine characteristics of the seabed sediments, with specific reference to redox potential depth gradient, particle size distribution/grain size, total organic carbon (TOC), hydrocarbon content (total petroleum hydrocarbons [TPH] and polycyclic aromatic hydrocarbons [PAHs]), metals (aluminum [Al]; arsenic [As]; barium [Ba]; beryllium [Be]; cadmium [Cd]; cobalt [Co]; chromium [Cr]; copper [Cu]; iron [Fe]; lead [Pb]; mercury [Hg]; manganese [Mn]; molybdenum [Mo]; nickel [Ni]; selenium [Se]; silver [Ag]; strontium [Sr]; tin [Sn]; thallium [Tl]; vanadium [V]; and zinc [Zn]), and infauna analysis;
- Determine water column characteristics through the collection of hydrographic profiling data and water samples for analyses of total suspended solids (TSS), TOC, hydrocarbon content (TPH and PAHs), and metals (same as for seabed sediments) at depth within the study area; and
- Document the existing state of the marine environment at selected areas with full color, high definition videographic data.

EBS data, in establishing baseline conditions, would provide the comparative basis for any future environmental monitoring. The EBS, as designed and approved by ExxonMobil, is considered fit-for-purpose to meet programmatic objectives as based on providing data of measurable, and with level of quality, to be scientifically defensible.

1.2 REPORT ORGANIZATION

This EBS report is organized as follows:

- **Section 1 – Introduction**: outlines general survey background, location and objectives.
- **Section 2 – Survey Design**: describes the attributes (e.g. number, location) of sampling stations.
- **Section 3 – Field Methods**: describes survey equipment, personnel, sampling methods specific to collection and on-board processing, and quality assurance measures.
- **Section 4 – Laboratory Methods and Data Processing**: summarizes aspects of sampling parameters, identifies analytical laboratories, and describes aspects of data analysis and laboratory techniques specific to sampling parameters.

- **Section 5 – Results and Discussion**: summarizes and presents survey data, including general interpretation of the findings, with comparisons to environmental standards and relevant regional programs, as appropriate.
- **Section 6 – Conclusions and Recommendations**: generally summarizes the analytical results relevant to understanding potential impacts to the environment and provides recommendations to address potential data gaps for assessing effects from oil and gas activities.
- **Section 7 – Literature Cited**: provides bibliographic information for referenced journal articles, books, or grey literature.
- **Appendices:** provides information in support of the EBS findings including analytical laboratory datasheets, infauna data, hydrographic profiles, and sediment metals regression plots.

2.0 Survey Design

The survey design, developed by ExxonMobil, consists of eight sampling stations at fixed locations within and around the Hammerhead Development Field. **Table 1** provides the EBS station designations based on Esso naming convention and sampling locations, proposed and actual navigational coordinates, and water depths. **Figure 2** shows the actual locations of sample stations surveyed during the EBS.

Table 1. Environmental baseline survey station designations, based on Esso naming convention and sampling location alpha-numeric codes, proposed and actual navigational coordinates, and water depths. Navigational coordinates are presented in the World Geodetic System 1984 (WGS84) and projected using the Universal Transverse Mercator (UTM), Zone 21 North.

Naming Convention Station	Sample Location	Navigational Coordinates				Water Depth (m)
		Proposed		Actual		
		X - Easting (m)	Y - Northing (m)	X - Easting (m)	Y - Northing (m)	
NC21G20EBC101	HH-01	487,396.6	877,361.6	487,378.6	877,355.1	1,033
NC21G20EWS101				487,363.9	877,336.1	
NC21G20EBC102	HH-02	488,856.5	879,755.9	488,860.2	879,762.5	1,149

NC21G20EWS103				490,268.1	878,634.5	
NC21G20EBC104	HH-04	484,301.5	875,632.8	484,294.7	875,635.5	873
NC21G20EWS104				484,280.8	875,622.9	
NC21G20EBC105	HH-05	513,374.4	880,015.1	513,372.5	880,036.1	1,545
NC21G20EWS105				513,254.9	880,089.8	
NC21G20EBC106	HH-06	505,791.0	881,310.5	505,793.8	881,319.6	1,481
NC21G20EWS106				505,686.2	881,319.8	
NC21G20EBC107	HH-07	495,413.3	879,347.0	495,414.9	879,359.8	1,261
NC21G20EWS107				495,341.9	879,401.4	
NC21G20EBC108	HH-08	512,694.4	884,738.1	512,688.1	884,754.6	1,633
NC21G20EWS108				512,601.5	884,771.1	

Note that sample naming convention follow the format as described:
AreaCode_Country_Year_SampleType_Station sequential#.
Area Code for this program is “NC21”; Country for this program is “G”; Year for this program is “20”; sample type is EBC = environmental box core or EWS = environmental water sample.

Sediment and water column sampling and seafloor imagery collection was conducted at each of the eight sampling stations. Sediment sampling was conducted for analyses of biotic (i.e. infauna) and abiotic parameters. Water column sampling included water sample collection and hydrographic profiling. At each station, water samples were collected at three depths within the water column: 1) near-surface; 2) mid-water (at the thermocline beneath the mixed surficial layer); and 3) near-bottom (approximately 20 m above the seafloor). Hydrographic profiling was conducted within the entire water column. To visually document the seafloor in the study area, videographic data was acquired at all sampling stations with a box core-mounted, remote pressure-activated high-definition camera system. Quality assurance (QA)/quality control (QC) samples (e.g. QA/QC blanks) were collected for selected sediment and seawater chemistry parameters.

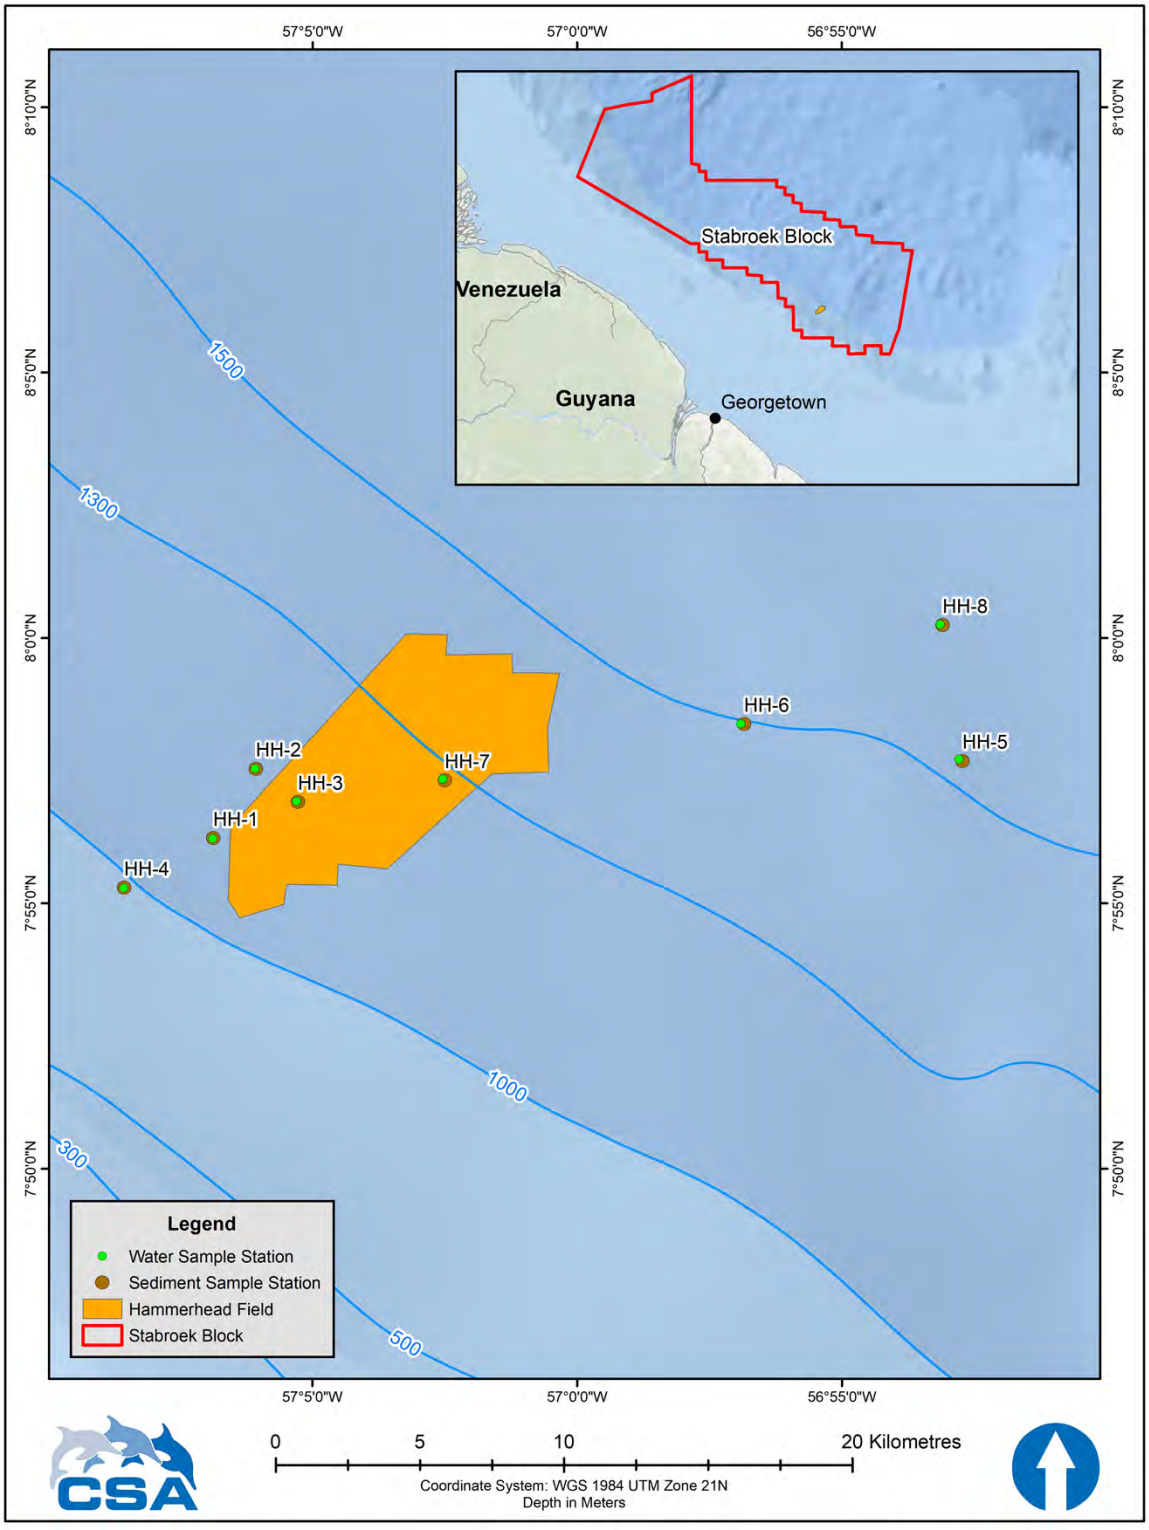

Figure 2. Locations of sampling stations for the Environmental Baseline Survey located within and around the Hammerhead Field in the Stabroek Block, offshore Guyana.

3.0 Field Methods

3.1 VESSEL, NAVIGATION AND EQUIPMENT

The Hammerhead Development EBS was conducted using the MMA *Valour*, a BENTHIC-contracted 84-m dynamic positioning-2 (DP-2) supply vessel. The MMA *Valour* was built in 2013 and capable of providing accommodation and provisioning for 60 persons. The vessel was outfitted with a winch system and articulating A-frame capable of launching and recovering all survey equipment.

Survey navigation services and associated equipment was provided by the BENTHIC contractor, UTEC, that configured, calibrated, tested, and operated survey positional equipment onboard the vessel. All positioning equipment and procedures were directed by BENTHIC in accordance with Esso specifications to meet with survey objectives. The high precision acoustic positioning system (HiPAP) was interfaced with the vessel ultra-short baseline (USBL) system for tracking the survey equipment during deployment. The HiPAP system during survey operations provides vessel guidance, digital navigation data logging, and a real-time display of the ship's position relative to deployed equipment during sample collection.

The primary sampling equipment used during the EBS to collect all survey data are listed and briefly described below.

- Sea-Bird Electronics (SBE) 19*plus* V2 Conductivity-Temperature-Depth (CTD) profiler is used to measure hydrographic profiles from the sea surface to near the seafloor; data was logged internally and then downloaded and processed by CSA personnel following retrieval.
- SBE 32 Water Carousel water sampling rosette is rated to 6,000 m depth and has a 12-position configuration that hold 5-L Go-Flo bottles. The Rosette was coupled with the CTD, allowing the bottles to be individually fired based on time and/or pressure.
- OSIL seabed camera system includes high definition camera (1080p at 30fps), dimmable 5,000 lumens light emitting diode (LED) light, and battery pack (rechargeable 13AH LiPo) that is rated to 6,000 m.
- United States Naval Electronic Laboratory (USNEL) box corer with removeable stainless steel sampling box that provides a 0.25 m^2 sediment sample surface area.
- Electrical high-power winch used to deploy and retrieve sampling equipment.
- A-frame with hydraulic power unit used to deploy and retrieve sampling equipment.
- Sediment infauna sieve station for processing infauna samples.

3.2 PERSONNEL

The survey team comprised of four CSA persons including two Marine Scientists and two Operations Specialists. The CSA survey team was assisted with all aspects of deck operations by BENTHIC personnel. The team conducted 24-hour operations and during the EBS, each 12-hr shift was be staffed by one Marine Scientist and one Operations Specialists.

Responsibilities of CSA marine scientists during the EBS were to:

- Implement the sampling plan in coordination with Operations Specialists;
- Review, interpret, and manage field data;
- Support science-based decision-making according to objectives and schedule;

- Provide additional QA/QC;
- Direct the compilation and distribution of scientific information; and
- Produce daily status reports.

Responsibilities of CSA operations specialists during the EBS were to:

- Implement the sampling plan in coordination with scientists;
- Support mobilization, demobilization, equipment integration and deck operations;
- Program and operate oceanographic instrumentation;
- Oversee sample collection and handling; and
- Implement CSA Health, Safety, Security and Environment policies and procedures.

3.3 SEDIMENT SAMPLING

Sediment sample parameters, associated guidelines for containers (type and size), preservation methods, and holding times are provided in **Table 2**. These guidelines are based on United States Environmental Protection Agency (USEPA) standards and laboratory recommendations.

Table 2. Summary of sediment parameters, guidelines for containers, preservation method and holding times for samples collected during the Hammerhead Development Environmental Baseline Survey.

Parameter/Analyte(s)	Minimum Sample Weight	Container Type and Size	Storage Conditions and/or Preservation Method	Holding Time
Redox Potential (Eh)	*In situ* measurement using oxidation-reduction potential meter			
Grain size	200 g (wet)	125-mL wide-mouth plastic jar	Freeze, ship on ice, and store frozen	Indefinite when frozen
TOC	50 g	125-mL wide-mouth plastic jar	Freeze, ship on ice, and store frozen	28 days
TPH and PAH	200 g	125-mL wide-mouth glass jar	Freeze, ship on ice, and store frozen	28 days
Metals[1]	150 g	250-mL wide-mouth plastic jar	Freeze, ship on ice, and store frozen	Delimited to 28 days for Hg
Infauna	--	1-L wide-mouth plastic	8% buffered formalin with rose bengal stain; ship and store at room temperature	90 days

PAH = polycyclic aromatic hydrocarbons, TOC = total organic carbon; TPH = total petroleum hydrocarbons; "-- " = not applicable.

[1] Metals include: aluminum (Al), arsenic (As), barium (Ba), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), iron (Fe), lead (Pb), mercury (Hg), nickel (Ni), manganese (Mn), molybdenum (Mo), selenium (Se), silver (Ag), strontium (Sr), tin (Sn), thallium (Tl); vanadium (V), and zinc (Zn).

A single sediment grab was collected at each sampling station with a standard deep-water USNEL box corer with removeable stainless steel sampling box. The USNEL box core opening is 0.25 m^2 and provides adequate sediment for concurrent collection of physicochemical and biological (i.e. infauna) sampling parameters. The sediment sampling gear was deployed and retrieved using an articulating A-frame and winch system. As each grab/box core sample was retrieved, it was visually examined to determine acceptability. Photographs and general description (e.g., color, texture, presence/absence of biota, odor) of surficial sediments were collected for acceptable box cores. The criterion for acceptance of each box core sample was a minimum depth of approximately 20 cm of undisturbed sediment. Acceptable cores were processed with the overlying water siphoned off using flexible tubing (e.g., Tygon). Overlying water was siphoned through a 0.5-mm sieve; organisms trapped on the sieve were included with the benthic infaunal sample. Processing for the box core included inserting a 0.35-m × 0.35-m stainless steel

partition into the sediment to separate the infauna sample inside the partition from the physicochemical sample outside the partition (**Image 1**).

Image 1. Sampling box of United States Naval Electronic Laboratory (USNEL) corer was partitioned with a 0.35-m × 0.35-m stainless steel partition to separate physicochemical and macroinfaunal samples during the Hammerhead Development Environmental Baseline Survey.

3.3.1 Redox Potential

Sediment redox potential (Eh value) as measured in millivolts was recorded from three subsurface locations: 0 to 2 cm; approximately 5 cm; and approximately 10 cm. Measurements were taken with an ExStik waterproof oxidation-reduction potential (ORP) meter to generally characterize the oxidative state of the surficial sediments with a positive Eh value indicating aerobic sediments probably with relatively low levels of organic matter.

A 3-inch diameter butyrate core tube was inserted into the sediment inside the 0.35-m × 0.35-m box core stainless steel partition to a depth of approximately 15 cm (**Image 2**). The butyrate core had holes along the side at the 2-cm, 5-cm, and 10-cm subsurface sediment locations for insertion of the ORP meter sensor probe. The holes in the core tube were taped closed at time of insertion with the tape being removed just prior to sensor probe insertion to minimize exposure of the sediment to air. The sensor probe remained in place until the meter reading was stable for obtaining the Eh value. Once all subsurface depth readings were taken, the sediment from the core was processed through the 0.5-mm sieve with the station's macroinfauna sample.

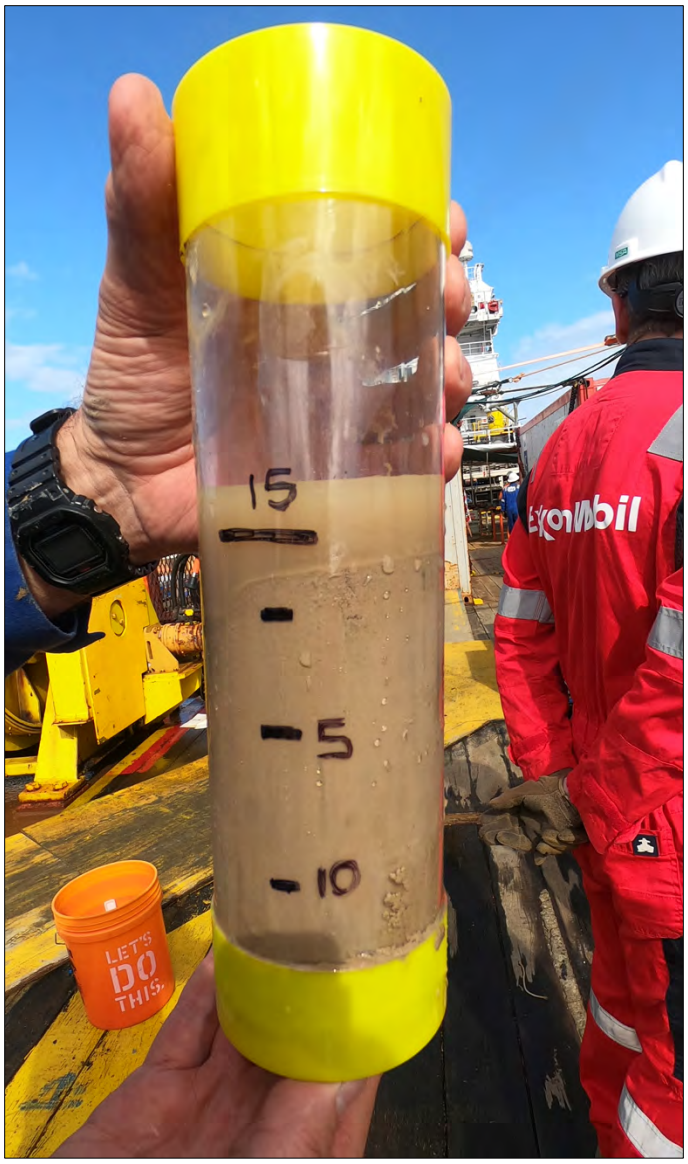

Image 2. A 3-inch diameter butyrate core tube was used to sample 2-cm, 5-cm, and 10-cm subsurface sediment locations for redox potential during the Hammerhead Development Environmental Baseline Survey.

3.3.2 Physiochemistry

Physicochemical samples were collected from outside the 0.35-m × 0.35-m partition. All chemical and geological samples were collected from the top 2 to 3 cm of sediment using a pre-cleaned stainless-steel spoon. Samples were placed directly in pre-cleaned and labeled sample containers (as appropriate for specified parameters). **Table 2** summarizes sample handling and storage requirements for sediment samples. Sediment samples were analyzed for grain size, TOC, total metals (Al, As, Ba, Be, Cd, Cr, Co, Cu, Fe, Pb, Hg, Ni, Mn, Mo, Se, Ag, Sr, Sn, Tl, V, and Zn) and hydrocarbons (TPH and PAH).

3.3.3 Macroinfauna

The portion of sediment within the 0.35-m x 0.35-m partition was sampled for macroinfauna analyses. Macroinfaunal samples were collected directly from top 12 to 15 cm of sediment. Samples were elutriated and wet-sieved on board over a 0.5-mm mesh sieve with gentle streams of seawater of high volume and low pressure using a floatation (overflow barrel) technique (**Image 3**) that minimizes trauma to the infaunal organisms and facilitates separation from the sediment. The 0.5-mm mesh sieve was selected for sampling to be consistent with previous Esso-contracted environmental survey work conducted in the Stabroek Block.

Image 3. Sieving station for processing infauna using the floatation (overflow barrel) technique.

The infaunal sieving station consists of a seawater supply manifold and hoses, mixing-overflow barrel, sieve screen and holder, and collection sink with drain hoses. The following three steps are required to process macroinfaunal samples:

1. Supply seawater in the barrel with a controllable flow rate to facilitate overflow of seawater from the barrel to the sieve screen.

2. The collected sediment is placed within the barrel in stages and is gently worked by hand and the flow of the supply seawater to break down and suspend the sediment.

3. After the sediment is emptied from the barrel, the processed sample (consisting of macroinfauna, some residual sediment and debris remaining on the sieve screen) is transferred to a sample container (or containers) and preserved with a 10% borax-buffered formalin-in-seawater solution (1:10 dilution of 37% formalin).

Processed samples were placed in 1-L plastic jars and labeled, taped, and properly stored aboard the vessel. Once preserved in formalin, infauna samples were stored at ambient temperature with a holding time of approximately 90 days.

3.4 WATER COLUMN SAMPLING

Water sample parameters, associated guidelines for containers (type and size), preservation method for samples, and holding times are provided in **Table 3**. These guidelines are based on USEPA standards and laboratory recommendations.

Table 3. Summary of seawater parameters, guidelines for containers, preservation method, and holding times for samples collected during the Hammerhead Development Environmental Baseline Survey.

Parameter	Minimum Sample Volume	Container Type and Size	Storage and Preservation Method	Holding Time
Temperature, conductivity/salinity, DO, pH, and turbidity	*In situ* measurement using SBE 19*plus* V2 SeaCAT profiler			
TOC	250-mL	250-mL amber glass bottle	H_2SO_4 to pH <2; cool to 4°C; ship on ice	28 days
TSS	1 L	1-L plastic bottle	In-field filtration with 1.5 µm particle retention glass-fiber filter; store pre-weighed filter frozen; ship on ice	Indefinite when filtered (within 7 days of collection) and frozen
TPH and PAH	1 L	1-L amber glass bottle	Methylene chloride; cool to 4°C; ship on ice	40 days
Metals[1]	1 L	1-L HDPE plastic	HNO_3 to pH <2; cool to 4°C; ship on ice	Delimited to 28 days for Hg

DO = dissolved oxygen; HDPE = high-density polyethylene; H_2SO_4 = sulfuric acid; HNO_3 = nitric acid; PAHs = polycyclic aromatic hydrocarbons; SBE = Sea-bird Electronics; TOC = total organic carbon; TPH = total petroleum hydrocarbons; TSS = total suspended solids.

[1] Metals include: aluminum (Al), arsenic (As), barium (Ba), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), iron (Fe), lead (Pb), mercury (Hg), nickel (Ni), manganese (Mn), molybdenum (Mo), selenium (Se), silver (Ag), strontium (Sr), tin (Sn), thallium (Tl); vanadium (V), and zinc (Zn).

3.4.1 Hydrographic Profiling

Hydrographic measurements were collected with a factory calibrated SBE 19*plus* V2 SeaCAT profiler mounted on the rosette sampler (**Image 4**). Hydrographic profiles were conducted for conductivity/salinity, temperature, dissolved oxygen (DO), pH, and turbidity. Two profiles were conducted at each sampling station; the initial profile was specific to determining the depth of the thermocline below the surficial mixed layer. The second profile was of the entire water column from near-surface to near-bottom and recorded at 0.5-second intervals as the profiler was lowered through the water column at a relatively constant speed.

Image 4. Hydrographic profiler and water sample bottles mounted on a rosette carousel sampler.

3.4.2 Seawater Collection

Discrete seawater samples were collected from three water depths (near-surface, mid-water, and near-bottom). Samples were collected using pre-cleaned, 5-L water bottles mounted on the water sampling rosette for analyses of TOC, TSS, metals, and hydrocarbons. Field and QA/QC samples were transferred into pre-cleaned sample containers, processed and stored; appropriate sample preservative volumes were put in containers prior to survey sampling.

3.5 PHOTOGRAPHIC DATA

Seafloor photographs and video were acquired at all sediment stations with a remote pressure-activated high-definition OSIL seabed camera system mounted onto the frame of the USNEL box core (**Image 5**). The high definition camera (1080p at 30fps), dimmable 5,000 lumens LED light, and battery pack (rechargeable 13AH LiPo) is rated to 6,000 m and can be programed prior to deployment to turn on and begin recording at a specific depth. Due to the water depths within the study area, the camera system

recorded continuous visual data during the within-station deployment. The box core was momentarily left stationary following penetration of the seafloor sediments to ensure adequate temporal photographic coverage for collection of a least 15 still images of the seafloor. The camera system's visual detection begins at approximately 1 m above the seafloor due to light penetration within the water column.

Image 5. Seafloor photographs and video were acquired at all sediment stations with a remote pressure-activated high-definition OSIL seabed camera system mounted onto the frame of the United States Naval Electronic Laboratory (USNEL) box core. The system consisted of a high definition camera (top mounted unit) and light emitting diode (LED) light (lower mounted unit).

3.6 QUALITY ASSURANCE/QUALITY CONTROL

Field QA/QC measures were implemented during the EBS in order to collect representative samples, allow assessment of potential sources of contamination, minimize data and sample loss, and ensure collection of requisite samples.

3.6.1 Quality Assurance

A QA program was undertaken to ensure that the project generated scientifically defensible data of known quality that meet the project objectives. CSA's QA program included the selection of qualified analytical laboratories, deployment of an experienced field team, and detailed preparation during mobilization.

Analytical Laboratories

Selected analytical laboratories had established QA programs and extensive experience in the analysis of marine samples. Sediment, seawater, and infauna analytical laboratories and accreditations, as appropriate, are presented in **Section 4.1.2**.

Field Personnel

The field survey team was composed of well-qualified and highly experienced CSA personnel and augmented with experienced subcontracted technicians. The use of experienced staff who follow appropriate precautions and are attentive to detail when conducting field operations minimizes error, enhances quality, and maximizes efficiency in conducting the survey. The EBS was conducted on a 24-hour basis and field team members worked in 12-hour shifts with between-shift briefings to ensure program continuity.

Mobilization

Prior to the survey, the scope of work was reviewed by the project team to ensure that all field survey operations and individual responsibilities were familiar to team members. The requirements for the survey included provision for, and access to, the following: appropriate numbers and types of containers, chemicals and other field supplies; field methods and procedures; sample identification labels; checklists; chain-of-custody (CoC) forms; sample disposition and shipping arrangements; and QC measures. Responsibilities for documenting these survey activities as an integral part of mobilization were assigned to field team members, as appropriate.

3.6.2 Quality Control Measures

QC measures included the following:

- Preparation of equipment blanks to determine the potential of sample contamination by the sampling equipment;
- Preparation of field blanks to determine the potential of sample contamination from containers and general sample handling;
- Use of field duplicates (i.e., homogenized splits) to check reproducibility of laboratory and field procedures;
- Preparation and completion of sample/data checklists;
- Equipment performance and data checks;
- Use of CoC processes for sample handling; and
- Post-survey shipment and sample tracking.

QC samples (e.g. blanks and laboratory duplicates) were prepared for sediment and seawater metals and hydrocarbon parameters. An approximate 10% level of QC was attained for appropriate sample parameters.

Sea-Bird Electronics Profiler Data Check

During or soon after a water column profile cast was completed, hydrographic data were examined by a CSA scientist to check the collected data were within expected ranges (for the conditions at the EBS study area), the equipment was functioning normally, and the configuration of data files was correct.

Data and Sample Collection Checklists

Prior to the survey, data and sample checklists were prepared by the Chief Scientist and completed in the field as appropriate for QC. Prior to departing each sampling station, the Chief Scientist reviewed the checklist and ensured collection and proper storage of the required station data and samples.

Sample Preservation and Holding Times

Samples were preserved as specified by the appropriate analytical laboratory or industry best practices. Post-survey planning for the shipment of samples to designated laboratories ensured delivery to within the recommended holding times and conditions.

3.6.3 Sample Handling and Transport

Samples were transported following a CoC process and a CoC record accompanied all samples. Persons involved in the custody of the samples signed the appropriate CoC forms and ensured the samples were properly handled, stored and transported to the analytical laboratory. Each sample had a unique identifier that was directly tracked to the data sheets. Labels were waterproof and securely fastened to the container. Bubble-wrap padding was used to separate and pad/insulate all glass containers to avoid breakage. Sample shipping containers were secured to be leak proof, avoid cross-contamination, and prevent sample loss during transport.

3.6.4 Document and Data Security

Station and date were indicated on all data sheets used for the hydrographic profile (CTD) logs, sample logs, and CoC sheets. Upon completion of the survey, the field logbook and other documents completed or acquired in the field were copied and the copies were archived with the project files. Copies of completed CoC forms were requested from the respective laboratories and stored with the project files.

Navigation and positioning data and field data files from the Sea-Bird CTD profiler were regularly saved to a computer file and backed up on a separate removable medium (e.g. flash memory/data stick or CD-R/RW). Backup media were stored and transported separately from the field computer. Upon return to Stuart (Florida), the Chief Scientist ensured that all data were properly backed up or archived on CSA's local area network file server.

4.0 Laboratory Methods and Data Processing

4.1 SEDIMENT AND WATER

4.1.1 Sampling Parameters

Table 4 summarizes the analytical methods and laboratory-specified method detection limits for sediment and seawater parameters, and the accredited laboratory used for sample analysis. Analytical data summaries for sediment and water samples are provided as **Appendix A**.

Table 4. Parameters, analytical methods, quantification limits and analytical laboratories for sediment and seawater samples collected during the Hammerhead Development Environmental Baseline Survey.

Parameter/Analyte	Analytical Method	Quantification Limits	Units	Analytical Laboratory
Sediment				
Grain Size Distribution	Particle Size Distribution; modified from Carter and Gregorich, 2006	0.1	µm	KaizenLab
Total Organic Carbon	USEPA 9060	0.1	%	ALS
Aluminum	USEPA 6010C	22 to 25	ppm	
Arsenic	USEPA 6020A	3.6 to 4	ppm	
Barium	USEPA 6010C	8.7 to 10	ppm

4.1.2 Analytical Laboratories

ALS Environmental (ALS) laboratories in Kelso, Washington, is a National Environmental Laboratory Accreditation Program (NELAP) accredited contract laboratory with extensive experience in seawater and marine sediments analyses. ALS provides sophisticated, modern analytical services specific to the minerals (i.e., geochemistry), life sciences (i.e., environmental), and energy (i.e., oil and gas) industries. More than 20 million samples per year are analyzed by ALS's staff of 13,000 in 350 locations in 55 countries around the world. ALS's major hub facilities are located in Australia, Asia, North America, South America, Europe, the Middle East, and Africa. ALS's certifications and accreditations include ISO/International Electrotechnical Commission (IEC) 17025:2005, NELAP (National Environmental Laboratory Accreditation Conference Institute 2009), and conformance with Good Laboratory Practice. ALS conducted the analyses of seawater TSS, TOC, and metals, and sediment TOC and metals.

TDI-Brooks International, Inc. (TDI Brooks), located in College Station, Texas, owns and operates B&B Laboratories. With state-of-the-art equipment and an accomplished staff, they specialize in the analysis of organics, including petroleum hydrocarbons, with extensive experience in analysis of seawater and marine sediments. B&B Laboratories operates a Quality Management System that complies with the requirements of ISO 9001:2015 for the analysis of geochemical, geotechnical, and environmental samples. They are also accredited for ISO\IEC 17025:2017 and have certification validating that all analytical processes are fully established, functional, and meet international standards. B&B Laboratories has participated in the highly rigorous U.S. National Institute of Standards and Technology intercalibration exercise for trace organics since 1997 and has always ranked in the top group for this exercise. B&B Laboratory methods are based on highly modified USEPA methods that are performance-based and meet the requirements of ISO 17025:2017 with specialization in the extraction and analysis of organic compounds. TDI Brooks conducted the analyses for seawater and sediment hydrocarbons (TPH and PAHs).

KaizenLab is an established environmental laboratory with expertise in environmental organic, inorganic and microbiology analysis. KaizenLab, Analytical Division of Kaizen Environmental Services (Trinidad) Limited, is a well-established environmental laboratory with over 20 years of analytical experience. It specializes in analytical techniques applied to environmental chemistry for water and wastewater analysis, oil analysis, soil and solid waste characterization, food chemistry and microbiology. As an ISO/IEC 17025:2005 internationally accredited laboratory, KaizenLab operates a rigorous QA/QC program. KaizenLab conducted the analyses of sediment grain size.

Fauna Trinidad Ltd. (FTL) provides services to address biological sample analyses for macroinfauna. Based in Trinidad and Tobago, they offer services in ecological and biological analyses specifically for environmental impact assessments and environmental monitoring. FTL has a combination of over 12 years of collected experience in the environmental field with dynamic and innovative approaches to science and ecology. Their primary expertise is in the identification of faunal species, particularly marine benthic macroinfauna. FTL offers expertise in ecological analyses complemented with reporting that integrates standard scientific techniques and indices with appropriate statistical analyses. CSA has previously worked with FTL to provide services to address infauna, phytoplankton, and zooplankton analysis. Certifications or accreditations are not applicable for taxonomic analytical laboratories. FTL analyzed the EBS macroinfauna samples.

4.1.3 Benchmark Values

Sediment chemistry analytical results were interpreted in the context of the actual values relative to benchmark values to evaluate their biological relevance. Metals and hydrocarbon concentrations were compared to the USEPA sediment quality benchmarks. A benchmark is a chemical concentration in sediment above which there is the possibility of harm to organisms in the environment. The USEPA recommends benchmark values such as the effects range low (ERL) and effects range median (ERM) to assess the potential risk to fish and other marine life (Long and Morgan, 1990). These sediment quality guidelines are based on marine sediment chemistry paired with sediment toxicity bioassay data. The benchmarks represent points on a continuum of chemical concentrations ranked from lowest (least toxic) to highest (more toxic) concentrations defined as follows:

- ERL is indicative of concentrations below which adverse effects rarely occur; and
- ERM is indicative of concentrations above which adverse effects frequently occur.

Analytical results of seawater metals were compared to USEPA Criterion Continuous Concentration (CCC) toxicity reference values (Buchman, 2008). The USEPA CCC for seawater analytes is the chronic criteria that are based on average chemical concentration estimates in water that does not adversely affect aquatic organisms during an extended exposure period (i.e., 96 hours). Survey results for seawater metals

analyses are presented in context with international environmental quality standards to evaluate potential toxicity risks within the Hammerhead Development EBS study area. There are no internationally accepted toxicity reference benchmark values for total nitrogen or TPH concentrations in seawater.

4.1.4 Normalization of Metals Data

To determine the relationship between individual pairs of parameters, sediment metal concentrations were normalized with aluminum. Concentrations of aluminum and other metals vary naturally in ambient seafloor sediments, primarily due to differences in sediment grain size. Clay sediments are composed primarily of aluminosilicates and typically have higher concentrations of metals. Sediments classified as silt or sand are primarily composed of quartz and fragments of carbonate shell, which dilute ambient metals concentrations (Herut and Sandler, 2006). Aluminum concentration is assumed to correlate linearly with other metals concentrations when there is no anthropogenic input (Trefry et al., 2003, 2013). It is reasonable to assume that a metal concentration is enhanced by anthropogenic activity if the metal concentration deviates greatly from the linear regression of that metal versus sediment percent concentration of aluminum.

4.2 INFAUNA

Multi-species assemblages such as marine infauna exhibit patterns in composition and abundance within a defined habitat that can be difficult to characterize in a single metric or analysis. Taking a hierarchical view can help reduce this complexity by examining different scales of assemblage structure ranging from assemblage-wide to individual species (e.g., Maurer, 1999). Assemblage-wide assessments summarize structure in a single unit such as total density, total abundance, or total biomass. These are variables that will correlate with broad scale environmental factors that affect all species in the assemblage collectively. At the opposite scale are species that respond individually to environmental influences. The individual species level is analyzed with multivariate methods capable of visualizing patterns of taxonomic composition among samples and, inversely, species or taxa responsible for potential patterns in the samples. Intermediate between these two scales are species richness, diversity, and evenness. These measurable assemblage properties do not account for the unique biology of individual species but view them as equivalent units. Intermediate assemblage structure is analyzed with indices calculated from raw sample data. The goal of pre-impact analyses is to establish patterns at these different levels prior to any potential disturbance to permit analysis of future effects.

Specimens were sorted, counted and identified to the lowest practical identification level (LPIL). Identifications were performed using relevant keys and literature. Specimens were sent to taxonomic experts for identification, if required. Infauna samples were transferred from the formalin preservative to 70% denatured alcohol for archival.

Species and their abundances were entered into a spreadsheet for each station. A tabulated list of taxa abundance observed for infauna samples at all stations is provided in **Appendix B**. The data were then used to determine the following:

- Species list;
- Relative proportions of each phylum by number of species and number of individuals to evaluate the dominance of the most common phyla;
- Mean and total number of individuals for each station; and
- Density of organisms per station. All macroinfauna samples were normalized by sediment surface area to estimate density.

Infauna assemblage structure in the EBS study area was assessed with univariate diversity indices and multivariate analysis of species composition. Three diversity indices that capture different aspects of

species-abundance relationships were used to analyze the samples. The Margalef's richness index (d) is a measure of biodiversity indicating the relative number of different species in a sample and/or stratum. Margalef index has no limit value and it varies depending upon the number of species. It is used for comparison of the stations considering only one component of diversity (species richness). The higher the d value the higher the species richness; it can be inferred that sites with more taxa are considered richer. The Shannon-Weiner index (H') emphasizes species in the middle (not common or rare) of the species rank abundance sequence and accounts for both abundance and evenness of the species present. The greater H' value, the greater the diversity and evenness of the sample; the values are generally between 1.5 and 3.5 with the index rarely greater than 4. Pielou's evenness index (J') measures how evenly the number of individuals is distributed among the species. J' ranges between 0 and 1; a lower J' value indicates less evenness in community structure, and possible presence of a dominant species, while a higher J' value indicates more evenness. Diversity indices were calculated using Plymouth Routines in Multivariate Ecological Research (PRIMER) version 7 software (Clarke and Gorely, 2006).

Multivariate analyses were used to identify groups of samples with similar taxonomic composition and proportional abundances. Groups or clusters may reflect physical environmental influences such as sediment grain size or organic carbon content but could also be caused by biotic patterns of competition and predation. Understanding the existence and cause of such groups is an important step in pre-impact analysis that will support interpretation of post-impact results.

Two multivariate analytical techniques (cluster analysis and ordination) that employ different numerical routines to identify patterns of compositional similarity were used to provide independent outcomes from the same data. Because multivariate methods can recognize structure from randomly generated data, corroborating outcomes from these different methods would suggest observed patterns to be real.

PRIMER software was used to perform a multivariate cluster analysis using the Bray-Curtis similarity index (Bray and Curtis, 1957) which compares pairwise, the similarities between each pair of variables (e.g. stations are the variables and criterion for comparison is species composition). Data was subject to a square root transformation prior to calculating pairwise similarity among all samples using the Bray-Curtis similarity index. The similarity matrix was analyzed with group-average cluster analysis and non-metric multi-dimensional scaling (MDS) ordination.

Clustering was carried out by group average sorting and results were displayed as a dendrogram. A similarity profiles (SIMPROF) test was used to test statistical significance of any groups formed by the cluster analysis (Clarke and Gorley, 2015). The SIMPROF test compares observed similarity profiles (similarities ordered from smallest to largest plotted against their rank) with a similarity profile representing a null hypothesis of no structure within that group. Repeated application of this test divides samples into increasingly smaller subgroups. SIMPROF tests performed here used 999 random permutations and a 5% significance level.

The same sample similarity matrix analyzed by cluster analysis was also analyzed with MDS. The MDS ordination technique provides a 2D projection of inter-sample relationships in abstract (ordination) space. Like the dendrogram, stations most similar in terms of faunal composition and proportional abundance clustered near one another in the 2D ordination diagram (Clarke and Gorley, 2015).

4.3 HYDROGRAPHIC PROFILES

Digital data files from hydrographic casts taken with the CTD profiler were processed by a CSA scientist using SBE data processing software, a proprietary modular family of data processing software specific to SBE oceanographic instruments. The SBE data, loop edit and bin mean modules were used to convert the data from the raw hexadecimal format to engineering units in a text file, extract the appropriate cast

section, remove any loops in the record, smooth the data and import the file into a spreadsheet. Hydrographic profile graphics were generated from the spreadsheet using Sigma Plot software.

4.4 SEAFLOOR IMAGERY

Video photograph data were reviewed to generally characterize the seafloor substrate and associated biota, if distinguishable, at each photographic location. The presence of epifauna, indications of infauna activity and sediment type were documented from the imagery. Photographic data were reviewed to provide representative images of the benthic habitat as documented within the EBS study area; representative images from each of the photographic locations is presented in **Section 5.3**. A complete set of seafloor imagery has been provided to Esso as an immediate post-survey deliverable; Esso required at least 15 seafloor still images from each of the sampling stations.

5.0 Results and Discussion

The EBS field sampling was conducted from 11 to 13 March 2020; this does not include the vessel transit to and from Chaguaramas, Trinidad and Tobago. The locations of the EBS sampling stations are shown in **Figure 2** and listed in **Table 1**. Weather conditions were relatively calm during the EBS sampling, with winds from the east and northeast direction at 10 to 15 knots and <1.5 m seas. No weather standby days were incurred during EBS sampling.

5.1 SEDIMENT

5.1.1 Redox Potential

Redox potential (Eh) is a measure of the oxidation or reduction state of a medium as measured in millivolts (mV). Oxidation is defined as removal of electrons from a compound and conversely reduction is defined as the addition of electrons to a compound. Eh values of less than −100 mV indicate anaerobic environments, while values greater than 100 mV indicate aerobic environments (Suthersan, 2001). **Table 5** provides the Eh values for the subsurface depths of 2-cm, 5-cm, and 10-cm at each of the EBS sediment sampling stations. Eh values were all positive ranging from a low of 100 to 233 mV that are indicative of aerobic conditions. As expected, there was a general trend of indirect correlation between Eh values and sediment depth with decreasing values with increasing depth.

Table 5. The redox potential values for the subsurface depths of 2-cm, 5-cm, and 10-cm at each of the Hammerhead Development Environmental Baseline Survey sediment sampling stations.

Station	Redox Potential (millivolts)		
	2-cm	5-cm	10-cm
HH-01	171	166	164
HH-02	164	139	127
HH-03	187	107	100
HH-04	167	151	139
HH-05	191	178	181
HH-06	233	212	201
HH-07	213	201	168
HH-08	230	210	215

5.1.2 Grain Size

Grain size and classification based on Shepard (1954) for all stations are presented in **Table 6**. Grain size fractions consist of sand, silt, and clay as defined by the Wentworth scale with sand-sized particles having diameters from <2 mm to >62.5 µm; silt-sized particles having diameters from <62.5 µm to >4 µm; and clay at < 4 µm. Overall, sediment grain size was mainly silty clay, based on Shepard's classification (Shepard, 1954). Except for Station HH-8, stations were characterized by sediment with less than 30% sand and high proportions of silt and clay fractions (**Table 6**). The grain size distribution observed within the study area is similar to sediments from the Liza 2 Field Development EBS (Benthic USA LLC., 2019) with mean value for the clay fractions exceeding 50%. **Figure 3** is a ternary diagram to graphically depict the relative proportions of the primary sediment components (sand, silt, and clay) for all stations.

Table 6. Grain size distribution and classification based on Shepard (1954) for sediment samples collected during the Hammerhead Development Environmental Baseline Survey.

Station	Sand (%)	Silt (%)	Clay (%)	Classification
HH-1	15.0	28.8	56.2	Silty Clay
HH-2	6.3	42.5	51.2	Silty Clay
HH-3	2.5	41.3	56.2	Silty Clay
HH-4	6.3	50.0	43.7	Clayey Silt
HH-5	21.3	25.0	53.7	Sand/Silt/Clay
HH-6	23.8	30.0	46.2	Sand/Silt/Clay
HH-7	2.5	38.8	58.7	Silty Clay
HH-8	31.3	28.7	40.0	Sand/Silt/Clay
Mean	13.62	35.64	50.74	Silty Clay

Shepard FP. 1954. Nomenclature based on sand-silt-clay ratios. Journal of Sedimentary Petrology 24:151-158.

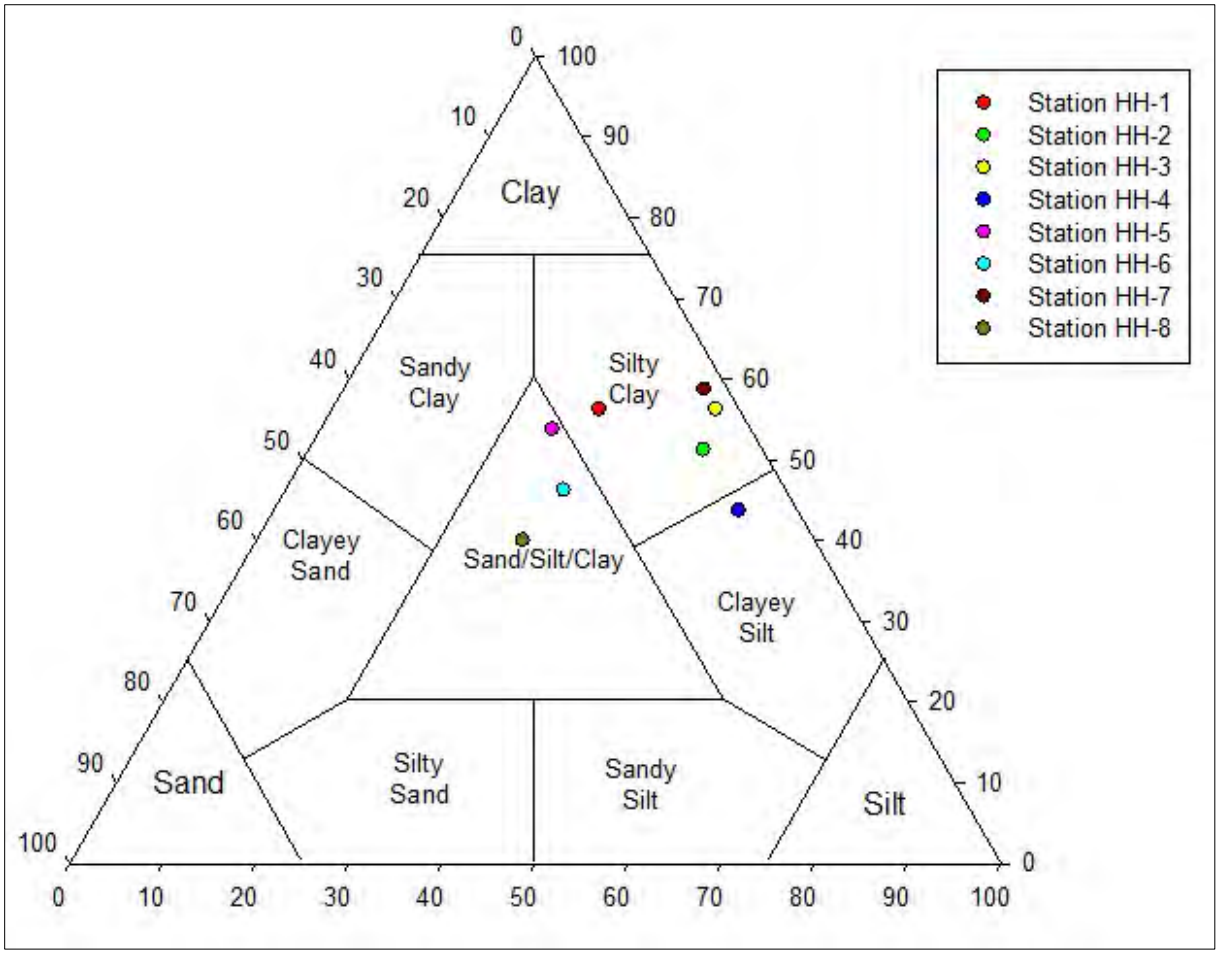

Figure 3. Ternary diagram depicting grain size characteristics for sediment samples collected during the Hammerhead Development Environmental Baseline Survey.

5.1.3 Total Organic Carbon

TOC concentrations (%) for all EBS stations are presented in **Table 7**. The sediment TOC concentrations in the study area are relatively low ranging from 0.17% to 0.65%. These low TOC concentrations are similar to the concentration range of 0.33% to 0.57% reported from a previous regional study for the Liza 2 Field Development (Benthic USA LLC., 2019) and are in the expected range for deep water offshore sediments (Escobar-Briones and García-Villalobos, 2009). There are currently no USEPA benchmark values for TOC concentration in marine sediments.

Table 7. Total organic carbon concentrations for sediment samples collected during the Hammerhead Development Environmental Baseline Survey.

Station	Total Organic Carbon (%)
HH-01	0.55
HH-02	0.17
HH-03	0.25
HH-04	0.49
HH-05	0.58
HH-06	0.55
HH-07	0.20
HH-08	0.65

5.1.4 Hydrocarbons

Sediment hydrocarbon concentrations within the Hammerhead Development EBS study area are presented in **Table 8**. Hydrocarbons analyzed in sediments included TPH and PAHs. TPH is a group of several hundred organic compounds that come from crude oil. The TPH value as presented is the collective total of extractable petroleum hydrocarbons from carbon range C9 through C40 and is the sum of unresolved and resolved analytes. The TPH value includes both the aliphatic and aromatic fractions with predominance of the aliphatics.

PAHs are constituents of crude oil and the PAHs found in the marine environment are divided into two groups, petrogenic and pyrogenic. Petrogenic PAHs are present in oil and oil products. Typically, the presence of petrogenic PAHs in offshore environments are associated with oil seeps, oil spills, and produced water discharges from offshore oil installations (Pampanin and Sydnes, 2013). Pyrogenic PAHs arise from the incomplete combustion of organic matter commonly produced by fires, internal combustion engines, and furnaces. Following dispersal via long-distance mechanisms, these pyrogenic PAHs can reach waters and sediments of relatively remote areas. PAHs analyzed from EBS sediment samples include 16 USEPA priority pollutants. PAHs are a component of the TPH value.

Hydrocarbons were analyzed further to determine predominant source for PAHs using the Fossil Fuel Pollution Index (FFPI) to estimate the ratio of petrogenic sourced PAHs relative to total PAHs (Boehm and Farrington, 1984). The FFPI is based on the knowledge that combustion-derived (pyrogenic) PAH assemblages are enriched in three- to five-ringed PAH compounds while fossil fuels (petrogenic) are enriched in polynuclear organosulfur compounds (e.g., dibenzothiophene) and two- to three-ringed PAH assemblages (Steinhauer and Boehm, 1992). The FFPI is calculated by the following equation (Boehm and Farrington, 1984):

$$\frac{\left[\Sigma\ naphthalenes(C_o - C_4) + \Sigma\ dibenzothiophenes(C_o - C_3) + \frac{1}{2}\Sigma\ phenanthrenes(C_o - C_1) + + \Sigma\ phenanthrenes(C_2 - C_4)\right]}{\Sigma\ PAH}$$

An FFPI ratio of 0 to 0.25 indicates PAH assemblages dominated by pyrogenic sources, a ratio of approximately 0.25 to 0.49 is indicative of intermediate PAH assemblages containing a mix of pyrogenic and petrogenic sources, and a ratio of 0.5 to 1.0 is indicative of PAH assemblages dominated by petrogenic sources (Boehm and Farrington, 1984). The FFPI ratio for sediments from the Hammerhead Development EBS study area as provided in **Table 8** range from 0.14 to 0.23 indicating that PAHs in sediments are predominantly from pyrogenic sources. This is contrary to the findings of the Liza 2 Field Development EBS (Benthic USA LLC., 2019) that indicated sediment PAHs were predominantly from biogenic sources, rather than pyrogenic.

Table 8. Hydrocarbon concentrations and Fossil Fuel Pollution Index (FFPI) ratio for sediment from the Hammerhead Development Environmental Baseline Survey.

Station	TPH ($\mu g\ g^{-1}$)	PAHs ($ng\ g^{-1}$)	FFPI
HH-1	10	70.0	0.15
HH-2	1,110	319	0.23
HH-2 Duplicate	1,233	319	0.23
HH-3	10	81.2	0.21
HH-4	14	87.4	0.17
HH-5	3	37.2	0.14
HH-6	11	64.9	0.21
HH-7	9	76.4	0.19
HH-8	4	37.9	0.23

PAHs = polycyclic aromatic hydrocarbons; TPH = total petroleum hydrocarbons.

TPH concentrations ranged from 3 to 1,233 $\mu g\ g^{-1}$ and were generally similar among all stations except Station HH-2. TPH concentrations exceeding 1,100 $\mu g\ g^{-1}$ were considerably elevated at Station HH-2 with levels hundredfold over the other EBS stations. A previous study concerning offshore oil and gas drilling impacts revealed near-field sediment with elevated TPH levels consisting of synthetic based fluids and biogenic hydrocarbons, with no indication of the presence of petroleum hydrocarbons (Neff et. al, 2005). The presence of synthetic based fluids in the sediment could be a possible reason for the observed elevated TPH at Station HH-2. The sediment TPH levels were generally elevated as compared to sediments from the Liza 2 Field Development EBS (Benthic USA LLC., 2019) that had extremely low levels, ranging from <1.4 to 2.21 $\mu g\ g^{-1}$. The TPH values, that included both aliphatic and aromatic fractions, had a different basis for this EBS than the Liza 2 Field Development EBS with TPH values that only included the aliphatic fractions (Benthic USA LLC., 2019) and is uncertain to what extent this influences observed differences in TPH values between the EBSs. There are no internationally accepted toxicity reference values for TPH concentrations in marine sediments.

Sixty-four PAHs, including the 16 USEPA priority PAHs, were analyzed in sediment samples that constituted total PAH (**Table 8**). PAH concentrations in sediment ranged from 37.2 to 319 $ng\ g^{-1}$ and like TPH were generally similar among all stations except Station HH-2. Station HH-2 total PAH concentration (319 $ng\ g^{-1}$) was considerably elevated but well below the ERL (4,022 $ng\ g^{-1}$) and ERM (44,702 $ng\ g^{-1}$) values for total PAHs in marine sediment. The sediment total PAH values within the Hammerhead Development EBS study area were elevated relative to the sediments from the 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019) that had low total PAH levels, ranging from 17.83 to 22.59 $ng\ g^{-1}$. Concentration of the 16 USEPA priority pollutant PAHs in sediments is presented in **Table 9**. All detectable concentrations of priority pollutant PAHs were below respective ERLs during the EBS. Acenaphthene, fluorene, and naphthalene were considerably elevated at Station HH-2 possibly a result of discharged drilling muds in the sediments (Sanzone et. al., 2016).

Table 9. Concentrations of the sixteen USEPA priority pollutant polycyclic aromatic hydrocarbons (PAH) in sediment during the Hammerhead Development Environmental Baseline Survey. PAH concentrations are compared to respective effects range low (ERL) values (Buchman, 2008).

5.1.5 Metals

Metal analytes include potential contaminants associated with offshore oil and gas activities, priority pollutants, and primary mineralogical indicators. Barite [barium sulfate ($BaSO_4$)] is a common weighting agent for all types of drilling fluids used in the oil and gas industry. Subsequently, Ba is an important tracer of drilling fluids that may be discharged during offshore drilling activities. Compared with marine sediments, commercial drilling mud barites may contain elevated concentrations of several metals, including As, Cd, Cu, Hg, and Pb. These metals, in addition to Cr, Ni, and Zn, are all priority pollutants (USEPA, 2014). V is found in relatively low concentrations in drill muds and certain crude oils. Al and Fe are useful in interpreting metals concentrations because they are good indicators of the sediment mineral type.

Total metal concentrations for sediment samples at each station during the Hammerhead Development EBS are presented in **Table10**. The respective USEPA ERL and ERM guideline values are also provided for metals, where available. Total Se and Ag concentrations were below the analytical laboratory's reporting limit of 8 mg kg^{-1} and 0.16 mg kg^{-1}, respectively; therefore, the analytical results for these sediment analytes will not be discussed further.

There were some notable elevated levels of metals at some stations. In particular, the levels of barium were extremely elevated at Station HH-2 and elevated to lesser extents at Stations HH-3 and HH-1. Barium in sediment samples from Stations HH-1, HH-2, and HH-3 (**Table 10**) with concentrations greater than 1,000 ppm (mg kg^{-1}) may be indicative of drilling activities with discharge of drilling muds (Neff, 2002; Neff et al., 2005). When compared to benchmarks, arsenic and nickel concentrations exceeded the ERL at 6 of 8 stations. Neither arsenic nor nickel concentrations, exceeded the ERM. All other metals concentrations for the survey were below their respective ERL benchmarks, where applicable.

Observed variability of metals concentrations within the EBS study area are likely a function of sediment grain size, organic carbon content, and mineralogy. Additionally, regional drilling activities may have influenced some potential barite-associated metal analytes. Highest concentrations of As, Cd, Cu, Pb, and V were observed at Station HH-2 that had the highest levels of Ba and appears to be the result of drill mud deposition. The sediment metal concentrations within the Hammerhead Development EBS study area were generally comparable to the sediments from the 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019) with the exceptions of Al, Ba, Se, and V. Selenium had much lower concentrations (less than half) while Al, Ba, and V had much higher concentrations than observed in the 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019).

Of particular concern was the approximate sevenfold increase in the mean Al concentration between this EBS (7.24%) and the 2018 Liza 2 Field Development EBS (1.15%) (Benthic USA LLC., 2019). An interlaboratory analytical calibration was conducted to validate the calculated Al concentrations for the Hammerhead Development EBS sediment samples with results confirming there is regional elevation in sediment Al concentrations as based on the findings of this EBS. There is variability in the observed sediment Al concentrations ranging from 3.85% to 8.46% (**Table 10**) during this EBS that well exceeds the Al concentration range of 1.04% to 1.27% observed during the 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019). The observed Al concentration during this Hammerhead Development EBS are most expected for deep water clay sediments (Turekian and Wedepohl, 1961, Salomons and Förstner, 1984, Wedepohl, 1995). The sources for the stark differences between this EBS and the 2018 EBS sediment Al concentrations are uncertain but could be influenced by analytical laboratories and associated methods between surveys, natural influx of aluminosilicate terrigenous sediments, and/or anthropogenic activities.

Al, useful in interpreting sediment metals concentrations, should have a concentration that correlates linearly with other metals concentrations when there is no anthropogenic influence (Trefry et al., 2003, 2013). To determine whether observed metal concentrations are regionally anomalous, regression analysis was conducted correlating sediment percent Al with other metals concentrations to assess the potential for influence by anthropogenic inputs. The positions of regression plots were based on a probability distribution relative to the 99% prediction interval; there is less than 1% probability that plots inside the prediction interval are due to chance. Subsequently, metal concentrations plotted outside the prediction interval could be considered anomalous in comparison with expected natural variation for specific metals. The prediction interval range is a function of the number of samples.

The Hammerhead Development EBS sediment sampling size (i.e. number of stations) is considered sufficient for this type of regression analysis to provide a relatively high degree of certainty; any outliers, beyond the 99% prediction interval would be considered anomalous. Due to the apparent contamination from regional drilling activities, the exceedingly high Ba concentrations from HH-1, HH-2, and HH-3 were removed before calculating the linear regression and 99% prediction intervals. This removal left only five data points for the Ba regression, a very low sample size for the analysis, but the resulting prediction limits will be sensitive to abnormally high barium concentrations in any future regional sampling efforts (**Figure 4**). The regression plots show that all metal concentrations when plotted in correlation with sediment percent Al were within the 99% prediction interval; therefore, the regression analyses indicate EBS metal concentrations are considered regionally ambient and establish baseline conditions specific to these sediment metal analytes. Two representative plots are provided in **Figures 4** and **5**; all regression plots are included in **Appendix C**.

Table 10. Metals concentrations (mg kg^{-1} unless otherwise noted) in sediment collected during the Hammerhead Development Environmental Baseline Survey. Concentrations are compared to effects range low (ERL) and effects range median (ERM) (Long and Morgan, 1990). Total selenium (Se) and silver (Ag) concentrations were below the analytical laboratory's reporting limit of 8 mg kg^{-1} and 0.16 mg kg^{-1}, respectively; results are not presented for these metals. Concentrations in red are in exceedance of the ERL.

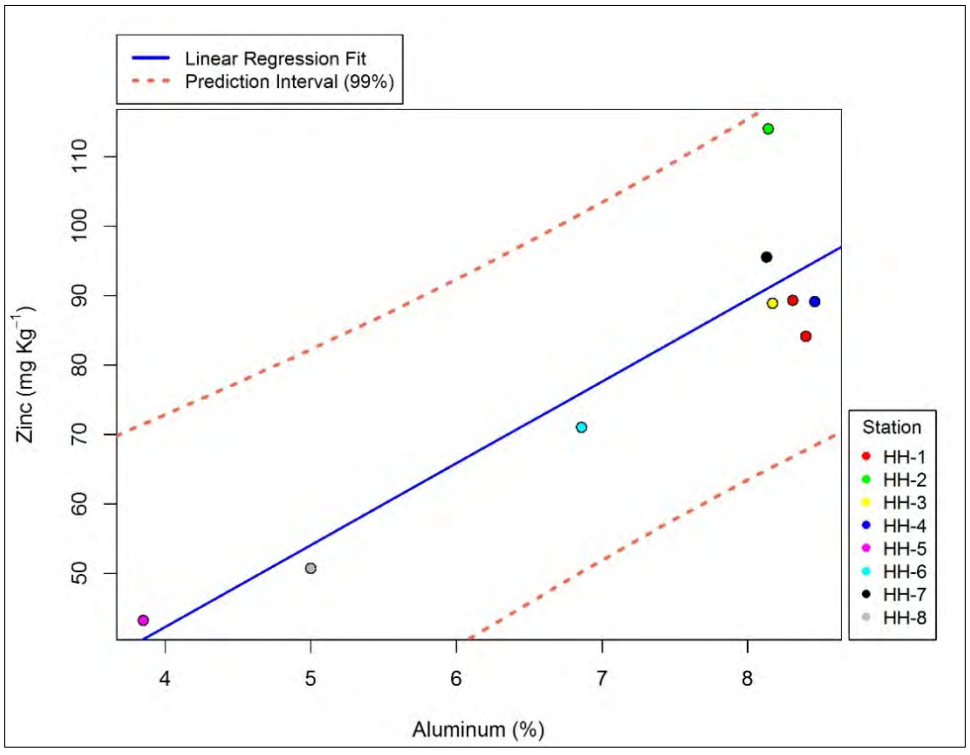

Figure 5. Representative linear regression for relationship between sediment percent aluminum and concentrations of zinc.

5.1.6 Macroinfauna

The 8 box core samples collected from the survey area yielded 204 individuals and 37 total taxa from eight phyla; the arthropod *Lucifer* sp., was removed prior to analyses as this taxon is a water column dweller not infauna. The distribution of abundance and taxa among these phyla are shown in **Figures 6** and **8**, respectively. Most of the individuals (60.3%) were contributed by the annelids followed by arthropods (19.6%), and nematodes (17.2%). Annelids were also represented by the most infaunal taxa (24) followed by arthropods (6), and echinoderms (2). The phyla Sipunculida, Nematoda, Nemertea, Mollusca, and Chordata, were each represented by a single taxon (**Figure 7**).

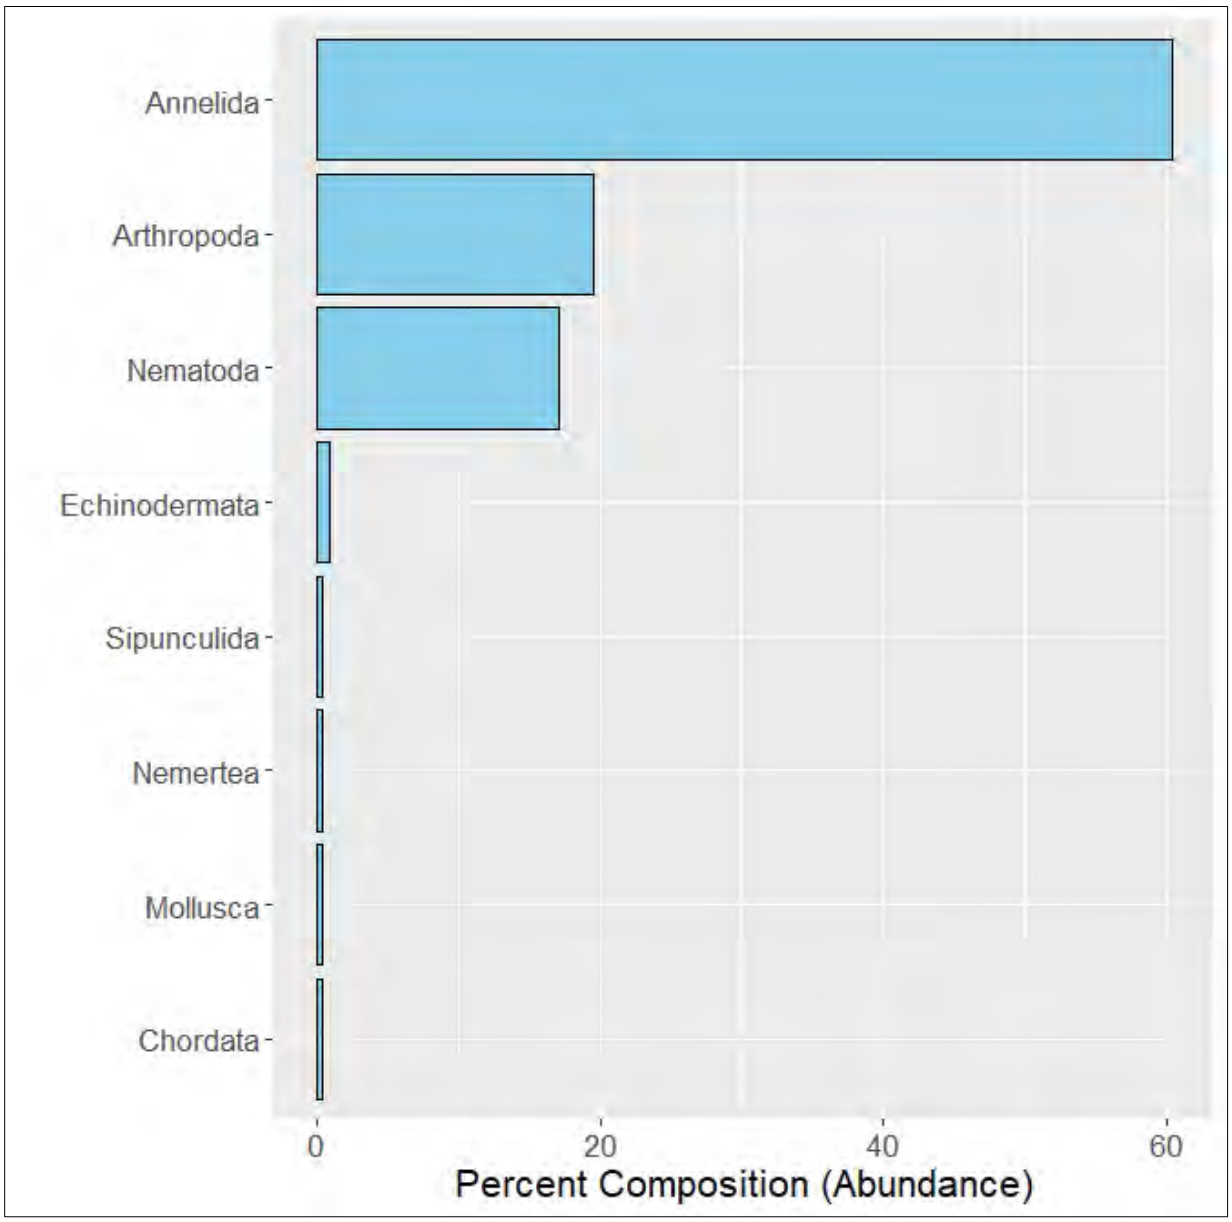

Figure 6. Percent composition of infauna individual organisms for each phylum collected during the Hammerhead Development Environmental Baseline Survey.

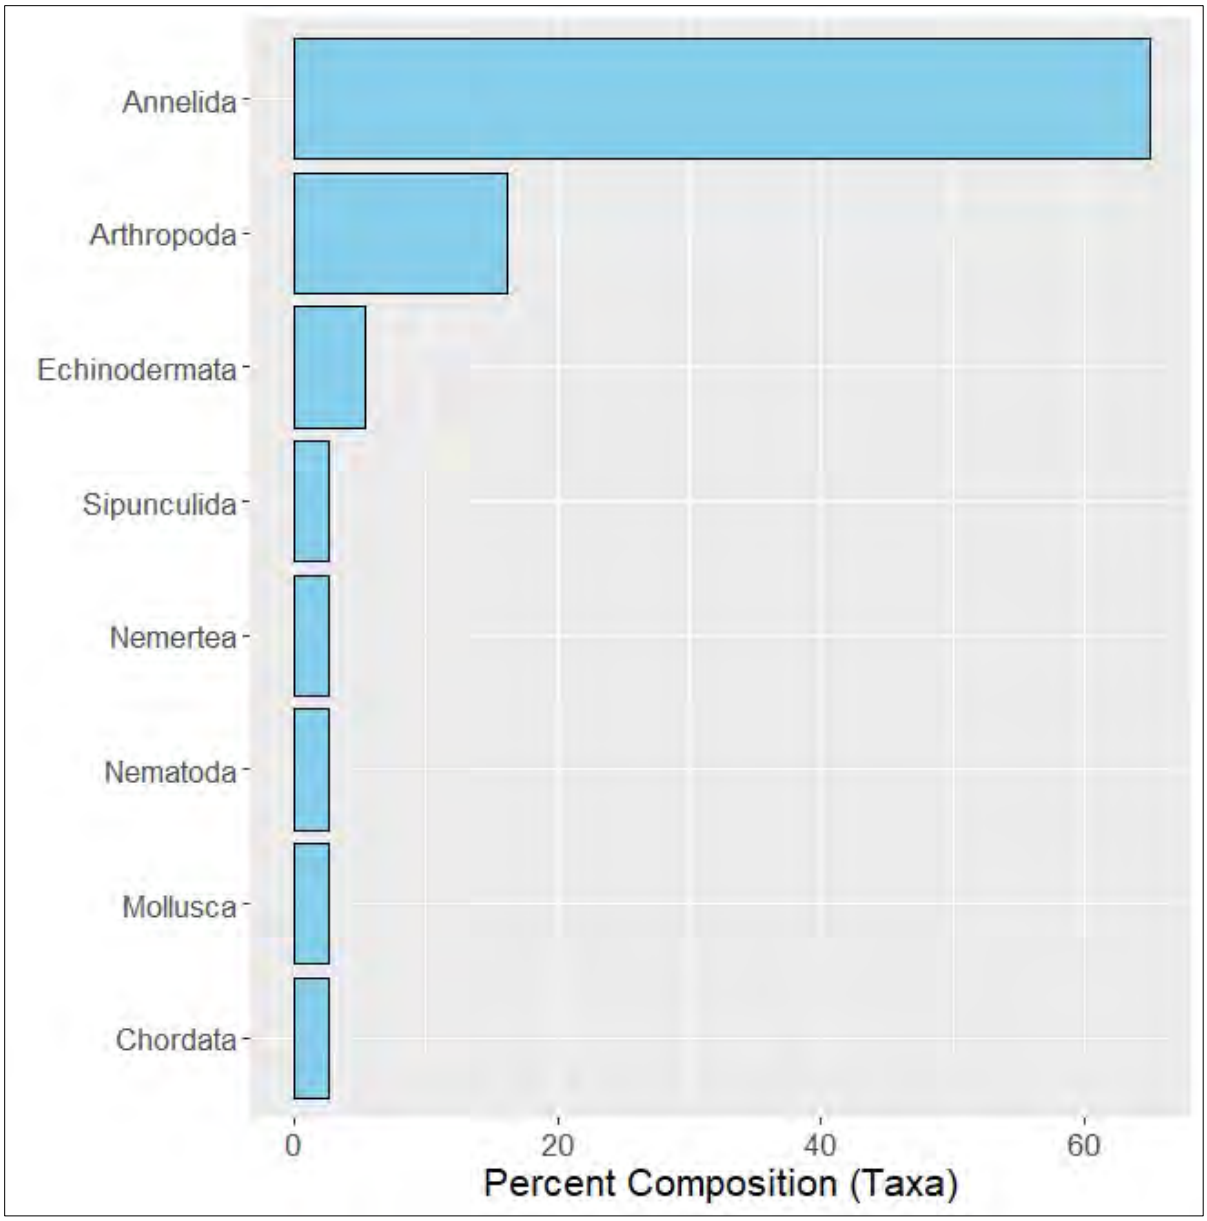

Figure 7. Percent composition of infauna taxa for each phylum collected during the Hammerhead Development Environmental Baseline Survey.

The overall infauna density ranged from 98.0 to 359.2 individuals per m^2 with a mean of 208.2 ± 79.3 individuals per m^2 across all stations (**Table 11**). Total numbers of taxa and individuals from each station are shown in **Figure 8** and presented in **Table 11**. Number of taxa, abundance, and density recorded from station HH-5 were higher than values observed at other stations.

The diversity indices indicated that the assemblage has generally low species richness (d) and diversity (H') but high evenness (J) **Table 11**. The species richness values ranged from 2.8 to 4.5 and diversity ranged from 1.98 to 2.49. Evenness measured with Pielou's J was high across all stations ranging from 0.86 to 0.95 indicating similar relative abundances among taxa and correspondingly low numerical dominance.

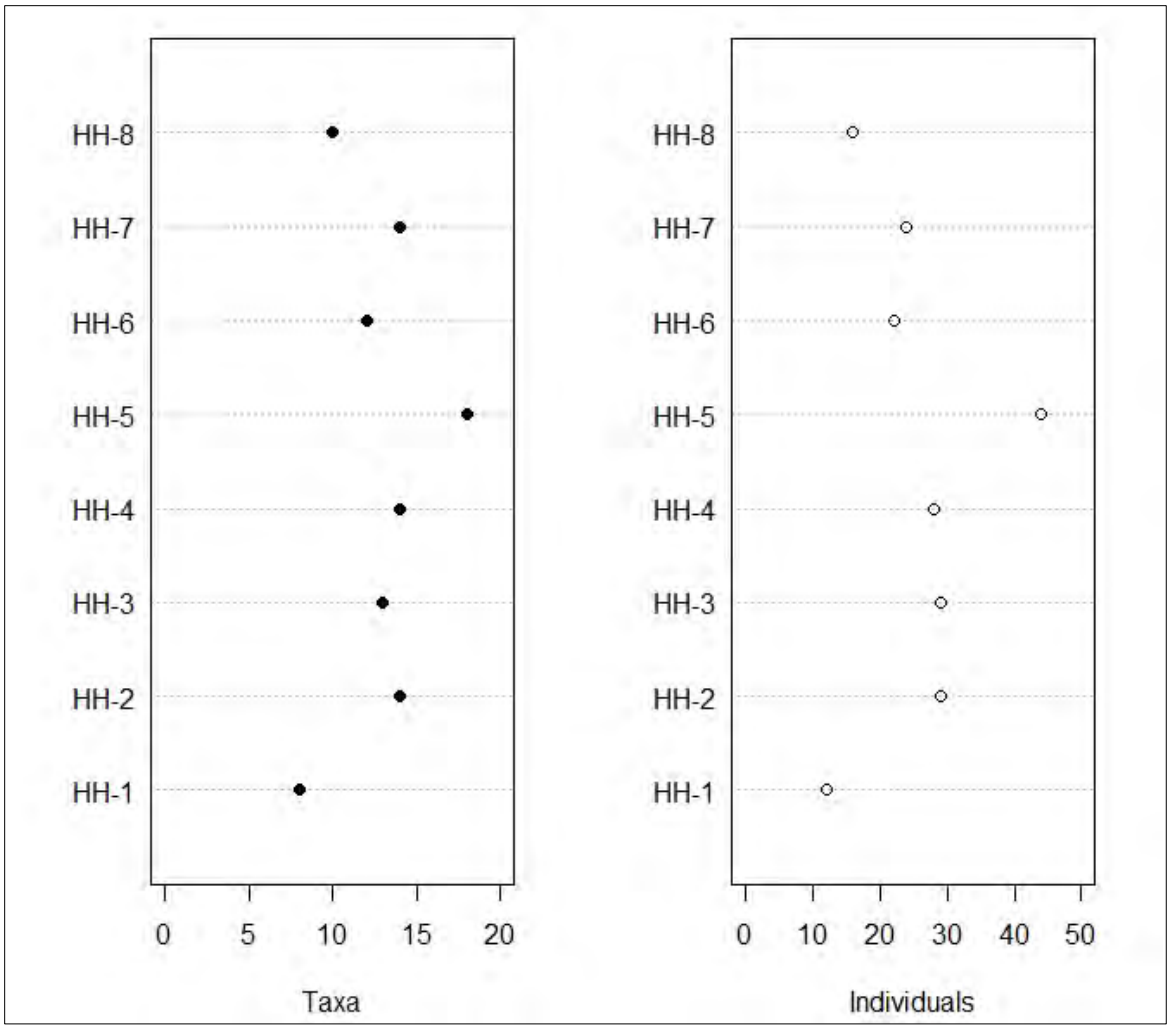

Figure 8. Number of taxa and total number of individuals collected during the Hammerhead Development Environmental Baseline Survey.

Table 11. Total taxa (S), number of individuals (N), density (N m^{-2}), species richness (d), evenness (J'), and diversity (H') calculated for infauna samples of the Hammerhead Development Environmental Baseline Survey.

Station	S	N	N m^{-2}	d	J'	H'
HH-1	8	12	98.0	2.817	0.952	1.979
HH-2	14	29	236.7	3.861	0.915	2.414
HH-3	13	29	236.7	3.564	0.931	2.387
HH-4	14	28	228.6	3.901	0.926	2.444
HH-5	18	44	359.2	4.492	0.862	2.492
HH-6	12	22	179.6	3.559	0.946	2.350
HH-7	14	24	195.9	4.091	0.893	2.358
HH-8	10	16	130.6	3.246	0.910	2.096
Mean	12.9	25.5	208.2	3.691	0.917	2.315

The ten most abundant taxa identified are shown in **Table 12**. These taxa collectively account for 68% of the abundance recorded during the EBS. Numerically dominant taxa include six polychaete annelids, three arthropods, and one nematode. The most abundant taxa, Nematode sp. a., *Glycera* sp. a, and *Capitella* sp. a., accounted for 17.2%, 9.3%, and 8.3% of the 204 individuals collected, respectively.

Table 12. The ten most abundant infaunal taxa collected during the Hammerhead Development Environmental Baseline Survey.

Phylum	Taxon	Occurrence (Number of Stations)	Numbers of Individuals	Density (m^2)	Percent Abundance
Nematoda	Nematode sp. a	7	35	35.7	17.2
Annelida	*Glycera* sp. a	6	19	19.4	9.3
Annelida	*Capitella* sp. a	5	17	17.3	8.3
Arthropoda	*Ampelisica* sp. a	8	15	15.3	7.4
Annelida	Spionid sp.a	5	11	11.2	5.4
Arthropoda	*Idotea* sp. a	5	10	10.2	4.9
Annelida	*Notomastus* sp. a	5	10	10.2	4.9
Annelida	*Magelona* sp.a	4	8	8.2	3.9
Annelida	*Cirratulus* sp. a	6	7	7.1	3.4
Arthropoda	*Gnathia* sp. a	3	7	7.1	3.4

The infauna assemblage was investigated using multivariate analyses to assess any patterns in taxonomic similarity among samples. To help objectively identify any discrete groups of stations or taxa, the stations-by-taxa data table was ordered based on cluster analyses of stations and taxa respectively (**Figure 9**); taxa include all 37 individual identified taxa. The cluster analysis of stations, with all stations having a similarity of around 40% or more, did not show any patterns of aggregation of taxa across the samples. However, the analysis did indicate some subtle compositional differences at stations HH-5 and HH-2. Station HH-5 was the only station with *Capitella capitata*, *Corbula aequivalvus*, *Diastylis* sp. a, and *Eunice* sp. a. while *Diplocirrus* sp. a., *Grubeulepis* sp. a, and *Gyptis* sp. a, were only collected at station HH-2. The SIMPROF test (p=0.32) supported the observation of no discrete groupings by showing that all samples formed a statistically similar group based on taxonomic composition at the level of the EBS study area. Like the cluster analysis, the MDS ordination plot does not reveal any discrete groups of samples that would indicate spatial aggregation or other assemblage patterns (**Figure 10**).

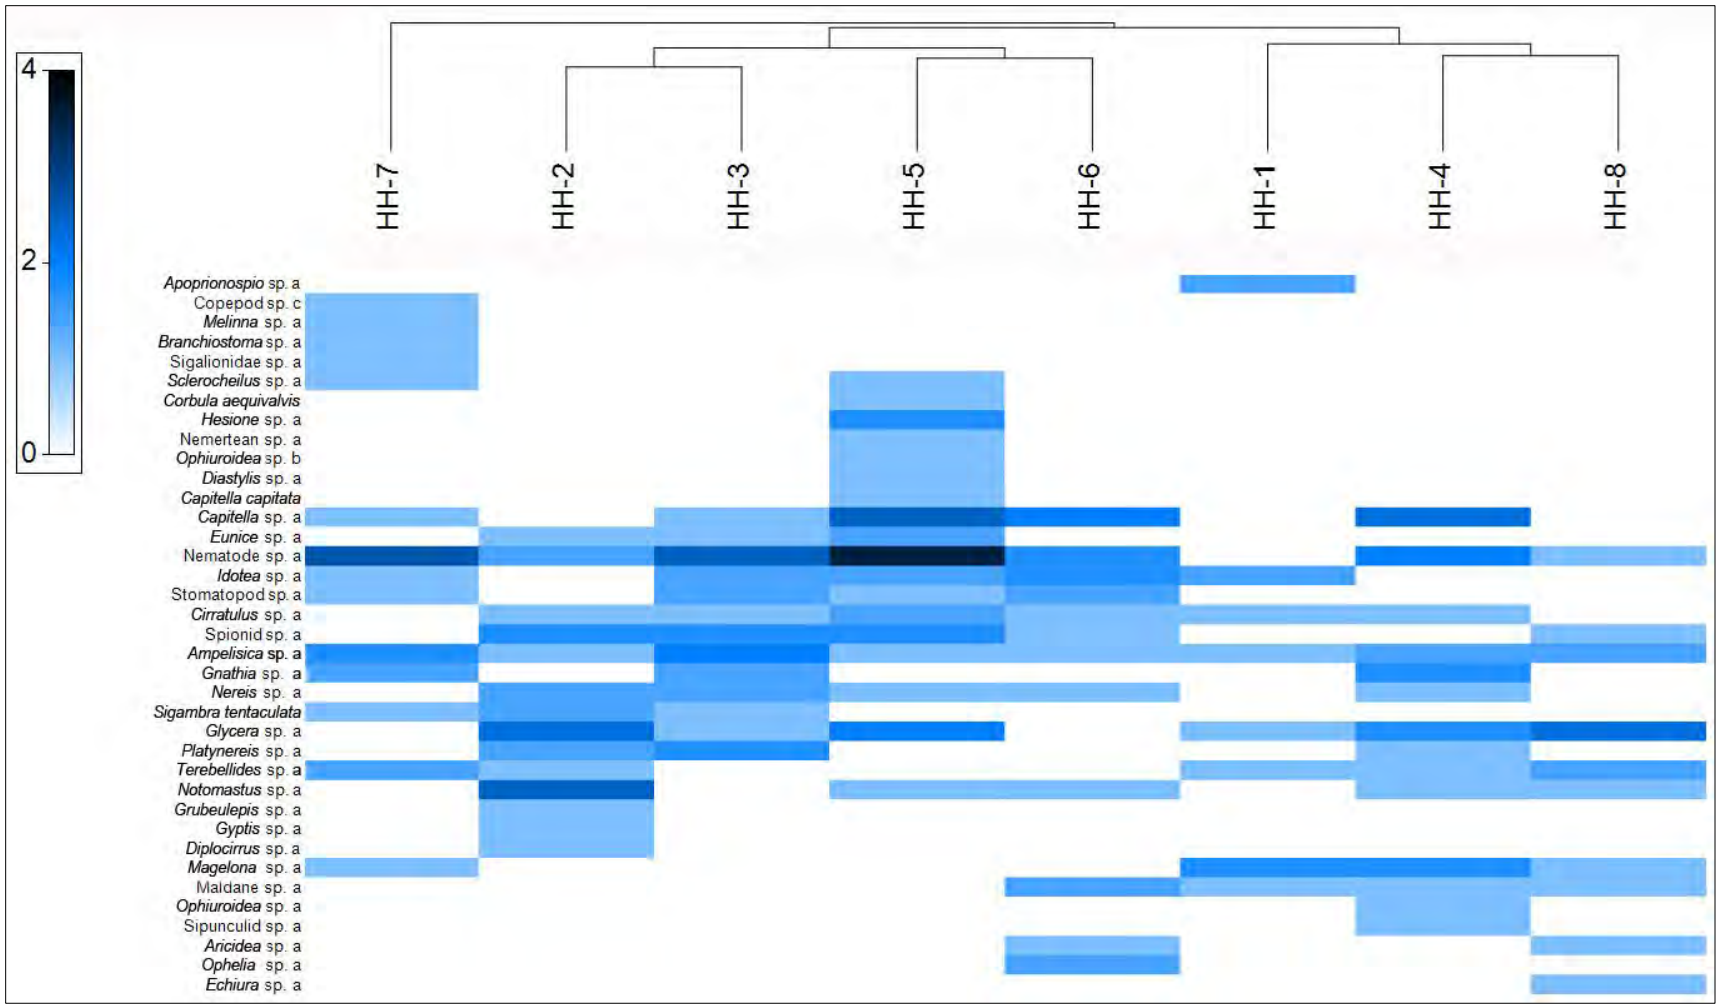

Figure 9. Two-way cluster analysis based on sample similarity (top) and the 37 individual identified taxa (side) from the study area infauna assemblage. The gray lines in the sample dendrogram indicate samples within a statistically defined group according to a SIMPROF test. The blue scale shows square root transformed abundance values for the listed taxa.

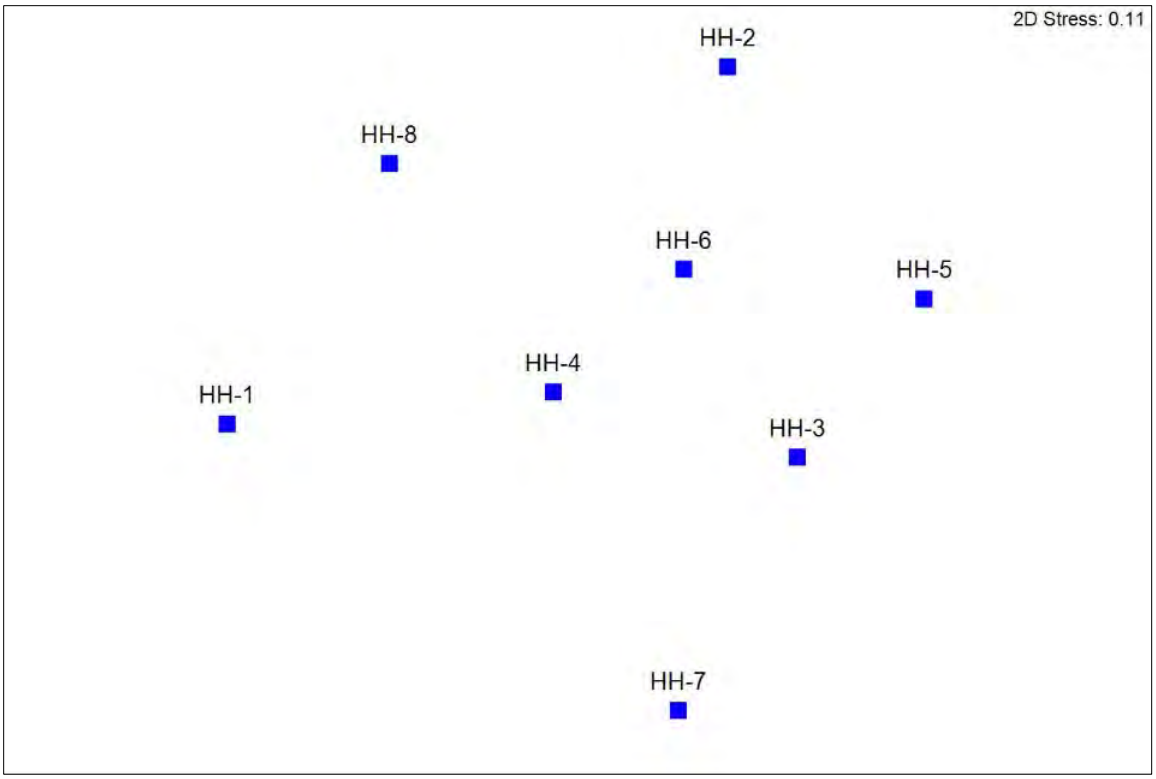

Figure 10. Multidimensional scaling (MDS) ordination of samples by similarity in taxonomic composition for infauna collected during the Hammerhead Development Environmental Baseline Survey. The MDS ordination does not reveal any discrete groups of samples that would indicate spatial aggregation or other assemblage patterns.

The infauna assemblage characterized by the samples collected in the EBS study area consisted mostly of polychaete annelids, arthropods, and nematodes which was similar to the assemblage described from the 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019). Community-wide measures of density (average 208 m^{-2}) and abundance were generally low when compared with other deep-sea areas in similar water depths (e.g., Grassle and Maciolek, 1992; Oliver et al., 2011) and lower than the average infauna density of 359 individuals m^{-2} from the 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019). Measures of diversity including total taxa, species richness, and species diversity were also low relative to other areas. Evenness (J) was high across stations largely due to the low abundances of individuals at each of the stations, the divisor in the J calculation. High evenness is a characteristic of deep-sea infauna assemblages in many areas (Grassle and Maciolek, 1992). High evenness corresponds with low numerical dominance which was observed with the present data set; the most abundant taxon, a nematode, accounted for 17.2% of the individuals collected during the EBS. It appears that the assemblage sampled within the EBS study area is a small part of a larger, relatively homogenous sedimentary environment with broad-scale influences such as low input of organic matter and similar sediment grain size distribution. The low diversity and abundance may be due to the very small seafloor sampling area (e.g., Oliver et al, 2011). Obvious species-level patterns were not evident from multivariate analyses, and no outlying groups of samples with similar taxonomic composition and proportional abundances were found in either cluster analysis or MDS. The assemblage properties of the infauna described from the eight stations will provide an adequate baseline from which to evaluate potential impacts of activities within the study area.

5.2 SEAWATER

5.2.1 Hydrographic Profiles

Hydrographic profiles were collected for conductivity/salinity, temperature, DO, turbidity, and pH. **Table 12** provides the minimum and maximum recorded values for hydrographic parameters at all stations. **Figures 11** and **12** provide representative hydrographic profiles of the study area (Station HH-7 based on being an intermediary between the shallowest and deepest stations). **Appendix D** contains all hydrographic profile plots for the Hammerhead Development EBS. Overall, hydrographic data at all EBS stations appeared typical of the offshore open ocean environment for the region.

Table 12. Minimum, maximum, and mean values for all hydrographic profile parameters at seawater sampling stations during the Hammerhead Development Environmental Baseline Survey.

Station	Data	Temperature (°C)	Salinity (PSU)	Dissolved Oxygen		pH	Turbidity (NTU)
				(mg L^{-1})	(%)

NTU = nephelometric turbidity unit; PSU = practical salinity unit.

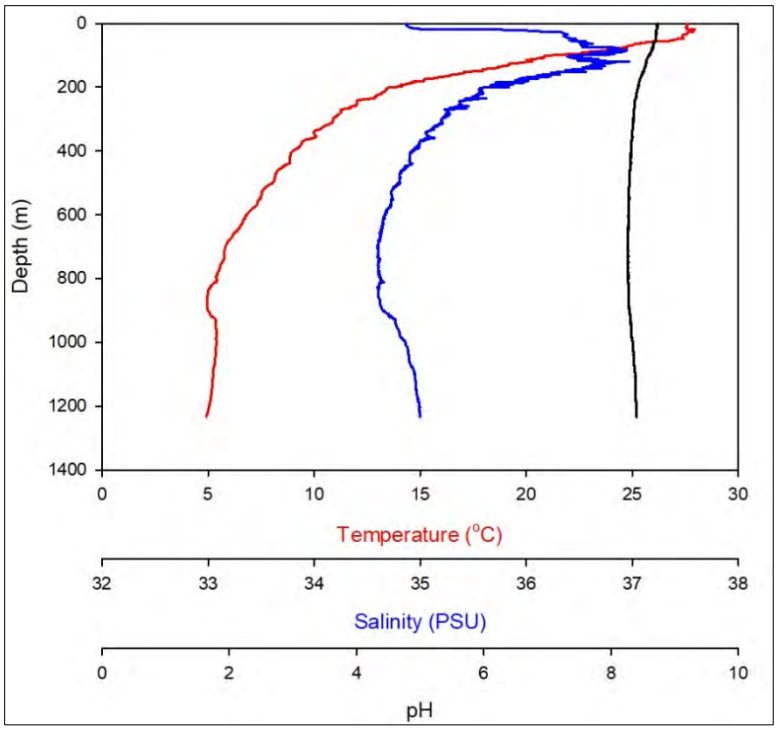

Figure 11. Representative water column profile for temperature, salinity, and pH from Station HH-7 during the Hammerhead Development Environmental Baseline Survey. PSU = practical salinity units.

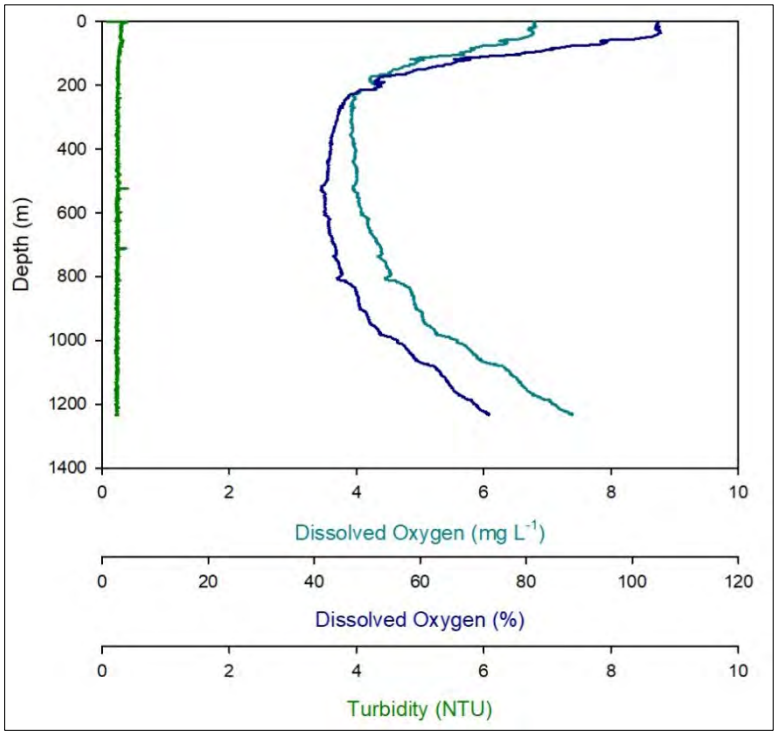

Figure 12 Representative water column profile for dissolved oxygen (concentration and saturation) and turbidity from Station HH-7 during the Hammerhead Development Environmental Baseline Survey. NTU = nephelometric turbidity units.

Seawater temperature ranged from 4.07°C to 28.19°C during the survey and had a similar trend at each station. Temperature changed very little in the upper 60 to 70 m of the water column. In this layer, as temperature decreased salinity increased which is expected in this well mixed layer. The top of the thermocline was observed below the well-mixed surface portion of the water column at approximately 70 m, seawater temperature continued to decrease with the lowest temperatures recorded at maximum depth for all stations. The steep decrease in water temperature from 70 m to about 200 m, with a temperature differential of approximately 15°C, coincides with the pycnocline separating the warmer, low-density surface waters and the colder, denser bottom of the water column.

Salinity ranged from 34.54 to 37.20 practical salinity units (PSU) during the survey with similar trends at each station. There was a distinctive surface lens of low salinity water above the high salinity layer with maximum of about 37 PSU that delineated the halocline depth at about 170 m. This salinity surface profile is most probably an artifact of low rain with lots of evaporation and movement of higher salinity and denser seawater within the upper water column as defined by the pycnocline. The lowest salinity values were measured at approximately 800 m depth of the water column for all stations. The salinity profile was relatively stable below 400 m.

The pH was generally stable throughout the water column ranging from 8.07 to 9.62. The average pH for open ocean seawater is around 8.2 with a generally extended range of 7.5 to 8.5 depending on local conditions (https://sfyl.ifas.ufl.edu/media/sfylifasufledu/miami-dade/documents/sea-grant/Temperature,-Salinity-and-pH.pdf, viewed 5-7-2020). It would not be expected to observe a pH well outside this typical pH range in the open ocean possibly with the exception of the presence of a localized point source. Therefore, it is thought there was a sensor glitch during the pH profile at Station HH-8 that accounted for an anomalously high near-bottom pH (**Appendix D**). Turbidity was low at all stations with an overall mean of 0.25 nephelometric turbidity units (NTU) during the survey.

DO concentration ranged from 3.90 to 8.47 mg L^{-1} during the survey and DO saturation ranged from 40.78% to 105.49%. As would be expected, the DO concentration and saturation profiles essentially mirror each other within the water column. The upper threshold of hypoxic conditions typically ranges from 2 to 5 mg L^{-1} (Gobler and Baumann, 2016) depending on the taxonomic grouping. Profiles show high DO levels in the upper 50-m depth layer coinciding with the well-mixed upper portion of the photic zone and at depths below approximately 1,000 m. The DO profiles reflect water column processes of primary productivity, respiration and mineralization. Typically, DO levels are highest at the near-surface where sunlight allows the highest rates of primary production (resulting in oxygen evolution). DO is greatest not at the surface of profiles but just below the water surface between 0 to 150 m due to the actinic effects of sunlight on photosynthesis. DO levels are lowest in the 200 to 800 m portion of the water column. In this layer, decreasing light availability depresses primary productivity and there is mineralization of organic matter which results in lower DO levels associated with oxygen consumption. Below approximately 800 m, DO levels increase from less than 5 to about 8 mg L^{-1} due to reduced microbial respiration in this layer and the physical properties of the water related to temperature and pressure. Similar trends can be observed along deepwater profiles obtained from the California Borderland where DO generally decreased up to depth of 700 m and then increased at 1,000 m (Torres et al., 2012). The general DO profiles were similar to those reported by 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019).

5.2.2 Total Organic Carbon

TOC in seawater could be used as an indicator for biological productivity, organic loading, and petroleum pollution. A study demonstrated TOC concentrations showed significant positive correlation with petroleum hydrocarbons in seawater (Emara, 1998). TOC concentrations were very low at all EBS stations and was detectable in the surface water at Station HH-1 with a level of 0.3 mg L^{-1}; all other

sampling locations were below the detection limit of 0.2 mg L^{-1}.These low TOC levels are similar to the concentrations of ≤1.2 mg L^{-1} for the Liza 2 Field Development (Benthic USA LLC., 2019). There are no internationally accepted toxicity reference values for TOC concentrations in seawater.

5.2.3 Total Suspended Solids

Concentrations of TSS in the water column at seawater sampling stations during the Hammerhead Development EBS are presented in **Table 13**. TSS is a water quality measure specific to understanding the level of particulate matter in the water column and are predominantly comprised of inorganic materials (e.g. sediment fine fractions). Deepwater open ocean TSS is expected to be low with occasional solids from organic sources such as water column planktors and decomposing materials. Deepsea near-bottom water generally has low TSS levels due to few disturbances that stir up the sediment on the seafloor. TSS levels were low in the EBS study area with most samples below the analytical laboratory reporting limits of 5 mg L^{-1}. These low TSS levels corroborate the reported low turbidity levels where turbidity is a visual property of the water quality that is affected by TSS.

Table 13. Concentrations of total suspended solids (TSS) in the water column at seawater sampling stations during the Hammerhead Development Environmental Baseline Survey. Bolded numbers display detected concentrations.

Station	Depth Strata	TSS (mg L^{-1})

5.2.4 Hydrocarbons

Concentrations of TPH and PAHs were measured to generally assess the presence of petroleum-related contamination in the water column. Concentrations of hydrocarbons in the water column of the EBS study were very low with TPH levels at all sampling stations and depths being below the analytical detection limit of 13 µg L^{-1}. These results for TPH were the same as for the 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019) with a similar TPH analytical detection limit. There is no internationally accepted toxicity reference value for TPH in seawater.

Similar to sediments, sixty-four PAHs, including the 16 USEPA priority PAHs, were analyzed in the seawater samples that constituted total PAH. Concentration of total PAH and the detectable USEPA priority pollutant PAHs in seawater are presented in **Table 14**; the respective CCC toxicity reference values (Buchman, 2008) are provided for individual PAHs, where available. PAH concentrations in seawater ranged from 0 to 24.1 ng L^{-1}. Highest total PAH concentration was observed in the surface waters at Station HH-2 that has sediments characterized by highly elevated TPH and PAHs levels. All PAH levels were well below CCC values, when applicable, indicating PAHs present in the water column do not represent a hazard to marine organisms and the general offshore marine ecosystem. There is no internationally accepted toxicity reference value for total PAHs in seawater.

Table 14. Concentration (ng L^{-1}) of total polycyclic aromatic hydrocarbons (PAHs) and the detectable United States Environmental Protection Agency priority pollutant PAHs with comparisons to Criterion Continuous Concentration (CCC) toxicity reference values (as available) in seawater at sampling stations during the Hammerhead Development Environmental Baseline Survey. **Bold** numbers display detected concentrations.

5.2.5 Metals

Concentration of metals with analytically detectable levels in the water column of the EBS study area are presented in **Table 15**. The respective toxicity reference values (Buchman, 2008) are also provided for metals, where available. Total aluminum and beryllium concentrations were below the analytical laboratory's reporting limit of 21.0 µg L^{-1} and 0.02 µg L^{-1}, respectively. Total metal concentrations within the water column were low with the exception of strontium and molybdenum. Strontium is one of the most abundant minerals in seawater and was at expected high levels of around 8,000 µg L^{-1} (https://www.lenntech.com/periodic/water/strontium/strontium-and-water.htm viewed 5-12-2020). All metal concentrations are reported as lower than the CCC toxicity reference values (Buchman, 2008) with a few exceptions of molybdenum. The levels of molybdenum in the EBS study area water column ranged from 10.3 to 35 µg L^{-1} that is elevated above the expected range in open ocean systems of 9.3 to 10.4 µg L^{-1} (Smedley and Kinniburgh, 2017). The source of the elevated levels of molybdenum are uncertain but could be influenced by regional mining activities (Smedley and Kinniburgh, 2017). Other than these exceptional molybdenum concentration, levels of all metals are relatively consistent throughout the EBS survey area and consistent with results for seawater metals during the 2018 Liza 2 Field Development EBS (Benthic USA LLC., 2019). Concentrations of cadmium, cobalt, iron, manganese, and silver were very low and below method detection limits at most of the EBS sampling stations (**Table 15**).

Table 15. Total metals concentrations with comparisons to Criterion Continuous Concentration (CCC) toxicity reference values (Buchman, 2008) in seawater at sampling stations during the Hammerhead Development Environmental Baseline Survey. Units presented in µg L^{-1} except for mercury (ng L^{-1}). Total aluminum and beryllium concentrations were below the analytical laboratory's reporting limit of 21.0 µg L^{-1} and 0.02 µg L^{-1}, respectively; results are not presented for these metals. Concentrations in red are in exceedance of the CCC.

5.3 BENTHIC HABITATS

Requisite programmatic imagery (i.e., video and still photographic grabs) were provided to Esso as an immediate post-survey deliverable. Representative images of the seafloor benthic habitat are provided to generally characterize the substrates at each of the sampling stations. No fish or invertebrate benthos were observed in the photographic data due primarily to the relatively small overall visual sampling area at each station that was estimated to be about 1 m^2.

All visually documented habitat was soft bottom substrate that supported a relatively depauperate biological assemblage as based on the sampling area viewed from the imagery. Photographic data document the EBS study area is characterized by soft sediments composed primarily of fine silt and clay fractions. Individual images provide small scale characterization of the study area sediments. These data are not suitable for interpretation of land-scape topographic features. No consolidated hard substrates were observed within the study area. Underwater conditions at the videographic sampling locations were generally very good with clear near-bottom visibility that was delimited by the artificial lighting provided by the camera system. A representative image and brief descriptive annotation describing the viewed benthic habit is presented in **Images 6** to **13**.

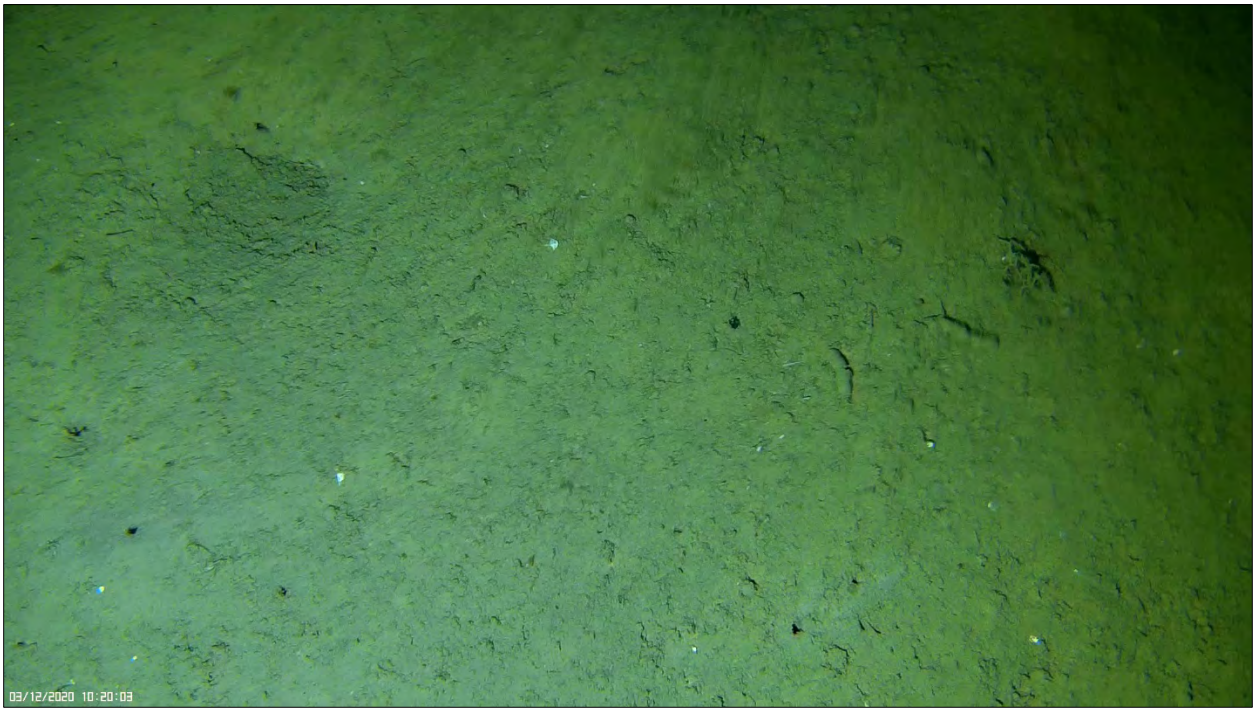

Image 6. Representative seafloor image at Station HH-01 with benthic habitat characterized by surficial sediment of predominantly silt and loose clay with incorporation of calcareous debris (e.g., pteropod tests). Loose organic materials, bioturbation (i.e., small burrows), what appear to be fecal casts, and subtle surface irregularities are visible in the image.

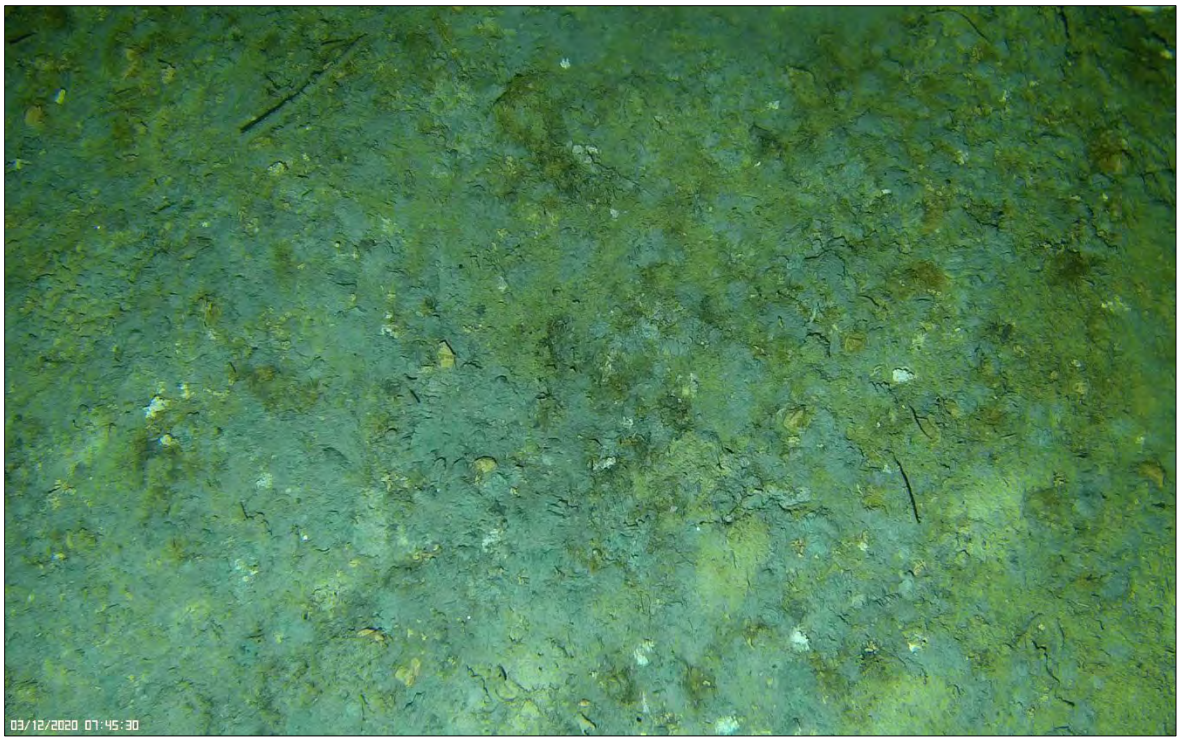

Image 7. Representative seafloor image at Station HH-02 with benthic habitat characterized by surficial sediment of predominantly silt and loose clay. Surficial sediments have an odd mottled appearance with formations of small clumps of clayey materials and incorporated organic materials. Based on the sediment sampling results at this station, it is very likely the content of the surficial sediments strongly influenced by discharges of drilling muds and cuttings.

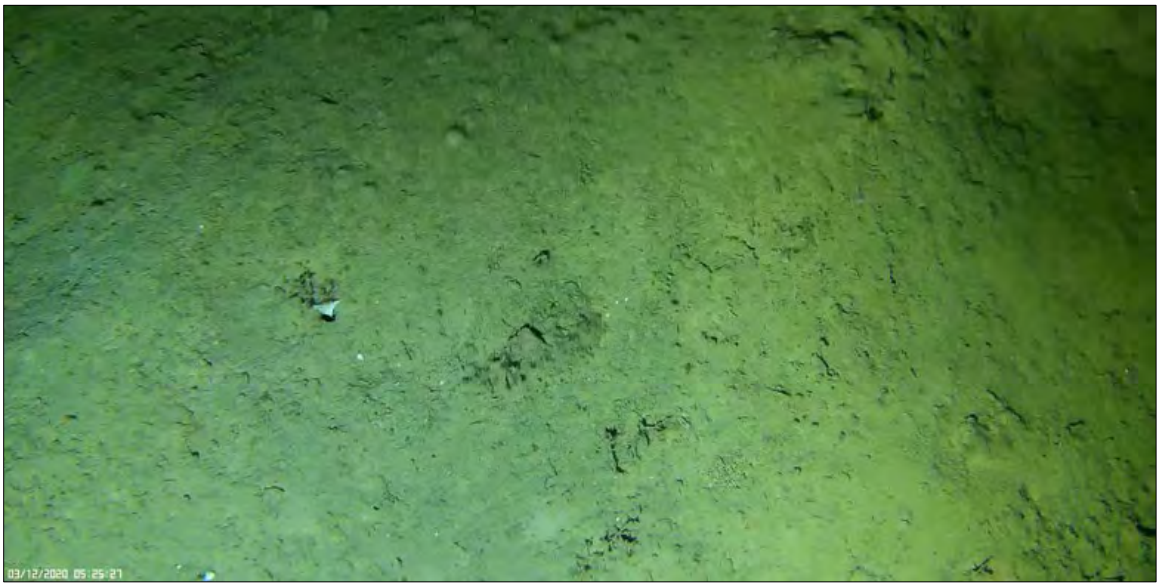

Image 8. Representative seafloor image at Station HH-03 with sediments predominantly silt and loose clay; irregular surface topography appears to be biologically active with subtle bioturbations and accumulated organic matter.

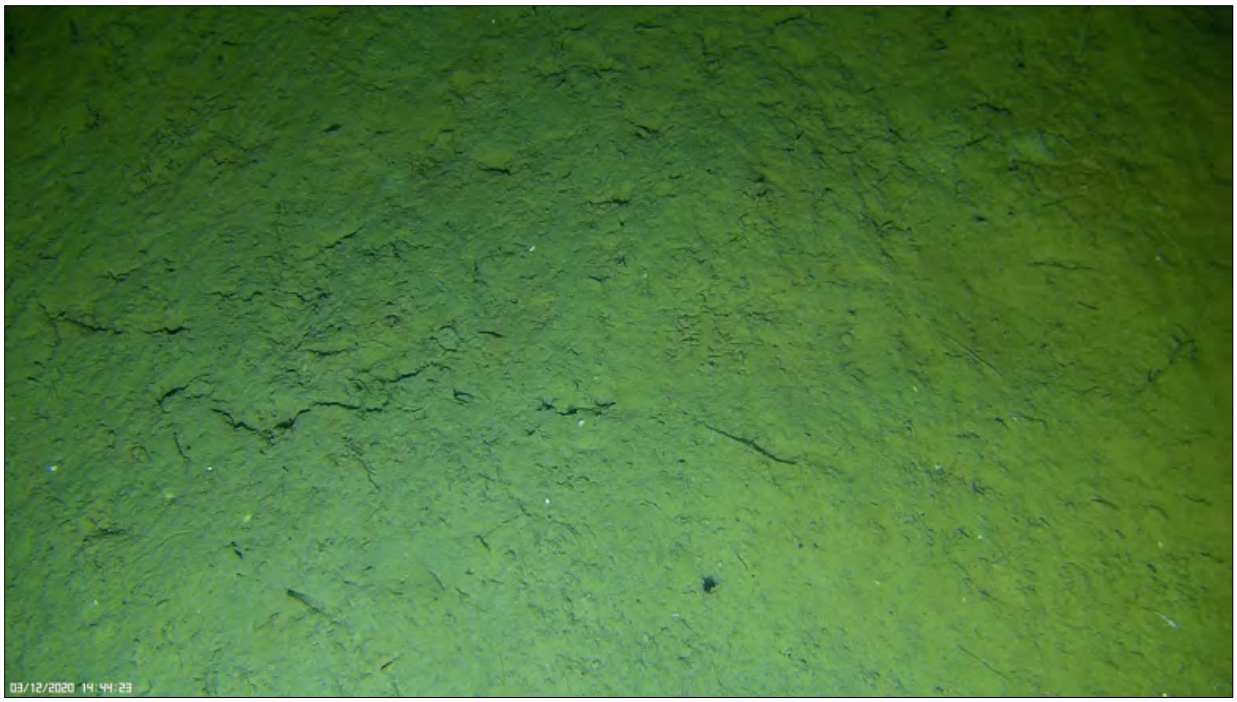

Image 9. Representative seafloor image at Station HH-04 with sediments predominantly silt and loose clay; irregular surface topography appears to be biologically active with subtle bioturbations (i.e., small burrows).

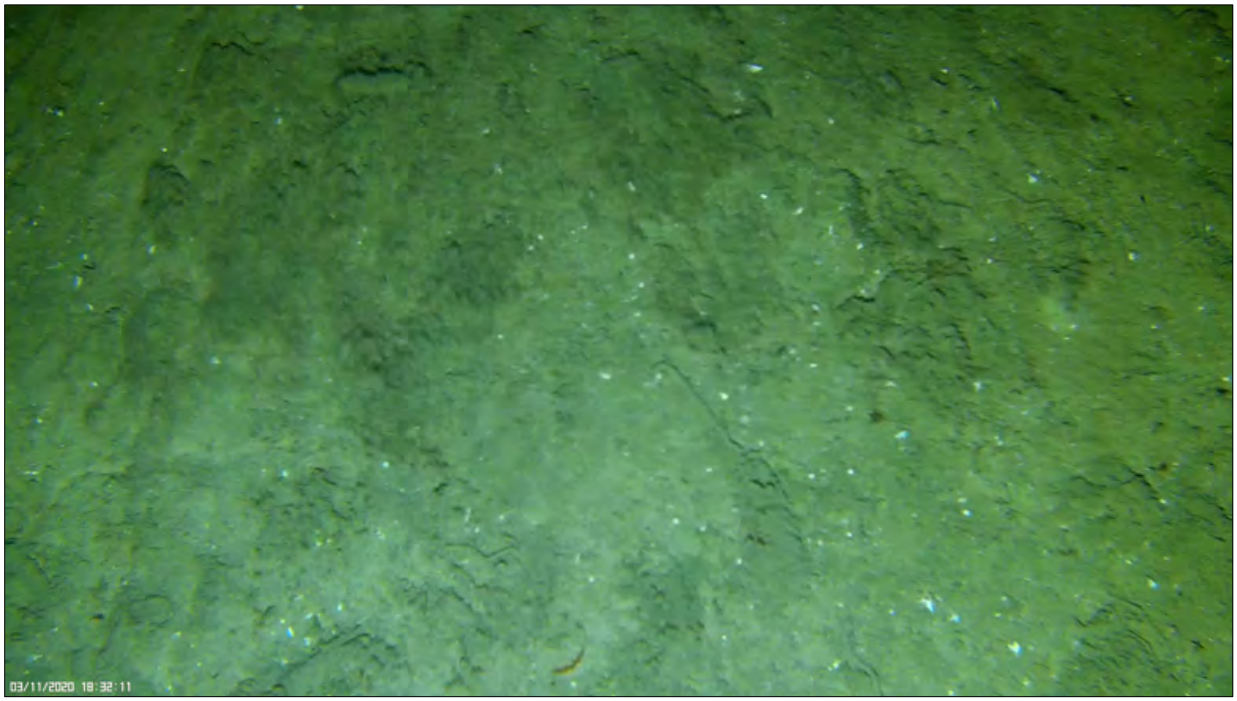

Image 10. Representative seafloor image at Station HH-05 with sediments composed of predominantly silt and loose clay with relatively high fraction of sand and incorporation of calcareous debris (e.g. pteropod tests). Substrate has a smooth surface topography with veneer of fine silt that appears to move with subtle near-bottom disturbances.

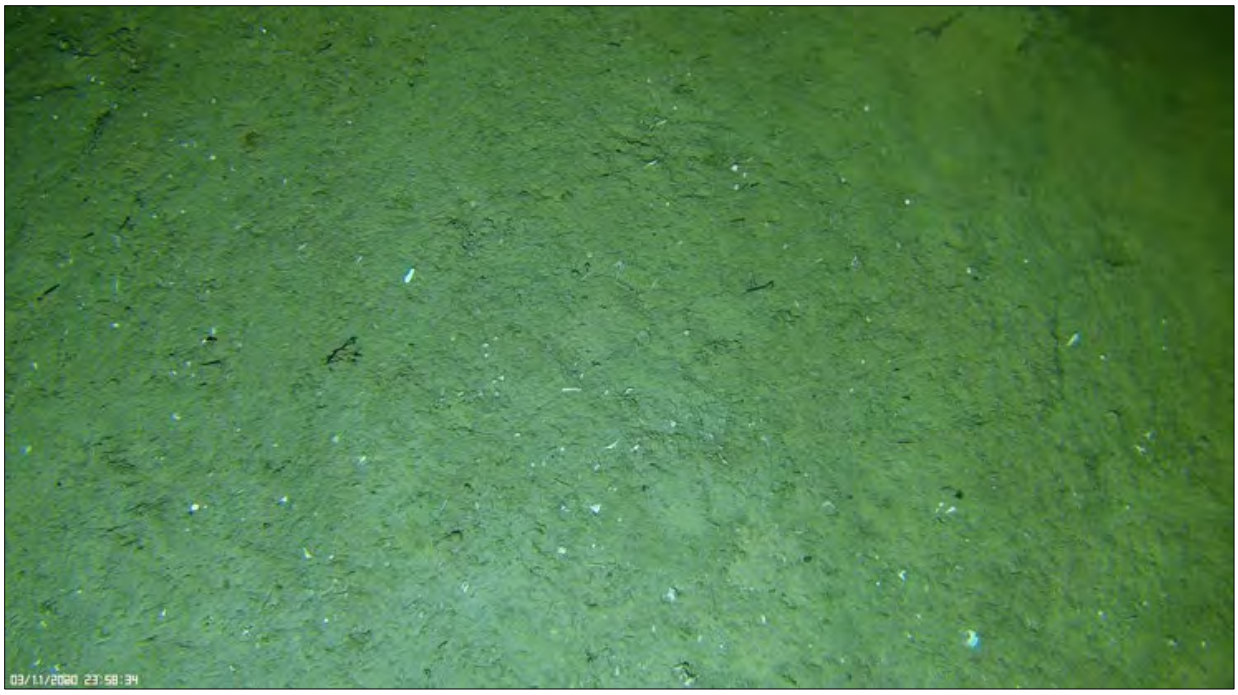

Image 11. Representative seafloor image at Station HH-06 with sediments composed of predominantly silt and loose clay with relatively high fraction of sand and incorporation of calcareous debris (e.g. pteropod tests). Substrate has a smooth surface topography with no visual indication of biological activity.

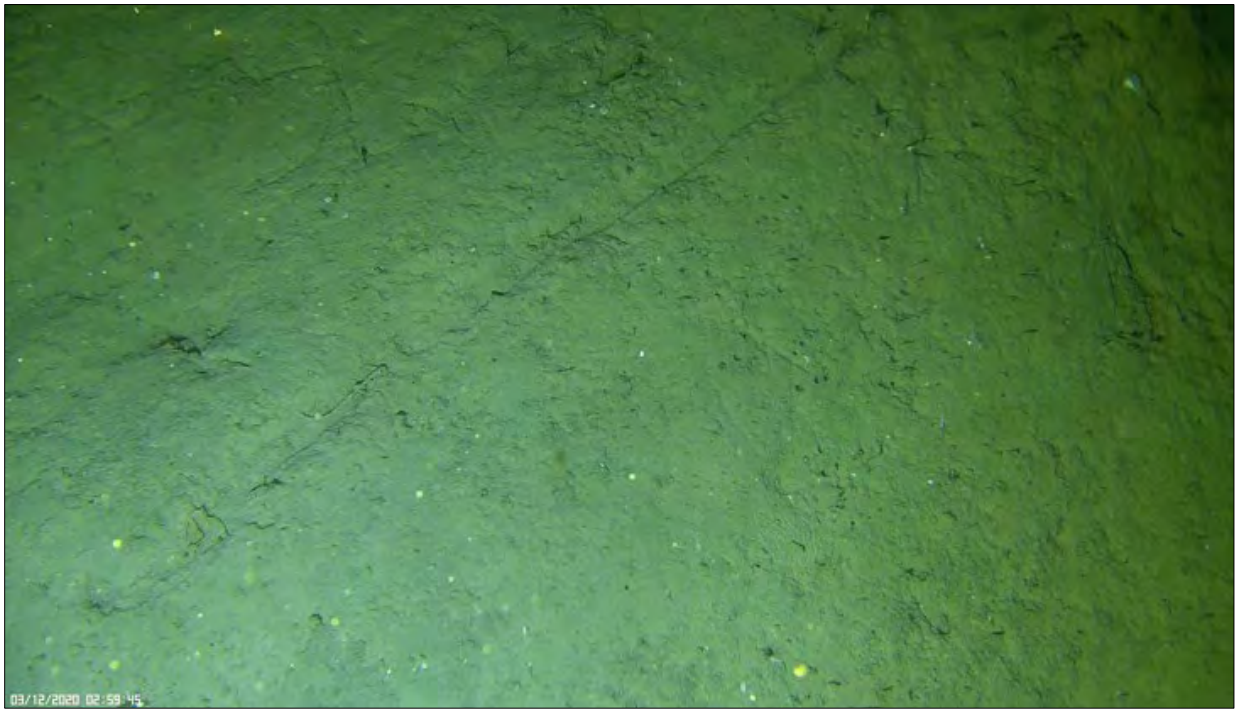

Image 12. Representative seafloor image at Station HH-07 with sediments composed of predominantly silt and clay with very low amounts of sand. Substrate surface topography has various indications of biological activity; however, these markings do not appear to be recent.

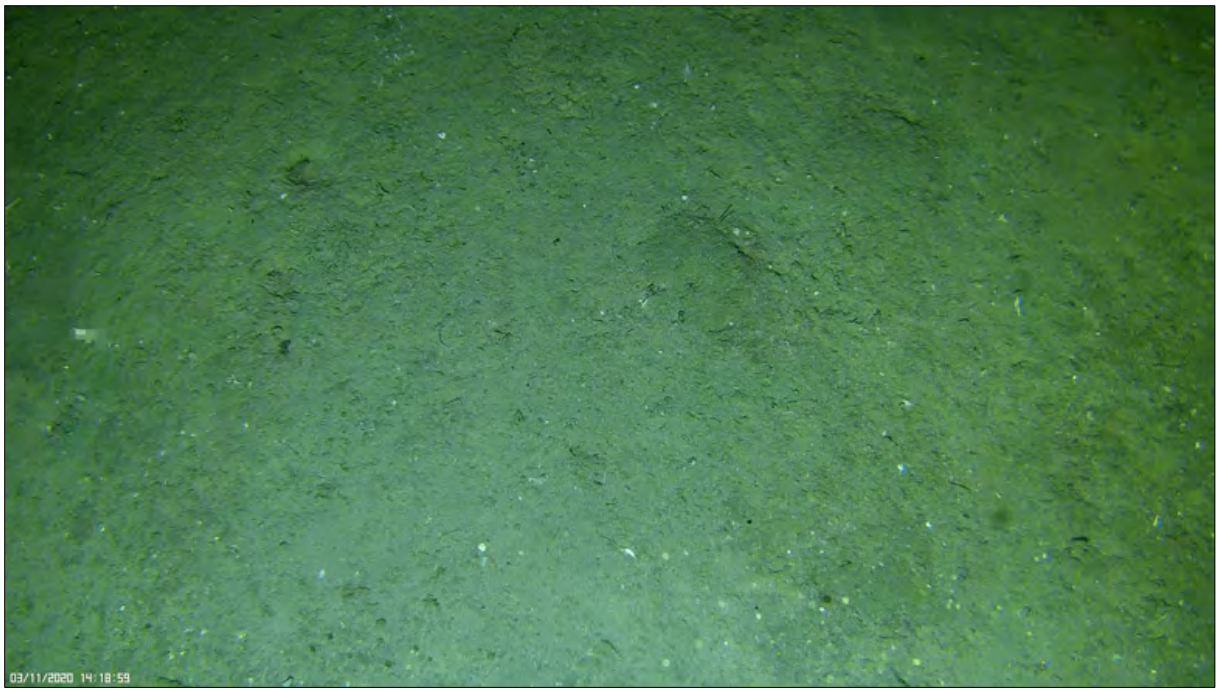

Image 13. Representative seafloor image at Station HH-08 with sediments composed of predominantly silt and loose clay with relatively high fraction of sand and incorporation of calcareous debris (e.g. pteropod tests). Substrate has a smooth surface topography with subtle visual indication of biological activity such as small depressions and mounds.

6.0 Conclusions and Recommendations

The findings of the EBS are generally summarized to present the analytical results relevant to understanding potential impacts to the various aspects of the environment from ongoing and future offshore oil and gas activities. These findings provide the basis for recommendations to address informational data gaps and parameters most informative to understanding and detecting impacts. A general recommendation based on extensive experience conducting offshore oil and gas monitoring programs would be to focus on benthic sampling because that is where the impacts will be detectable. A minimal level of effort for water column sampling (e.g. three stations) would be adequate to provide the "snapshot" characterization of the water mass present within the study area and establish regional conditions. The continuous movement of regional water masses and flushing of potential inputs by oceanographic conditions does not facilitate using water column sampling to assess large-scale effects of development activities.

Sediment characteristics and analyte concentrations are similar to the previous regional study for the Liza 2 Field Development (Benthic USA LLC., 2019) and generally within the expected ranges for deep water offshore sediments, with a few exceptions.

TPH concentrations in sediment ranged from 3 to 1,233 $\mu g\ g^{-1}$ and were generally similar among all stations except Station HH-2. TPH concentrations exceeding 1,100 $\mu g\ g^{-1}$ were considerably elevated at Station HH-2 with levels hundredfold over the other EBS stations. Theses elevated TPH levels are very possibly due to the presence of synthetic based fluids in the sediments. Like TPH, the total PAH concentration was considerably elevated at Station HH-2. This high sediment hydrocarbon location could facilitate appropriate monitoring initially to understand the hydrocarbon source by using "fingerprint" sampling for operator-utilized non-aqueous drilling fluids and secondarily to evaluate persistence in the environment and recovery to ambient conditions.

Observed variability of sediment metals concentrations within the EBS study area are likely a function of sediment grain size, organic carbon content, and mineralogy. In addition, regional drilling activities appear to have influenced some metal analytes. Ba in sediment samples was elevated at Stations HH-1, HH-2, and HH-3 with concentrations greater than 1,000 ppm ($mg\ kg^{-1}$) may be indicative of drilling activities with discharge of drilling muds. Highest concentrations (albeit slightly higher) of As, Cd, Cu, Pb, and V were observed at Station HH-2 that had the highest levels of Ba and appears to be the result of drill mud deposition. Similar to the sediment hydrocarbons, these high sediment metal locations could facilitate appropriate monitoring to establish spatial gradients relative to previous drilling mud discharges and temporal effects concerning persistence in the environment and recovery to ambient conditions.

There was an approximate sevenfold increase in the mean Al concentration between this EBS (7.24%) and the 2018 Liza 2 Field Development EBS (1.15%) (Benthic USA LLC., 2019). The observed Al concentration during this Hammerhead Development EBS are most expected for deep water clay sediments (Turekian and Wedepohl, 1961, Salomons and Förstner, 1984, Wedepohl, 1995). The sources for the stark differences between this EBS and the 2018 EBS sediment Al concentrations are uncertain but could be influenced by analytical laboratories and associated methods between surveys, natural influx of aluminosilicate terrigenous sediments, and/or anthropogenic activities. To better understand potential regional variability concerning sediment mineral types and metals concentrations, all pre-drilling data could be used to establish a regional baseline; post-drill data would need to be evaluated within the evolving baseline to assess its applicability for use in establishing baseline. CSA has done this in the Eastern Mediterranean for the Leviatine Basin. This regional baseline can be applied to all sediment sampling parameters for assessing whether sediment analytical levels are within the range of regional natural variability.

The sediment metals regression plots were conducted to determine whether observed metal concentrations are regionally anomalous. The regression analysis was conducted to correlate sediment percent Al with other metals concentrations to assess the potential for influence by anthropogenic inputs. With the exception of the high barium samples, regression analysis show that all metal concentrations when plotted in correlation with sediment percent Al were within the 99% prediction interval; therefore, the regression analyses indicate EBS metal concentrations are considered regionally ambient and establish baseline conditions specific to these sediment metal analytes. Moving forward, the established 99% predication intervals could be used for future studies within the Hammerhead Development area to assess anomalous sediment metal concentrations.

The 8 box core samples collected from the survey area yielded 204 individuals and 37 total taxa from eight phyla. Most of the individuals (60.3%) were contributed by the annelids followed by arthropods (19.6%). Annelids were also represented by the most infaunal taxa (24) followed by arthropods (6). The overall infauna density ranged from 98.0 to 359.2 individuals per m^2 with a mean of 208.2 ± 79.3 individuals per m^2 across all stations. The diversity indices indicated that the assemblage has generally low species richness and diversity but high evenness across all stations indicating similar relative abundances among taxa and correspondingly low numerical dominance. Cluster analysis and the multidimensional scaling ordination do not reveal any discrete groups of infauna samples that would indicate spatial aggregation or other assemblage patterns.

Infauna, as a biological indicator of impacts, are an important component of monitoring programs because they are sedentary and typically respond to pollutant stresses. The level of EBS infauna sampling appears to be adequate for generally characterizing the regional assemblage. However, a more comprehensive characterization of the assemblage may be required for infauna data to detect potential effects of offshore activities within the study area. More infauna samples within the EBS study area with a random positioning for stations stratified based on water depth would greatly enhance the ability to characterize the assemblage relative to local variability (e.g. depth gradient), species diversity, and spatial patterns (i.e., distinct assemblage groupings).

This EBS documents the existing state of the seafloor marine environment with high definition videographic data. All visually documented habitat was soft bottom substrate that supported a relatively depauperate biological assemblage as based on the sampling area viewed from the imagery. The dearth of observable seafloor features both topographic and biological was due primarily to the relatively small overall visual sampling area at each station. To use visual data to characterize large-scale features, it is recommended that a towed or drift camera system be utilized for data collection.

It should be noted, the Hammerhead Development Environmental Baseline Survey did detect potential effects of previous regional drilling activities; however they appeared to be localized and with no probable biological significance.

Technical Report 20-3961

Determination of:

Aliphatic, Total Petroleum Hydrocarbons (TPH), and Polycyclic Aromatic Hydrocarbons (PAH) in Sediment and Water Samples

Please take a moment and answer a quick survey. We would like to know how we can improve our services.

Narrative

B&B Laboratories, Inc.

Case Narrative

Sample Receipt and Storage

B&B Laboratories received a total of 10 ice chests in two separate shipments containing samples that were sent via FedEx by Steve Viada of CSA Ocean Sciences Inc. on March 16, 2020. Eight of the ten ice chests arrived in College Station (SDG # SDG20031701) sealed and in good condition. The remaining two of the ten ice chests arrived in College Station (SDG # SDG20031801) sealed and in good condition. Refer to the Supporting Documents section for the Sample Receiving/Integrity Report pages for sample discrepancies and the Sample Custody Corrective Action Report (SCCAR). Client was notified of discrepancies via email.

SDG20031801			
1	Cooler: 7.8°C Temp. Blank: NA	6 Water Samples	NA
2	Cooler: 8.9°C Temp. Blank: NA	6 Water Samples	NA

The water and sediment samples were collected on March 11-13, 2020 for CSA Ocean Sciences Job #3532. The water and sediment samples were logged-in according to B&B Laboratories standard operating procedure (B&B 1009) and stored in an access-controlled refrigerator (4.0°C) and freezer (≤ -16.0°C), respectively, prior to analysis.

The samples were analyzed for aliphatic hydrocarbons and Total Petroleum Hydrocarbons (TPH) by GC/FID and for Polycyclic Aromatic Hydrocarbons (PAHs) by GC/MS (SIM).

The analytical results for aliphatic hydrocarbons/TPH for the water samples, and the aliphatic hydrocarbons/TPH and alkylated PAHs with select biomarkers data for the sediment samples are included in this report.

B&B Laboratories, Inc.

Standard Operating Procedures

The sample preparation, extraction, and analytical methods employed for aliphatic hydrocarbons/TPH and PAH are listed in Table 1.

Table 1. Standard Operating Procedures for each analytical test.

Matrix	Sample Preparation	Extraction	Aliphatic Hydrocarbons/TPH	PAH
Water	B&B 1012	B&B 1011	B&B 1016	NA
Sediment	B&B 1012	B&B 1003	B&B 1016	B&B 1006

Sample Preparation and Extraction

Extraction of waters for Aliphatic, Aromatic, Chlorinated Hydrocarbons and Total Petroleum Hydrocarbons (Synopsis of SOP 1011)

This standard operating procedure provides a precise and accurate method for extraction, isolation and concentration of selected organic compounds from water samples. Final extracts can be used for the quantitative determination of polycyclic aromatic hydrocarbons (PAHs), aliphatic hydrocarbons, total petroleum hydrocarbon (TPH), and chlorinated hydrocarbons (including planar PCBs) by chromatographic procedures. This procedure is also used to extract water for gravimetric determination of extractable organic material (EOM). The extraction procedure is modified from EPA Method 3510 (separatory funnel method).

Water samples are serially extracted with dichloromethane in separatory funnels and the extracts are concentrated to a final volume of 0.5 to 4 mL. The protocol is designed for 1-liter water samples, but water samples of other sizes may be collected and extracted by appropriately adjusting the volume of dichloromethane used during the extraction process.

Extraction of Sediments for Aliphatic, Aromatic and Chlorinated Hydrocarbons and Total Petroleum Hydrocarbons (Synopsis of SOP 1003)

This standard operating procedure provides an accurate and precise method for extraction, isolation, and concentration of selected organic compounds from soil and sediment samples. It achieves analyte recoveries equivalent to those from Soxhlet extraction, using less solvent and taking significantly less time. Final extracts can be used in the quantitative determination of polycyclic aromatic hydrocarbons (PAHs), aliphatic hydrocarbons, total petroleum hydrocarbon (TPH), and chlorinated hydrocarbons (including planar PCBs) by chromatographic procedures. This procedure is also used to extract soil and sediment samples for gravimetric determination of extractable organic material (EOM).

An automated extraction apparatus (Dionex ASE200 Accelerated Solvent Extractor) is used to extract various organics from 1 to 15 g (usually 15 g if adequate material is present) of pre-dried sample. The extractions are performed using 100% dichloromethane inside stainless-steel extraction cells held at elevated temperature and solvent pressure. The extracted compounds dissolved in the hot solvent are collected in 60-mL glass vials. Extracts are concentrated to a volume of 1 - 3 mL, using an evaporative solvent reduction apparatus (Zymark TurboVap II or water bath), and if necessary, processed through a clean-up column in order to minimize matrix interference. Extracts are then concentrated to a final volume of 1 mL and submitted for determination of TPH, aliphatic, aromatic, and chlorinated hydrocarbon analytes using B&B SOPs 1016, 1006, 1007, and 1078, respectively.

Determination of Percent Moisture in Tissues, Soils and Sediment

Percent moisture (weight/weight basis) is determined in samples by measuring the loss in mass of the sample due to drying at 105°C to a constant weight. Typically, between one and two grams of sample are used for the determination. Wet and dried samples are weighed to the nearest milligram. This procedure is documented in B&B SOP 1098, *Percent Moisture Determination.*

Analytical Methods

Aromatic Hydrocarbon Determination by Selected Ion Monitoring – Gas Chromatography/Mass Spectrometry (Synopsis of SOP 1006)

This quantitative method is for the determination of polycyclic aromatic hydrocarbons (PAHs) and their alkylated homologues in extracts of water, sediment, biological tissue, products, oiled samples. Quantitation is performed by capillary gas chromatography/mass spectrometry (GC/MS) in selected ion

monitoring mode (SIM). The gas chromatograph is temperature-programmed and operated in splitless mode. The capillary column is an Agilent Technologies DB-5MS (60 m long by 0.25 mm ID and 0.25 μm film thickness), or equivalent. Carrier flow is by electronic pressure control. The autosampler is capable of making 1 to 5 μL injections. The mass spectrometer is capable of scanning from 35 to 500 m/z every second or less, utilizing 70 volts electron energy in electron impact ionization mode. The data acquisition system allows continuous acquisition and storage of all data during analysis and is capable of displaying ion abundance versus time or scan number.

Calibration solutions are prepared at six concentrations ranging from 20 to 5,000 ng/mL by diluting reference standard solutions containing the analytes of interest. For each analyte of interest, a relative response factor (RRF) is determined for each calibration level. The 6 response factors are then averaged to produce a mean relative response factor for each analyte.

Aliphatic and Total Petroleum Hydrocarbon Determination by Gas Chromatography/Flame Ionization Detection (Synopsis of SOP 1016)

The quantitative method described in this document is for the determination of aliphatic hydrocarbons and total petroleum hydrocarbons in extracts of water, sediment, biological tissue, products and oiled samples. The samples are analyzed by high resolution, capillary gas chromatography with flame ionization detection (GC/FID). Normal alkanes with 8 to 40 carbons (*n*-C_8 to *n*-C_{40}), and the isoprenoids pristane and phytane are determined with this procedure. The gas chromatograph is temperature-programmed and operated in split mode. The capillary column is a Restek Scientific RTX-1 (30 m long by 0.25 mm ID and 0.25 μm film thickness), or equivalent. Carrier flow is regulated by electronic pressure control. The autosampler is capable of making 1 to 5 μl injections. Dual columns and FIDs are used. The data is acquired using Agilent OpenLab CDS and is processed using Agilent MSD Chemstation.

A calibration curve is established by analyzing each of 6 calibration standards (1.25, 10, 25, 40, 50 and 100 μg/ml), and fitting the data to a straight line using the average response factors. For each analyte of interest, a relative response factor (RRF) is determined for each calibration level. All 6 response factors are then averaged to produce a mean relative response factor for each analyte. If an individual aliphatic hydrocarbon is not in the calibration solutions, a RRF is estimated from the average RRF of the hydrocarbon eluting immediately before the compound.

B&B Laboratories, Inc.

Data Reporting

The reporting units for each analyte are listed in Table 2. Data Qualifier Definitions are listed in Table 3. The method detection limits (MDLs) for each analyte are listed in Table 4.

Table 2. Analytical reporting units.

Matrix	Aliphatics/TPH	PAH
Water	µg/L	NA
Sediment	µg/dry g	ng/dry g

Table 3. Data Qualifier Definitions.

Qualifier	Definition
B	Analyte detected in the method blank greater than 3X MDL
D	Diluted Value
E	Analyte concentration exceeds the calibration range of the GC/MS for that specific analysis.
I	Analytical interference
J	Analyte detected below the method detection limit
L	Loss due to matrix effect
NA	Not Applicable
U	Analyte not detected
X	Analyte <3X MDL
X	Analyte <2X MDL for TOC analysis
Y	Spiked level of analyte <50% of the native concentration
*	Outside QA limits, refer to narrative

Quality Assurance/Quality Control – Water and Sediment

The quality assurance/quality control procedure for the water samples for this program included the analyses of a method blank, blank spike/blank spike duplicate, and reference oil (SRM2779) per analytical batch of no more than 20 samples.

The quality assurance/quality control procedure for the sediment samples this program included the analyses of a method blank, blank spike, matrix spike/matrix spike duplicate, laboratory duplicate, and reference oil (SRM2779) per analytical batch of no more than 19 samples. All QC samples are subject to the identical preparation and analysis steps as samples. The appropriate surrogate solution is added to every sample including quality control samples. The data are corrected based on surrogate recovery up to 100%. Refer to Tables 5 and 6 for Method Performance Criteria for n-alkanes and PAH, respectively.

TABLE 5. Method Performance Criteria for Alkanes/Isoprenoids Compounds and Total Petroleum Hydrocarbons

Element or Sample Type	Minimum Frequency	Measurement Quality Objective/ Acceptance Criteria	Corrective Action
Initial Calibration (all target analytes, see Table 2)	Prior to every sequence, or as needed based on continuing calibration/verification check.	6-point calibration curve %RSD ≤ 15%	Resolve before proceeding.
Continuing Calibration Verification (CCV)	Beginning, end, and every 10 injections (12 hour intervals)	%D ≤ 20%	Perform Instrument Maintenance. Re-analyze affected samples.
Initial Calibration Verification (ICV, Second Source CCV)	Per initial calibration	%R target analytes 80-120%	Resolve before proceeding.
NIST SRM2779 Reference Oil (Instrument SRM)	One per batch per GC sequence	Baseline resolution of n-C17 from pristine, and analytes must be ±3σ of laboratory derived mean	Resolve before proceeding.
Performance Evaluation Mixture (PEM)	One per batch per GC sequence	%R 75-125% for all surrogates	Resolve before proceeding.
Matrix Spike/Matrix Spike Duplicate (Sediments, Soils, Tissues only)	One per batch/every 20 client samples	%R 40% - 120% for target analytes; average %R 60-120% for valid spikes, RPD ≤30%. No more than 2 analytes may exceed 40-120%	Evaluate impact to data, discuss with lab manager to determine if corrective action is needed.
Blank Spike/Blank Spike Duplicate	One per batch/every 20 client samples	%R 40% - 120% for target analytes; RPD ≤30%. No more than 2 analytes may exceed 40-120%	Evaluate impact to data, discuss with lab manager to determine if corrective action is needed.
Method Blank	One per batch/every 20 client samples	No more than 2 analytes to exceed 3x MDL unless analyte not detected in associated sample(s) or analyte concentration >10x blank value	Evaluate impact to data, discuss with lab manager to determine if corrective action is needed.
Laboratory Duplicate (not required for aqueous samples)	One per batch/every 20 client samples	RPD ≤ 30% if analyte concentration is 3x greater than the MDL, no more than 2 individual analyte RPDs with conc. 3x MDL can exceed 35%.	Evaluate impact to data, discuss with lab manager to determine if corrective action is needed.
Mass Discrimination	Initial calibration and CCVs (mid-level)	Ratio for the raw areas of n-C36 / n-C20 ≥0.70	Resolve before proceeding.
Internal Standard (IS)	Every sample	50% - 200% of the area of the IS in the associated calibration standard	Evaluate impact to data, discuss with lab manager to determine if corrective action is needed.
Surrogates	Every sample	%R 40-120%	Evaluate impact to data, discuss with lab manager to determine if corrective action is needed.

TABLE 6. Method Performance Criteria for Extended PAH (Parent and Alkyl Homologs) and Related Compounds

Element or Sample Type	Minimum Frequency	Measurement Quality Objective/ Acceptance Criteria	Corrective Action
Tuning	Prior to every sequence	As specified in Section 7.1	Resolve before proceeding.
Initial Calibration (All parent PAH and selected alkyl homologue PAH)	Prior to every sequence, or as needed based on CCV	6-point calibration, RSD ≤ 20%	Resolve before proceeding.
Continuing Calibration Verification (CCV)	Beginning, end, and every 6-9 injections (12 hour intervals)	%D ≤ 25%, No more than 2 analytes can be between 25% and 35%	Perform instrument maintenance. Re-analyze affected samples.
Initial Calibration Verification (ICV, Second Source CCV)	Per initial calibration	%R target analytes 80-120%	Resolve before proceeding.
If available, use SRMs for appropriate matrices	One per batch/every 20 client samples	Within ±30% of NIST 95% uncertainty range for analytes within the quantitation range. No more than 2 analytes may exceed this criterion.	Evaluate impact to data, discuss with lab manager to determine if corrective action is needed..
SRM 2779 Gulf of Mexico Reference Oil Standard	One per batch/every 20 client samples	Peak resolution >80% of 4/9-methylphenanthrene from 1-methylphenanthrene (m/z 192). Within ±20% of NIST 95% uncertainty range for analytes within the quantitation range. No more than 2 analytes may exceed this criterion.	Evaluate impact to data, discuss with lab manager to determine if corrective action is needed.
Matrix Spike/Matrix Spike Duplicate (Sediments, Soils, Tissues only)	One per batch/every 20 client samples	%R 40% - 120% for target analytes, except biphenyl (40%-140%), decalin (25%-120%) and perylene (10-120%); RPD ≤30%, average %R 60-120% for valid spikes. No more than 2 analytes may exceed 40-120% recovery or >30% RPD.	Evaluate impact to data, discuss with lab manager, determine if corrective action is needed.
Blank Spike/Blank Spike Duplicate	One per batch/every 20 client samples	See MS/MSD criteria above.	Evaluate impact to data, discuss with lab manager, determine if corrective action is needed.

B&B Laboratories, Inc.

TABLE 6 (Continued). Method Performance Criteria for Extended PAH (Parent and Alkyl Homologs) and Related Compounds

Element or Sample Type	Minimum Frequency	Measurement Quality Objective/ Acceptance Criteria	Corrective Action
Method Blank	One per batch/every 20 client samples	No more than 2 analytes to exceed 3x target MDL unless analyte not detected in associated sample(s) or analyte concentration >10x blank value	Evaluate impact to data, discuss with lab manager, determine if corrective action is needed.
Laboratory Duplicate (not required for aqueous samples)	One per batch/every 20 client samples	RPD ≤ 30% if analyte concentration is 3x greater than the MDL, no more than 2 individual analyte RPDs with conc. 3x MDL can exceed 30%.	Evaluate impact to data, discuss with lab manager, and determine if corrective action is needed.
Mass Discrimination	Initial calibration and CCVs (mid-level)	Ratio for the concentration of Benzo[g,h,i]perylene to phenanthrene ≥0.70	Resolve before proceeding.
Internal Standard (IS)	Every sample	50% - 200% of the area of the IS in the associated calibration standard	Evaluate impact to data, discuss with lab manager, and determine if corrective action is needed.
Surrogates	Every sample	%R 40-120% except d12-perylene which is 10-120%	Evaluate impact to data, discuss with lab manager, and determine if corrective action is needed.

B&B Laboratories makes no representation or certifications as to the method of sample collection, sample identification, or transporting/handling procedure used prior to the receipt of samples by B&B Laboratories. To the best of my knowledge, the information contained in this report is accurate and complete.

This report may not be reproduced except in full, and with written approval from the laboratory. Results relate only to the samples tested and apply to sample(s) as received by the laboratory.

We appreciate the opportunity to serve your analytical needs and please do not hesitate to contact us should you have any questions.

Infauna Listing

This page intentionally left blank

Table B-1. Tabulated list of taxa abundance observed for infauna samples at all stations during the Hammerhead Development Environmental Baseline Survey.

Taxa/Station	HH-1	HH-2	HH-3	HH-4	HH-5	HH-6	HH-7	HH-8	TOTAL
Phylum Mollusca									
Corbula aequivalvis	0	0	0	0	1	0	0	0	1
Phylum Annelida									
Apoprionospio sp.a	2	0	0	0	0	0	0	0	2
Aricidea sp. a	0	0	0	0	0	1	0	1	2
Capitella capitata	0	0	0	0	1	0	0	0	1
Capitella sp. a	0	0	1	5	6	4	1	0	17
Cirratulus sp. a	1	1	1	1	2	1	0	0	7
Diplocirrus sp. a	0	1	0	0	0	0	0	0	1
Echiura sp. a	0	0	0	0	0	0	0	1	1

1. INTRODUCTION

On behalf of Esso Exploration and Production Guyana Limited (EEPGL), Environmental Resources Management (ERM) conducted five seasonal marine bird surveys in the Stabroek Block and surrounding waters offshore Guyana between September 2018 and October 2019. These surveys, collectively referred to as the Year 2 Marine Bird Study, were a continuation of the Year 1 Marine Bird Study conducted pursuant to a condition of the Environmental Permit for the Liza Phase 1 Development Project.

The Year 2 Marine Bird Study is an elective study commissioned by EEPGL, and was not conducted pursuant to any regulatory requirement. The objective was to build on the Year 1 Marine Bird Study and continue to document the marine bird assemblage offshore Guyana and identify seasonal patterns in bird abundance and species composition.

This report summarizes the results of the Year 2 surveys and compares results across all marine bird surveys conducted to date for the Year 1 and Year 2 studies.

2. SURVEY METHODS

The Year 2 Marine Bird Study consisted of five seasonal surveys of marine birds conducted between September 2018 and October 2019. The Year 2 Marine Bird Study was a continuation of the Year 1 Marine Bird Study, which consisted of two surveys conducted in September 2017 and April 2018 (Table 2-1). In total, 7 seasonal surveys, including 11 individual survey events encompassing approximately 750 survey hours, have been conducted to date for the Year 1 and Year 2 studies. Table 2-1 summarizes information about each of these surveys and Figure 2-1 depicts the locations of the surveys and the bird sightings.

Similar to the Year 1 Marine Bird Study, the marine bird surveys were conducted by teams of international and Guyanese bird specialists aboard vessels conducting various types of work between the Stabroek Block and Georgetown or within the Stabroek Block. The surveys applied the protocol established for the Year 1 Marine Bird Study to facilitate comparison of data across surveys. During each survey, one or two observers were stationed on a vessel's top deck. To minimize observer fatigue and eyestrain caused by continuous observation, observers conducted 30-minute surveys, each followed by a 15- or 30-minute break, between the hours of 05:30 and 17:30. At the beginning of each 30-minute observation period, the observers noted sky condition, wind strength, intensity of swells, density of whitecaps (which tend to impede visibility of birds near the water surface), boat speed, and bow direction. During each 30-minute observation period, the observers continuously scanned the vessel and the ocean surrounding the vessel with binoculars (10 x 40 or 10 x 50 magnification) to locate and identify any birds present. The observers noted the locations of birds relative to the vessel (general direction or, when possible, compass heading), along with their estimated distance from the observer (greater or less than 300 meters [984.3 feet]) and direction of movement. Observers recorded data electronically in Microsoft Excel using a data entry template developed for the surveys by ERM and the specialist team[1] (Appendix A). Whenever possible, observers collected global positioning system points at the locations of sightings and photographed birds[2] for documentation and, in some cases, later species identification or confirmation. Appendix B contains

[1] An electronic data collection tool using the Survey 123 platform was piloted during three of the five Year 2 marine bird surveys and determined to be unsuitable for offshore use due to weather conditions, the fragility of the data entry tool (ruggedized IPad), and the lack of consistent and strong internet connection.

[2] Photographic equipment used during the marine bird surveys included Digital Single Lens Reflex (DSLR) cameras with magnification of 300 millimeters or higher.

the photographic records of bird species documented offshore Guyana during the EEPGL-commissioned marine bird surveys conducted to date.

[a] Refers to whether the survey occurred aboard a stationary or mobile vessel. The stationary vessels were drill ships and the mobile vessels were various types of drill ship support vessels or sampling vessels.

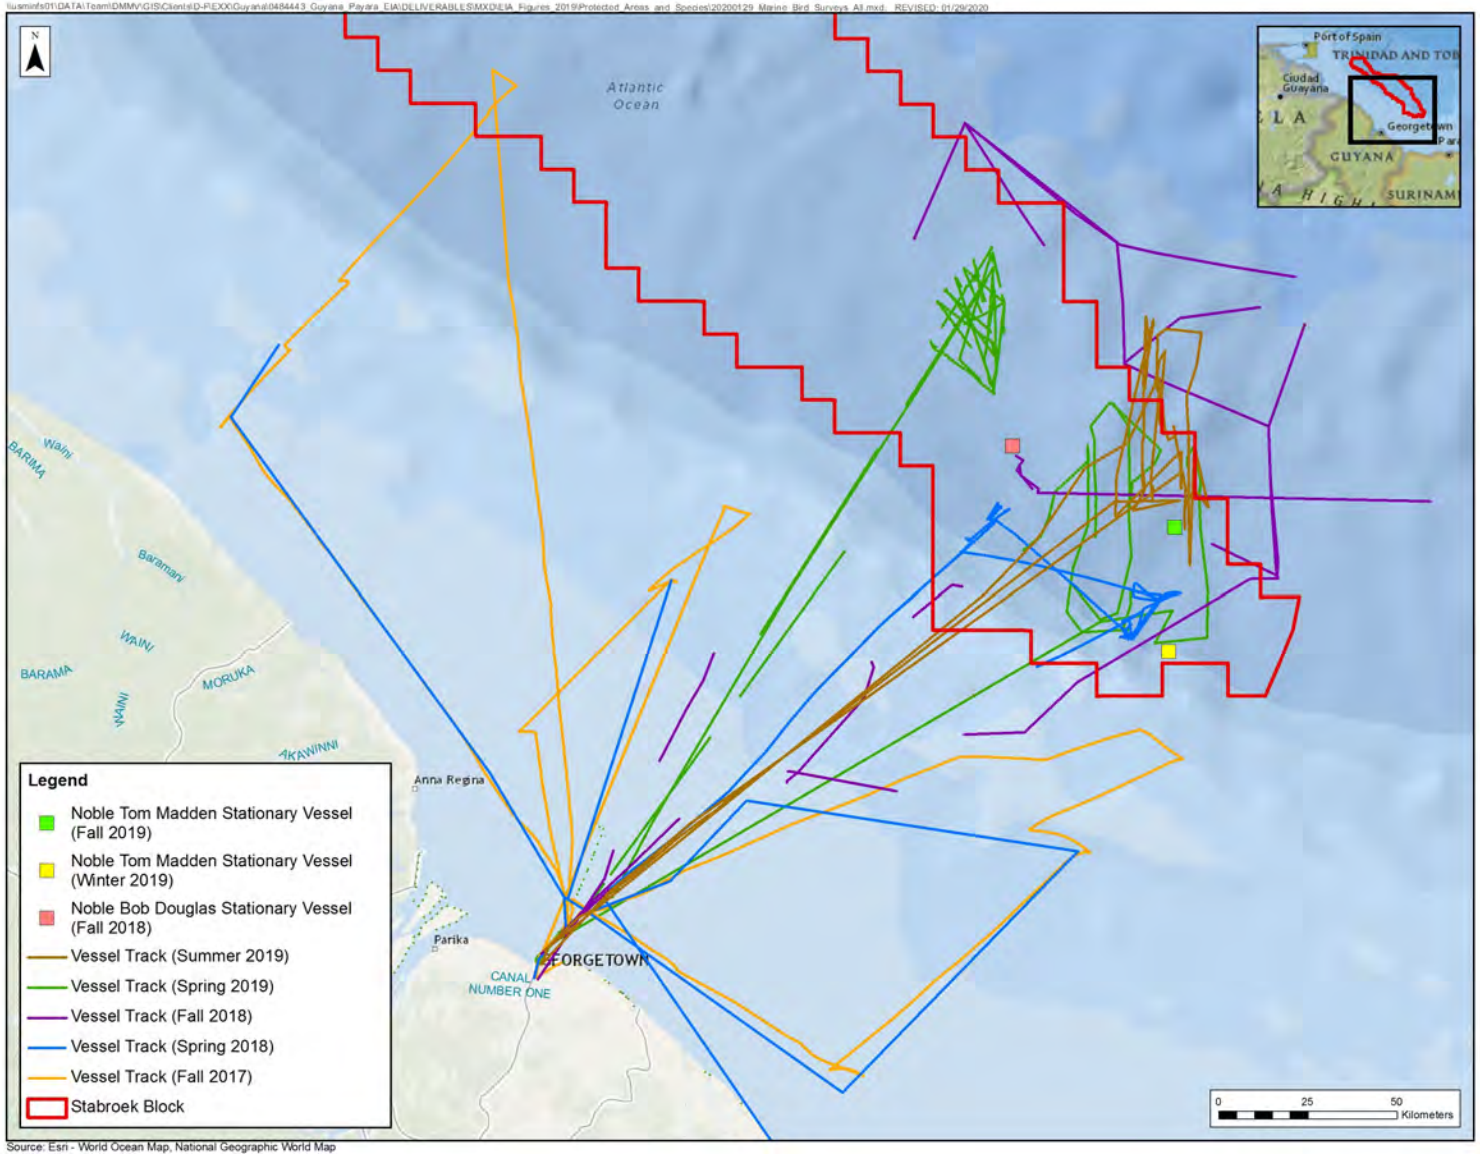

Figure 2-1: Map of Marine Bird Survey Locations, 2017–2019

3. YEAR 2 MARINE BIRD STUDY RESULTS

The five marine bird surveys conducted during the Year 2 Marine Bird Study yielded a total of 1,510 bird observations representing 51 species offshore Guyana (defined for the purpose of the study as greater than 3.1 miles (5 kilometers) from shore). Additional bird observations were recorded at the port in Georgetown or very near the shoreline, and all of those observations were of non-migratory landbird or coastal bird species that are not representative of the offshore marine bird community. As such, for the purposes of this analysis and report, only birds observed more than 3.1 miles (5 kilometers) from shore were included in the analysis to allow for more clear characterization of the offshore marine bird community.

Table 3-1 presents the bird species observed offshore and their abundance during each of the five surveys conducted as part of the Year 2 Marine Bird Study. The following subsections summarize the results of each of the five surveys.

3.1 Fall 2018 Survey

Three surveys (two mobile and one stationary) were performed between 15 September and 6 October 2018. The surveys included 18 survey days and a total of 232.8 survey hours. The detection rate varied among the three surveys, from 0.73 to 13.4 birds per survey hour (average 2.73). The high detection rate of 13.4 birds per survey hour for Survey 1b was driven by one observation of a large flock of Common Terns (n = 190), which skewed the detection rate; the adjusted detection rate without the single flock of Common Terns was 5.28 for Survey 1b, yielding an adjusted average of 1.92 across all surveys.

Across all three Fall 2018 Survey events, 637 birds were recorded of 28 species (Table 3-1). Ten species were Nearctic-Neotropical migrant landbirds or shorebirds that were migrating south *en route* to their wintering areas; the remainder were nearshore and pelagic seabirds actively foraging in the offshore survey area or commuting between offshore foraging sites. Because the surveys were conducted aboard vessels travelling different routes, the species and numbers recorded varied among the three Fall 2018 Survey events. In both Surveys 1a and 1b, the dominant marine bird species observed was Magnificent Frigatebird, while in Survey 1c, the dominant marine bird observed was Masked Booby. Across all three surveys, Common Terns and Laughing Gulls were the most abundant species recorded offshore.

Overall bird diversity was relatively high in Survey 1a compared with the other two Fall 2018 Survey events, and Survey 1a documented a notable number and assemblage of migrating landbirds.

3.2 Winter 2019 Survey

The Winter 2019 Survey was a stationary survey conducted from 28 January to 4 February 2019, with 36.5 survey hours. Two nocturnal observation periods of 30 minutes each did not record any birds. This survey documented 58 birds of seven species during the diurnal observation periods (Table 3-1). The diurnal observation periods yielded a bird detection rate of 1.59 birds per survey hour.

All of the species observed were nearshore marine or pelagic seabirds - some of which winter in the region, while others are vagrants or permanent residents. Roughly half of the bird observations recorded during this survey most likely involved only two individual birds that were observed repeatedly over the course of the survey—a single Brown Noddy (*Anous stolidus*) and a single Great Black-backed Gull—both of which were roosting on the drill ship. The most abundant species recorded were Magnificent Frigatebird and Masked Booby. The survey also documented breeding interactions, including courtship activity, among boobies and Magnificent Frigatebirds.

3.3 Spring 2019 Survey

Two mobile marine bird survey events were conducted on two separate vessels from 20–26 April and 18–23 April 2019. In total, the survey effort encompassed 81.2 survey hours. Survey 1a recorded 4.3 birds per survey hour, while Survey 1b recorded 1.54 birds per survey hour.

In total, 269 individual birds were recorded of 21 species (Table 3-1). Nineteen species were pelagic or nearshore marine, several occurring almost exclusively offshore in this region. Two species were Nearctic-breeding shorebirds seen migrating through the survey area. The dominant marine bird species observed was Wilson's Storm-Petrel (*Oceanites oceanicus*), followed by Masked Booby, Sooty Tern (*Onychoprion fuscatus*), and Leach's Storm-Petrel (*Oceanodroma leucorhoa*; International Union for Conservation of Nature Vulnerable).

3.4 Summer 2019 Survey

One mobile survey was conducted in between 27 June and 17 July 2019 (139.5 hours of survey effort). In total, 251 individual birds were recorded of 10 species (Table 3-1). The detection rate was 1.8 birds per survey hour. However, the detection rate for this survey was skewed by a few large groups of Magnificent Frigatebirds, with four observations totaling 107 birds. Without these four observations, the detection rate was 1.0 bird per survey hour.

Similar to other surveys, Magnificent Frigatebird was the dominant marine species observed. Masked Booby, Brown Booby (*Sula leucogaster*), and Common Tern were also among the most commonly observed (Table 3-1). Five species were nearshore marine, three were pelagic, and one was a shorebird.

3.5 Fall 2019 Survey

One stationary survey was conducted from 17 September to 3 October 2019. The total survey effort was 100.5 survey hours, and the detection rate was 0.94 birds per survey hour (Table 3-1).

Ninety-four birds were recorded from 16 species (Table 3-1). Seven species of migratory landbirds were observed, including 41 barn swallows (*Hirundo rustica*), the most abundant species during this survey. Another six species were migratory shorebirds, such as sandpipers and plovers. The remaining species were the more typical pelagic and nearshore marine species, the most abundant of which were Masked Booby, Brown Booby, and Common Tern.

3.6 Year 2 Survey Overview

Consistent with the Year 1 Marine Bird Study results, the Year 2 survey events varied considerably in bird species assemblage, bird abundance, and species richness, as well as in detection rate (observations per number of survey effort hours). Across all surveys, Magnificent Frigatebird (*Fregata magnificens*) was the most commonly observed species, followed by Masked Booby (*Sula dactylatra*), Common Tern (*Sterna hirundo*), and Laughing Gull (*Leucophaeus atricilla*).

Five species were observed in the Year 2 surveys that had not previously been documented in Guyana's offshore waters, including: Red-billed Tropicbird (*Phaethon aethereus*), Manx Shearwater (*Puffinus puffinus*), White-tailed Tropicbird (*Phaethon lepturus*), Great Black-backed Gull (*Larus marinus*), and Arctic Tern (*Sterna paradisea*). Appendix B contains photographs of each of these species. This adds to two new species records for Guyana documented during the Year 1 Marine Bird Study, which included Bridled Tern (*Onychoprion anaethetus*) and Bulwer's Petrel (*Bulweria bulwerii)*. Two species documented in prior reporting as new records for Guyana (Band-rumped Storm-Petrel [*Oceanodroma castro*] and Long-tailed Jaeger [*Stercorarius longicaudus*]), have recently been confirmed through photographic review by taxonomic specialists to be other previously recorded species, so the corrected total of new species records for Guyana associated with the EEPGL marine bird surveys conducted to date is seven species.

The Year 2 surveys included survey events in each of the four seasons (winter, spring, summer, and fall); this allowed for a comparison of seasonal differences in species assemblage and bird abundance. The surveys documented clear seasonal differences in bird species composition, bird abundance, and bird species richness. Shorebirds and migratory landbird species were only recorded during spring and/or fall surveys in Year 2 (Figure 3-1), and more species were observed in both of the fall surveys (2018 and 2019) than in the spring survey (2019). Overall species richness was highest during fall and spring surveys (Figure 3-2), while bird abundance was highest in fall 2018 followed by both spring and summer 2019 (Figure 3-3). Summer 2019 had high abundance of fewer species, all of which were pelagic and nearshore marine species. Winter 2019 had few species (low species richness), all of which were pelagic and nearshore marine species similar to those observed in the summer 2019 survey, and low abundance (Table 3-1 and Figures 3-1 and 3-2).

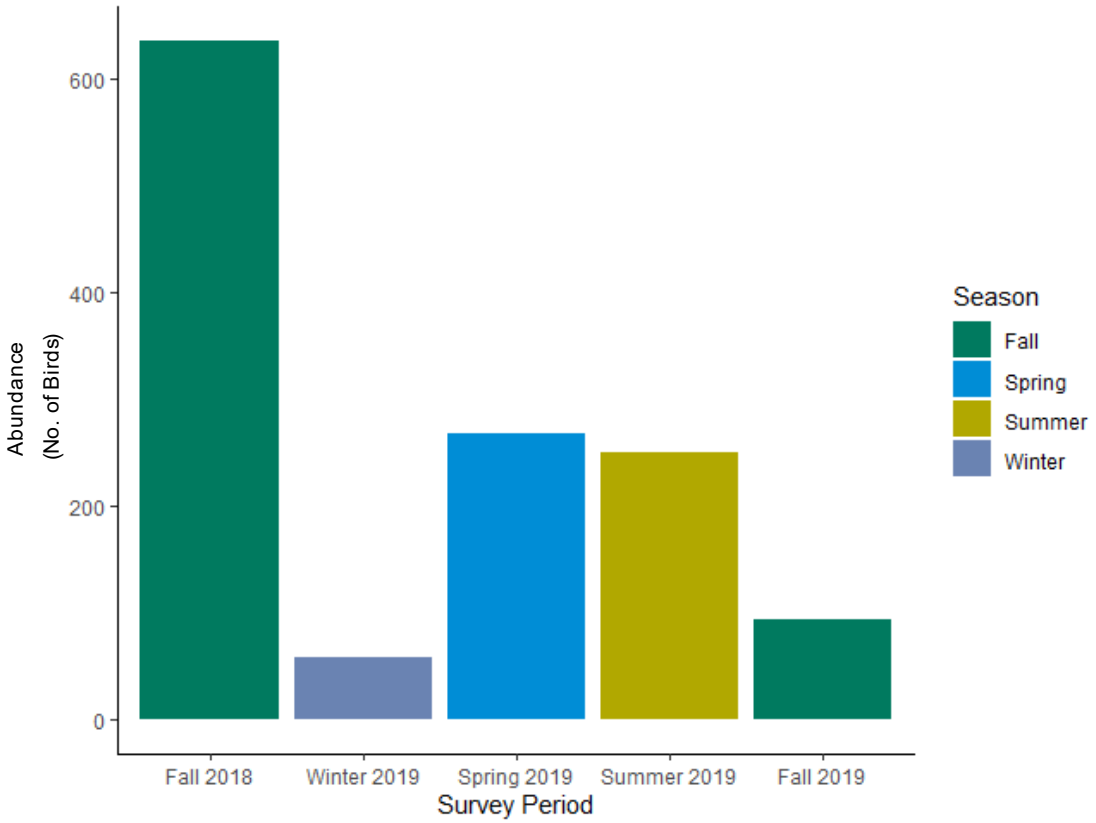

Figure 3-3: Bird Abundance by Survey Period, Marine Bird Study Year 2

4. OVERVIEW OF ALL EEPGL-COMMISSIONED MARINE BIRD SURVEYS CONDUCTED TO DATE 2017–2019

The 11 EEPGL-commissioned marine bird survey events conducted to date yielded a total of 2,169 bird observations representing 73 bird species within the Stabroek Block and the area between Georgetown and the Stabroek Block. Excluding birds observed within 3.1 miles (5 kilometers) from shore, the surveys yielded 1,610 bird observations of 52 species offshore Guyana (Table 4-1). Fewer than half of the species observed during the surveys are classified as pelagic species[3] (19 of 52 species). The other species are migratory shorebirds (19 species) or landbirds (8 species) that fly over the Caribbean during seasonal (spring and fall) migrations, nearshore marine birds undertaking regional (short-distance) movements between breeding and non-breeding areas (13 species), coastal birds on long-distance offshore foraging trips (1 species), and non-migratory landbirds that were offshore for unknown reasons (1 species).

[3] Includes species that spend their lives at sea except when breeding.

Table 4-1: Summary of Bird Abundance, Species Richness, and Detection Rate for EEPGL-Commissioned Marine Bird Surveys Conducted within the Stabroek Block and between the Stabroek Block and Georgetown, Guyana (2017–2019) [a]

Survey Name	Survey Date	Mobile or Stationary Survey Vessel	Survey Hours	Bird Abundance	Bird Species Richness	Detection Rate (# observations/ survey hour)

All Surveys Combined	--	--	749.5	1,610	52	2.15

[a] Excludes birds observed within 3.1 miles (5 kilometers) from shore.

[b] Fall 2018 Survey 1b and Summer 2019 Survey detection rates are skewed by large flocks of Common Tern (n= 190) and Magnificent Frigatebird (n = 107) respectively. Corrected detection rates are 1.92 for fall 2018 (5.27 for Survey 1b), and 1.0 for summer 2019.

Bird abundance and species richness varied across the survey periods and between the Year 1 and Year 2 studies (Table 4-1 and Figures 4-1 through 4-3). Fall 2018, the first survey period of Year 2, had the highest abundance and richness of any survey period, and the third-highest detection rate when survey effort was considered. The fall 2018 surveys recorded many migratory coastal and landbird species, documenting use of the area by latitudinal migrants. Neither of the Year 1 surveys (fall 2017 and spring 2018) had particularly high abundance (Figure 4-1), but all spring and fall surveys across years had higher species richness than the winter and summer surveys (Figure 4-2), due to the presence of migratory species in spring and fall. Winter 2019 had the lowest bird abundance and species richness,

but also had among the lowest number of survey hours; hence when detection rate is considered, the number of observations was within the range of detection rates for other EEPGL-commissioned marine bird surveys (Figure 4-3). Detection rate varied greatly between survey periods, likely linked to random variation in presence and detectability of birds rather than season or year (Figure 4-3).

The differences seen across survey periods in both the Year 1 and Year 2 studies are typical of seasonal patterns—with higher richness and abundance during migration periods—as well as some random variation between periods. The following are key seasonal differences:

- Fall surveys in both years had a preponderance of migratory swallow and migratory shorebird species (e.g., sandpipers, plovers, etc.).
- A substantial portion of the pelagic birds sighted during the spring surveys in both years was Leach's Storm-Petrel.
- Winter and summer surveys had lower abundance[4], and the species assemblage was heavily dominated by pelagic and nearshore marine species.

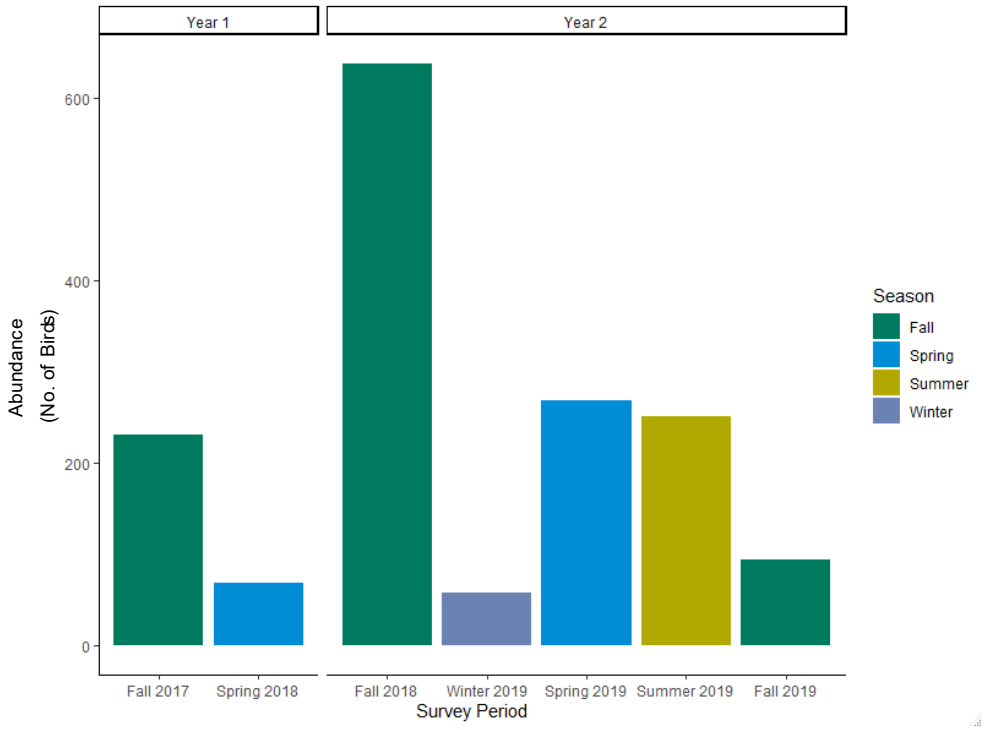

Figure 4-1: Bird Abundance across Survey Periods and Years of the Marine Bird Study

[4] Overall bird abundance recorded for the Summer 2019 Survey depicted in Figure 4-1 was skewed high due to the presence of one large flock of Magnificent Frigatebirds.

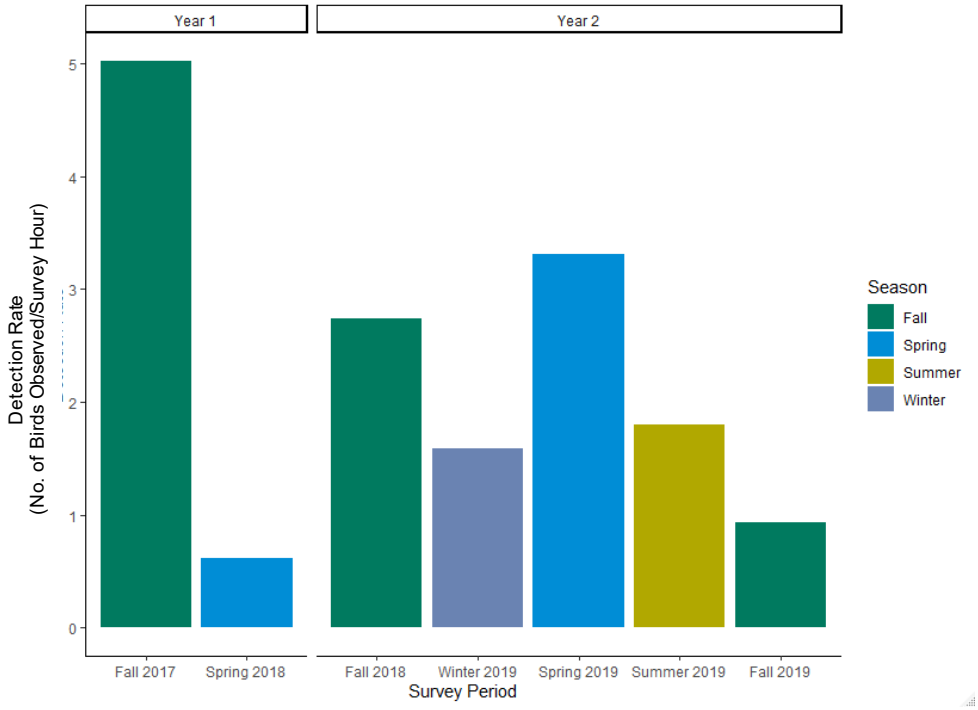

Figure 4-3: Detection Rate across Survey Periods and Years of the Marine Bird Study

5. CONCLUSIONS

The results of the EEPGL-commissioned marine bird surveys conducted to date make clear that the Guyana offshore avifauna changes substantially and consistently across a broad geographic area over the course of the year. The data indicate that the seasonal differences in bird community composition are driven by the occurrence in fall and spring of migratory species that breed at northern latitudes in late spring and summer and move offshore and to South America during the winter months.

Overall, the following points can be drawn from the EEPGL-commissioned marine bird surveys conducted to date:

1. A wide complement of seabirds (including 19 pelagic and 13 nearshore marine species), including two species of global conservation importance (Leach's Storm-Petrel and Black-capped Petrel [*Pterodroma hasitata*][5]), occur in the Stabroek Block and surrounding waters.
2. Spring and fall surveys in both years recorded numerous species of migratory shorebirds and landbirds from North America, confirming that at least some individuals of these species arrive in Guyana over water rather than by following the continental coastline.
3. Seasonal, latitudinal migration of seabirds, shorebirds, and landbirds occurs in the Stabroek Block and surrounding waters.
4. Seabird abundance is generally low far offshore but increases with proximity to shoreline, and many seabirds - such as terns and gulls - specialize in the nearshore environment instead of far offshore.
5. Bird observations recorded within and near the Stabroek Block were largely of lone individuals, which is generally characteristic of seabirds when far offshore.
6. Many of the species observed during the Spring 2018 Survey and Spring 2019 Survey were northern breeders that had not yet departed for the breeding grounds (or were passing through, e.g., Arctic Tern), suggesting that Guyana's offshore marine ecosystem may be an important staging area[6] for seabirds breeding in both the northern hemisphere.
7. During both the Spring 2018 Survey and Spring 2019 Survey, the bird species composition documented within and near the Stabroek Block was dominated by storm-petrels of at least two species—Wilson's Storm-Petrel, an abundant seabird breeding in the far southern Atlantic, and Leach's Storm-Petrel, which breeds in New England and maritime Canada and is listed as Vulnerable by the International Union for Conservation of Nature. Neither of these species was observed during the Fall 2018 Survey or the Fall 2017 Survey, indicating that their use of offshore Guyana waters is strictly seasonal (spring). The presence of these birds in substantial numbers during the spring surveys of both years (2018 and 2019) highlights the importance of this area as a regular migration waypoint for these species from both northern and southern hemispheres.

Prior to the EEPGL-commissioned surveys, there was little understanding of the populations of seabirds and other birds (migrating and vagrant birds) in the Guyanese waters of the southern Caribbean. The two years of EEPGL-commissioned bird surveys constitute a notable increase in the knowledge of Guyana's offshore bird communities, as is confirmed by the documentation of seasonal migrations in the Stabroek Block by a wide range of bird species and seven new species records for Guyana generated during the surveys.

[5] Black-capped Petrel was not observed during EEPGL-commissioned marine bird surveys but rather recorded by Protected Species Observers while conducting other work in the Stabroek Block during the time period from 2015 to 2019. Discussions with species experts indicate that the species likely occurs as a rare transient offshore Guyana.

[6] Staging areas are areas along bird migration corridors that are consistently used by migrating birds for foraging and resting.

6. RECOMMENDED NEXT STEPS

The two years of EEPGL-commissioned offshore marine bird survey data collected to date constitute a notable increase in the knowledge of Guyana's offshore bird community. The data clearly demonstrate a highly dynamic community within and around the Stabroek Block that changes substantially with seasons and across years. Understanding these patterns is important for impact assessment and emergency response planning as well as conservation and management. ERM recommends continuing the EEPGL marine bird survey program and expanding its geographic scope into other blocks to further establish the marine bird baseline in the region for use as a basis for future impact assessment and monitoring.

Continuing the survey program would yield important information on the variability in seasonal and annual patterns of bird abundance and species composition; potentially document the presence of presumed present but yet-to-be-confirmed species, including the Endangered Black-capped Petrel (reported only during Protected Species Observer surveys with no photographic documentation); determine if there are spatial patterns in marine bird use offshore Guyana; and likely confirm the presence of additional species, particularly during migration. The information gathered during additional surveys would further strengthen the marine bird baseline and document the degree of variability in offshore marine bird use, which is particularly important in light of a rapidly changing regional and global environment.

Should the survey continue, ERM recommends several changes to the marine bird survey protocol to maximize the data collection potential of the effort: (1) add a pre-dawn and dusk check of specific vessel areas that are accessible per vessel rules and that are potentially suitable for bird use or are known by the vessel crew to be used by birds - to allow for quantification of bird use of survey vessels; and (2) use a simple and inexpensive passive radar system that could be placed on stationary offshore features (e.g., drill ships) to record the height and density of day- and night-migrating birds passing over the vessels. This would help document the prime migratory periods during fall and spring and the flight orientation and passage rates for diurnal and nocturnal migrating birds through the region, which is a major scientific data gap that has implications for emergency response planning as well as coastal management, as many of the migratory birds passing through offshore Guyana are shorebirds that use the Guyana coastline as wintering sites or migratory stopover points. The presence of EEPGL's stationary features offshore Guyana, on which these types of radar devices could be installed, presents an excellent opportunity to passively and very cost effectively collect data on migratory birds; this would augment EEPGL's ongoing marine and coastal bird survey programs and potentially provide key information for a future government-led coastal bird monitoring program should one be developed.

To drive local capacity building, we recommend the continued training of local specialists Meshach Pierre and Leon Moore in all aspects of the survey program (survey planning, health and safety planning, survey, data quality control and management, and reporting) and training of at least one additional Guyanese specialist in the marine bird protocol.

1. INTRODUCTION

On behalf of Esso Exploration and Production Guyana Limited (EEPGL), Environmental Resources Management (ERM) conducted eight seasonal coastal bird surveys, collectively referred to herein as the Coastal Bird Study, along the coastline of Guyana in Regions 2 through 6[1] between September 2017 and February 2020. The Coastal Bird Study was an elective study commissioned by EEPGL and was not conducted pursuant to any regulatory requirement. The objectives of the Coastal Bird Study were to document the distribution, abundance, and diversity of coastal birds along Guyana's coastline during different seasons and years. This report summarizes and compares the results of the eight surveys conducted for the Coastal Bird Study.

2. BACKGROUND

The bird community along Guyana's coastline is abundant and diverse, with 208 recorded species within 21 families representing multiple bird groups including but not limited to coastal birds such as parrots and macaws, passerines, waterfowl, colonial waterbirds, shorebirds, and raptors. The bird groups that are most strongly affiliated with the coast (collectively referred to as coastal birds in this report) are waterfowl, shorebirds, and colonial waterbirds.[2] Guyana's coastal bird community is better known than the marine bird community and that of the forested interior portions of the country, as coastal areas are easier to access than these environments. There is considerable public and scientific interest in coastal bird populations, and Guyana's coastal bird community contains many emblematic and charismatic species that support ecotourism. Nevertheless, no systematic, multi-year coastal bird survey of Guyana's coastline is known to have been conducted until this study.

Several other bird surveys along Guyana's coastline have been reported, but these surveys covered only a portion of the coastline (e.g., around Georgetown or within the Shell Beach Protected Area [SBPA]) and were short in duration (e.g., conducted during one or two seasons during the same year). Braun et al. (2007) developed a comprehensive checklist of the 814 bird species within 11 habitats documented in Guyana, including coastal habitats (mangrove forests had 47 coastal bird species documented, and mudflats had 38 coastal bird species documented; Braun et al. 2007). Another coastal bird survey conducted along the coast in the Georgetown region by Bayney and Da Silva (2005) documented 32 coastal bird species. A more recent bird survey within coastal mangrove habitats in southeast Guyana identified 37 coastal bird species (Da Silva 2014). Lastly, two biodiversity surveys undertaken within SBPA over roughly the past decade documented over 200 bird species in the Shell Beach area, including many forest interior species that occur in the inland habitats of Shell Beach (Mendonca et al. 2006; EPA et al. 2004). Collectively, species accounts from all these reports document the presence of 95 species of coastal birds from 32 families in Guyana.

[1] During the Spring 2018 survey, an opportunistic survey of a portion of the Region 1 coastline was conducted in coordination with other activities in the region. The survey covered only a small portion of the Region 1 shoreline outside of the Shell Beach Protected Area.

[2] Waterfowl are species of birds that are ecologically dependent upon wetlands or waterbodies for their survival (e.g., ducks, geese). Shorebirds are found mainly on beaches and mudflats between the low and high water marks and are typically migratory, utilizing Guyana's coastline during the course of their bi-annual migrations. Colonial waterbirds are birds that live near water and nest in colonies or groups (e.g., gulls, terns, ibis, herons).

3. SURVEY METHODS

The Coastal Bird Study consisted of eight seasonal surveys of coastal birds conducted between September 2017 and February 2020. Surveys were conducted by a team of Guyanese bird specialists in the following time periods.

- Winter 2020 Survey: Occurred 25 January to 5 February 2020 along the coastline in Regions 2 through 6 and the Essequibo Islands
- Fall 2019 Survey: Occurred 30 September to 10 October 2019 along the coastline in Regions 2 through 6 and the Essequibo Islands
- Summer 2019 Survey: Occurred 21 to 28 June 2019 along the coastline in Regions 2 through 6 and the Essequibo Islands
- Spring 2019 Survey: Occurred 27 March to 4 April 2019 along the coastline in Regions 2 through 6 and the Essequibo Islands
- Winter 2019 Survey: Occurred 22 January to 2 February 2019 along the coastline in Regions 2 through 6 and the Essequibo Islands
- Fall 2018 Survey: Occurred 14 to 15 September 2018 and 30 September to 3 October 2018 along the coastline in Regions 2 through 6 and the Essequibo Islands
- Spring 2018 Survey: Occurred 3 to 13 April 2018 and 16 to 24 April 2018 at coastal sites in Regions 1 through 6 and the Essequibo Islands
- Fall 2017 Survey: Occurred 23 to 27 September 2017 and 19 to 22 October 2017 at coastal sites in Regions 2 through 5 and the Essequibo Islands

In total, the Coastal Bird Study surveyed 112 sites (Table 3-1 and Appendix A). The number of sites surveyed during each of the eight survey events varied slightly based on the scope of the survey in a given year,[3] site accessibility, and refinements to the survey approach that were implemented to maximize survey efficiency and spatial coverage. Appendix A lists the coastal and island survey sites that were surveyed during the Coastal Bird Study, and includes a mapbook that depicts the locations of the sites. The coastal habitat types surveyed included mangrove (riverine and coastal), intertidal and tidal wetlands, mudflat, plantation (island surveys only), vegetated low bank, sand beach, and artificial coastal habitat types such as sea wall and jetty.

The coastal bird surveys were conducted using standardized point count methods tailored for coastal and island sites, as described below.

3.1 Coastal Point Count Surveys

Surveyors conducted 15-minute point count surveys at each of the survey sites. To the extent practicable, surveys were conducted in the morning hours between 06:00 a.m. and 10:00 a.m., when birds are most active. However, this was not always possible due to tidal stage and related site accessibility or other constraints.

At each survey site, observations were made within a radius of approximately 500 meters (0.3 mile) around the survey site. All birds seen and heard during the 15-minute surveys were recorded. Surveyors viewed birds with binoculars (10 x 40 or 10 x 50 magnification) and/or a spotting scope erected on a tripod (Bushnell 60x magnification). Survey site locations were electronically recorded using GPS, and the

[3] The scope of the surveys in 2017 only included Regions 2 through 5 and Region 1 was surveyed during only the Spring 2018 survey in conjunction with other work.

sites were photographed. Observers recorded data using an iPad equipped with the Survey 123 for ArcGIS application and a tailored electronic data collection form developed for the surveys by ERM (Appendix B). This electronic data collection system is compatible with ERM's EEPGL Project Geographic Information System platform.

The following information was collected during each point count survey:

- Survey location (latitude and longitude)
- Date
- Observation type (incidental, transect survey, point count survey)
- Start/stop time of survey
- Brief site/habitat description and site identification
- Weather (percent cloud cover, precipitation, wind speed, wind direction, temperature)
- For each species seen or heard:
    - Species identification (or lowest taxonomic level identifiable)
    - Number of individuals (if in a group)

3.2 Island Point Count Surveys

Surveys of the Region 3 island sites (Essequibo Islands) were conducted via boat. These sites were surveyed from the water using the same point count methodology as the land-based surveys described above.

Table 3-1: Number of Coastal Bird Sampling Sites by Region in the Coastal Bird Survey (2017–2020)

Region	Geographic Range of Survey Area	September/ October 2017	April 2018	September/ October 2018	January/ February 2019	March/ April 2019	June/July 2019	September/ October 2019	February/March 2020	Total [a]

4. COASTAL BIRD STUDY RESULTS

4.1 Species Assemblage

The 2017–2020 coastal bird surveys documented a total of 225 species and over 109,471 birds across all regions and survey sites. The 227 species include waterbirds (20 species), shorebirds (20 species), nearshore marine birds (13 species), migratory landbirds (12 species), and non-migratory landbirds (160 species). Coastal sites accounted for 211 species and island sites accounted for 145 species, with 130 species found at both coastal and island sites. All of the species documented during the 2017–2020 surveys have been previously recorded in Guyana, although many species (19) were newly documented in the coastal regions of the country. These new occurrences are likely due to the limited number of documented comprehensive surveys of coastal birds along the Guyana coast prior to these surveys. Of note is the Red Knot (*Calidris canutus;* International Union for Conservation of Nature [IUCN] Red List [IUCN 2020] Near Threatened), which was documented in both Fall 2018 and Winter 2019 surveys, and was thereby confirmed for the first time as overwintering in Guyana. In addition, some species previously known to occur along the Guyana coast, based on historical records, were not documented during this study; therefore, the coastal bird community likely has even higher bird species richness (number of species) than documented in this study. Appendix C contains the list of species documented during this study and denotes the regions where they were observed. Appendix D contains a photographic log of many of the species observed during this study.

The most common species observed during this study (inclusive of all surveys, more than 1,000 individuals each) included one species of nearshore marine bird, five species of waterbirds, three species of shorebirds, one species of migratory landbird, and two species of non-migratory landbirds, as follows:

- Nearshore Marine Bird
  - Black Skimmer (*Rynchops niger*)
- Waterbirds
  - Great Egret (*Ardea alba*)
  - Little Blue Heron (*Egretta caerulea*)
  - Scarlet Ibis (*Eudocimus ruber*)
  - Snowy Egret (*Egretta thula*)
  - Tricolored Heron (*Egretta tricolor*)
- Shorebirds
  - Lesser Yellowlegs (*Tringa flavipes*)
  - Semipalmated Plover (*Charadrius semipalmatus*)
  - Semipalmated Sandpiper (*Calidris pusilla*)
- Migratory Landbird
  - Barn Swallow (*Hirundo rustica*)
- Non-migratory Landbirds
  - Gray-breasted Martin (*Progne chalybea*)
  - Great Kiskadee (*Pitangus sulphuratus*)

Of particular note, Barn Swallow was a dominant species in all fall coastal bird surveys (2017, 2018, and 2019). This species also was a dominant species observed offshore Guyana during concurrent EEPGL-commissioned marine bird surveys in fall 2018 and fall 2019. The observance of large numbers of this species both offshore and onshore during the same time period in successive years is a strong indication of documentation of the fall migratory period for this species through Guyana, which was unknown prior to this survey.

4.2 Bird Abudance and Species Richness

4.2.1 Bird Abundance

Average bird abundance varied by season and region. The Summer 2019 survey recorded the lowest average abundance across all regions (Figure 4-1); this is likely due to the fact that many migrants are not present in Guyana during the summer months. There was moderate variation in average abundance across all regions during spring and fall surveys; surveys with higher abundance (e.g., Region 6 in Fall 2018; Figure 4-1) recorded large numbers of migrants, typically occurring in large groups. Outside the seasonal migration peaks, Region 5 had the highest average abundance across survey periods (Figure 4-1). Several sites in this region contain mudflats and coastal mangroves, which provide important foraging, roosting, and breeding habitat for many coastal birds in Guyana. In general, Region 3 had much lower average abundance (at both island and coastal sites) across all surveys than other regions. Despite having lower average abundance, data from these sites are particularly important to document the full range of coastal species present in Guyana. These Region 3 sites, particularly the Essequibo Islands sites, have unique riverine mangrove habitat that support species not recorded in any of the other regions.

One survey event of note is the September/October 2018 survey, which likely coincided with peak migration given the consistently high bird abundance across regions; Region 6 had over 2,000 birds per site during this survey, on average (Figure 4-1).

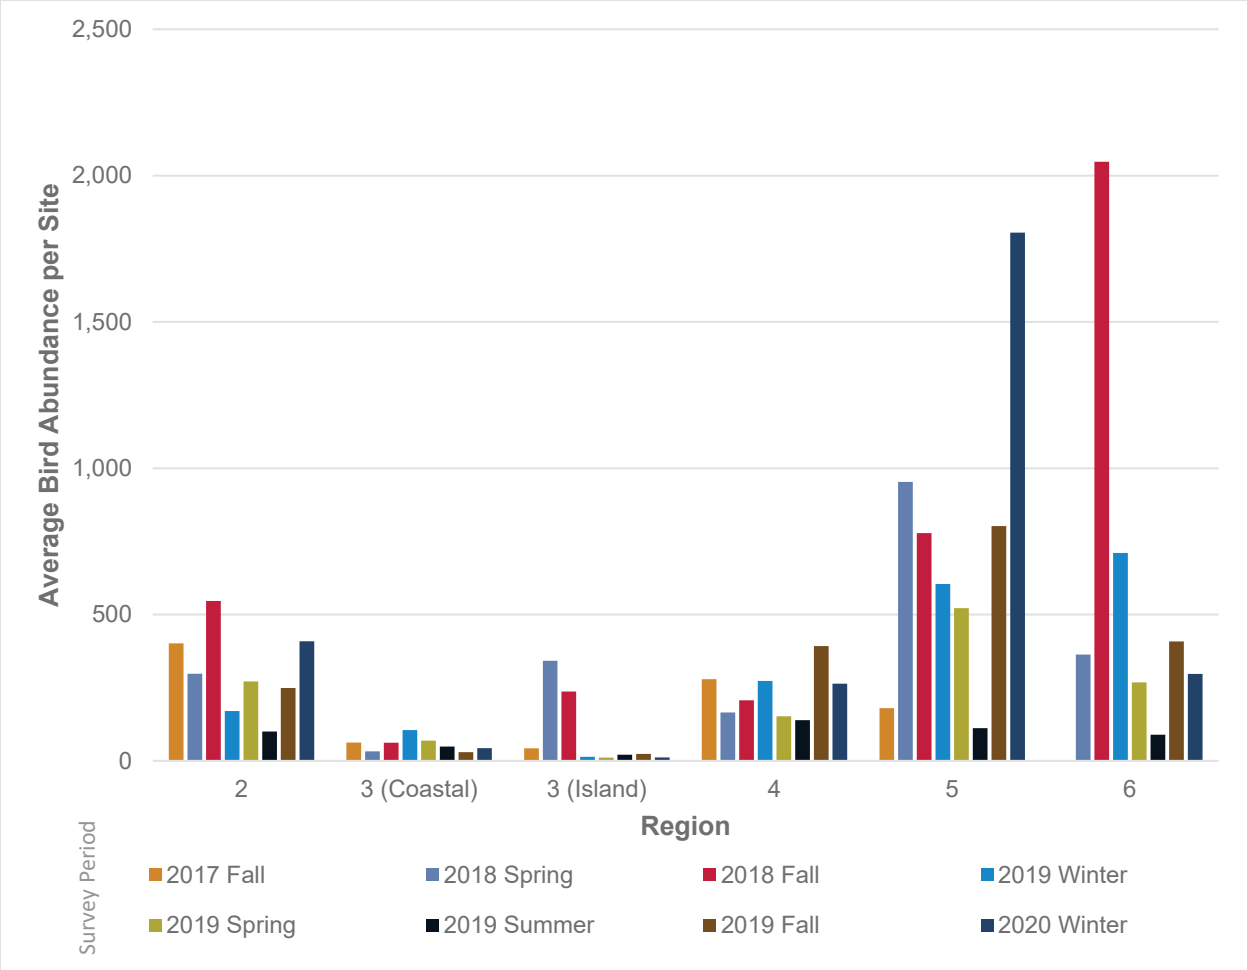

Figure does not include Region 1, which was surveyed in only Spring 2018.

Figure 4-1: Average Bird Abundance across Regions and Survey Periods 2017–2020

4.2.1.1 Bird Abundance by Life History Category

Species observed were grouped according to life history categories: Shorebirds (e.g., sandpipers), Waterbirds (e.g., egrets and herons), Nearshore Marine (e.g., gulls and terns), Non-migratory Landbirds (most species associated with inland habitats, including passerines and birds of prey), and Migratory Landbirds (e.g., some warblers). In terms of abundance, shorebirds and waterbirds were the most abundant species category across surveys, with few exceptions (Figure 4-2):

- The Summer 2019 survey had very few shorebirds.
- The Fall 2017 and Spring 2018 surveys had fewer shorebirds and higher numbers of non-migratory landbird species than other surveys.

The high numbers of birds (either waterbirds or shorebirds) observed in Spring and Fall 2018, Fall 2019, and Winter 2020 were related to large flocks of congregating birds being recorded.

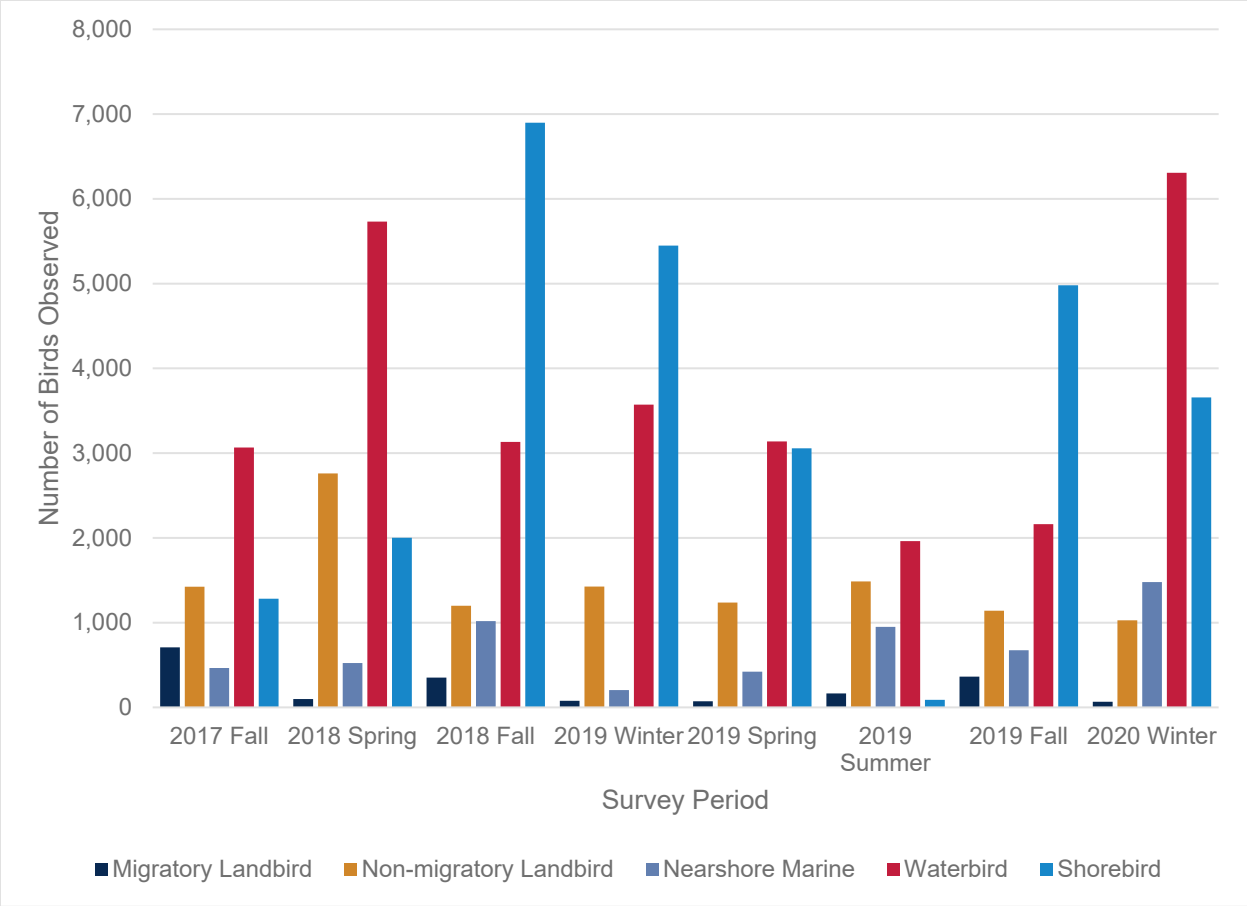

Figure does not include Region 1, which was surveyed during only the Spring 2018 survey.

Figure 4-2: Bird Abundance by Bird Category per Survey Period 2017–2020

4.2.2 Species Richness

Average species richness varied less than abundance across survey periods and regions. There were no clear seasonal patterns in species richness, with all coastal (i.e., non-island) surveys ranging between 11 and 21 species per site on average (Figure 4-3). Aside from two island surveys (Region 3), Region 5 generally had the highest species richness (Figure 4-3). Sites in this region contain extensive mudflat and mangrove habitats, which attract a diversity of species throughout the year. The Region 3 island sites typically had lower species richness than other regions, except during the Spring and Fall 2018 surveys, which recorded the two highest average species richness of the entire study (24 and 30 species per site, in Spring and Fall 2018, respectively; Figure 4-3). The lower species richness and abundance in this region is due to the number of sites surveyed along the entire coast on each island. There were typically around 50 island sites surveyed during each period, resulting in more sites with few or no birds at the time of survey, often as a byproduct of tide or other conditions. The high average species richness in Region 1 in Spring 2018 is likely due to the survey area covering a greater diversity of habitats, including more inland habitats than the other regions (i.e., riverine mangroves, wetlands, and riverine forests, which are not present in the coastal survey sites in Regions 2 through 6).

The island sites have different habitats than the coastal areas and, therefore, have unique bird species assemblages. Fifteen species were only documented at island sites during the entire survey. Many of the species unique to the island sites are inland species such as hawks, woodpeckers, and flycatchers.

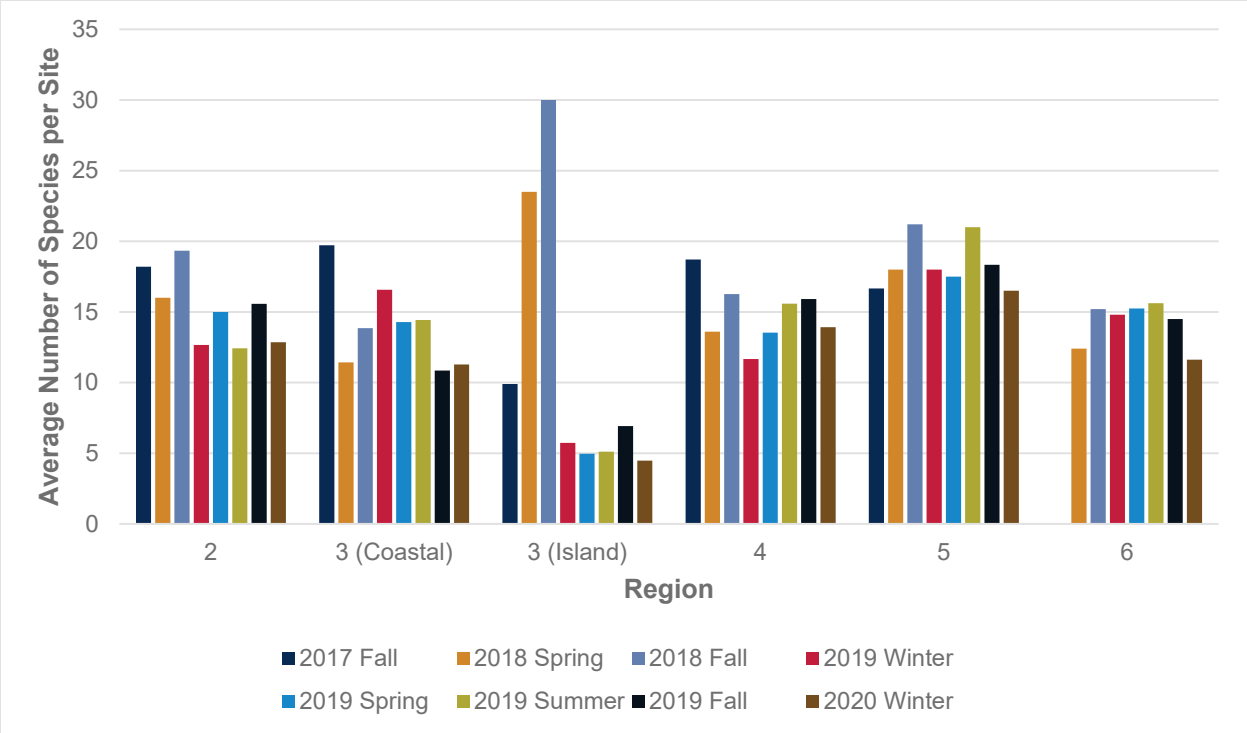

Figure does not include Region 1, which was surveyed in only Spring 2018.

Figure 4-3: Average Bird Species Richness across Regions and Survey Periods 2017–2020

4.2.2.1 Speces Richness by Life History Category

The non-migratory landbird category had by far the highest number of species observed across all surveys (Figure 4-4). This was expected because non-migratory landbirds (resident species) make up the vast majority of all bird species known to occur in Guyana. The migratory landbird category had the lowest number of species observed across all surveys. This is likely because most of the migratory landbirds that come to Guyana use inland (non-coastal) habitats or only occur as transients during migration.

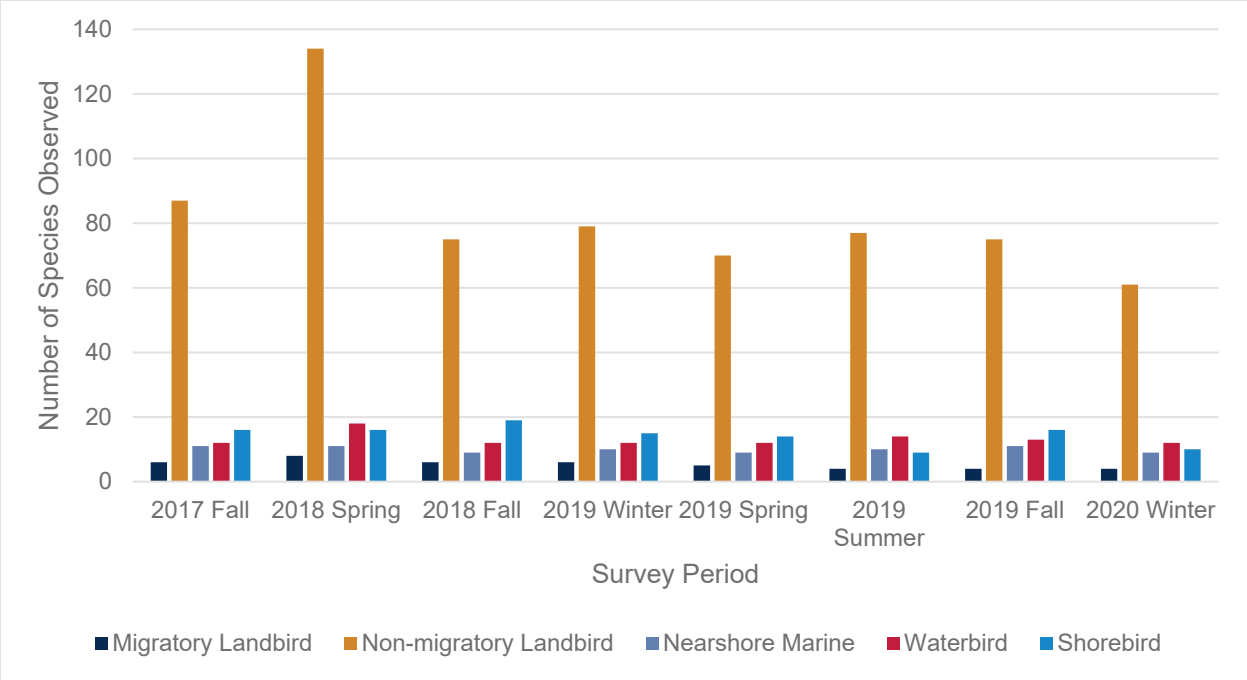

Figure does not include Region 1, which was surveyed in only Spring 2018.

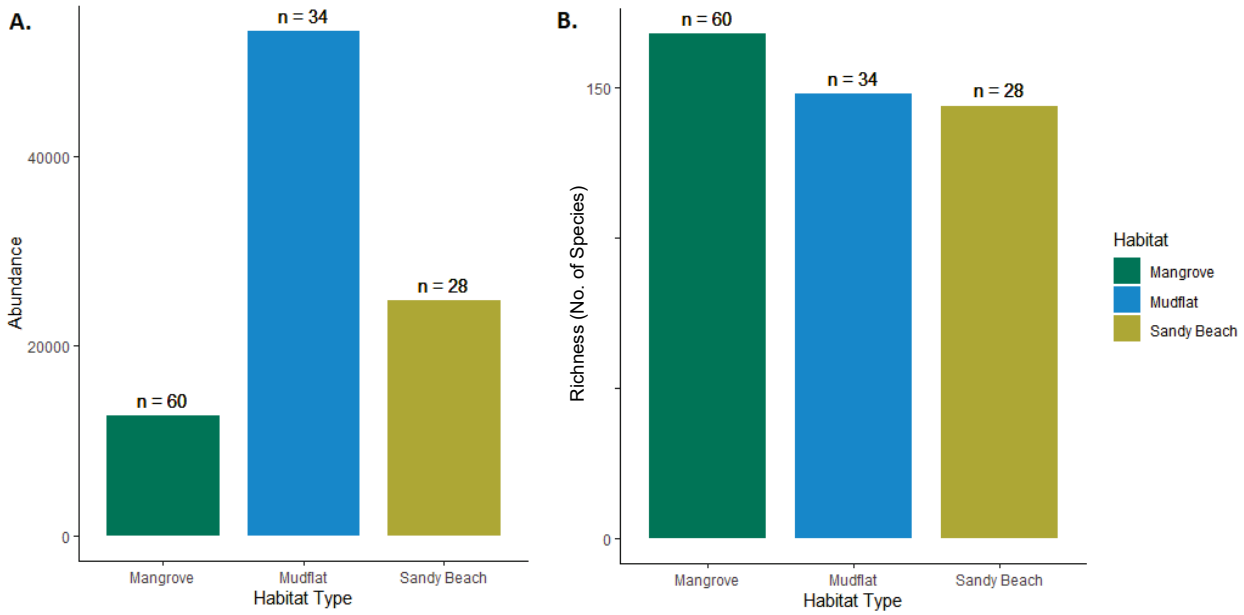
Figure 4-4: Bird Species Richness by Bird Category per Survey Period 2017–2020

4.3 Species-Habitat Associations

Habitat use documented during the surveys was similar across survey periods and years. However, several survey sites contain multiple habitat types, so abundance and richness estimates are not completely exclusive between habitats.

Overall, mudflats had the highest bird abundance (more than three times as many individuals per site as compared to mangrove habitats). Sites with mangrove habitat had the highest average richness (12 species per site), followed by mudflat and sandy beach habitats. These comparisons reflect the abundance of colonial (i.e., occurring in large groups or colonies) shorebirds at mudflat sites and the high diversity of species at mangrove sites (Figure 4-5).

The bird communities of the Essequibo Islands and the coast were quite different despite having significant overlap in species. Island sites were dominated by waterbirds and landbirds, and coastal sites were dominated by shorebirds, particularly during migration. The Essequibo Islands contain some unique habitat types not found along the coastline (agriculture, riverine mangrove), which support a different bird community year-round. Many of the species unique to the island sites are inland species such as hawks, woodpeckers, and flycatchers.



Number of sites with each habitat type is indicated above bars.

Figure 4-5: (A) Average Bird Abundance, and (B) Average Species Richness by Habitat Type, All Surveys 2017–2020

4.4 Conservation Status of Bird Species Documented during the Coastal Bird Study 2017–2020

Of the bird species documented during the Coastal Bird Study, most are currently listed on the IUCN Red List as Least Concern, which means that the population status of the species does not meet the IUCN criteria for a Threatened or Near Threatened designation. Eight species documented during the study have elevated conservation status, classified as Vulnerable (VU) or Near Threatened (NT) per the IUCN Red List (Table 4-1).

In addition, three bird species of local conservation interest were recorded along the Guyana coast during this study. The Silvered Antbird (*Sclateria naevia*) was recorded in Fall 2017, Spring 2018, Winter/Summer/Fall 2019, and Winter 2020, while the Gray-headed Kite (*Leptodon cayennensis*) and the subspecies *fumosus* of Fuscous Flycatcher (*Cnemotriccus fuscatus*) were observed on the Essequibo Islands during the Fall 2017 / Spring 2018 surveys and Fall 2017 survey, respectively. Species of local conservation interest are species that are considered by Guyanese and international bird specialists to be rare and/or declining in Guyana or have very limited distribution in Guyana, but are not species of global conservation concern based on their IUCN Red List status.

Table 4-1: Coastal Bird Species with Elevated Global Conservation Status Documented to Occur in Coastal Guyana during the Coastal Bird Study 2017–2020

Species	IUCN Red List Status	Regions Observed	Time of Year (Season) Observed
Bicolored Conebill (*Conirostrum bicolor*)	NT	1, 2, 3 (coastal and island), 4, 5, 6	All Seasons
Harpy Eagle (*Harpia harpyja*)	NT	1	Spring 2018

Species	IUCN Red List Status	Regions Observed	Time of Year (Season) Observed
Red Knot (*Calidris canutus*)	NT	4, 5, 6	Fall 2018, Winter 2019
Semipalmated Sandpiper (*Calidris pusilla*)	NT	2, 3 (coastal and island), 4, 5, 6	All Seasons
Ruddy Pigeon (*Patagioenas subvinacea*)	VU	1	Spring 2018
Rufous Crab-hawk (*Buteogallus aequinoctialis*)	NT	1, 3 (coastal and island), 4, 5, 6	All Seasons
White-bellied Piculet (*Picumnus spilogaster*)	VU	3 (coastal and island), 4, 5, 6	All Seasons except Fall 2018
White-throated Toucan (*Ramphastos tucanus*)	VU	1, 3 (island)	Fall/Spring 2018, Fall/Summer/Winter 2019

4.5 Important Bird Habitats Identified during the Coastal Bird Study 2017–2020

BirdLife International (2016) has designated several Important Bird Areas (IBAs) in the neighboring countries of Suriname, Trinidad and Tobago, and Venezuela. These IBAs provide foraging, breeding, and nesting habitats similar to those found along Guyana's coastline. While no IBAs have been designated in Guyana, several areas along the Guyana coastline meet the definition of a 'threshold site' by BirdsCaribbean (www.birdscaribbean.org) for high abundance (criterion for threshold site is more than 3,000 individuals) that is consistent and predictable from year to year during coastal bird migration periods.

Based on the results of this study and other available data from historical or ongoing surveys and local bird specialists' knowledge, fourteen coastal sites of importance to birds, defined in this study as Important Bird Habitats (IBH), were identified in Regions 1 to 6 (Figure 4-6). While these sites are not formally classified or recognized, they are considered important to birds because they support one or more of the following: (1) predictable congregations of migratory shorebirds, including 'threshold sites'; (2) concentrations of roosting and/or nesting wading birds; (3) unique habitat that supports large numbers of riverine forest- and mangrove-dependent species; and/or (4) important nesting sites for regional endemic species of conservation interest.

All of these IBH sites consistently had higher average bird abundance and species richness per site than other survey locations. Coastal IBH sites had an average abundance of 890 birds and 21 species per site across all surveys conducted to date, more than double that of non-IBH sites. Appendix E contains a summary and photographs of the 14 IBH sites.

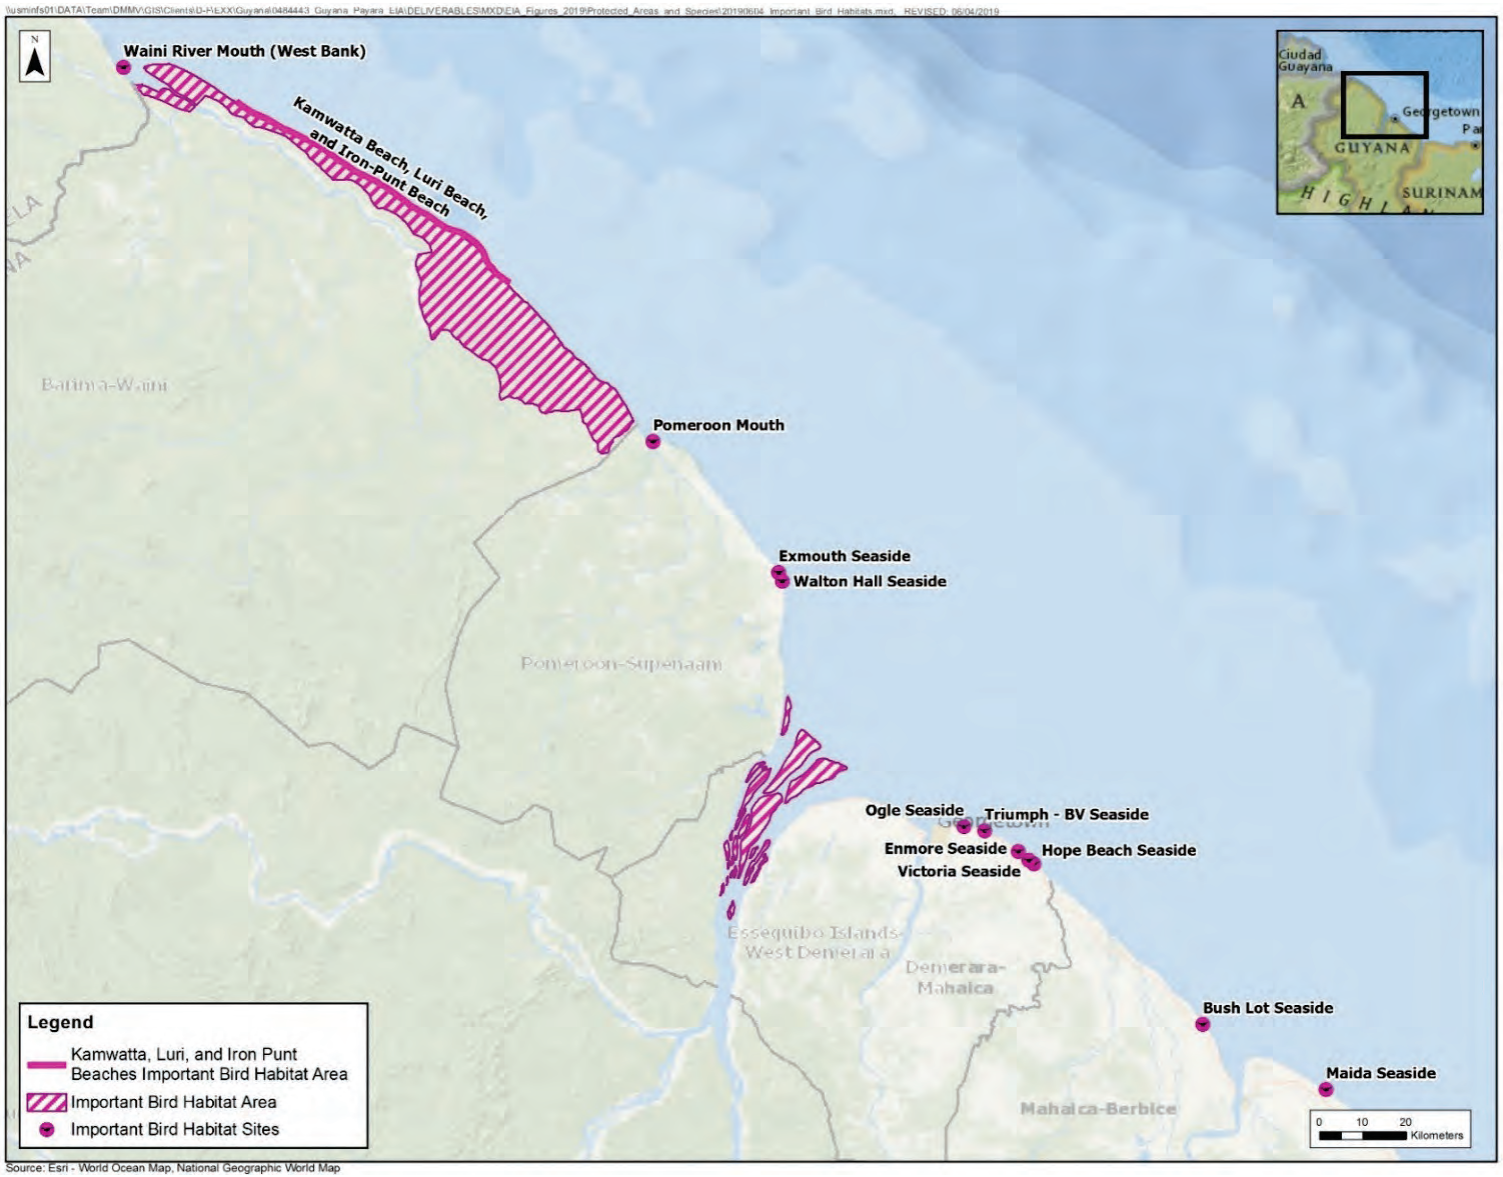


Figure 4-6: Locations of Important Bird Habitats—Regions 1 to 6

5. CONCLUSIONS AND NEXT STEP RECOMMENDATIONS

The Coastal Bird Study was the first comprehensive survey of Guyana's coastline outside the SBPA, and the first to systematically survey across all seasons (including migratory and non-migratory periods) and years, providing information on seasonal (migratory) species occurrence, as well as the species present year-round (i.e., resident species). This study constitutes a notable increase in the knowledge of Guyana's coastal bird community. Throughout the study, the surveys continued to document new findings, as is confirmed by the continued accumulation of bird species documented in Guyana's coastal habitats up through the last survey. The study also documented clear seasonal patterns in species assemblage and the timing of such, and confirmed overwintering activity by several species whose wintering range is poorly known. The results of the study make clear that Guyana's coastal avifauna is abundant and diverse and changes seasonally and across years. Understanding these patterns is important for impact assessment and emergency response planning as well as conservation and management.

ERM recommends continuing the EEPGL coastal bird survey program to further establish the coastal bird baseline in the region for use as a basis for future impact assessment and monitoring. Continuing the survey program would yield important information on the variability in seasonal and annual patterns of bird abundance and species composition, potentially document the presence of presumed present but yet-to-be-confirmed species, and likely confirm the presence of additional species, particularly during migration. A key unknown of relevance to EEPGL operations is the location and temporal stability (movement from year to year) of coastal bird breeding locations. This information is important for oil spill response planning since coastal birds are particularly vulnerable to oil spills during the breeding season. Data on coastal bird breeding locations could be collected in tandem with future suveys and through consultation with knowledgeable stakeholders (e.g., local community members, government staff, non-government entities).

The information gathered during additional surveys would further strengthen the coastal bird baseline and document the degree of variability in coastal bird use, which is particularly important in light of a rapidly changing regional and global environment. In addition, birds are well recognized as harbingers of environmental change and are used to monitor the health of the environment. EEPGL's coastal bird survey program is particularly well suited for use as a platform for future biodiversity monitoring, for which the Government of Guyana has indicated keen interest. Continuing the survey program would allow for training of additional Guyanese staff in program execution, including staff from relevant government agencies that have responsibilities involving coastal management, in preparation for a transition to a government-led monitoring program.

APPENDIX C BIRD SPECIES PRESENT BY REGION DURING THE COASTAL BIRD STUDY (2017–2020)

Bird Species Present by Region during the Coastal Bird Study (2017-2020)

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Accipitridae	Black Hawk-Eagle	*Spizaetus tyrannus*						X	
Accipitridae	Black-collared Hawk	*Busarellus nigricollis*	X		X	X	X	X	X
Accipitridae	Common Black Hawk	*Buteogallus anthracinus*				X			
Accipitridae	Crane Hawk	*Geranospiza caerulescens*				X			X
Accipitridae	Gray-headed Kite	*Leptodon cayanensis*	X			X			
Accipitridae	Great Black Hawk	*Buteogallus urubitinga*				X	X		X
Accipitridae	Grey-lined Hawk	*Buteo nitidus*	X	X	X	X	X		
Accipitridae	Harpy Eagle	*Harpia harpyja*	X						
Accipitridae	Long-winged Harrier	*Circus buffoni*	X	X			X	X	X
Accipitridae	Osprey	*Pandion haliaetus*	X	X	X	X	X	X	X
Accipitridae	Pearl Kite	*Gampsonyx swainsonii*			X				X
Accipitridae	Plumbeous Kite	*Ictinia plumbea*	X			X			
Accipitridae	Roadside Hawk	*Rupornis magnirostris*	X	X	X	X	X	X	X
Accipitridae	Rufous Crab-hawk	*Buteogallus aequinoctialis*	X		X	X	X	X	X
Accipitridae	Savanna Hawk	*Buteogallus meridionalis*		X		X		X	X
Accipitridae	Slender-billed Kite	*Helicolestes hamatus*				X			
Accipitridae	Snail Kite	*Rostrhamus sociabilis*	X	X	X	X	X	X	X
Accipitridae	Swallow-tailed Kite	*Elanoides forficatus*	X						
Accipitridae	White-tailed Hawk	*Geranoaetus albicaudatus*	X			X			
Accipitridae	Zone-tailed Hawk	*Buteo albonotatus*	X	X		X	X		
Alcedinidae	Amazon Kingfisher	*Chloroceryle amazona*	X						
Alcedinidae	Green Kingfisher	*Chloroceryle americana*			X	X	X	X	X
Alcedinidae	Green-and-rufous Kingfisher	*Chloroceryle inda*	X						
Alcedinidae	Ringed Kingfisher	*Megaceryle torquata*	X			X	X	X	X
Alcedinidae	Toco Toucan	*Ramphastos toco*				X			
Anatidae	Black-bellied Whistling Duck	*Dendrocygna autumnalis*	X			X		X	
Anatidae	Muscovy Duck	*Cairina moschata*	X						
Anhingidae	Anhinga	*Anhinga anhinga*	X						

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Apodidae	American Pygmy Kingfisher	*Chloroceryle aenea*	X			X			
Apodidae	Band-rumped Swift	*Chaetura spinicaudus*			X	X			
Apodidae	Fork-tailed Palm-Swift	*Tachornis squamata*	X			X	X	X	
Apodidae	Gray-rumped Swift	*Chaetura cinereiventris*	X						
Aramidae	Limpkin	*Aramus guarauna*		X	X		X	X	
Ardeidae	Black-crowned Night-Heron	*Nycticorax nycticorax*	X	X	X	X	X	X	X
Ardeidae	Cattle Egret	*Bubulcus ibis*	X	X	X	X	X	X	
Ardeidae	Cocoi Heron	*Ardea cocoi*	X			X	X	X	X
Ardeidae	Great Egret	*Ardea alba*	X	X	X	X	X	X	X
Ardeidae	Little Blue Heron	*Egretta caerulea*	X	X	X	X	X	X	X
Ardeidae	Snowy Egret	*Egretta thula*	X	X	X	X	X	X	X
Ardeidae	Striated Heron	*Butorides striata*	X	X	X	X	X	X	X
Ardeidae	Tricolored Heron	*Egretta tricolor*	X	X	X	X	X	X	X
Ardeidae	Yellow-crowned Night-Heron	*Nyctanassa violacea*					X	X	X
Cardinalidae	Grayish Saltator	*Saltator coerulescens*	X	X	X	X	X	X	X
Cathartidae	Black Vulture	*Coragyps atratus*	X	X	X	X	X	X	X
Cathartidae	Greater Yellow-headed Vulture	*Cathartes melambrotus*				X			
Cathartidae	Lesser Yellow-headed Vulture	*Cathartes burrovianus*	X	X				X	
Cathartidae	Turkey Vulture	*Cathartes aura*	X	X		X	X	X	X
Charadriidae	Black-bellied Plover	*Pluvialis squatarola*		X			X	X	X
Charadriidae	Collared Plover	*Charadrius collaris*		X					X
Charadriidae	Hudsonian Godwit	*Limosa haemastica*					X		X
Charadriidae	Semipalmated Plover	*Charadrius semipalmatus*		X	X	X	X	X	X
Charadriidae	Southern Lapwing	*Vanellus chilensis*	X	X	X	X	X	X	
Ciconiidae	Wood Stork	*Mycteria americana*	X						
Columbidae	Common Ground-Dove	*Columbina passerina*	X	X	X	X	X	X	X
Columbidae	Gray-fronted Dove	*Leptotila rufaxilla*				X			

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Columbidae	Pale-vented Pigeon	*Patagioenas cayennensis*	X		X	X	X	X	X
Columbidae	Rock Pigeon	*Columba livia*	X	X	X		X		X
Columbidae	Ruddy Ground-Dove	*Columba talpacoti*	X	X	X	X	X	X	X
Columbidae	Ruddy Pigeon	*Patagioenas subvinacea*	X						
Columbidae	White-tipped Dove	*Leptotila verreauxi*	X		X	X	X	X	X
Corvidae	Cayenne Jay	*Cyanocorax cayanus*	X						
Cotingidae	Screaming Piha	*Lipaugus vociferans*	X						
Cracidae	Variable Chachalaca	*Ortalis motmot*	X		X				
Cuculidae	Greater Ani	*Crotophaga major*	X			X	X	X	X
Cuculidae	Little Cuckoo	*Coccycua minuta*				X		X	
Cuculidae	Mangrove Cuckoo	*Coccyzus minor*							X
Cuculidae	Smooth-billed Ani	*Crotophaga ani*	X	X	X	X	X	X	X
Cuculidae	Squirrel Cuckoo	*Piaya cayana*	X						
Cuculidae	Striped Cuckoo	*Tapera naevia*	X			X	X		X
Dendrocolaptidae	Straight-billed Woodcreeper	*Dendroplex picus*	X		X	X	X	X	X
Dendrocolaptidae	Striped Woodcreeper	*Xiphorhynchus obsoletus*				X		X	
Emberizidae	Grassland Yellowfinch	*Sicalis luteola*		X					
Falconidae	Bat Falcon	*Falco rufigularis*				X	X		
Falconidae	Black Caracara	*Daptrius ater*	X						
Falconidae	Crested Caracara	*Caracara cheriway*	X	X		X	X	X	X
Falconidae	Laughing Falcon	*Herpetotheres cachinnans*	X			X			
Falconidae	Peregrine Falcon	*Falco peregrinus*		X			X		X
Falconidae	Yellow-headed Caracara	*Milvago chimachima*	X	X	X	X	X	X	X
Fregatidae	Magnificent Frigatebird	*Fregata magnificens*	X	X	X	X	X	X	X
Fringillidae	Finsch's Euphonia	*Euphonia finschi*	X						
Fringillidae	Violaceous Euphonia	*Euphonia violacea*	X		X	X			
Furnaridae	Yellow-chinned Spinetail	*Certhiaxis cinnamomeus*	X	X	X	X	X	X	X

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Furnariidae	Buff-throated Woodcreeper	*Xiphorhynchus guttatus*	X						
Furnariidae	Pale-breasted Spinetail	*Synallaxis albescens*	X		X	X	X		X
Galbulidae	Green-tailed Jacamar	*Galbula galbula*	X					X	
Hirundinidae	Barn Swallow	*Hirundo rustica*	X	X	X	X	X	X	X
Hirundinidae	Gray-breasted Martin	*Progne chalybea*	X	X	X	X	X	X	X
Hirundinidae	White-winged Swallow	*Tachycineta albiventer*	X	X	X	X	X	X	X
Icteridae	Carib Grackle	*Quiscalus lugubris*		X	X	X			
Icteridae	Crested Oropendola	*Psarocolius decumanus*	X			X			
Icteridae	Epaulet Oriole	*Icterus cayanensis*	X						
Icteridae	Giant Cowbird	*Molothrus oryzivorus*	X			X			
Icteridae	Red-breasted Meadowlark	*Leistes militaris*	X	X	X	X	X	X	
Icteridae	Red-rumped Cacique	*Cacicus haemorrhous*	X						
Icteridae	Shiny Cowbird	*Molothrus bonariensis*	X	X	X	X	X	X	X
Icteridae	Yellow Oriole	*Icterus nigrogularis*	X	X	X	X	X	X	X
Icteridae	Yellow-hooded Blackbird	*Chrysomus icterocephalus*	X	X	X	X	X		
Icteridae	Yellow-rumped Cacique	*Cacicus cela*	X			X			
Jacanidae	Wattled Jacana	*Jacana jacana*	X	X	X	X	X	X	X
Laridae	Black Skimmer	*Rynchops niger*	X	X	X	X	X	X	X
Laridae	Common Tern	*Sterna hirundo*		X			X	X	X
Laridae	Gull-billed Tern	*Gelochelidon nilotica*		X	X		X	X	X
Laridae	Large-billed Tern	*Phaetusa simplex*	X	X	X	X	X	X	X
Laridae	Laughing Gull	*Leucophaeus atricilla*		X	X	X	X	X	X
Laridae	Least Tern	*Sternula antillarum*		X	X	X	X	X	X
Laridae	Lesser Black-backed Gull	*Larus fuscus*							X
Laridae	Royal Tern	*Thalasseus maximus*		X	X	X	X	X	X
Laridae	Royal/Sandwich Tern	*Thalasseus maximus/sandvicensis*				X			
Laridae	Sandwich Tern	*Thalasseus sandvicensis*				X			

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Laridae	Yellow-billed Tern	*Sternula superciliaris*		X			X	X	
Motmotidae	Amazonian Motmot	*Momotus momota*	X						
Parulidae	Masked Yellowthroat	*Geothlypis aequinoctialis*	X						
Parulidae	Northern Waterthrush	*Parkesia noveboracensis*				X	X		
Parulidae	Riverbank Warbler	*Myiothlypis rivularis*	X			X			
Parulidae	Yellow Warbler	*Setophaga petechia*	X	X	X	X	X		
Passerellidae	Pectoral Sparrow	*Arremon taciturnus*	X						
Pelecanidae	Brown Pelican	*Pelecanus occidentalis*		X	X	X	X	X	X
Phalacrocidae	Neotropic Cormorant	*Phalacrocorax brasilianus*	X	X	X	X	X	X	X
Picidae	Blood-colored Woodpecker	*Veniliornis sanguineus*					X	X	
Picidae	Chestnut Woodpecker	*Celeus elegans*	X						
Picidae	Chestnut/Cream-colored Woodpecker	*Celeus elegans/flavus*				X			
Picidae	Crimson-crested Woodpecker	*Campephilus melanoleucos*				X			
Picidae	Lineated Woodpecker	*Dryocopus lineatus*	X	X		X			
Picidae	White-bellied Piculet	*Picumnus spilogaster*			X	X	X	X	X
Psittacidae	Blue-and-yellow Macaw	*Ara ararauna*	X						
Psittacidae	Brown-throated Parakeet	*Eupsittula pertinax*	X		X	X	X	X	X
Psittacidae	Green-rumped Parrotlet	*Forpus passerinus*							X
Psittacidae	Red-and-green Macaw	*Ara chloropterus*	X						
Psittacidae	Red-shouldered Macaw	*Diopsittaca nobilis*	X		X	X			
Psittacidae	Yellow-crowned Parrot	*Amazona ochrocephala*	X						
Psitticidae	Orange-winged Parrot	*Amazona amazonica*	X		X	X		X	
Psitticidae	Red-bellied Macaw	*Orthopsittaca manilatus*	X			X			

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Rallidae	Grey-cowled Wood-Rail	*Aramides cajaneus*	X			X			
Rallidae	Mangrove Rail	*Rallus longirostris*						X	
Ramphastidae	Short-tailed Swift	*Chaetura brachyura*				X	X	X	
Ramphastidae	White-throated Toucan	*Ramphastos tucanus*	X			X			
Recurvirostridae	Black-necked Stilt	*Himantopus mexicanus*						X	X
Scolopacidae	Greater Yellowlegs	*Tringa melanoleuca*		X			X	X	X
Scolopacidae	Least Sandpiper	*Calidris minutilla*		X	X		X	X	X
Scolopacidae	Lesser Yellowlegs	*Tringa flavipes*		X	X	X	X	X	X
Scolopacidae	Pectoral Sandpiper	*Calidris melanotos*					X		
Scolopacidae	Red Knot	*Calidris canutus*					X	X	X
Scolopacidae	Ruddy Turnstone	*Arenaria interpres*		X	X		X	X	X
Scolopacidae	Sanderling	*Calidris alba*		X	X		X	X	X
Scolopacidae	Semipalmated Sandpiper	*Calidris pusilla*		X	X	X	X	X	X
Scolopacidae	Short-billed Dowitcher	*Limnodromus griseus*		X			X	X	
Scolopacidae	Solitary Sandpiper	*Tringa solitaria*			X	X	X	X	
Scolopacidae	Spotted Sandpiper	*Actitis macularius*	X	X	X	X	X	X	X
Scolopacidae	Western Sandpiper	*Calidris mauri*		X	X		X		
Scolopacidae	Whimbrel	*Numenius phaeopus*		X	X		X	X	X
Scolopacidae	White-rumped Sandpiper	*Calidris fuscicollis*		X			X	X	X
Scolopacidae	Willet	*Tringa semipalmata*		X	X	X	X	X	X
Strigidae	Great Horned Owl	*Bubo virginianus*				X		X	
Thamnophilidae	Barred Antshrike	*Thamnophilus doliatus*	X	X	X	X	X	X	
Thamnophilidae	Black-chinned Antbird	*Hypocnemoides melanopogon*	X			X			
Thamnophilidae	Black-crested Antshrike	*Sakesphorus canadensis*	X	X	X	X	X	X	X
Thamnophilidae	Black-throated Antbird	*Myrmophylax atrothorax*	X						

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Thamnophilidae	Dusky Antbird	*Cercomacroides tyrannina*	X						
Thamnophilidae	Silvered Antbird	*Sclateria naevia*	X			X			
Thamnophilidae	White-browed Antbird	*Myrmoborus leucophrys*	X						
Thamnophilidae	White-flanked Antwren	*Myrmotherula axillaris*	X						
Thraupidae	Bananaquit	*Coereba flaveola*	X	X	X	X	X		
Thraupidae	Bicolored Conebill	*Conirostrum bicolor*	X	X	X	X	X	X	X
Thraupidae	Blue-black Grassquit	*Volatinia jacarina*	X	X	X	X	X	X	
Thraupidae	Blue-grey Tanager	*Thraupis episcopus*	X	X	X	X	X	X	X
Thraupidae	Burnished-buff Tanager	*Tangara cayana*		X	X	X	X		
Thraupidae	Chestnut-bellied Seedeater	*Sporophila castaneiventris*	X			X			
Thraupidae	Lined Seedeater	*Sporophila lineola*	X						
Thraupidae	Palm Tanager	*Thraupis palmarum*	X	X	X	X	X		
Thraupidae	Red-capped Cardinal	*Paroaria gularis*			X	X	X	X	
Thraupidae	Ruddy-breasted Seedeater	*Sporophila minuta*	X						
Thraupidae	Silver-beaked Tanager	*Ramphocelus carbo*	X		X	X			
Thraupidae	Turquoise Tanager	*Tangara mexicana*	X			X			
Thraupidae	White-lined Tanager	*Tachyphonus rufus*			X				
Thraupidae	White-shouldered Tanager	*Tachyphonus luctuosus*	X						
Thraupidae	Wing-barred Seedeater	*Sporophila americana*		X	X	X			
Threskiornithidae	Green Ibis	*Mesembrinibis cayennensis*	X						
Threskiornithidae	Scarlet Ibis	*Eudocimus ruber*	X	X	X	X	X	X	X
Tityridae	Black-tailed Tityra	*Tityra cayana*	X						
Tityridae	Cinereous Becard	*Pachyramphus rufus*				X			
Tityridae	White-winged Becard	*Pachyramphus polychopterus*				X			

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Trochilidae	Black-throated Mango	*Anthracothorax nigricollis*			X				
Trochilidae	Blue-chinned Sapphire	*Chlorestes notata*				X			X
Trochilidae	Fork-tailed Woodnymph	*Thalurania furcata*	X			X			
Trochilidae	Glittering-throated Emerald	*Amazilia fimbriata*	X		X	X	X		
Trochilidae	Little Hermit	*Phaethornis longuemareus*				X			
Trochilidae	Plain-bellied Emerald	*Amazilia leucogaster*		X	X	X			
Trochilidae	Reddish Hermit	*Phaethornis ruber*	X						
Trochilidae	Tufted Cocquette	*Lophornis ornatus*	X						
Trochilidae	White-chested Emerald	*Amazilia brevirostris*			X	X		X	X
Troglodytidae	House-wren	*Troglodytes aedon*	X	X	X	X	X	X	X
Trogonidae	Green-backed Trogon	*Trogon viridis*	X						
Turdidae	Pale-breasted Thrush	*Turdus leucomelas*	X		X	X	X		
Tyrannidae	Boat-billed Flycatcher	*Megarynchus pitangua*	X	X	X	X	X		
Tyrannidae	Brown-crested Flycatcher	*Myiarchus tyrannulus*	X	X	X	X	X	X	X
Tyrannidae	Cinnamon Attila	*Attila cinnamomeus*	X			X			
Tyrannidae	Common Tody Flycatcher	*Todirostrum cinereum*	X		X	X	X	X	X
Tyrannidae	Fork-tailed Flycatcher	*Tyrannus savana*		X			X	X	
Tyrannidae	Fuscous Flycatcher	*Cnemotriccus fuscatus*				X			
Tyrannidae	Gray Kingbird	*Tyrannus dominicensis*	X	X	X	X	X	X	
Tyrannidae	Grayish Mourner	*Rhytipterna simplex*	X						
Tyrannidae	Great Kiskadee	*Pitangus sulphuratus*	X	X	X	X	X	X	X
Tyrannidae	Guianan Tyrannulet	*Zimmerius acer*	X						
Tyrannidae	Helmeted Pygmy Tyrant	*Lophotriccus galeatus*	X			X			
Tyrannidae	Lesser Kiskadee	*Pitangus lictor*	X	X	X	X	X	X	
Tyrannidae	Mouse-colored Tyrannulet	*Phaeomyias murina*	X		X	X		X	X

Family	Common Name	Scientific Name	Region 1 (Coastal)	Region 2 (Coastal)	Region 3 (Coastal)	Region 3 (Island)	Region 4 (Coastal)	Region 5 (Coastal)	Region 6 (Coastal)
Tyrannidae	Pale-eyed Pygmy-Tyrant	*Atalotriccus pilaris*	X						
Tyrannidae	Pale-tipped Tyrannulet	*Inezia caudata*						X	
Tyrannidae	Pied Water Tyrant	*Fluvicola pica*	X	X	X	X	X	X	X
Tyrannidae	Piratic Flycatcher	*Legatus leucophaius*	X		X				
Tyrannidae	Rusty-margined Flycatcher	*Myiozetetes cayanensis*	X	X	X	X	X	X	X
Tyrannidae	Short-crested Flycatcher	*Myiarchus ferox*	-		X	X	X	X	
Tyrannidae	Southern Beardless-Tyrannulet	*Camptostoma obsoletum*	X		X	X	X	X	X
Tyrannidae	Spotted Tody Flycatcher	*Todirostrum maculatum*	X	X	X	X	X	X	X
Tyrannidae	Sulphury Flycatcher	*Tyrannopsis sulphurea*				X			
Tyrannidae	Tropical Kingbird	*Tyrannus melancholicus*	X	X	X	X	X	X	X
Tyrannidae	Tropical Mockingbird	*Mimus gilvus*	X	X	X	X	X	X	
Tyrannidae	White-headed Marsh-Tyrant	*Arundinicola leucocephala*	X	X					
Tyrannidae	White-lored Tyrannulet	*Ornithion inerme*				X			
Tyrannidae	Yellow-bellied Elaenia	*Elaenia flavogaster*	X		X	X	X	X	X
Tyrannidae	Yellow-bellied Flycatcher	*Empidonax flaviventris*				X		X	
Tyrannidae	Yellow-breasted Flycatcher	*Tolmomyias flaviventris*				X		X	
Tyrannidae	Yellow-crowned Tyrannulet	*Tyrannulus elatus*	X		X				
Vireonidae	Ashy-headed Greenlet	*Hylophilus pectoralis*	X		X	X	X	X	X
Vireonidae	Lemon-chested Greenlet	*Hylophilus thoracicus*	X					X	
Vireonidae	Red-eyed Vireo	*Vireo olivaceus*	X						
Vireonidae	Slaty-capped Shrike-vireo	*Vireolanius leucotis*				X			

APPENDIX D PHOTOGRAPH LOG—BIRDS PHOTOGRAPHED DURING EEPGL-COMMISSIONED COASTAL BIRD SURVEYS 2017–2020

Photograph Log Index

Photo No.	Photo Caption
Survey Team	
1	ERM staff Jenny Leon and Wally Prince—field observation and data entry
2	Bird observer Philip Odwin at the Darthmouth site—Region 2
3	Bird observers Garey Sway and Wally Prince at Ogle seaside—Region 4
4	Bird observer Jeffrey McCrary at Ruimzeight shoreline—Region 3
Waterbirds	
5	Scarlet Ibis *(Eudocimus ruber)* at Leguan mudflats—Region 3
6	Scarlet Ibis
7	Scarlet Ibis and multiple egret species at Affiance seaside—Region 2
8	Cattle Egrets (*Bubulcus ibis*) nesting on Wakenaam Island—Region 3
9	Great Egrets (*Ardea alba*) nesting on Wakenaam Island—Region 3

APPENDIX E IMPORTANT BIRD HABITATS IDENTIFIED IN REGIONS 1 THROUGH 6

Important Bird Habitat	Region	Primary Bird Habitat	Rationale for Designation as Important Bird Habitat	Photograph
Shell Beach Protected Area (SBPA)	1	Sandy beach, mudflat, mangrove	SBPA contains critically important nesting and foraging habitats for over 200 species of waterbirds and land birds, including several globally threatened species.	
Pomeroon River Mouth	1	Mudflat, mangrove	Extensive tidal mudflat that is an important congregation and foraging site for shorebirds and wading birds. Thousands of wading birds roost in the mangroves in this area.	
Kamwatta Beach, Iron Punt Beach, and Luri Beach	1	Sandy beach, mudflat, mangrove	These beaches host hundreds of flamingos (multiple species) and thousands of other colonial waterbirds (ERM Personal Communication 26) for nesting and feeding. The photo depicts Luri Creek, which is located just inland from Luri Beach and is the location of the colonial waterbird roosting and nesting site.	

Important Bird Habitat	Region	Primary Bird Habitat	Rationale for Designation as Important Bird Habitat	Photograph
Waini River Mouth (west bank)	1	Mangrove	Pristine mangrove forest supporting large congregations of colonially roosting and nesting wading birds (herons, egrets, ibis, etc.).	
Exmouth Seaside	2	Mudflat	Extensive tidal mudflat that is an important congregation and foraging site for shorebirds and wading birds, including over 3,000 shorebirds (*Calidris* sp.) at a time, qualifying it as a Threshold Site[4] during the migratory season.	
Walton Hall Seaside	2	Mudflats and mangrove	Tidal mudflats and mangroves supporting large congregations of shorebirds and wading birds.	

[4] BirdLife International's definition of a Threshold Site for migratory birds is one that is known or thought to hold congregations that are equal to or more than 1 percent of the global population of one or more species (including species group or family) on a regular or predictable basis (BirdLife International 2011).

Important Bird Habitat	Region	Primary Bird Habitat	Rationale for Designation as Important Bird Habitat	Photograph
Essequibo Island Complex	3	Mangrove	Unique transition zone between riverine forest and mangrove ecosystems that provides important roosting and nesting habitat for riverine birds and wading birds.	
Ogle Seaside	4	Mudflat	Extensive mudflat that is heavily populated with foraging shorebirds (over 3,000 individuals at a time, qualifying it as a Threshold Site for *Calidris* sp.) during the migratory season.	
Triumph-BV Seaside	4	Mudflat and mangrove	Extensive mudflat and natural revegetation of mangroves that supports large numbers of migratory shorebirds and waterbirds and is also considered very important as a nesting site for Snail Kite (*Rostrhamus sociabilis*).	

Important Bird Habitat	Region	Primary Bird Habitat	Rationale for Designation as Important Bird Habitat	Photograph
Enmore Seaside	4	Mudflat and mangrove	Tidal mudflats and mangroves that host large congregations of shorebirds and wading birds, and serve as nesting site for Snail Kite (*Rostrhamus sociabilis*) and other mangrove-dependent species, including conebills.	
Hope Beach Seaside	4	Vegetated sand flat	Fine sand flats overlain with compact mud at low tide that host large congregations of shorebirds and wading birds (including Scarlet Ibis [*Eudocimus ruber*]) and mangroves that support large numbers of nesting and roosting wading birds.	
Victoria Seaside	4	Mangrove and brackish marsh	Extensive mangrove and brackish marsh along the shoreline and inland that provides important roosting and breeding site for shorebirds and waterbirds, particularly Scarlet Ibis (*Eudocimus ruber*) and mangrove-dependent species.	

Important Bird Habitat	Region	Primary Bird Habitat	Rationale for Designation as Important Bird Habitat	Photograph
Bush Lot Seaside	5	Mudflat and mangrove	Extensive mudflats used by thousands of shorebirds during migration (threshold site for *Calidris* sp.) and waterbirds throughout the year.	
Mangroves between Maida and Phillipe	6	Mangrove	Important roosting and breeding area for thousands of colonial waterbirds.

EXECUTIVE SUMMARY

In 2016, ExxonMobil's affiliate Esso Exploration and Production Guyana Limited (EEPGL) applied to the Guyana Environmental Protection Agency (EPA) for approval of the Liza Phase 1 Development Project in the Stabroek Block, offshore Guyana. The EPA approved both the Application and the Environmental Impact Assessment on 1 June 2017, and issued an Environmental Permit for the Liza Phase 1 Development Project. As a condition of the permit, the EPA required EEPGL to conduct a study of the marine fish community offshore Guyana (referred to hereafter as the Marine Fish Study). In 2017-2018, Environmental Resources Management (ERM), EEPGL's environmental consultant, developed and implemented a study approach that included two seasonal surveys (one in the dry season and one in the wet season) in the deepwater, continental shelf, and nearshore zones, as well as a fish landing study at the major landing sites across the coast ("the Year 1 Study"). EEPGL elected to add an estuarine/riverine component to the EPA-required components during the second seasonal survey in April 2018. The results of the Year 1 Study were reported to the EPA in May 2018 (ERM 2018).

EEPGL subsequently elected to voluntarily repeat the study for a second year in 2018–2019 ("the Year 2 Study"). The study scope was modified in the second year to include a plankton component and the fish landing study was expanded into a standalone participatory fishing study, the results of which were reported separately (ERM 2020). This report describes the second year of the Marine Fish Study (not including the participatory fishing study) and is organized as follows:

1. Deepwater Component—conducted aboard Trinidad and Tobago-flagged *Captain Grady* (an offshore utility/cargo ship) using deep sea traps;
2. Continental Shelf Component—conducted aboard Guyanese-flagged vessels using trawls and longlines;
3. Nearshore Component—conducted from small boats at or near the shore in the shallow subtidal zone using gillnets and cast nets;
4. Estuarine/Riverine Component—conducted from small boats using electrofishing equipment; and
5. Plankton Component—conducted concurrently with the deepwater, continental shelf, and nearshore components.

All of the Year 2 components listed above were completed once in the wet season and once in the dry season except for the deepwater trap component, which was only completed in the wet season. A total of 203 species were captured across all the study components. The trap component of the deepwater assessment was not conducted during the dry season because of rough sea conditions in the Stabroek Block. The wet season deepwater survey yielded no captured nekton.

Ninety-two species of fish (49 families) were captured within the continental shelf transect stations. The wet season produced the most diverse catch for all continental shelf transects. The "A" Stations (closest to shore) tended to be the most species-rich stations on the continental shelf during the wet season, but during the dry season the "C" Stations (furthest from shore) were the most species-rich. The trawl samples from the continental shelf transects also produced a variety of benthic bycatch. Although not the focus of this assessment, the benthic bycatch data are noteworthy because of the diversity of species captured and the distribution of the bycatch. Numerous benthic species that are not targeted by the commercial fisheries in Guyana were captured. Benthic bycatch was widespread across the continental shelf transect stations and included live corals at several locations.

Sixty-two species of fish (23 families) were captured at the nearshore stations, many of which were also captured on the continental shelf. With 17 species, the Scianidae was the most diverse family captured in the nearshore zone. The Ariidae family was the second most diverse family captured in the nearshore

zone, with nine species. Most of the species captured during the wet season were either anadromous and likely entered the coastal area from the sea in response to increased freshwater discharge to the coastal zone, or were euryhaline species that entered the study area from further up the rivers.

Twenty-one species of fish (14 families) were captured at the estuarine/riverine stations. Most of the fish captured at the estuarine/riverine stations were juvenile marine species. The results of the estuarine/riverine component illustrate the importance of the estuaries, and particularly the mangroves, as nursery habitat for many marine species, as well as the key supporting role that estuaries (and mangroves in particular) play in sustaining Guyana's marine ichthyofauna and marine fisheries.

One hundred eleven species of fish (51 families) were represented in the plankton samples, accounting for 55 percent of the total number of species captured in the study. Nearly all the ichthyoplankton captured were obtained from the dry season samples. The extent of the seasonal differences in ichthyoplankton densities was consistent with traditional ecological knowledge concerning seasonal patterns in marine fish abundance and spawning behavior.

1. INTRODUCTION

In 2016, ExxonMobil's affiliate Esso Exploration and Production Guyana Limited (EEPGL) applied to the Guyana Environmental Protection Agency (EPA) for approval of the company's initial offshore oilfield development in the Stabroek Block (referred to as the Liza Phase 1 Development Project). The Liza Phase 1 Development consists of 17 subsea development wells and a Floating Production, Storage, and Offloading vessel (FPSO). EEPGL submitted an Environmental Impact Assessment (EIA), prepared by Environmental Resources Management (ERM) to support its Application for Environmental Authorisation for the Liza Phase 1 Development Project. The Guyana EPA approved both the Application and the EIA on 1 June 2017, and issued an Environmental Permit for the Liza Phase 1 Development Project. The Liza Phase 1 Development is located approximately 120 miles offshore of Georgetown, Guyana. The Liza Phase 1 Development began operations in December 2019.

1.1 Year 1 (2017–2018) Marine Fish Study Activities

The Environmental Permit issued by the EPA for the Liza Phase 1 Development included the following requirement to complete fishery studies within a year of permit issuance:

> "[C]onduct fishery dependent studies in the nearshore zone, augmented by fishery-independent studies in the nearshore and offshore zones. Field methods shall include a sufficient variety of survey techniques to capture surface, mid-water, and bottom-oriented fish. The objective of the study shall be to develop a more complete understanding of the marine fish community outside the Liza Area of Interest. The study shall include at least one wet and one dry season (notionally several weeks duration each) to enable comparison of data across seasons."

In accordance with the above permit condition, EEPGL engaged ERM to complete a Marine Fish Study in 2017-2018 ("the Year 1 Study") that included industrial[1] and small-scale[2] fishery techniques to develop a more complete understanding of the marine fish community outside the Liza Area of Interest. The study included four direct sampling components and one interview-based component. The direct sampling components included:

1. Deepwater fish sampling
2. Continental shelf fish sampling
3. Nearshore fish sampling
4. Estuarine/riverine juvenile fish sampling

The interview-based component consisted of an observational and interview-based assessment of fish landings at several fish landing sites throughout Regions 1–6.

A Year 1 Study report was prepared, and the results of the Year 1 Study were used to inform an update of the Liza Phase 1 Development Project Environmental Impact Statement and the Liza Phase 1 Development Project Environmental and Socioeconomic Management Plan. EEPGL submitted these documents to the EPA in May 2018.

1.2 Year 2 (2018–2019) Marine Fish Study Activities

After completing the initial year of fish surveys required by the Environmental Permit for the Liza Phase 1 Development Project, EEPGL elected to continue the study for another year, extending the field

[1] Primarily for sale, typically larger volume than small-scale fisheries

[2] Typically small volume, and often using traditional techniques and little technology; sometimes referred to as "artisanal" fisheries

component of the study through the second quarter of 2019 (“the Year 2 Study”). Analysis of the samples collected during the second year of study continued through June 2020. The Year 2 Study included the same major components as the Year 1 Study, but in Year 2 EEPGL elected to add plankton sampling to the field program and expanded the fish landing study into a standalone participatory fishing study. Plankton sampling was carried out concurrently with the deepwater, continental shelf, and nearshore elements.

Coastal Guyana has a humid tropical climate characterized by two wet and two dry seasons. The Year 2 field activities were conducted from December 2018 through early February 2019 for the dry season, and from May to June 2019 for the wet season. As Figure 1-1 shows, rainfall data from Ogle Airport in Georgetown indicate that Guyana’s coastal region was transitioning into the dry season during the initial portion of the first Year 2 survey period, and was near the 9-month minimum for total monthly rainfall by the end of this survey period in February 2019. Rainfall increased sharply during the second Year 2 survey period. The results discussed herein therefore encompass conditions characteristic of both dry and wet season conditions.

Figure 1-1: Coastal Rainfall Data, October 2018 to June 2019

2. OBJECTIVES

The goal of the second year of the Marine Fish Study was to continue to characterize Guyana's marine and estuarine fish communities. The primary objectives underpinning this goal were:

- Continue to develop the species lists that were initially developed during the Year 1 Study;
- Identify the main fish taxa occurring within each targeted zone (e.g., continental shelf, nearshore zone, etc.);
- Describe any important life history or ecological characteristics (such as reproductive status or gut contents) of the main species caught; and
- Collect information on benthic biological communities on an opportunistic basis (primarily on the continental shelf).

In addition to these primary objectives, the Year 2 Study had the following secondary objectives:

- Collect information on water quality conditions in the estuarine, nearshore, continental shelf, and deepwater marine zones; and
- Develop local capacity in marine survey techniques among government regulatory staff as well as local Guyanese contractors.

3. DISTRIBUTION OF SAMPLING STATIONS

Sampling stations were distributed from the estuaries to the outer continental slope in areas between the Stabroek Block and the Guyana coast. The following subsections describe the locations of sampling stations within the four hydrographic zones included in the Marine Fish Study (i.e., deepwater, continental shelf, nearshore, and estuarine zones).

3.1 Deepwater Sampling Stations

Deepwater sampling was carried out using a set of four traps (cylindrical in shape, with a mesh size of ½ inch and each weighing approximately 20 kilograms) on the seafloor at two different depths: ~1,000 meters (in the vicinity of the Liza field) and ~2,000 meters (in the vicinity of the Payara field). Four traps in total were deployed at each depth.

The sample locations were selected based on bathymetry and were intended to help sample and analyze a cross-section of different water depths, benthic habitats, and known fishing areas and zones. The currents were so strong during the dry season that deepwater sampling was not conducted. Table 3.1 shows the release coordinates (when traps were lowered into the water), and retrieval coordinates (when the traps were retrieved) for the deepwater traps. Figure 3.1 depicts the locations where the traps were released and retrieved.

Table 3.1: Year 2 Deepwater Sampling Locations (Wet Season Only)

Location	Trap Numbers	Release/Recovery	UTM—WGS 84 Coordinates	Depth (m)
Location Liza ~ 1,000 m depth				
Location A	NAS-1 and NAS-2	Release	500039.67 m E, 889422.51 m N	1,050
	NAS-3 and NAS-4	Release	500005.74 m E, 889472.69 m N	
Location B	NAS-1 and NAS-2	Recovery	483697.63 m E, 899282.66 m N	
	NAS-3 and NAS-4	Recovery	483240.89 m E, 899570.75 m N	
Location Payara ~ 2,000 m depth				
Location C	NAS-1 and NAS-2	Release	499678.26 m E, 910029.50 m N	2,010
	NAS-3 and NAS-4	Release	499533.38 m E, 910023.97 m N	
Location D	NAS-1 and NAS-2	Recovery	464965.47 m E, 934255.55 m N	2,005
	NAS-3 and NAS-4	Recovery	464894.85 m E, 934306.33 m N

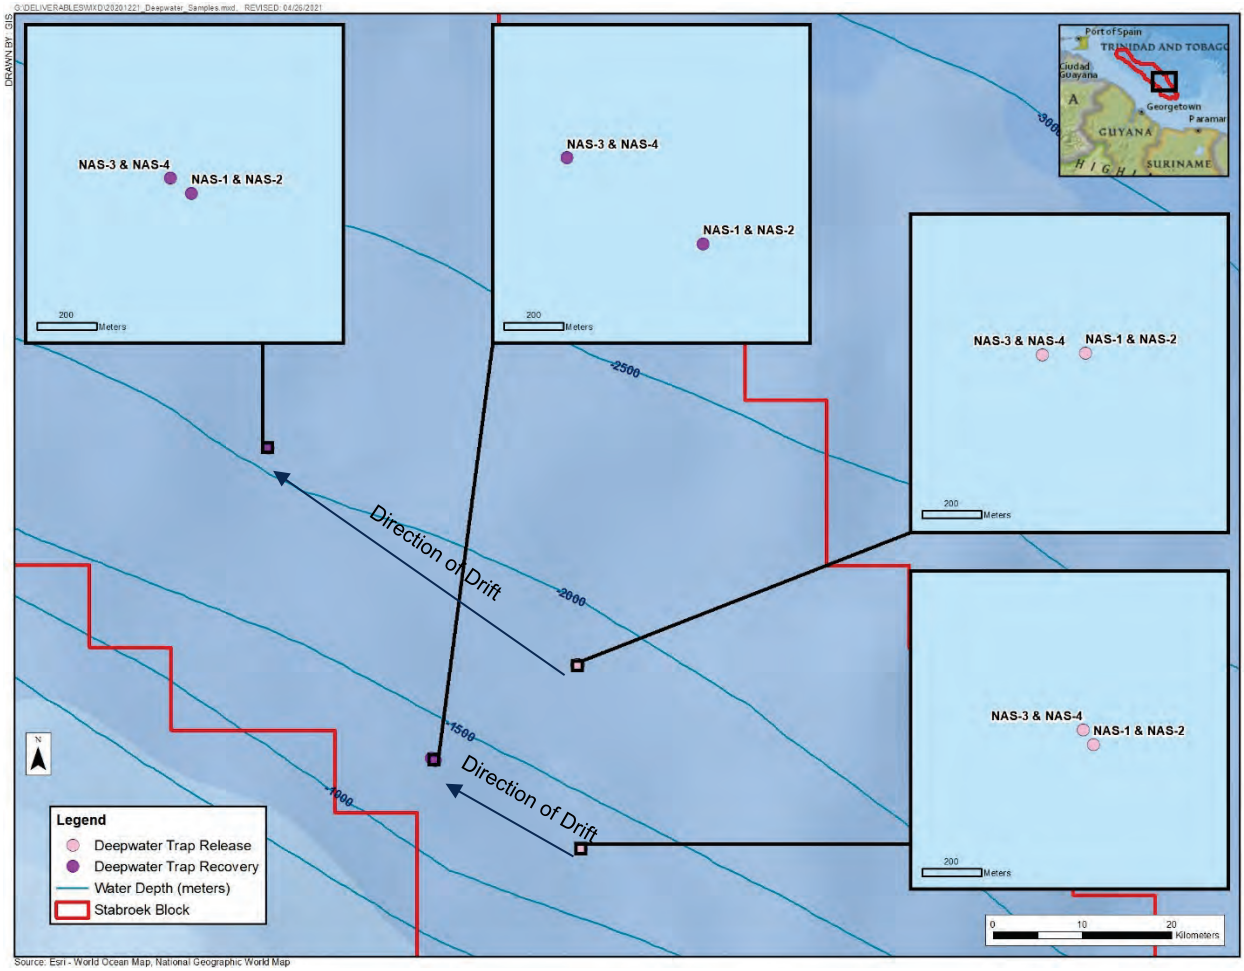

Figure 3-1: Locations of Year 2 Deepwater Trap Releases and Recoveries

3.2 Continental Shelf Sampling Stations

Thirteen continental shelf stations were arranged along four transects roughly perpendicular to the coast. The four transects were established with reference to the coastal regions: near the Shell Beach Protected Area in Region 1 (transect EOR1), Region 3 (transect EOR3), Region 4 (transect TRAWL), and Region 5 (transect EOR5). Transects EOR1, EOR3, and EOR5 were arranged approximately equidistant from one another with a northeasterly orientation, and the fourth transect (TRAWL) was established exclusively for trawl sampling and was located between the EOR3 and EOR5 transects. During the wet season, the fourth transect (TRAWL) was not sampled.

Three stations were established on each transect, and were labeled “A,” “B,” and “C,” in order of increasing depth. Four stations were established on the TRAWL transect at approximately 20-meter depth intervals between the coast and the 80 m isobath. The coordinates of the continental shelf stations are provided in Table 3.2. Table 3.2 shows the locations of the continental shelf sampling stations.

3.3 Nearshore Sampling Stations

Nearshore sampling stations were located based on observations of fishing activity, habitat characteristics, and input received during the first year of the Marine Fish Study from former fisheries officers and from local community members that were knowledgeable about fishing activities. The nearshore sampling stations were generally located near main fish landing sites along the coast or near the mouths of rivers or canals where small-scale fishing captains moor their vessels. The coordinates of the nearshore sampling stations are provided in Table 3.3. Figure 3.3 shows the locations of the nearshore sampling stations.

3.4 Estuarine/Riverine Sampling Stations

Estuarine/riverine sampling stations were located within the estuarine portions of the main rivers draining Guyana's coastal plain to assess the species composition of the estuarine fish community and evaluate the continuity between the estuarine and marine fish communities. Five major rivers (Pomeroon, Essequibo, Demerara, Mahaica, and Berbice) were sampled during the dry season; these same rivers were sampled and a sampling station on the Waini River was added in the wet season. The coordinates of the estuarine sampling stations are provided in Table 3.4. Figure 3.4 shows the locations of the estuarine sampling stations.

3.5 Plankton Sampling Stations

The study area for the plankton component was defined using a transect approach that extended from the nearshore zone to the 2,000-meter (6,561.7-foot) isobath in the Stabroek Block. The study area was surveyed once during the dry season, and once during the wet season. During the dry season, samples were taken along five parallel transects that extended from nearshore to offshore waters. Five stations were established per transect. Additionally, another four stations were established at specific locations of interest, including one each near the Payara and Liza Phase 2 Project Development Areas, one station at the mouth of the Waini River, and one station at the mouth of the Essequibo River.

The wet season plankton survey was performed on three transects on the continental shelf. The wet season plankton survey included a smaller number of stations than the dry season for the following reasons:

- The coastal stations generally produced few species samples during the dry season. No eggs were captured at any of the coastal stations, and the zooplankton and ichthyoplankton samples at these stations contained far fewer species than the stations further out on the continental shelf. The coastal stations were therefore eliminated from the wet season sampling;
- As noted above, the TRAWL transect was eliminated entirely in the wet season;
- No other sampling was planned in the far northwestern and southern portions of the Stabroek Block, and the sea conditions and capabilities of the vessel combined would have required several additional days to reach these areas; accordingly, these sample stations were abandoned in favor of collecting samples in the Liza and Payara Project Development Areas.

The coordinates of the plankton sampling stations are provided in Table 3.5. The locations of the plankton sampling stations are depicted on Figure 3.5.

4. METHODS AND EQUIPMENT

The methodologies and equipment used in the second year of the Marine Fish Study were generally similar to the methods used in the first year of the study, as described in Sections 2 and 3 of this report. The methodologies and equipment used to sample the fish community were selected based on their expected effectiveness for the species of fish that are known to occur in the region, and have been proven effective in other fishery assessments in the northern South America/ Caribbean region. Equipment and instruments used to sample fish in the field included: trawl nets, longlines, gillnets, cast nets, seines, and fish traps. Descriptions of the methods used to sample the deepwater, continental shelf, nearshore, and estuarine zones are provided in the following subsections.

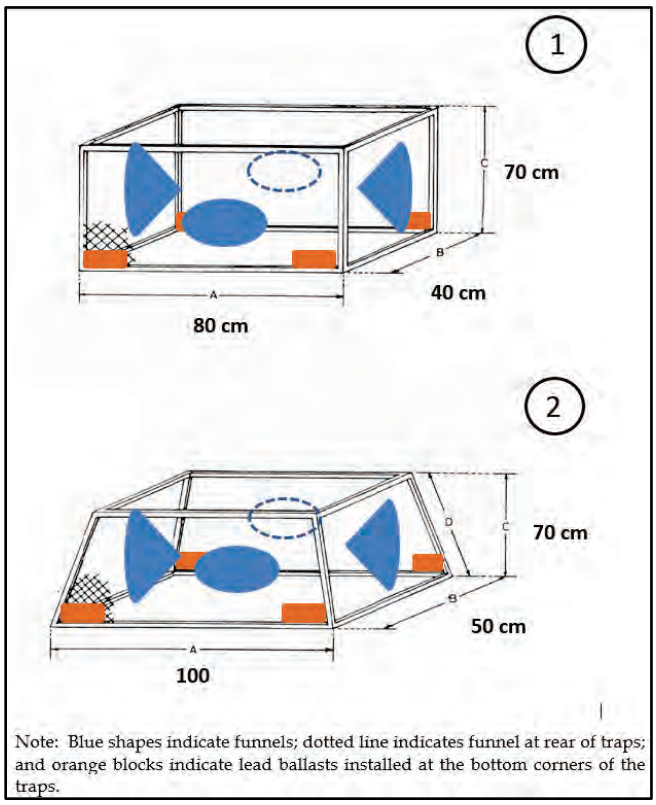
4.1 Deepwater Fish Sampling Methods

Due to the extreme depths within the Stabroek Block, net- and hook-based sampling technologies were not practical for sampling demersal species at the deepest sample stations. Accordingly, ERM constructed purpose-built deep-sea traps in Guyana in order to sample demersal biota on the continental slope and within the Stabroek Block. Sea trap frames were constructed of welded rebar that was treated with a rustproof coating. Each trap was then fitted with an outer mesh, and four mesh cones were sewn into the outer mesh to allow organisms to enter the traps. Traps were constructed in rectangular or trapezoidal shapes. Figure 5-1 illustrates the two types of traps and Figure 4-2 shows a photograph of the traps. Traps were baited with two King weakfish (also known as Bangamary; *Macrodon ancylodon*) and 1 kilogram (kg) of pork chop per trap.

Sampling locations are provided in Section 3.1. Pairs of rectangular and trapezoidal traps were deployed at each sampling station and each pair of traps was connected to a pair of buoys that remained at the surface with a line between them to aid in retrieval (Figure 4-3). Traps were deployed and left overnight before being retrieved the following day.

The different sizes of nets and hooks described below were selected to target specific sizes of fish and because they are known to be effective for a type or size of fish that was anticipated to occur in the study area. By deploying a variety of types and sizes of fishing gear, the study sought to increase the likelihood of catching specimens of different species and sizes, targeting a more complete representation of the fish community in the study area. In addition to the nets described below, supplemental sampling was completed using lines with hooks (hand lines) and luminescent “lures” targeting squid and to be able to cover a larger portion of the water column at each station.

Figure 4-1: Rectangular and Trapezoidal Traps



Note: 1 = rectangular trap; 2 = trapezoidal trap

Figure 4-2: Photograph of Traps

Figure 4-3: Deep Sea Trap Buoy System

4.2 Continental Shelf Fish Sampling Methods

4.2.1 Trawl Sampling Procedure

Trawling consists of dragging one or more nets over the seafloor. The net has a chain on its lower end, a line of buoys at the top, and large wooden planks called “doors” at each side. As the vessel tows the trawl through the water, pressure exerted on the doors by water passing over their leading surface causes the mouth of the net to open and catch marine organisms. This fishing gear is typically used to target shrimp and demersal fish.

Doors were comprised of four planks of 8-foot length and 36-inch width – each with five vertical and four horizontal wood planks with 2-inch slots between them. The cable securing system was composed of ½-inch chains that allow easy attack angle adjustment. To accommodate the desired trawl depth (which varied between 10 m and 80 m), the amount of towing cable per reel was approximately 400 m. The ballast system was made up of 30 sets of 3/8-inch chain with 6 links, for a total weight of approximately 50 kg per net. The trawl net panels consisted of N° 21 green polyethylene (PE) with a 2-inch mesh.

The trawl nets used in the study were fitted with turtle excluder devices (TEDs). The devices were constructed of solid galvanized aluminum bars with an oval frame approximately 40 inches high by 35 inches wide, with a ¾-inch diameter. The frame contained parallel bars with 4.5 inches of space between each bar. The TEDs were located on the cod end[3] of the trawl nets and each TED was fitted with two 200-mm diameter buoys to maintain proper position while deployed. In order to standardize sampling effort, soak time for the trawls was limited to 30 minutes per station. In commercial situations, the Guyana shrimp fishing fleet typically trawls for longer periods. Trawling was carried out at Stations A, B, and C alongthe EOR-1, EOR-3, and EOR-5 transects and at 20m, 40m, 60m, and 80m depths on the TRAWL transect.

4.2.2 Gillnet Sampling Procedure

Gillnets are designed to entangle fish and other organisms, and can be used alone or in groups (set of nets). Depending on design, ballast, and buoyancy, they may be used at the surface, in the middle of the water column, or near the seafloor. Gillnets are generally constructed of monofilament nylon, and may have one or more panels, each with a variable length (typically between 100 m and 180 m) and a height between 1.5 m and 2.4 m. The net openings are known as the “mesh”, and are generally measured in inches when stretched corner to corner. The size of the mesh is proportional to the gauge of the monofilament, with larger mesh nets using heavier gauge monofilaments. Heavier-gauge lines form the upper and lower edges of the net, holding the edges of the mesh in place and helping to give the net its shape. Buoys are attached to the upper line and weights to the lower one in order to keep the net extended through the water column and prevent it from collapsing.

Gillnets used in this study were made of green nylon monofilament. Each panel was 100 m long by 2 m wide (i.e., for a total net set length of 300 m). Each net set was allowed to soak for 2.5 hours excluding time to deploy and retrieve each set. Gillnets were deployed at the surface and on the bottom at each station and contained up to three panels of different mesh sizes (mesh sizes of ¼ inch, 1 inch and 2½ inch – collectively a “set of nets”) at each of the surface and bottom (30 m) strata.

Three sets of nets were deployed at the surface at each station. Buoys were affixed at the ends of each surface set to maintain adequate positive buoyancy. Bottom net sets were arranged similarly, but additional ballast was added to the bottom net sets to keep them on the sea floor. A halyard connected the bottom net set to a buoy to mark the location of the net set and maintain the net set at the desired depth. Surface and bottom net sets were deployed from the vessel side in the direction of the current; after releasing the last buoy, the end was attached to the ship’s bow and the engines were shut down for the 2.5-hour standard soak time.

4.2.3 Longline Sampling Procedure

Longlines consist of a series of baited hooks and can be fished at the surface or lower in the water column. Longlines were deployed at two depths in the survey: one at the surface and the other at a depth of 50 m. Each line was composed of 35 hooks in three sizes (Mustang scale: 01, 04 and 06), including 15 hooks of size 01, 10 hooks of size 04, and 10 hooks of size 06. These were separated along the main line at a spacing of 5 m, with 2-m snoods[4]. Each longline had a total length of 200 m. The physical characteristics of the longlines used in this assessment are presented in Table 4.1.

[3] Rear portion of a trawl net, which retains the catch.

[4] A “snood” is a short line that connects the hook to the main longline. It is often abrasion-resistant and made of a smaller diameter line and provides some separation between the bait and the main line to help prevent fish from detecting the main line.

Table 4.1: Characteristics of Longlines Used to Sample on the Continental Shelf

Characteristics	Deep Longline (50 m depth)	Surface Longline (1 m depth)
Length of line	200 m	200 m
Number of hooks	35	35
Type of steel hook (Mustang Number/Size)	N° 10 (15 hooks)	N° 10 (15 hooks)
	N° 04 (10 hooks)	N° 04 (10 hooks)
	N° 06 (10 hooks)	N° 06 (10 hooks)
Line material	Monofilament nylon (3.5 mm)	Monofilament nylon (3.5 mm)

Each longline was deployed into the water at a constant speed from one of the vessel sides in order to keep the fishing gear oriented in the direction of the current, and to avoid entanglement with the vessel. Prior to deployment, a signal buoy was tied to each end of the longline. Once in the water, the longline was secured to the vessel using a 50-m cord to ensure the fishing gear was deployed correctly and to avoid it being carried away by the current. The location where each longline was deployed was recorded on the vessel's Global Positioning System (GPS) unit.

4.3 Nearshore Fish Sampling Methods

All nearshore sampling was done in the morning. Vessel-based sampling was performed with gillnets which were deployed from shallow-draft small-scale fishing vessels smaller than 30 feet in length, with outboard motors of 40 to 60 horsepower. Nearshore gillnets were deployed at the surface and at the bottom in 7 to 8 feet of water at each station. Each net contained up to three panels of mesh sizes (mesh sizes of 0.25 inch, 1 inch, and 2.5 inches). The gillnets used in this study were made of nylon monofilament. Each panel was 50 meters long by 2 meters wide (i.e., for a total net set length of 100 square meters). Buoys were affixed at the ends of each surface multipanel net to maintain adequate positive buoyancy. Bottom nets were arranged similarly, but additional ballast was added to the bottom net sets to keep them on the sea floor. A halyard connected the bottom net set to a buoy to mark the location of the net set and maintain the net set at the desired depth. Surface and bottom net sets were deployed from the vessel side in the direction of the current. After the last buoy was released, the end was attached to the ship's bow and the engines were shut down to allow the net to soak. Each multipanel net was allowed to soak for 2 hours, excluding time to deploy and retrieve.

Land-based sampling was performed using cast nets in shallow water (1-2 m depth). Cast nets were thrown 10 times at each station (Table 4.2). Seines were pulled in wadeable waters at each sampling station. Three seine passes were completed at each station (Table 4.2).

Table 4.2: Characteristics of Gear Used to Sample Nearshore Stations

Gear	Mesh Size (Inches)	Panel Length/ Weight	Effort per Station
Gillnet	1	100 meters	2.5 hours
Seine net	0.25	12 meters	3 passes
Cast net	1	8 kg	10 throws

4.4 Estuarine Fish Sampling Methods

Estuarine sampling stations were established at the mouths of large rivers. Habitats that appeared likely to aggregate fish (especially juvenile fish) were selected based on physical habitat complexity, water velocity, type of substrate, depth, and type of riparian vegetation. At each station, an area of approximately 25 m^2 was sampled using electrofishing equipment. The position of each sampling station

was determined by marking the coordinates with a GPS unit, navigator, and by means of visual references.

Sampling was carried out during daylight and to the extent possible during high tides to allow navigational access to riparian vegetation, mangrove areas, and other shallow riparian habitat features that are known to attract juvenile fish.

Safety considerations specific to electrofishing included:

- Adjusting the output based on the salinity of the water, such that the minimum voltage required to achieve the desired effect was used;
- Recognizing that sampling activities would occur in shallow water and would require the operation of sampling equipment of the sides of the vessels, selection of vessels with shallow draft and wide beams to enhance lateral stability;
- Placing the electric generator as near as possible to the center of the vessel's hull to minimize the risk of destabilizing the vessel; and
- Using tarps to cover the equipment during rainy weather.

Electrofishing operations were carried out from a vessel with capacity for five people that was prepared for electrofishing activities. This vessel allowed the containment of the electrofishing equipment (generator, battery, power converter, anode and cathode cables) and personnel and other sampling equipment (including safety equipment).

In slow waters, the movement of the boat was controlled by the use of a rope attached to an anchor on the shore. Specimens captured were placed in labeled plastic containers and the containers were stored on ice in order to preserve the diagnostic characteristics of the fish, and to improve the ability to identify them taxonomically and perform the necessary biometrics measurements.

4.5 Ichthyoplankton Sampling Procedure

The ichthyoplankton component was added as a new study component in the second year of the Marine Fish Study. Plankton were collected at three different depths using conical-cylindrical double Bongo nets towed behind a vessel. The Bongo net was put into the water after being connected to a towrope. The boat traveled at a speed of 2 knots[5] for 15 to 20 minutes. The start and end time of each sampling period was recorded. The nets were towed at an oblique orientation through the water column; see Figure 4-4). Plankton samples were collected at the surface in the offshore stations, at mid-depths (50 to 150 meters [164 to 492.1 feet]) on the continental shelf, and near the bottom in the nearshore stations. A double Bongo net (0.7-meter mouth diameter) with a 500-micrometer mesh was used for offshore and continental shelf samples (see Figure 4-4). In the nearshore environment, a smaller Bongo net was used (0.25-meter [2.3-foot] mouth diameter). Each mesh was attached to a collection container. A calibrated flowmeter was mounted in the center of each net mouth for determination of the volume of water filtered through the net.

Once brought on board, the net was carefully rinsed and the collection containers were removed from the meshes and emptied into pre-marked jars labeled with date, time, and location. The biological material captured in the collection container was preserved in formaldehyde solution, and buffered with sodium tetraborate diluted in seawater to effect an approximate final concentration of 4 percent.[6] Ichthyoplankton species were identified in a laboratory setting to the lowest taxonomic level practicable using keys and

[5] Measured with Global Positioning System, towed against the current

[6] All materials were purchased locally, to the extent that they were available.

references. The filtered volume was calculated from the flowmeter readings and used to calculate the abundance of fish eggs and larvae per 100 cubic meters of filtered water.

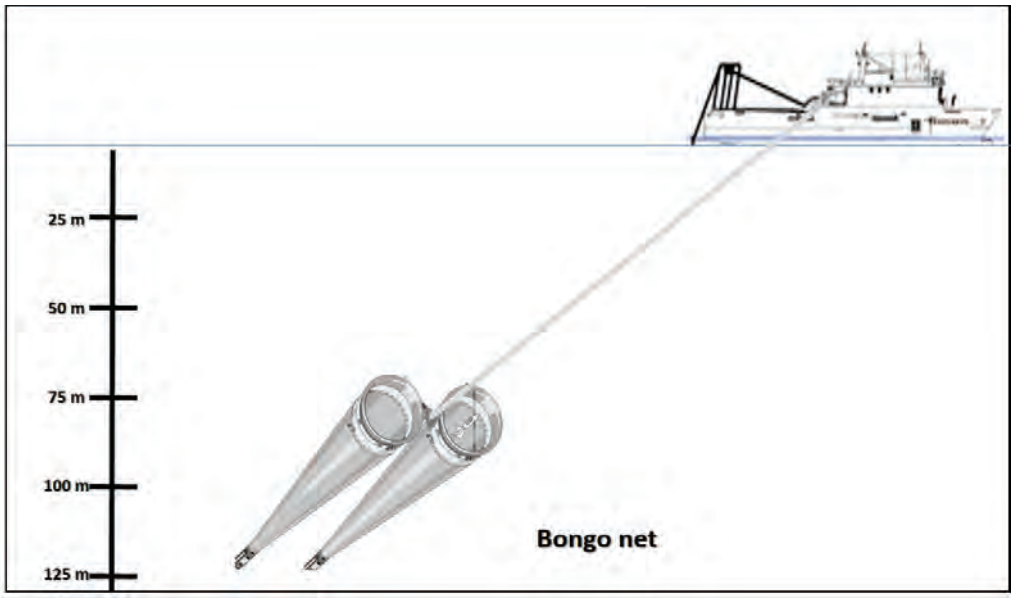


Figure 4-4: View of Oblique Plankton Trawl Using a Bongo Net

4.6 Sampling Abiotic Parameters

A Van Dorn sampling bottle was used to collect water samples at each continental shelf and nearshore sampling station[7]. The following abiotic measurements were taken using a multi-parameter water quality sampler, turbidimeter, and Secchi disk:

- Ambient air temperature (°C)
- Surface temperature (°C)
- pH (standard pH units)
- Dissolved oxygen (mg/L)
- Salinity (ppm)
- Conductivity (mS/cm)
- Turbidity (NTU)

[7] Abiotic data were not collected at the deepwater stations because EEPGL has conducted multiple environmental baseline surveys that include water quality data collection.

5. RESULTS

5.1 Deepwater Sampling Results

The deepwater zone was not sampled with the deepwater traps in the dry season due to rough sea conditions in the Stabroek Block that made it impossible to deploy the traps safely. Although deepwater traps were deployed during the wet season, no species were captured during the deepwater sampling effort. Please see Attachment A for photographs of field activities during the deepwater assessment.

5.2 Continental Shelf Sampling Results

5.2.1 Species Richness

Thirteen stations were sampled across four transects on the continental shelf during the Year 2 surveys. These stations produced 92 species belonging to 49 families (see Table 5.1). The most diverse families in the continental shelf samples were the Sciaenidae (drums and croakers, 13 species), Haemulidae (grunts, seven species), Ariidae (sea catfishes, four species), Triglidae (sea robins, four species) and Lutjanidae (snappers, four species). These five families accounted for approximately 35 percent of the species captured on the continental shelf, exclusive of plankton[8].

The dry season catch included 41 species distributed across 25 families. The wet season catch included 78 species distributed across 45 families. Unidentified flying fish (*Exocetus* sp.*)* were observed regularly at the deeper stations, while dolphinfish and triggerfish (probably *Balistes capriscus*) were observed sporadically in these areas. Squid were often observed in these areas at night, likely because they were attracted to the vessel lights. These species were not caught, likely because they were not attracted to the bait used or because the individuals were too small for the fishing gear being used. The C stations accounted for the highest numbers of species across all transects during the dry season. During the wet season, the A stations accounted for the highest number of species caught.

[8] Plankton are analyzed separately from nekton in this report because the distribution of plankton is driven almost entirely by environmental factors, whereas the distribution of nekton results from a combination of environmental and behavioral factors.

[a] For most species, the common name used by the Food and Agriculture Organization of the United Nations (FAO) (as reported by Fishbase) is used in this report.
[b] For species that have a single Guyanese common name that is (1) different from the FAO common name and (2) is in general use throughout the country, the Guyanese common name is used in place of the FAO common name.

-Page Intentionally Left Blank-

As summarized in Table 5.2, the TRAWL transect accounted for the highest number of species caught in the dry season, with 24 species, or 30 percent of the total species caught. The EOR3 transect, located offshore of the Essequibo River, accounted for the second highest number of species in the dry season (21 species or 26 percent), followed closely by the EOR1 transect, located off Region 1, with 20 species (or 25 percent of all species). EOR5, located near the Berbice River, had the fewest species of all transects, with 16 species (20 percent). During the wet season, transects EOR1 and EOR5 tied for the highest number of species (45 species each, or 34 percent each). EOR3 had slightly fewer species (42 species or 32 percent).

Table 5.2: Continental Shelf Total Species Richness by Transect

Transect	Dry Season		Wet Season	
	No. of Species	Percent of Total Dry Season Species	No. of Species	Percent of Total Wet Season Species
EOR1	20	25	45	34
EOR3	21	26	42	32
EOR5	16	20	45	34
TRAWL	24	30	—	—

The combined catch from the continental shelf stations was richer in terms of species during the wet season than the dry season. Over half of all the species documented on the continental shelf occurred in only the wet season samples. Table 5.3 summarizes diversity in the continental shelf samples by season and station. During the dry season, the C stations accounted for the highest numbers of species across all transects, with 17 species, or 38.6 percent of all species caught in the continental shelf. The B stations accounted for approximately 36.4 percent of the species (16 species) caught in the dry season in the continental shelf, and A stations accounted for 11 species (25 percent). During the wet season, the A stations accounted for the highest number of species caught (42 species, or 42.4 percent), followed by the B stations with 38 species (38.4 percent), and then the C stations with only 19 species (19.2 percent). Attachment B contains photographs of the Year 2 continental shelf assessment.

Table 5.3: Continental Shelf Total Species Richness by Station Group

Transect	Dry Season		Wet Season	
	No. of Species	Percent of Total Dry Season Species	No. of Species	Percent of Total Wet Season Species
A Stations	11	25	42	42.4
B Stations	16	36.4	38	38.4
C Stations	17	38.6	19	19.2

5.2.2 Abundance

Fish were more abundant in the wet season samples than in the dry season continental shelf samples by nearly a factor of three (603 individuals captured in the wet season compared to 204 individuals captured in the dry season). Bangamary (*Macrodon ancylodon*) was the only species that accounted for more than five percent of the total individuals in the wet season samples. Grey triggerfish (*Balistes capriscus*), wenchman (*Pristipomoides aquilonaris*), smalleye croaker (*Nebris microps*), lane snapper (*Lutjanus synagris*), live sharksucker (*Echeneis naucrates*), and false herring (*Harengula clupeola*) all accounted for more than five percent of the total individuals in the dry season samples.

5.2.3 Biomass

There were marked differences in the continental shelf samples between the dry and wet seasons in terms of biomass, abundance, and diversity. Slightly more than 46 kilograms of fish were caught in the dry season, composed of 204 individuals. Approximately 68 kilograms of fish were caught in the wet season, composed of 603 individuals. Although the wet season samples contained a higher number of species and more individual fish than the dry season samples, the mean mass of individual fish captured in the wet season (113 grams per individual) was almost exactly half the mean mass of individual fish captured in the dry season (225 grams per individual). Several relatively large fishes (lemon shark, ladyfish, longnose stingray, crevalle jack, and dolphinfish), were captured only in the wet season. These species were encountered very rarely; together, they were represented by a total of six individual specimens, but they accounted for approximately 42 percent of the total biomass of fish caught in the wet season. All of these fishes with the exception of the ladyfish are considered predatory species. When these uncommon large predator fishes are removed from the wet season dataset, the mean mass of individual fish captured during the wet season decreases to 66 grams per individual. These results suggest that during the Year 2 surveys, the wet season fish community on the continental shelf was comprised of a relatively large number of abundant, small-bodied species with a few large predatory species mixed in, but that the medium-sized bottom fish that are the mainstay of the trawl fishery on the continental shelf were largely absent. Fewer species were present and the large pelagic predators were scarcer during the dry season than in the wet season, but the medium-sized bottom fishes were more abundant during the dry season.

5.2.4 Gut Contents of Species Captured Using Gillnets, Longline, and Trawl

Analysis of stomach contents demonstrated that shrimp were a primary food item for coastal fish, particularly at the A and B stations. This is consistent with the habitat preferences of crustaceans, such as seabob and prawns, which are typically abundant in shallow coastal waters. Shrimp comprised nearly 80 percent of Siluriformes' (catfishes') stomach contents, especially white spring cariss (*Cathorops arenatus*).

Several species of Sciaenids, including white basha (*Plagioscion squamosissimus*), bangamary (*Macrodon ancylodon*), shorthead drum (*Larimus breviceps*), rake stardrum (*Stellifer rastrifer*), smalltooth weakfish (*Cynoscion steindachneri*), and sea trout (*Cynoscion virescens*), also had large numbers of shrimp in their digestive tracts, but small fish (probably anchovies) were more common in the gut contents of drum than in those of catfish.

Most specimens captured with the longline had empty stomachs; the only species captured via longline that had identifiable stomach contents were dolphinfish (*Coryphaena hippurus*) and bashaw (*Micropogonias furnieri*). Stomach contents in dolphinfish consisted entirely of fish (probably anchovies), while bashaw stomach contents consisted of unidentifiable crustacean remains.

5.2.5 Benthic Incidental Take in Trawl Samples

Several non-target (incidental catch or bycatch) species were captured with trawl gear at various continental shelf stations. Bycatch included sea cucumbers (*Holothuroidea* sp.), sea urchins (*Eucidaris tribuloides*, *Hygrosoma* sp.), various sea stars (*Astropecten americanus, Astropecten marginatus*, *Anthenoides guyanensis, Luidia clathrata*), and several crustacean taxa including mantis shrimp (*Squilla empusa*) and crabs *(Hepatus gronovii, Callinectes* sp.). Several mollluscan taxa were also represented including marine snails (*Distorsio clathrata*, *Turritella variegata*, *Tonna galea),* bivalves (*Euvola chazaliei*, *Arcinella sp.*), and squid *(Loligo* sp.). Non-reef-building coral (*Madrepora oculata*) and reef-building coral (*Solenosmilia variabilis*) also appeared in several samples, similar to the results of the first year of the

Marine Fish Study. Attachment C provides representative photographs of some of the non-target benthic species captured on the continental shelf.

5.2.6 Water Quality Conditions at the Continental Shelf Sampling Stations

Water quality data collected during the continental shelf survey are reported in Attachment D.

5.3 Nearshore Sampling Results

5.3.1 Species Richness

Twelve stations were sampled across the nearshore zone. These stations produced 62 species (23 families; Table 5.4). Thirty-four of these species were captured in both seasons. Most species that were only captured in one season were found in low numbers. The most diverse families in the nearshore samples were the Sciaenidae (drums and croakers, 17 species), Ariidae (sea catfishes, nine species), and Engraulidae (anchovies, seven species). Together, these three families accounted for over 53 percent of the total species diversity in the nearshore samples. Abundance in the nearshore zone was the highest of any of the four sampling zones, with 1,429 individuals collected.

Approximately 55 kilograms of fish were caught in the dry season, while approximately 44 kilograms were caught in the wet season. Slightly more fish were captured in the dry season than in the wet season (726 individuals and 704 individuals, respectively). The mean mass of individual fish caught in the dry season was slightly higher than the mean mass caught in the wet season (75 grams and 63 grams, respectively).

— = species was not observed during the survey; g = gram
[a] For most species, the common name used by the Food and Agriculture Organization of the United Nations (FAO) (as reported by Fishbase) is used in this report.
[b] For species that have a single Guyanese common name that is (1) different from the FAO common name and (2) is in general use throughout the country, the Guyanese common name is used in place of the FAO common name.

Region 2 had the highest species richness out of the five regions sampled. Its proximity to the largest river in Guyana (the Essequibo) most likely contributed to the relatively high number of species captured in that region, although it is notable that stations in closest proximity to river mouths (e.g., EPR2-6, EPR1-12, EPR4-4) often produced fewer species than stations in the same region but further away from river mouths (see Table 5.5). Attachment E includes photographs of species caught during the nearshore assessment.

Table 5.5: Nearshore Stations Total Species Richness

Station	Dry Season		Wet Season	
	Species Richness	Percent of Total Species Richness	Species Richness	Percent of Total Species Richness
EPR1-9	10	9.4	7	6.1
EPR1-10	5	4.7	7	6.1
EPR1-11	6	5.7	4	3.5
EPR1-12	4	3.8	8	7.0
EPR2-6	8	7.5	--	--
EPR2-7	17	16.0	23	20.2
EPR2-8	16	15.1	12	10.5
EPR4-3 Hope	16	15.1	10	8.8
EPR4-3 Mahaica	7	6.6	5	4.4
EPR4-4	10	9.4	12	10.5
EPR5-1	4	3.8	9	7.9
EPR5-2	3	2.8	17	14.9

5.3.2 Abundance

Unlike the individual counts from the continental shelf, samples from the nearshore zone had very similar numbers of individuals in both seasons (703 individuals in the wet season and 726 individuals in the dry season). There was less seasonal variation in terms of the taxonomic distribution of the catch in the nearshore zone than on the continental shelf. Five species individually accounted for more than five percent of the total individuals captured in the wet season: white spring cariss (*Cathorops arenatus*), highwaterman catfish (*Hypoptahlamus edentatus*) rockhead (*Stellifer brasiliensis*), Bressou sea catfish (*Arius quadriscutis*), and coco sea catfish (*Bagre bagre*). Three of these species (white spring cariss, highwaterman catfish, and rockhead) also individually accounted for more than five percent of the total individuals captured in the dry season. Parassi mullet (*Mugil incilis*), Pemecou sea catfish (*Sciades herzbergii*), and Bates sabretooth anchovy (*Lycengraulis batesii*) also individually accounted for more than five percent of the total individuals captured in the dry season.

5.3.3 Biomass

Biomass data from the nearshore zone were similar to the biomass data from the continental shelf in terms of differences between the dry and wet seasons and the disproportionate effects of large individuals on total biomass during the wet season. Slightly more than 44 kilograms of fish were caught in the dry season, compared to 55 kilograms of fish caught in the wet season. The mean mass of individual fish captured was 61 grams per individual in the dry season and 79 grams in the wet season. Two particularly large individual predatory fish captured in the wet season, a lacandon sea catfish (*Potamarius sp.*) and a couma sea catfish (*Sciades couma*) together accounted for 7.5 kilograms of the entire wet

season biomass. When these individuals are removed from the wet season dataset, the mean mass of individual fish captured during the wet season decreases by 14 percent to 68 grams per individual. These results suggest that, similar to the continental shelf surveys, during the Year 2 nearshore surveys the wet season fish community was comprised of a large number of abundant, small-bodied species with a few larger individuals mixed in. Unlike the dry season data from the continental shelf, which showed a decrease in abundance and a modest increase in mean size of individuals, the dry season catch in the nearshore zone was also dominated by small fishes. Most of the individuals captured in both seasons were either small-bodied coastal species or immature forms of larger species whose adult life stages are more prevalent on the continental shelf.

5.3.4 Water Quality Conditions at the Nearshore Sampling Stations

Water quality data collected during the nearshore survey are reported in Attachment F.

5.4 Estuarine/Riverine Assessment

5.4.1 Species Richness

Six stations were sampled across the estuarine/riverine zone. Twenty-one fish species were captured during the survey (see Table 5.7). No more than six species were found at any one location during the wet or dry seasons. During the dry season, six species were observed at each of the Pomeroon, Demerara, and Berbice river stations, four species were observed at the Mahaica River station, and three species were observed at the Essequibo River station. Despite overall species richness across all the river stations combined being slightly higher in the wet season than in the dry season (16 species versus 13 species, respectively), wet season species richness was equivalent to or slightly lower than dry season species richness at most of the river stations (Table 5.6). This indicates a more uniform species composition between estuaries in the wet season than in the dry season.

5.4.2 Abundance

Unlike the continental shelf and nearshore zone, fish were more abundant in the dry season than the wet season in the estuaries (Table 5.6). Parassi mullet (*Mugil incilis*) dominated the dry season samples, accounting for over 38 percent of the total dry season catches across all estuarine/riverine stations. Rockhead (*Stellifer brasiliensis*), banded puffer (*Colomesus psittacus*), zabaleta anchovy (*Anchovia clupeoides*), and false herring (*Harengula clupeola*) were the only other species that individually accounted for more than five percent of the total catch during the wet season. Whereas the dry season samples were dominated by mullet, the wet season samples were dominated by anchovies. The most common species caught in the wet season were broadband anchovy (*Anchoviella lepidentostole*) and zabaleta anchovy (*Anchovia clupeoides*), followed by rockhead (*Stellifer brasiliensis*), unidentified elopids (*Elops sp.*), banded puffer (*Colomesus psittacus*), leatherjacket (*Oligoplites palometa*) and pemecou sea catfish (*Sciades herzbergii*). All other species each accounted for less than five percent of the total abundance in the wet season. The results of the estuarine survey clearly indicate a fish community with a coastal-marine affinity; in fact, only one species captured in either the wet or dry season - suckermouth catfish (*Hypostomus plecostomus*) - is typically considered a freshwater species (Table 5-7).

5.4.3 Biomass

Biomass was not measured in the estuarine/riverine samples because most of the individuals caught were juvenile and the biomass of individual fishes was not reliably measureable with the equipment on board the sampling vessel. See Attachment G for photographs of species caught during the estuarine/riverine assessment.

5.4.4 Water Quality Conditions at the Estuarine/Riverine Sampling Stations

Water quality data collected during the estuarine/riverine survey are reported in Attachment H.

Table 5.6: Estuarine/Riverine Stations Species Richness by River

5.5 Ichthyoplankton Assessment

5.5.1 Deepwater Zone

For the purposes of the ichthyoplankton assessment, the deepwater zone consisted of the “E”, “Payara” and “Liza” sample locations depicted on Figure 3-5. Forty-seven species of fish in twenty-nine families were identified in the ichthyoplankton samples taken from the deepwater zone (Table 5.8). Most of the ichthyoplankton collected from the deepwater zone were eggs, with comparatively small numbers of post-yolk sac larvae. No yolk sac larvae were collected. The most common and most diverse family was Scombridae (mackerels and tunas), which accounted for 37 percent of the entire number of individual planktonic fishes collected, and eight species (approximately 20 percent of the species collected). The second- and third-most abundant families were the Dactylopteridae (round herrings) and Nomeidae (snappers). The second- and third-most diverse families were Myctophidae (lanternfish, five species) and Carangidae (jacks), Serranidae (seabasses and groupers), and Sphyraenidae (barracudas) (three species each). All ichthyoplankton in the deepwater zone was captured in the dry season; the deepwater zone was sampled in the wet season, but no plankton were recovered from the wet season samples.

5.5.2 Continental Shelf Zone

The continental shelf zone included the “B”, “C”, and “D” sample locations, as depicted on Figure 3-5. Seventy-two species of fish in thirty-six families were identified from the plankton samples taken from the continental shelf zone (Table 5.9). Small numbers of sailfin flyingfish (*Parexocoetus brachypterus*) eggs were collected in the wet season; all other species were captured in the dry season only. No eggs were collected in the dry season; most of the ichthyoplankton captured on the continental shelf in the dry season were post-yolk sac larvae with small numbers of yolk sac larvae and leptocephalus larvae mixed in. The most abundant family was Sciaenidae, followed by Carangidae and Scombridae, which together accounted for slightly more than 50 percent of the entire number of individual planktonic fishes collected. The most diverse ichthyoplankton families on the continental shelf were Scombridae (10 species), Myctophidae (eight species), and Sciaenidae (six species). Together, these species accounted for 33 percent of the species collected.

5.5.3 Nearshore Shelf Zone

The nearshore zone included the “A” sample locations as depicted on Figure 3-5. Twenty-two species of fish in eleven families were identified from the plankton samples from the nearshore zone (Table 5.10). No eggs were collected in the nearshore zone; most of the ichthyoplankton captured in the nearshore zone were post-yolk sac larvae with small numbers of yolk sac larvae and early juveniles mixed in. The

most abundant family was Engraulidae (anchovies), followed by Sciaenidae and Gobiidae (gobies), which together accounted for 97 percent of the entire number of individual planktonic fishes collected. The dominance of these three families was primarily due to the overwhelming abundance of two species in particular, broadband anchovy (*Anchoviella lepidentstole*) and acoupa weakfish (*Cynoscion acoupa*), which together accounted for over 76 percent of all ichthyoplankton collected in the zone. The most diverse ichthyoplankton families in the nearshore zone were Sciaenidae and Engraulidae. Together, these two families accounted for 50 percent of the species collected. All ichthyoplankton in the nearshore zone was captured in the dry season; none was captured in the wet season.

Table 5.8: Ichthyoplankton Data from the Deepwater Zone

Family	Species	Common Name	Number of Individuals	Percent of Individuals
Achiridae	*Aulostomus maculatus*	Trumpetfish	1	0.16

6. DISCUSSION

A total of 203 species were captured during the 2018–2019 (Year 2) Marine Fish Survey. A total of 213.9 kilograms (471.6 pounds) of fish (not counting estuarine/riverine catches or plankton) were caught. Similar to the results of the first year of the Marine Fish Study, the continental shelf had the most diverse nektonic fish community, with 92 species (49 families), followed by the nearshore zone, with 62 species (23 families). The estuarine area was the least diverse, with only 21 species (14 families). The plankton community showed remarkable diversity in the deepwater zone (47 species) given the lack of adult fishes captured in this zone. Ichthyoplankton species richness in the continental shelf and nearshore zones (72 species and 22 species, respectively) followed the trends seen in the nektonic samples, which suggest that the fish community on the continental shelf is the most diverse of the four zones included in the study.

6.1 Continental Shelf Assessment

Seasonal influences on biomass and species composition across the continental shelf were markedly different between the first and second years of the Marine Fish Study in several respects. Total biomass was much higher during the first year than during the second year, in both seasons. Biomass was highest in the dry season during the first year, unlike in the second year. Large predatory species (e.g., sharks, mackerels, barracudas, dolphinfish, jacks) were also more commonly encountered during the first year (especially sharks) than in the second year, and most commonly encountered in the dry season. Water quality may have played a role in the differences between years. Maximum measured water temperatures in the dry season reached approximately 35 degrees Celsius (ºC) in the second year's dry season, approximately 5 ºC higher than in the first year. These temperatures may have been sufficiently high to cause some species to seek cooler water. While it is impossible to conclusively identify the cause of the warmer water temperatures in the second year, water quality on the continental shelf is subject to the influence of oscillations in the Guiana Current as well as fluctuations in freshwater inputs from coastal rivers. Mean temperatures at the continental shelf sites during the second years dry season were more than 2.5 ºC higher than at the coastal sites during the same period, so it seems unlikely that riverine influences caused the high temperatures on the shelf and more likely that the warm temperatures on the continental shelf were oceanic in origin. Very few marine fish prefer water temperatures above 32 ºC, so water temperatures during the second year's dry season probably had some effect on fish distributions; however, temperatures above 32 ºC did not occur frequently, so thermal effects on fish distribution were probably limited. Dissolved oxygen levels were also conspicuously low during the wet season in the second year, with concentrations at the seafloor below 2.0 milligrams per liter at four of the 13 sampling stations during the wet season in the second year. This is below the optimum range for most marine fishes, and may partially explain the apparent scarcity of large fishes during this period. Low dissolved oxygen concentrations were more widespread in the wet season than high temperatures were in the dry season, so dissolved oxygen concentrations likely had a more significant effect on fish distribution than temperature.

Although the overall catch data across the entire continental shelf differed in a number of ways between the first and second study years, seasonal and spatial distribution of fish species diversity within the continental shelf were remarkably consistent between years. During the second study year, fish diversity was uneven between the transects in the dry season, but relatively consistent in the wet season. The same pattern was observed in the first study year, which suggests that seasonal influxes of freshwater across the continental shelf may obscure the effects of localized differences in physical habitat on the fish community. Species richness also increased at the "A" sites in the wet season in both years, which provides further evidence of the seasonal influence of freshwater inputs on species richness, especially on the inner continental shelf. The "B" stations produced the highest number of species in both seasons

in the first study year and the "C" stations produced the highest number of species in the second year, indicating that despite seasonal increases in nearshore diversity in the wet season, the highest fish diversity is consistently found on the mid- to outer-continental shelf. Visual observations made by the field team during the second year of study indicate that the B zone is an area of transition from the mixture of "blackwater"[9]and highly turbid silt-laden water near shore to clearer waters more characteristic of offshore conditions, an observation that is supported by the turbidity data collected from the continental shelf stations (Attachment D).

Although benthic marine resources were not the primary target of the survey, the sampling team reported the presence of living hard corals (*Madrepora oculata* and *Solenosmilia variabilis*) in some of the trawl samples at the B stations on transects EOR1, EOR3, and EOR5. These tended to be most common at depths from 110-160 m, on the outer continental shelf. This corroborated similar findings from the first year of study, which was the first known scientific evidence of living corals on Guyana's continental shelf. As noted in the Year 1 report for the Marine Fish Study, it is unknown whether the corals represent the remnant of a long-established population or a nascent recovery.

6.2 Nearshore Assessment

Sixty-two species were captured at the nearshore stations. The most common species observed at the nearshore stations were white spring cariss, rockhead, highwaterman catfish (*Hypophthalmus edentatus*), parassi mullet (*Mugil incilis*), and Pemecou sea catfish (*Sciades herzbergii*). Nearshore catches consisted primarily of catfish, which were found in salinities from 3.5 to 34 parts per thousand. This variability is caused primarily by substantial freshwater inputs from rivers, which explains the dominance of estuarine species in all of the nearshore samples (even those located several kilometers away from river mouths) and the presence of freshwater species in some low salinity areas along the coast. Some species were observed in the nearshore zone, but were not captured due to limitations inherent in the selected sampling protocols and equipment. One example is the widely distributed four-eyes (*Anableps anableps*), which is common in extremely shallow water where cast nets are not effective. Most of the species captured during the wet season were anadromous species that had presumably entered the coastal area from the sea in response to increased freshwater discharge to the coastal zone, or euryhaline species that entered the study area from further up the rivers.

Similar to the continental shelf, seasonal influences on the nearshore fish community manifested differently in the first and second years of the Marine Fish Study. During the first study year, total diversity in the nearshore zone was comparatively low (48 total species captured across both seasons) and there was a marked difference in the total number of species captured between seasons (25 species in the dry season versus 42 species in the wet season). In the second year, the total number of species captured across both seasons was higher (62 species) and about 45 percent of the species were only found in one season, but the total number of species captured was the same for both seasons. Region 2 had the most diverse fish community in both years and in both seasons in the second study year, which illustrates the importance of the Essequibo River's freshwater inputs in shaping the nearshore fish community. Although freshwater inputs clearly influence fish distribution, proximity to rivers is not the only factor that influences nearshore fish diversity. A few nearshore stations that were located in close proximity to river mouths had lower than average species diversity. This phenomenon was exemplified at EPR2-6. No fish were captured at this station during the wet season in the second study year, when freshwater influence was

[9]The clarity of water flowing out of Guyana's rivers onto the continental shelf is limited by two types of influences. The first is so – called-"blackwater" contributions, which come from swamps and other wetlands that characteristically have deep accumulations of organic debris. Water flowing from these areas has a very dark color and low light transmissivity because of high tannin content, but typically has very low suspended solids. The second type of influence has very high suspended soilds content (i.e.; turbidity) but little if any tannin content. In the estuaries and near-shore marine environments where both of these types of water mix with oceanic water, water clarity is typically low.

presumably near its annual peak. It is possible that a moderate amount of freshwater increases fish diversity but that above a certain threshold diversity begins to decrease as large numbers of marine species are excluded, but the exact nature of the relationship between salinity and nearshore fish diversity in Guyana is currently unclear.

6.3 Estuarine/Riverine Assessment

Twenty-one species were captured at the estuarine/riverine stations. Parassi mullet, rockhead, zabaleta anchovy, and false herring (*Harengula clupeola*) were the most common species collected at the estuarine/riverine stations. The stations with the highest catches of juvenile fish were located near riparian vegetation such as aquatic plants, grass, submerged palm trees, and plants of small size with abundant foliage. Smaller catches were associated with areas among mangrove roots. The abundance of Leptocephalii (which are a larval form that is unique to elopomorphic fish, primarily the marine and diadromous eels) in the estuarine samples points to the value of the estuaries as nursery areas.

6.4 Plankton Assessment

The total diversity of the ichthyoplankton community across the study area was remarkably high. One hundred eleven species of fish were represented in the plankton samples, accounting for 55 percent of the total number of species represented in the study. The paucity of ichthyoplankton in the wet season samples was consistent with local traditional knowledge. As documented in ERM's Participatory Fishing Study, local fisherpeople generally believe that spawning activity for most marine fish peaks from July through September, which is just after the wet season portion of this study was conducted. This is consistent with the low numbers of ichthyoplankton that appeared in the wet season samples (ERM 2020). Although the traditional knowledge regarding the seasonal aspect of spawning behavior is widely accepted in Guyana, ERM had not expected our data to validate this phenomenon so strongly based on such a limited dataset. It is not known whether the comparatively high number of ichthyoplankton collected during the dry season is typical of this season, or if a late spawn in 2018 increased the numbers of plankton beyond the normal seasonal levels for this period. Although the degree of seasonal difference in ichthyoplankton concentrations was unexpected, the differences in species composition between the zones was expected and consistent with known habitat preferences for the various families of fishes represented in the samples.

1 EXECUTIVE SUMMARY

This report covers the protected species mitigation measures and efforts on board the Vessel Normand Frontier for the period of 14 December 2019 to 21 May 2020. This is a continuation report for the Multi AUV Operation, which was conducted by Ocean Infinity, on behalf of ExxonMobil. This Geophysical survey was equipped with five AUV's.

The AUV's operation testing commenced on 14 December at 14:59 UTC following one hour of pre-watch and concluded on 21 May 2020 at 21:34 UTC. The AUV's were launched on in accordance to mission assign on continuous operations, in shallow and deep waters ranging from 52 meters to 2099 meters with in the Southeast Stabroek Block.

In accordance with Environmental Permit Ref. No. 20161202-CSPEP Clauses 3.1-3.6 and industry best practices and in alignment with "JNCC guidelines for minimizing the risk of injury to marine mammals from geophysical surveys" the following protocols were to be observed during the program: one PSO would perform a 60-minute visual pre-search prior to any use of the acoustic source. If any protected species were observed within a 500 and 800-meter radius of the acoustic source, the ramp-up would be delayed. Once the acoustic source was activated the PSOs would monitor continuously.

The AUV's source was active for a total of 1612 hours 43 minutes during the survey. Full volume production was carried out for 1538 hours 29 minutes. There were 222 ramp ups.

There were 23 visual sightings; 13 detections of Common bottlenose dolphins, four detections of unidentified dolphins, two detections Short-finned pilot whale, one detection of Atlantic spotted dolphin, one detection of Pantropical spotted dolphin, one detection of green sea turtle, and one detection of loggerhead sea turtle.

2 INTRODUCTION

The Geophysical survey were conducted by Ocean Infinity on behalf of ExxonMobil aboard the M/V Normand Frontier and the M/V Seabed Constructor. During the Geophysical survey, AUVs were deployed. The AUVs would conduct a ramp up in both shallow and deeper zone before full power. The AUVs then dove to the assigned depth for production. The mitigation and monitoring procedures were used for these AUV deployments regardless of the number of AUVs deployed at the time.

The survey site is in the Southeast Stabroek block approximately 100 miles from Georgetown, Guyana.

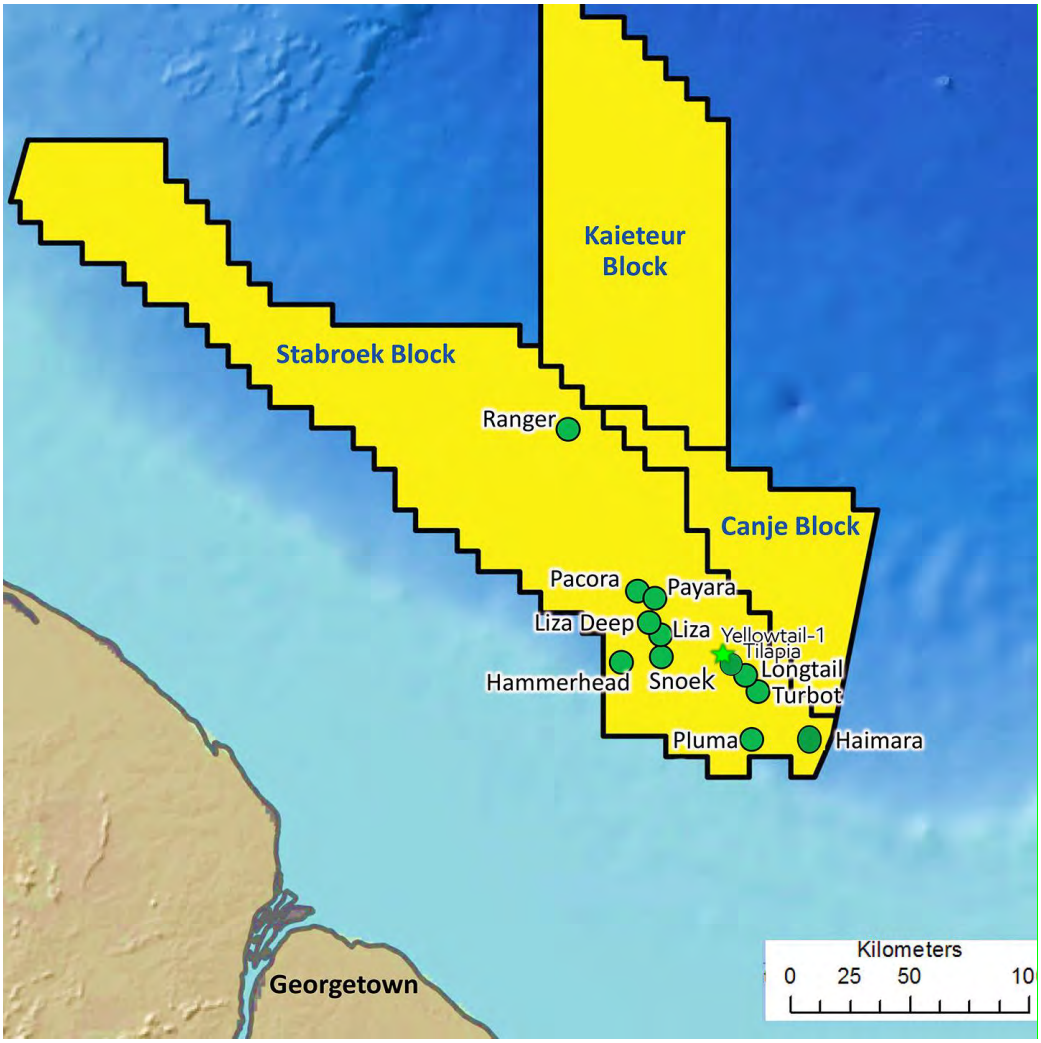

Figure 1: Guyana block map indicating the general location of the survey

2.1 Vessel Information

The Seabed Constructor was used for the first part of this survey (December 2019 to January 2020). The Seabed Constructor was the source vessel for the duration of the early part of the survey. The vessel is 115 m in length and carried the AUVs (Figure 2). The M/V Normand Frontier was used for the second part of this survey (February – May 2020). The Normand Frontier was the source vessel for the duration of the later part of the survey. The vessel is 121 m in length and carried the AUVs (Figure 3).See Table 1 with additional vessel information.

Other Vessels Involved:	n/a
Support/Chase Vessels:	n/a
Vessel Configuration description:	The AUVs were deployed from the vessels

3 MITIGATION AND MONITORING METHODS

3.1 Visual Monitoring Survey Methodology

There were two trained and experienced PSOs on board the M/V Seabed Constructor and the M/V Normand Frontier to conduct monitoring for protected species, record and report on observations, and request mitigation actions accordingly. The PSOs were provided by RPS and have completed a BSEE approved PSO training program.

Observers scanned the sea surface with the naked eye and binoculars with a 10 x 42 magnification. Watches were held from the top deck of the vessel providing an optimal 360-degree view which was approximately 20 meters at observer's eye level above the water's surface. Shifts lasted three hours followed by at three hours of break. Monitoring occurred daily beginning at approximately 09:45 UTC and continued throughout the end of the UTC day until the surrounding area could no longer be effectively observed due to darkness at approximately 22:00 UTC.

PSOs collected data at approximately 20-minute intervals while on watch and recorded in observation logs. Daily observation logs included information about environmental conditions, vessel and survey operations, marine debris observed, any vessel/gear and wildlife interactions, and any wildlife sightings.

Distances to protected species were determined visually by comparing an animal or an object's position relative to objects at known distances. Prior to the initiation of the source for ramp-ups or tests during daylight hours, dedicated watches of no less than 60 minutes were conducted to monitor for protected species within the exclusion zone. Communication between visual observers, and seismic operators was carried out using the vessel's internal communication system.

Identification of marine mammals and sea turtles were made or confirmed using Guide to Marine Mammals and Turtles of the U.S. Atlantic & Gulf of Mexico (Wynne, K. and Schwartz, M. 1999) and Whales, Dolphins and Porpoises (Mark Carwardine and Martin Camm).

4 SURVEY DATA

4.1 Operations Summary

The AUV sources was active 1612 hours 43 minutes. Full volume production occurred for a total of 1538 hours 29 mins. There was a total of 222 AUV source ramps ups and deployments, all occurring during daylight hours. AUV retrievals were done during daylight and occasionally at nighttime during the survey.

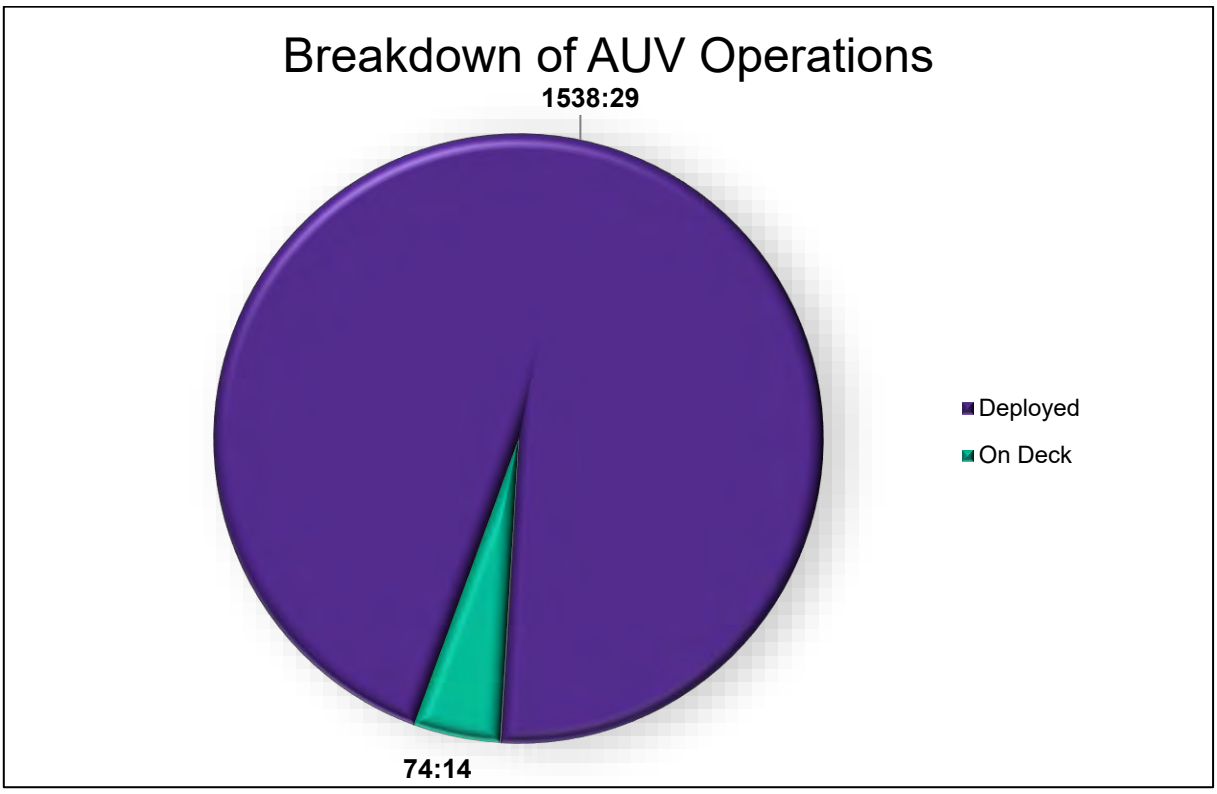

Figure 4: Breakdown of active AUV Operations

4.2 Visual Monitoring Effort Summary

Visual observations were conducted by the PSOs for a total of 1537 hours 12 minutes. A total of 1329 hours 30 minutes of visual watch was undertaken while the source was active. A total of 207 hours and 42 minutes of visual watch was conducted while the source was not active. There were 116 hours and 45 minutes were the AUVs were deployed without visual monitoring due to nighttime operations.

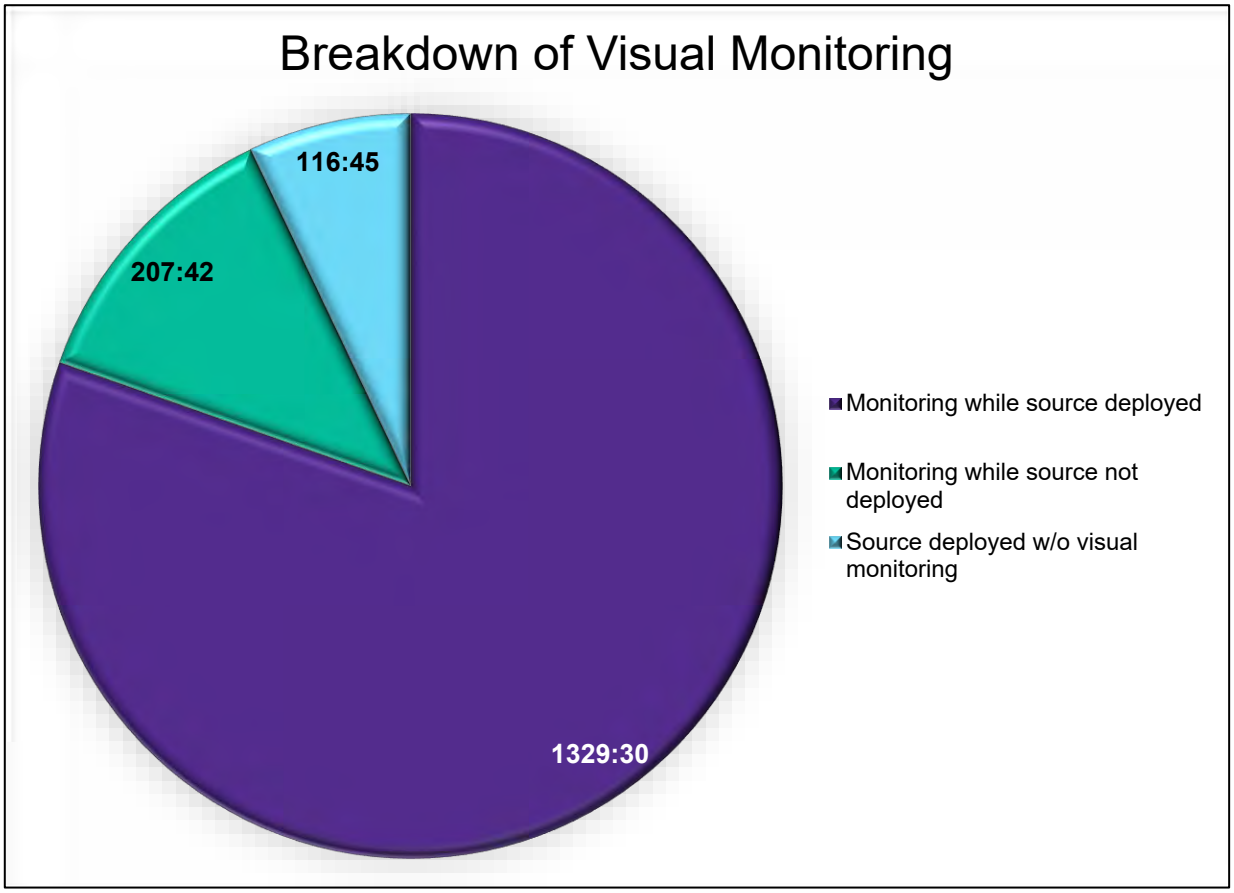

Figure 5: Breakdown of Visual Monitoring

Beaufort state was between two to six during the reporting period with visibility of more than five kilometers (km). with exception during times of rain when visibility was reduced to 2-5km for less than two hours. Swells were less than two and no more than four meters and glare from the sun was mostly moderate during the reporting period.

4.3 Mitigation Action Summary

There were no mitigation actions required during either part of this survey.

4.4 Wildlife Summary

There were 23 visual sightings; 13 detections of Common bottlenose dolphins, four detections of unidentified dolphins, two detections Short-finned pilot whale, one detection of Atlantic spotted dolphin, one detection of Pantropical spotted dolphin, one detection of green sea turtle, and one detection of loggerhead sea turtle. Figure 6 shows the distribution of the visual detections in the survey area.

The detection information is provided in Table 2 for each visual sighting.

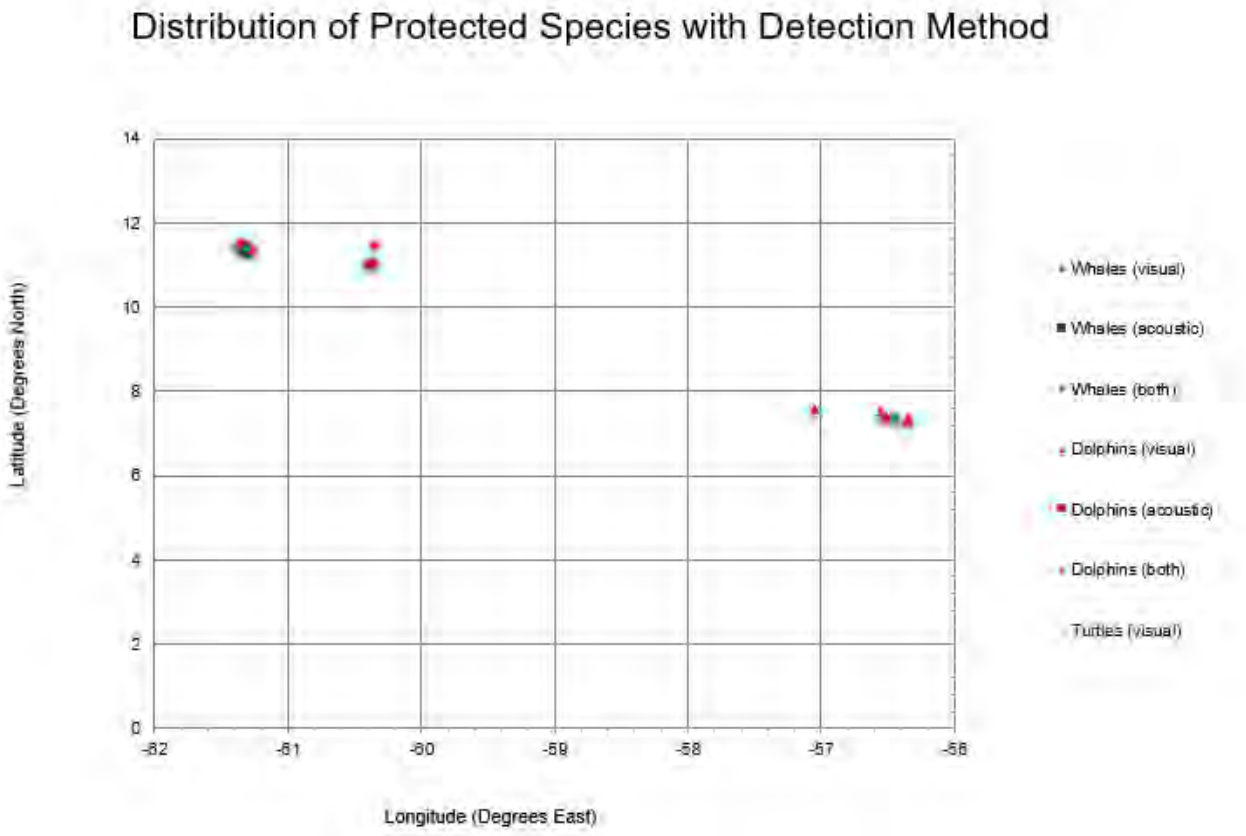

Figure 6: Distribution of protected species during the survey.

LIST OF BIODIVERSITY FOUND WITHIN THE SHELL BEACH AREA

AVIFAUNA OF SHELL BEACH

Source: Mendonca, Sean, Michelle Kalamandeen, and Robin S. McCall. 2006. A Bird's Eye View: Coastal Birds of Shell Beach. Proceedings of International Conference on the Status of Biological Sciences in Caribbean and Latin American Societies.

Scientific Name	Common Name
Actitis macularia	Spotted Sandpiper
Agelaius icterocephalus	Yellow-hooded Blackbird
Amazilia chionopectus	White-Chested Emerald
Amazilia fimbriata	Glittering-throat Emerald
Amazilia spp.	Amazilia Hummingbird
Amazona amazonica	Orange-winged Parrot
Amazona ochrocephala	Yellow-crowned Parrot
Anhinga anhinga	Anhinga
Ara ararauna	Blue & Gold Macaw
Ara chloropterus	Red & Green Macaw
Ara manilata	Red-bellied Macaw
Ara nobilis	Red-shouldered Macaw
Aramides cajanea	Gray-necked Woodrail
Ardea alba	Great Egret
Ardea cocoi	Cocoi Heron
Ardei cocoi	White-necked Heron
Arenaria interpres	Ruddy Turnstone
Arundinicola leucocephala	White-headed Marsh Tyrant
Asturina nitida	Gray Hawk
Attila spadiceus	Bright-rumped Attila
Bubo virginianus	Great Horned Owl
Bubulcus ibis	Cattle Egret
Busarellus nigricollis	Black-collared Hawk
Buteo magnirostris	Roadside Hawk
Buteogallus aequinoctialis	Rufous Crab-hawk

[1] In instances where either scientific or common names were not included in the source document, they have been included where possible.

Scientific Name	Common Name
Buteogallus anthracinus	Common Black Hawk
Butorides striatus	Striated Heron
Cacicus cela	Yellow-rumped Cacique
Cacicus haemorrhous	Red-rumped Cacique
Cairina moshata	Muscovy Duck
Calidris minutilla	Least Sandpiper
Calidris pusilla	Semipalmated Sandpiper
Camptostoma obsoletum	Southern beardless Tyrannulet
Campylopterus largipennis	Gray-breasted Sabrewing
Cathartes aura	Turkey Vulture
Cathartes burrovianus	Yellow-headed Vulture
Celeus flavus	Cream-colored Woodpecker
Cercomacra spp	Slaty Antwren
Cercomacra tyrannina	Dusky Antshrike
Certhiaxis cinnamomea	Yellow-throated Spinetail
Certhiaxis cinnamomea	Yellow-chinned Spinetail
Ceryle torquata	Ringed Kingfisher
Charadrius collaris	Collared Plover
Charadrius wilsonia	Wilson's Plover
Chelidoptera tenebrosa	Swallow-wing Puffbird
Chlorestes notatus	Blue-chinned Sapphire
Chloroceryle aenea	American Pygmy Kingfisher
Chloroceryle aenea	Pygmy Kingfisher
Chloroceryle amazona	Amazon Kingfisher
Chloroceryle americana	Green Kingfisher
Chloroceryle inda	Green & Rufous Kingfisher
Chlorophanes spiza	Green Honeycreeper
Ciconia maguari	Maguari Stork
Circus buffoni	Long-winged Harrier
Cissopis leveriana	Magpie Tanager
Claravis prestiosa	Blue Ground-dove
Coccyzus melacoryphus	Dark-billed Cuckoo
Cochlearius cochlearius	Boat-billed Heron
Coereba flaveola	Bananaquit
Columba plumbea	Plumbeous Pigeon
Columba subvinacea	Ruddy Pigeon
Columbina talpacoti	Ruddy Ground-dove
Conirostrum bicolor	Bicolored Conebill
Conirostrum leucogenys	White-eared Conebill
Coragyps atratus	Black Vulture
Crotophaga ani	Smooth-billed Ani
Crotophaga major	Greater Ani

Scientific Name	Common Name
Cyanocorax cayanus	Cayenne Jay
Cymbilaimus lineatus	Fasciated Antshrike
Daptrius ater	Black Caracara
Dendrocyna autumnalis	Black-bellied Whistling-duck
Dendrocyna longicauda	Long-tailed Woodcreeper
Dendroica aestiva	Yellow Warbler
Dryocopus lineatus	Lineated Woodpecker
Egretta caerulea	Little Blue Heron
Egretta thula	Snowy Egret
Egretta tricolor	Tricolored Heron
Elaenia flavogaster	Yellow-bellied Elaenia
Elanoides forficatus	Swallow-tailed Kite
Elanus leucurus	White-tailed Hawk
Eudocimus ruber	Scarlet Ibis
Euphonia violacea	Violaceous Euphonia
Eurypga helias	Sunbittern
Falco peregrinus	Peregrine Falcon
Falco rufigularis	Bat Falcon
Falco sparverius	American Kestrel
Fluvicola pica	Pied Water-tyrant
Formicarius analis	Black-faced Ant-thrush
Frederickena viridis	Black-throated Antshrike
Fregata magnificens	Magnificent Frigatebird
Galbula albirostris	Yellow-billed Jacamar
Geranospiza caerulescens	Crane Hawk
Glaucis hirsuta	Rufous-breasted Hermit
Glyphorynchus spirurus	Wedge-billed wood creeper
Harpia harpyja	Harpy Eagle
Heliornis fulica	Sun Grebe
Herpetotheres cachinnans	Laughing Falcon
Hirundo rustica	Barn Swallow
Hoploxypterus cayanus	Pied Plover
Ibycter americanus	Red-throated Caracara
Icterus chrysocephalus	Moriche Oriole
Icterus nigrogularis	Yellow Oriole
Jacana jacana	Wattled Jacana
Larus atricilla	Laughing Gull
Leptotila rufaxilla	Gray-fronted Dove
Leptotila verreauxi	White-tipped Dove
Lipaugus vociferans	Screaming Piha
Lophotriccus galeatus	Helmeted Pygmy-tyrant
Manacus manacus	White-bearded Manakin

Scientific Name	Common Name
Megarynchus pitangua	Boat-billed Flycatcher
Melanerpes cruentatus	Yellow-tufted Woodpecker
Mesembrinibis cayennensis	Green Ibis
Micrastur ruficollis	Barred Forest-falcon
Milvago chimachima	Yellow-headed Caracara
Momotus momota	Blue-crowned Motmot
Morphnus guianensis	Crested Eagle
Myiarchus ferox	Short-crested Flycatcher
Myiarchus swainsoni	Swainson's Flycatcher
Myiodynastes maculatus	Streaked Flycatcher
Myiopagis gaimardi	Forest Elaenia
Myiozetetes cayanensis	Rusty-margined Flycatcher
Myrmceciza atrothorax	Black-throated Antbird
Myrmornis torquata	Wing-banded Antbird
Myrmotherula brachyura	Pygmy Antwren
Numenius phaeopus	Whimbrel
Nyctanassa violacea	Yellow-crowned Night-heron
Nyctibius grandis	Great Pootoo
Nycticorax nycticorax	Black-crowned Night-heron
Nyctidromus albicollis	Common Paraque
Odontophorus gujanensis	Marbled Woodquail
Ortalis motmot	Little Chacalaca
Oryzoborus angolensis	Chestnut-bellied Seedeater
Otus choliba	Tropical Screech-owl
Pandion haliaetus	Osprey
Pelecanus occidentalis	Brown Pelican
Penelope jacquacu	Spix's Guan
Phaeothlypis flaveola	River Warbler
Phaethornis superciliosus	Longtailed Hermit
Phaetusa simplex	Large-billed Tern
Phalacrocorax brasilianus	Neotropical Cormorant
Philohydor lictor	Lesser Kiskadee
Phoenicopterus ruber	American Flamingo
Piaya cayana	Squirrel Cuckoo
Piaya melanogaster	Black-bellied Cuckoo
Piaya minuta	Little Cuckoo
Picumus spp	Piculet
Pionus menstruus	Blue-headed Parrot
Pipile pipile	Common Piping-guan
Pipra aureola	Crimson-hooded Manakin
Pitangus sulphuratus	Greater Kiskadee
Pitylus spp	Grosbeak

Scientific Name	Common Name
Porzana carolina	Sora Crake
Progne chalybea	Gray-breasted Martin
Psarocolius decumanus	Crested Oropendula
Psarocolius viridis	Green Oropendula
Pteroglossus aracari	Black-necked Aracari
Pulsatrix perspicillata	Spectacled Owl
Querula purpurata	Purple-throated Fruitcrow
Quiscalus lugubris	Carib Grackle
Ramphastos tucanus	Red-billed Toucan
Ramphastos vitellinus	Channel-billed Toucan
Ramphocelus carbo	Silver-beaked Tanager
Rostrhamus sociabilis	Snail Kite
Rynchops niger	Black Skimmer
Sakesphorus canadensis	Black-crested Antshrike
Saltator coerulescens	Grayish Saltator
Sarcoramphus papa	King Vulture
Scaphidura oryzivora	Giant Cowbird
Seiurus noveboracensis	Northern Waterthrush
Sterna anaethetus	Bridled Tern
Sterna antillarum	Least Tern
Sterna maxima	Royal Tern
Sterna nilotica	Gull-billed Tern
Sterna superciliaris	Yellow-billed Tern
Sturnella militaris	Red-breasted Blackbird
Sublegatus arenarum	Northern Scrub-flycatcher
Tachornis squamata	Fork-tailed Palm-swift
Tachycineta albiventer	White-winged Swallow
Tachyphonus rufus	White-lined Tanager
Tangara mexicana	Turquoise Tanager
Tapera naevia	Striped Cuckoo
Thamnophilus doliatus	Barred Antshrike
Thamnophilus murinus	Mouse-coloured Antshrike
Thraupis episcopus	Blue-gray Tanager
Thraupis palmarum	Palm Tanager
Thryothorus coraya	Coraya Wren
Thryothorus leucotis	Buff-breasted Wren
Tiaris obscura	Dull-colored Grassquit
Tigrisoma lineatum	Rufescent Tiger Heron
Tinamus major	Great Tinamou
Todirostrum cinereum	Common Tody Flycatcher
Todirostrum maculatum	Spotted Tody Flycatcher
Tringa flavipes	Lesser Yellowlegs

Scientific Name	Common Name
Tringa melanoleuca	Greater Yellowlegs
Tringa solitaria	Solitary Sandpiper
Troglodytes aedon	Southern House Wren
Trogon viridis	White-tailed Trogon
Turdus leucomelas	Pale-breasted Thrush
Tyrannus dominicensis	Gray Kingbird
Tyrannus melancholicus	Tropical Kingbird
Tyrannus savana	Fork-tailed Flycatcher
Vanellus chilensis	Southern Lapwing
Vireo olivaceus	Red-eyed Vireo
Volatinia jacarina	Blue-black Grassquit
Xiphorhynchus guttatus	Buff-throated Woodcreeper

HERPETOFAUNA OF SHELL BEACH

Sources: (1) Kalamandeen, Michelle and Phillip DaSilva. 2005. A Preliminary Survey of the Herpetofauna of Shell Beach. Biodiversity and Conservation Studies in Guyana: Volume 2.

Reptiles

Scientific Name	Common Name
Ameiva ameiva	Ameiva Lizard
Anolis sp.	Anolis Lizard
Bothrops atrox	Labaria
Caiman crocodilus	Spectacled Caiman
Chelonia mydas	Green Turtle
Cnemidophorus gramivagus	Whiptail Lizard
Cnemidorphous lemniscatus	Rainbow Whiptail Lizard
Constrictor constrictor	Boa Constrictor
Corallus hortulanus	Cook's Tree-boa
Dermochelys coriacea	Leatherback Turtle
Drymarchon corais	Tiger Snake
Eretmochelys imbricata	Hawksbill Turtle
Eunectus marinus	Anaconda
Gonatodes humeralis	Trinidad Gecko
Gonatodes sp.	Gecko
Helicops angulatus	Water Labaria
Hydropis sp.	Sea Snake
Iguana iguana	Green Iguana
Kentropyx calcarata	Striped Forest Whiptail
Kinosternon scropiodes	Mud Turtle
Leptotyphlops sp.	Blind Snake
Liophis cobella	Water Snake
Mabuya mabuya	Mabuya
Plica plica	Tree Lizard
Rhinoclemmys punctularia	Labaria Turtle
Thecadactylus rapicauda	Turnip-tailed Gecko
Tupinambis negropunctatus	Tegu

Amphibians

Scientific Name	Common Name
Dendrosophus marmorata	Marbled Treefrog
Dendrosophus minuta	Lesser Treefrog
Hyla crepitans	Emerald-eyed Treefrog
Hyla spp1	Treefrog sp.
Hyla spp2	Treefrog sp.
Hyla spp3	Treefrog sp.
Hyla spp4	Treefrog sp.
Leptodactylus mystaceus	Basin White-lipped Frog
Leptodactylus sp.	White-lipped Frog sp.
Pipa pipa	Suriname Toad
Psuedes paradox	Paradox Frog
Rhinella marina	Cane Toad
Scinax ruber	Red-snouted Treefrog

MAMMALS OF SHELL BEACH

Sources: (1) Kalamandeen, Michelle and Phillip DaSilva. 2005. A Preliminary Survey of the Herpetofauna of Shell Beach. Biodiversity and Conservation Studies in Guyana: Volume 2.

(2) Prince, Waldyke, Michael Patterson, Floria Francis, Romeo De Freitas, and David Rodriques. 2004. Shell Beach Biodiversity Assessment: a Summary Report

Scientific Name	Common Name
Alouatta macconnelli	Red Howler Monkey
Artibeus obscurus	Dark Fruit-eating Bat
Artibeus sp.	Neotropical Fruit Bat sp.
Artibeus spp 2	Neotropical Fruit Bat sp.
Ateles paniscus	Spider Monkey
Bradypus tridactylus	Three-toed Sloth
Cebus olivaceus	Wedge-capped capuchin
Cebus paella	Brown Capuchin
Dasyprocta leporina	Agouti
Eira Barbara	Tayra
Glossophaga soricina	Common long-tongued Bat
Inia geoffrensis	Porpoise
Lontra longicaudis	Southern River Otter
Nasua nasua	Coati
Noctilio leporinus	Bulldog Bat
Panthera onca	Jaguar
Pithecia pithecia	White-face Saki
Procyon cancrivorus	Raccoon
Pteronura brasiliensis	Giant River Otter
Saccopteryx bilineata	Two-lined Riverside Bat
Saimiri sciureus	Squirrel Monkey
Tamandua tetradactyla	Southern Tamandua
Trichechus manatus	Manatee
Unidentified genera	Deer
Unidentified genera	Long-nosed Bat
Unidentified genera	Rat
Uroderma bilobatum	Common Tent-making Bat

FISHES OF SHELL BEACH

Sources: (1) Kalamandeen, Michelle and Phillip DaSilva. 2005. A Preliminary Survey of the Herpetofauna of Shell Beach. Biodiversity and Conservation Studies in Guyana: Volume 2.

(2) Prince, Waldyke, Michael Patterson, Floria Francis, Romeo De Freitas, and David Rodriques. 2004. Shell Beach Biodiversity Assessment: a Summary Report

Scientific Name	Common Name
Anableps anableps	Foureye
Anableps sp[2]	Blinker
Bagre marinus	Catfish
Batrachoides surinamensis	Pacu
Bothus ocellatus	Flounder
Boulengerella cuvieri	Swordfish
Brycon falcatus	Curimai
Caranx hippos	Couvalli
Cathorops spixii	Spring Courass
Centropomus undecimalis	Snook
Chaetodipterus sp.	Spadefish
Cichla ocellaris	Lukanani
Cichlasoma sp.	Patwa
Crenicichla sp.	Sunfish
Cynoscion ocoupa	Grey Snapper
Cynoscion virescens	Trout
Rhinoptera bonasus	Cownose Stingray
Dasyatis sp.	Stingray
Diapterus rhombeus	Sea Patwa
Epinephelus itajara	Jewfish
Genyatremus luteus	Annafoke
Heptranchias perlo	Sharpnose Sevengill Shark
Sciades parkeri	Gillbacker
Hexanematichthys proops	Kokwari
Hoplerythrinus unitaeniatus	Yarrow
Hoplias malabaricus	Houri
Hoplosternum sp.	Hassa
Hypophthalmus edentatus	Highwater
Hypostomus sp	Seahassa
Lobotes surinamensis	Paggie
Lutjanus campechanus	Red Snapper
Lutjanus griseus	Gray Snapper

[2] Presumed to be of the Anableps genus

Scientific Name	Common Name
Macrodon ancylodon	Bangamary
Manta birostris	Manta Ray
Megalops atlanticus	Cuffum
Mugil cephalus	Mullet
Mugil liza	Quamina
Myleus rubripinnis	Katabac
Nebris microps[3]	Butterhead
Notarius grandicassis	Tampocker
Oncorhynchus mykiss	Rainbow Trout
Paralonchurus brasiliensis	Banded Croaker
Parauchenipterus galeatus	Imeri
Pimelodus blochii	Cassi
Plagioscion sp	Basha
Plagioscion squamosissimus	Crocrer Basha
Poecilia reticulata	Guppy
Pomacanthus arcuatus	Grey Anglefish
Pseudodoras (Oxydoras) niger	Yadaro
Sciades parkeri	Gillbacker
Sciades passany	Cuma Cuma/Black Cuirass[4]
Sciades proops	Hardhead Cuirass
Scomberomorus brasiliensis	Mackerel
Serrasalmus rhombeus	Black Pirai
Stellifer rastrifer	Rockhead
Unidentified genera	Cock-a-net
Unidentified genera	Wabaru

[3] Presumed to be butterfish
[4] Presumed to possibly be Mud Cuirass

PLANTS OF SHELL BEACH

Sources: (1) Kalamandeen, Michelle and Phillip DaSilva. 2005. A Preliminary Survey of the Herpetofauna of Shell Beach. Biodiversity and Conservation Studies in Guyana: Volume 2.

(2) Prince, Waldyke, Michael Patterson, Floria Francis, Romeo De Freitas, and David Rodriques. 2004. Shell Beach Biodiversity Assessment: a Summary Report

Scientific Name	Common Name
Avicennia germinans	Black Mangrove
Canavalia rosea	Bay Bean/Horse Bean/Sea Bean
Carapa guianensis	Crab-wood
Carica papaya	Papaya
Cecropia sp.	Cecropias sp.
Ceiba pentandra	Kapok
Chrysobalanus sp.	Kaunta
Cissus verticillatus	Grapevine sp.
Cocos nucifera	Coconut
Cucurbita moschata	Squash
Cuscuta umbellata	Flatglobe Dodder
Cyperus sp.	Flatsedge/Nutsedge sp.
Eperu falcata	Soft Wallaba
Eschiwella sp.	Kakaralli
Euterpe sp.	Manicole
Goupia glabra	Kabukalli
Guilandina bonduc	Grey Nicker/Nickar Bean
Hibiscus pernambucensis	Sea Hibiscus
Ipomoea pes-caprae	Beach Morning Glory
Jatropha gossypiifolia	Bellyache-bush/Black Physicnut
Languncularia racemose	White Mangrove
Manihot esculenta	Cassava
Mauritia flexuosa	Ite Palm
Mora excelsa	Mora
Morindra citrifolia	Noni
Parahancornia sp.	Dukalli
Pterocarpus sp.	Corkwood
Rhizophora mangle	Red Mangrove
Sesuvium portulacastum	Shoreline Purslane
Terminalia catappa	Almond
Thespesia populnea	Portia Tree

MACROINVERTEBRATES OF SHELL BEACH

Source: Kalamandeen, Michelle and Phillip DaSilva. 2005. A Preliminary Survey of the Herpetofauna of Shell Beach. Biodiversity and Conservation Studies in Guyana: Volume 2.

Scientific Name	Common Name
Aratus pisonii	Tree Crab
Atta sp.	Machusi Ant
Avicularia sp.	Tarantula
Cardisoma guanhumi	Bundari Crab
Danaus plexipus	Monarch Butterfly
Euedes sp.	Butterfly
Euptichia sp.	Buttefrly
Eurema sp.	Butterfly
Morpho menelaus	Blue Morpho Butterfly
Ocypode quadrata	Ghost Crab
Parides sp.	Butterfly
Thelpusa sp.	Grasshopper
Minuca rapax	Fiddler Crab
Unidentified genera	Ladybug
Unidentified genera	Millipede
Unidentified genera	Mosquito
Unidentified genera	Roach
Unidentified genera	Sand Wasp
Unidentified genera	Scorpion
Unidentified genera	Spider
Unidentified genera	Bee
Unidentified genera	Field Cricket
Unidentified genera	Fly
Unidentified genera	Centipede
Unidentified genera	Coconut Worm
Unidentified genera	Dragonfly

SUPPLEMENT 1: ADDITIONAL AVIFAUNA DOCUMENTED DURING 3–13 APRIL 2018 COASTAL BIRD SURVEY IN REGION 1 AND 24-25 JANUARY 2019 NEARSHORE BIRD SURVEY IN REGION 1

Additional bird species (other than those listed in the above table *Avifauna of Shell Beach*) were observed during an April 2018 coastal bird survey conducted in Region 1 that was conducted in coordination with coastal mapping and ecosystem services work and a January 2019 nearshore bird survey conducted within 5 kilometers of the shoreline in Region 1 up to the mouth of the Waini River. The April 2018 and January 2019 surveys did not replicate the survey that produced the observations in the table above (*Avifauna of Shell Beach*) in terms of survey area or level of effort. In addition, some of the observations reflected in the April 2018 survey were made some distance inland of Shell Beach. However, as all observations from the April 2018 and January 2019 surveys were collected within 20 kilometers from the coastline of Shell Beach, it is considered reasonably possible that these species could be present at times within the Shell Beach Protected Area.

Scientific Name	Common Name
Arremon taciturnus	Pectoral Sparrow
Atalotriccus pilaris	Pale-eyed Pygmy-tyrant
Attila cinnamomeus	Cinnamon Attila
Buteo nitidus	Grey-lined Hawk
Buteogallus urubitinga	Great Black Hawk
Caracara cheriway	Crested Caracara
Cathartes burrovianus	Lesser Yellow-headed Vulture
Cathartus melambrotus	Greater Yellow-headed Vulture
Celeus elegans	Chestnut Woodpecker
Chaetura cinereiventris	Gray-rumped Swift
Columba livia domestica	Rock Pigeon
Columbina passerina	Common Ground-Dove
Diopsittaca nobilis	Northern Red-shouldered Macaw
Euphonia finschi	Finsch's Euphonia
Eupsittula pertinax	Brown-throated Parakeet
Geothlypis aequinoctialis	Masked Yellowthroat
Glabula galbula	Green-tailed Jacamar
Hylophilus pectoralis	Ashy-headed Greenlet
Hylophilus thoracicus	Lemon-chested Greenlet
Hypocnemoides melanopogon	Black-chinned Antbird
Ictinia plumbea	Plumbeous Kite
Legatus leucophaius	Piratic Flycatcher
Leptodon cayanensis	Gray-headed Kite

Scientific Name	Common Name
Lophornis ornatus	Tufted Cocquette
Mimus gilvus	Tropical Mockingbird
Molothrus bonariensis	Shiny Cowbird
Mycteria americana	American Woodstork
Myiarchus tyrannulus	Brown-crested Flycatcher
Myiothlypis rivularis	Riverbank Warbler
Myrmotherula axillaris	White-flanked Antwren
Myrmoborus leucophrys	White-browed Antbird
Patagioenas cayennensis	Pale-vented Pigeon
Phaeomyias murina	Mouse-colored Tyrannulet
Phaethornis ruber	Reddish Hermit
Rhamphastus tucanus	White-throated Toucan
Rhytipterna simplex	Grayish Mourner
Rupornis magnirostris	Zone-tailed Hawk
Sclateria naevia	Silvered Antbird
Sporophila lineola	Lined Seedeater
Sporophila minuta	Ruddy-breasted Seedeater
Sterna sandvicensis	Sandwich Tern
Synallaxis albescens	Pale-breasted Spinetail
Tachornis squamata	Neotropical Palm-swift
Tachyphonus luctuosus	White-shouldered Tanager
Thalurania furcata	Fork-tailed Woodnymph
Tityra cayana	Black-tailed Tityra
Tyrannulus elatus	Yellow-crowned Tyrannulet
Zimmerius acer	Guianan Tyrannulet
Oceanites oceanicus	Wilson’s Storm-Petrel

SUPPLEMENT 2: ADDITIONAL FISH SPECIES DOCUMENTED DURING 24–25 JANUARY 2019 NEARSHORE FISH SURVEY OF REGION 1

Additional fish species (other than those listed in the above table *Fishes of Shell Beach*) were recorded during a nearshore fish survey conducted in the nearshore zone (within 5 kilometers of the shoreline) of Region 1 in January 2019.

Scientific Name	Common Name
Albula vulpes	Bonefish
Amphiarius rugispinis	Softhead Sea Catfish
Anchoa spinifer	Spicule Anchovy
Anchoa sp.	Unidentified Anchovy
Bagre bagre	Coco Sea Catfish
Cathorops arenatus	White Spring Cariss
Centropomus ensiferus	Swordspine Snook
Micropogonias furnieri	Bashaw
Pseudauchenipterus nodosus	Cocosoda Catfish
Sciades couma	Sciades Sea Catfish

SUPPLEMENT 3: ADDITIONAL FISH SPECIES DOCUMENTED DURING OTHER SURVEYS

Additional fish species (other than those listed in the above table *Fishes of Shell Beach*) documented during various other fish surveys conducted between 1943–2017.

EXECUTIVE SUMMARY

In 2016, Esso Exploration and Production Guyana Limited (EEPGL) applied to the Guyana Environmental Protection Agency (EPA) for an Environmental Authorization for the Liza Phase 1 Development Project in the Stabroek Block, offshore Guyana. On 1 June 2017, the EPA approved the Environmental Impact Assessment submitted as part of the Application for Environmental Authorization and issued an Environmental Permit for the Liza Phase 1 Development Project. As a condition of the Environmental Permit, the Guyana EPA required EEPGL to "work with appropriate sea turtle conservation organizations and/or academia in Guyana and the region to expand existing sea turtle telemetry programs where practicable." Following on the initial success of sea turtle-related field research organized and completed in 2018, EEPGL decided to continue the program in 2019 even though such a continuation was not required as part of any permitting condition.

Since the early 1960s, four species of sea turtles have been documented nesting seasonally along the remote shores of the Shell Beach Protected Area (SBPA). This important terrestrial habitat is now protected under a Guyanese law (Protected Areas Act 2011) that, together with legislation protecting the turtles at sea (Fisheries Act 2002), strengthens conservation actions aimed at ensuring species survival. However, little information exists to date on Guyana's marine turtle populations at sea. Environmental Resources Management (ERM), EEPGL's environmental consultant, enlisted the assistance of Environmental Management Consultants (EMC) and the Chelonian Research Institute to develop a scope of study, engage with appropriate entities, and conduct the field work for a sea turtle tracking and telemetry program to satisfy the above-referenced Environmental Permit condition. The methodology for the program was developed in partnership with local entities to build on prior work conducted in Guyana and elsewhere in the Caribbean region. It represents current best practice in terms of minimizing stress to turtles, minimizing potential disruption of their reproductive behaviors, and supporting data acquisition objectives. The goal of this study was to obtain empirical data focused on characterizing the turtles' inter-nesting and movement behaviors in both the horizontal (spatial) and vertical (depth) dimensions, with the potential for capturing their migrations to foraging grounds.

The 2018 Expedition included two deployments to the SBPA. The first deployment was undertaken from 21 to 27 March 2018; the second deployment was undertaken from 8 to 14 June 2018. A third mobilization to the SBPA ("the 2019 Expedition") was conducted from 7 to 17 May 2019. The field teams worked in close collaboration with Protected Areas Commission (PAC) rangers and local community members during all field activities in the SBPA. Pursuant to the permits issued by the PAC, the details of the three deployments and preliminary analyses of the telemetry data were submitted to the PAC in a series of four reports issued from May 2018 to May 2019. This report provides an expanded analysis of the tracking data obtained through mid-May 2020, when the last transmitter (of the two green turtles [*Chelonia mydas*] and five leatherback turtles [*Dermochelys coriacea]* tagged in 2019) ceased operating, as well as a

comprehensive summary of the data obtained from the 2018 and 2019 Expeditions and associated tracking.

Methodology, Data Acquisition, Processing, and Analyses

During the studies, nightly patrols of the northern-most section of the SBPA, known as Almond Beach, were carried out by PAC rangers to monitor the beach for sea turtle nesting. When a turtle was encountered, the rangers notified the rest of the awaiting team to approach. Rangers measured the turtle and checked for flipper tags, noting any scars or unique physical attributes. If no flipper tag was present, an Inconel tag was applied to the left front flipper (green turtles) or to a rear flipper (leatherbacks) to uniquely identify the turtle in future nesting events. Between 21 and 27 March 2018, four adult, female green turtles were tagged with satellite transmitters immediately after they had finished laying their eggs. Between 9 and 14 June 2018, three adult, female leatherback turtles were tagged with satellite transmitters, but attachment was done during egg deposition when the turtle was in a calm, trance-like state rather than upon completion of nesting. Between 7 and 17 May 2019, two adult, female green turtles were tagged with satellite transmitters after they had finished laying eggs. During this period, five adult, female leatherback turtles were tagged with satellite transmitters, but attachment was done during egg deposition rather than upon completion of nesting.

The information collected by the satellite tags was transmitted as encoded, fixed-frequency radio signals each time the turtle surfaced to breathe. Raw sensor data, such as dive profiles and Fastloc global positioning system (GPS) locations, were also transmitted through the Argos System, but required additional processing to decode the data. Processed and filtered data were then analyzed in the Albers Equal Area coordinate system using geographic information system (ArcGIS) and statistical (R) software programs.

Tag Performance

The quantity and quality of data received during satellite tracking is strongly influenced by the animal's behavior and this was evident among all 14 turtles tagged in this program. Data reception from all deployed transmitters exceeded expectations given the satellite coverage at Guyana's low latitude. Variability in data acquisition appeared to be related to movement behavior, producing similar numbers of locations, sensor data messages, and tag durations among green turtles. Leatherback data were more variable among individuals - likely to be directly related to tracking duration.

The tracking duration of all tag models was shorter than projected by battery life and programming alone. This could be due to a variety of factors such as animal behavior, biofouling, predation, incidental capture of the animal, antenna damage, discharged battery, or attachment failure. Incidental capture of the animal can probably be ruled out, as there was no sudden increase in a series of high-quality locations that are typically associated with an animal being on land or in a boat.

Inter-nesting Period

While all individuals showed strong nesting-site fidelity to their capture locations throughout this period, three different inter-nesting movement behaviors were identified:

1. Remained in the immediate vicinity of Almond Beach, making small near-shore loops;
2. Moved moderate distances up and down the Guyana-Venezuela coastline, making small near-shore loops; and
3. Moved large distances, making small near-shore loops in the vicinity of Almond Beach and larger offshore loops between Venezuela, Trinidad, and Guyana.

Turtles returned to nest between zero and six times, exclusively on Almond Beach, in typical intervals of approximately 12 days, with the exception of one green turtle (Violet), who also nested across the Barima-Waini river mouth and nested at longer time intervals than the other turtles. All turtles demonstrated remarkable nesting-site fidelity irrespective of their maximum displacements among nests. With respect to the size of the area used by the turtles during the inter-nesting period, there were no significant differences between species or among individuals; however, the leatherback turtles occupied waters at a farther distance from shore during inter-nesting than the green turtles.

The greatest density of recorded green turtle locations during inter-nesting occurred in less than 5 meters of water and less than 10 meters for leatherback turtles. The leatherback turtles occupied deeper water (35 meters as an average for the 2018-tagged turtles and 91 meters as an average for the 2019-tagged turtles) than did the green turtles (7 meters as an average for the 2018-tagged turtles and 5 meters as an average for the 2019-tagged turtles). Green turtles recorded dives up to 16.7 meters whereas the leatherbacks recorded dives up to 202 meters, but data indicated that most dives were within the upper 20 meters of the water column.

Generally, the turtles' inter-nesting habitat use was concentrated within the territorial seas of Guyana in the immediate vicinity of Almond Beach, but also included the territorial seas of Venezuela and Trinidad. The three leatherbacks and one of the green turtles demonstrated more itinerant movement behaviors. Karin, a green turtle, exhibited the farthest movements during her inter-nesting period, extending along 261.7 kilometers of coastline, venturing 50 kilometers offshore of the Orinoco River Delta in Venezuela on one of her loops, and reaching the Port of Galeota on the Trinidad coastline on another. Julie was the only leatherback with a flipper tag scar, and so was likely not a neophyte nester. She displayed the most moderate offshore movements (54 kilometers from shore) among the leatherback turtles during the nesting season, traveling along 104.9 kilometers of coastline between Guyana and Venezuela and staying within the 50-meter bathymetric contour. Denise, a leatherback turtle, moved the farthest distance from shore (111 kilometers), crossing the 100-meter bathymetric contour during three inter-nesting loops that spanned 120.4 kilometers of shoreline, including both Guyana and Venezuela.

Migration Period

All of the turtles tagged in the 2018 Expedition retained their tags until the onset of the migration period, but tag performance was variable once the turtles left the nesting area. All the green turtles tagged in 2018 headed southeast to Brazil, following a near-shore corridor across an average distance of 2,485 kilometers; all the leatherback turtles initially headed directly out to sea in a northeasterly direction, but none were tracked to their foraging areas. Both green and leatherback turtles used deeper waters during their migration periods, as compared to the water depths used during other tracking periods. Both green turtles fitted with dive-sensors displayed deep dives of up to 60 meters before or after major river mouths (i.e., Essequibo River, Guyana; Corentyne River, Suriname; Amazon and Pará rivers, Mearima River/Arraial Bay, and Parnaíba River, Brazil). The leatherbacks dove deeper, but generally remained in the upper 500 meters of the water column.

Unlike in 2018, all of the turtles tagged during the 2019 Expedition were tracked from their nesting sites on Almond Beach to or near their foraging grounds. Both green and leatherback turtles used deeper waters during their migration period than in prior tracking periods. As in 2018, both green turtles tagged in 2019 also headed southeast to Brazil by following a near-shore corridor across an average distance of 2,696.5 kilometers. Two leatherback turtles tagged in 2019 initially headed directly out to sea in a northeasterly direction and the three others headed due north. The leatherbacks foraged in two areas, one off the coastal southeastern United States and another offshore the Canadian Maritime Provinces. The leatherbacks tended to dive deeper than the green turtles during their migration, including one surprisingly deep dive to 1,400 meters; however, similar to 2018, they generally remained in the upper 500 meters of the water column.

Foraging Period

Three of the green turtles tagged in 2018 were tracked to their ultimate foraging destination, which were determined to be foraging grounds in the State of Ceará, Brazil. Two of three turtles overlapped geographically in area, adjacent to the Mundaú River Estuary Environmental Protection Area. These three green turtles displayed similar foraging habitat use (area) and movements (dispersal from foraging centroid) among individuals, and their locations were at similar distances from shore as during the inter-nesting period, although water depths in the foraging area were slightly deeper. The fourth green turtle and all of the leatherbacks tagged in 2018 did not reach the foraging grounds during their tracking periods.

Of the turtles tagged in 2019, both green turtles were tracked to their ultimate foraging ground destination in Brazil. Two of the leatherbacks (Christine and Rhoda) migrated to the southeastern United States and remained in near-shore waters, moving up and down the coast – likely in search of jellyfish. The rest of the leatherbacks (Teij, Kari, and Regina) migrated to the continental shelf waters of Canada before turning and heading south again into the open ocean. In some cases, they remained in these areas for prolonged periods, but in others they moved to another site quickly, likely depending upon the availability of prey resources that they

encountered. The leatherback turtles tagged in 2019 concentrated their foraging dives in the upper 30 meters of the water column.

Conclusions

The results of this study provided a wealth of new information about the sea turtles that nest in Guyana. Although sample sizes were small, they provided the first look into the at-sea behaviors of green and leatherback turtles in this region and elsewhere in the Atlantic Basin. The SBPA is an important yet under-described nesting area for green and leatherback sea turtles that migrate to disparate foraging grounds in Brazil and the Caribbean region, and the North Atlantic, respectively. The study shows that turtles may remain in the inter-nesting zone for several months, venturing northwest into the territorial seas of Venezuela and Trinidad and Tobago, laying multiple clutches of eggs, and displaying strong site fidelity. Data indicate that green turtles stayed near the nesting beach, generally within the 5-meter isobath, while leatherbacks ranged farther offshore, generally on the continental shelf (200-meter depth), with occasional forays over the continental slope (around 1,000-meter depth). During this period, turtles remained primarily in the upper 10 meters of the water column near to shore, but leatherbacks made occasional forays within the continental shelf between nests. After nesting, green turtles followed a narrow migration corridor along the coastline, avoiding the effects of the opposing Guiana and North Brazil western boundary currents to arrive at shallow water seagrass foraging sites in northern Brazil, where they remained for extended, yet undefined, periods. Leatherback turtles dispersed into the high seas after nesting, taking an initial northeasterly course. Figures ES-1 and ES-2 display the paths recorded for the turtles tagged in 2018 and 2019 for green and leatherback turtles, respectively, focused on the area adjacent to Guyana's shoreline.

Transmitter life was the primary limitation in this study. While significant efforts were made to maximize tag retention and life (as well as data quality and quantity), additional preparation of all tags with a coat of a more reliable antifouling product prior to future deployments may help extend transmitters' operational endurance.

1. INTRODUCTION

Esso Exploration and Production Guyana Limited (EEPGL) retained a team of marine scientists, local experts, and environmental managers to conduct two research expeditions in Region 1 of Guyana in March and June 2018 to study the inter-nesting and at-sea behaviors of sea turtles at the Shell Beach Protected Area (SBPA). EEPGL retained the team for a third expedition in May 2019.

Sea turtles nest on land and exhibit natal philopatry[1], making this the most understood part of their life cycle. Since the early 1960s, under the pioneering field studies of Dr. Peter Pritchard—Chelonian Research Institute, four species of sea turtles have been documented to nest seasonally along the remote shores of the SBPA, including leatherback (*Dermochelys coriacea*), green (*Chelonia mydas*), hawksbill (*Eretmochelys imbricata*), and olive ridley (*Lepidochelys olivacea*) turtles. This important terrestrial habitat is now protected under Guyanese law (Protected Areas Act 2011) that, together with legislation protecting the turtles at sea (Fisheries Act 2002), strengthens conservation actions aimed at ensuring species survival. However, little information exists to date on the behavior of Guyana's marine turtle populations at sea.

The goal of this study was to provide empirical data on a cryptic aspect of these animals' lives. Specifically, the research design focused on characterizing the turtles' inter-nesting phenological[2] and movement behaviors in both the horizontal (spatial) and vertical (depth) dimensions, with the additional goal of tracking their migrations to foraging grounds. Due to turtles' exceptional dispersal capabilities and the unpredictability of encountering them at sea, the only way to gain such information is to deploy autonomous data tracking devices on wild animals. At present, this can be done at the only time and place when human beings can reliably expect to encounter them with a reasonable degree of predictability: when they come ashore to dig a nest and lay their eggs.

This report presents the methodology and results of the expeditions completed to tag turtles in at the SBPA in 2018 and 2019, and of the subsequent tracking of the tagged turtles during the 2018 to 2020 period.

1.1. Permitting and Regulatory Compliance

1.1.1. 2018 Expedition

As a condition of the Environmental Permit for the Liza Phase 1 Development Project, the Guyana Environmental Protection Agency (EPA) required EEPGL to "work with appropriate sea turtle conservation organizations and/or academia in Guyana and the region to expand existing sea turtle telemetry programs where practicable." Environmental Resources Management (ERM), EEPGL's environmental consultant, enlisted the assistance of The Ocean Foundation

[1] The tendency to return to their birthplace to breed
[2] Of or related to the timing of growth and breeding events

(specifically the Sea Turtle Census Initiative program) and Environmental Management Consultants (EMC) to consult with the Chelonian Research Institute and develop a scope of study, engage with appropriate entities, and conduct the field work for a sea turtle tracking and telemetry program. The methodology for the first year of study (referred to herein as the 2018 Expedition) was developed in partnership with local entities to build on prior work conducted in Guyana and elsewhere in the Caribbean region.

The 2018 Expedition included two deployments to the SBPA. The first deployment was undertaken from 21 to 27 March 2018; all field work was permitted through the Guyana Protected Areas Commission (PAC) and all conditions detailed in the PAC's "Letter of No Objection to ERM Conducting Turtle Telemetry Study in the Shell Beach Protected Area" dated 19 March 2018 were strictly followed. The second deployment was undertaken from 8 to 14 June 2018, for which all field work was conducted in accordance with the permit conditions detailed in the PAC's "No Objection to ERM Conducting 2nd Turtle Telemetry Study in the Shell Beach Protected Area" letter dated 31 May 2018 (PAC 2018). The field teams worked in close collaboration with PAC rangers and local community members during field activities in the SBPA. In accordance with the PAC's requirements, the details of the March and June 2018 deployments, along with preliminary analysis of the telemetry data for four green turtles and three leatherback turtles, were submitted to the PAC in separate reports in May 2018 (ERM 2018) and August 2018 (ERM and EMC 2018), respectively.

1.1.2. 2019 Expedition

Fieldwork continued in 2019 to build on the 2018 effort and increase the sample size for two sea turtle species. On behalf of EEPGL, ERM enlisted the assistance of EMC and scientists with the Chelonian Research Institute to refine the approach developed in 2018 and execute an additional round of tagging in the field. As was done in 2018, the methodology for the 2019 field effort (referred to herein as the 2019 Expedition) was developed in partnership with local entities. The field work component of the 2019 Expedition was undertaken from 7 to 17 May 2019 in accordance with a research permit providing Permission to Conduct Biodiversity Research from the EPA (Reference Number 050219 BR 008, dated 2 May 2019) (EPA 2019) in addition to a "Letter of No Objection" from the PAC dated 3 May 2019 (PAC 2019). All conditions in the EPA permit and the PAC letter were strictly followed. The field teams worked in close collaboration with PAC rangers and local community members during field activities in the SBPA.

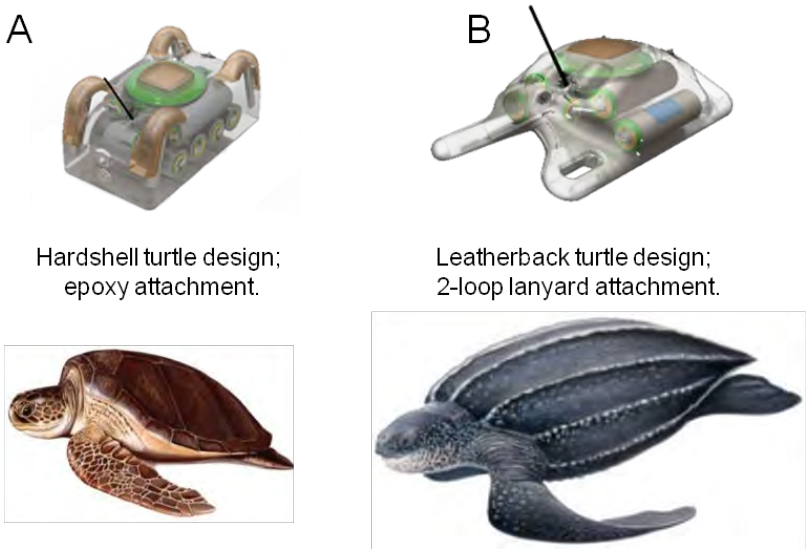
Pursuant to the letter of no objection issued by the PAC, the details of the 2019 Expedition, along with tagging information for two green turtles and five leatherback turtles, were submitted to the PAC in a report in late May 2019 (Stewart 2019).

2. METHODOLOGY

2.1. Tracking System Design

Wildlife Computers model MK10 SPLASH satellite transmitters were used to track sea turtles in this study and were programmed with species-specific behavioral configurations prior to going into the field. Satellite tag models were selected to enable species-specific attachment methodologies, and the tag model dictated the number and size of batteries encased in the mold (Figure 2-1). Furthermore, because there is a limit to the volume and frequency of data that can be transmitted through the Argos satellite system, the sampling rate of tags was set to balance the tradeoffs between successful transmissions, data acquisition, and battery life. All tags were programmed to transmit continuously (i.e., at all hours) and to produce Argos locations and haul-out[3] information. Half of the tags also transmitted locations derived using Fastloc GPS (global positioning system) technology, which has greater location accuracy but requires greater surface time to establish a location fix. The Fastloc tags were set to re-attempt GPS fixes at 3-hour intervals. The other half of the purchased tags transmitted dive information that was sampled at 10-second intervals and summarized into species-specific histogram bins over a 24-hour period, including depth (meters), duration (minutes), and temperature (degrees Celsius [°C]). These “dive-enabled” tags also transmitted hourly summaries of the percent dry time (i.e., surface intervals) every 24 hours, as well as time-series information summarized into 10-minute intervals.

Figure 2-1: Wildlife Computer Satellite Transmitter Designs



Note: Wildlife Computers satellite transmitters were designed to accommodate sea turtle species’ carapace morphologies and the attachment methodologies that are most appropriate to each species. A. Green turtle design MK10-BF-334 for epoxy attachment; mass 980 grams; 6 x lithium AA batteries. B. Leatherback turtle design MK10-BF-295 for 2-loop lanyard attachment; mass 233 grams; 4 x lithium AA batteries.

[3] Defined as more than 10 consecutive minutes dry (i.e., representing nesting, resting, or capture events)

To attach the transmitter tags to green turtles, a wooden box was assembled around the turtle after it had finished nesting to keep it on the beach during the lengthy transmitter attachment process, and a wet towel was placed over the animal's eyes to keep it calm. Rangers measured the turtle and checked for flipper tags, noting any scars or unique physical attributes. If no flipper tag was present, an Inconel tag was applied to the left front flipper to uniquely identify the turtle in future nesting events. The carapace was prepared for the transmitter attachment by washing it with fresh water and a scrub pad, removing epibionts,[4] sanding away any rough patches on the scute margins, and wiping it down with acetone. Two thin layers of cool-setting, two-part epoxy (Quickrete or Superbond) were then used to affix the transmitter to the two anterior vertebral scutes. For the initial expeditions, the pretreated transmitter and dried epoxy were then painted with antifouling paint (Torginol) before releasing the turtle. Based on findings of the 2018 Expedition, the transmitters for the 2019 Expedition were pretreated with Interlux InterProtect 2000E primer and three layers of Interlux Micron 66 antifouling paint. After the transmitters were affixed to the turtles and the epoxy had dried, the transmitters and epoxy were then painted with antifouling paint (Interlux Micron 66) before releasing the turtle.

Leatherbacks are far too large and powerful to be held on the beach in a box and epoxies do not adhere well to their "leathery" expandable carapace; therefore, rapid and direct attachment methods were required. Attachment was performed during egg deposition when the turtle was in a calm, trance-like state rather than upon completion of its nest. When located, rangers intercepted and measured the turtles, and checked for existing tags or scars (no flipper tags were identified). While the turtle was digging the egg chamber, the dorsal ridge of the carapace was cleaned with three treatments consisting of water, 70 percent isopropyl alcohol, and iodine. Following the deposition of three to four eggs, two 4.5-millimeter holes (10 centimeters apart, following treatment with topical analgesic) were drilled through the dorsal ridge at approximately two-thirds of the way posterior on the carapace using a cordless drill fitted with a sterile orthopedic drill bit. The drill holes were cleaned thoroughly using Vetericyn spray. Sterile plastic-coated wire lanyards were threaded through silicone Tygon tubing sheaths and inserted through the holes in the carapace. Equinox®35 fast-set silicone molding putty was mixed by hand and formed into a cushion that was placed between the dorsal ridge and the satellite transmitter. The wire lanyards were then threaded through the transmitter fittings, tightened, and secured with a metal crimp.

2.2. Field Expeditions

PAC rangers carried out nightly patrols (1900 to 0500 hours) of Almond Beach to monitor the beach for sea turtle nesting. When a turtle was encountered, the rangers notified the rest of the team with light signals to approach. During the June 2018 and May 2019 deployments, rangers were equipped with hand-held radios to relay information to the waiting team members. Care was taken to limit disturbance of wildlife and habitat during these patrols.

[4] Living organisms attached to the turtles, such as barnacles, bryzoans, algae, etc. These organisms must be removed to ensure secure attachment of the transmitters.

2.2.1. 2018 Expedition

Between 21 and 27 March 2018, four adult, female green turtles were tagged with satellite transmitters immediately after they had finished laying their eggs (Figure 2-2A and Figure 2-2B). The entire tagging process, from encounter to return to the water, took an average of 4.7 hours (+/- 0.3 hours) per turtle and occurred between 2000 and 0930 hours.

Figure 2-2: Sea Turtle Tagging at Almond Beach (March and June 2018)

Photos by CMM, KRS, and DC.

A. After nesting, green turtles were restricted to a wooden box during the multi-stage tag attachment procedure and shaded if the process extended past sunrise. B. Once the attachment was completed, the box was removed and the turtles were free to move down the beach. C. Leatherback turtles were tagged during nesting by threading wire lanyards through the dorsal ridge of the carapace. D. Attachment was complete before the turtle had begun covering the nest.

Between 9 and 14 June 2018, three adult female leatherback turtles were tagged with satellite transmitters (Figure 2-2C and Figure 2-2D). The entire tagging process, from encounter to attachment completion, took an average of 0.8 hours (+/- 0.5 hours) per turtle and occurred between 2140 and 0100 hours. In the case of the leatherbacks, the team did not wait to observe the turtle going back into the water because several turtles were encountered in rapid succession on the same night.

2.2.2. 2019 Expedition

Between 7 and 17 May 2019, two adult, female green turtles were tagged with satellite transmitters immediately after they had finished laying their eggs (turtle ID: Sadie) or after nesting attempt was abandoned (i.e., a false crawl; turtle ID: Michelle; Figure 2-3A). The entire tagging process, from encounter to return to the water, took an average of 3.5 hours per turtle (+/- 0.40) and occurred between 2333 and 0338 hours.

Figure 2-3: Sea Turtle Tagging at Almond Beach (May 2019)

Photos by NR and KRS

A. green turtle; B. leatherback turtle

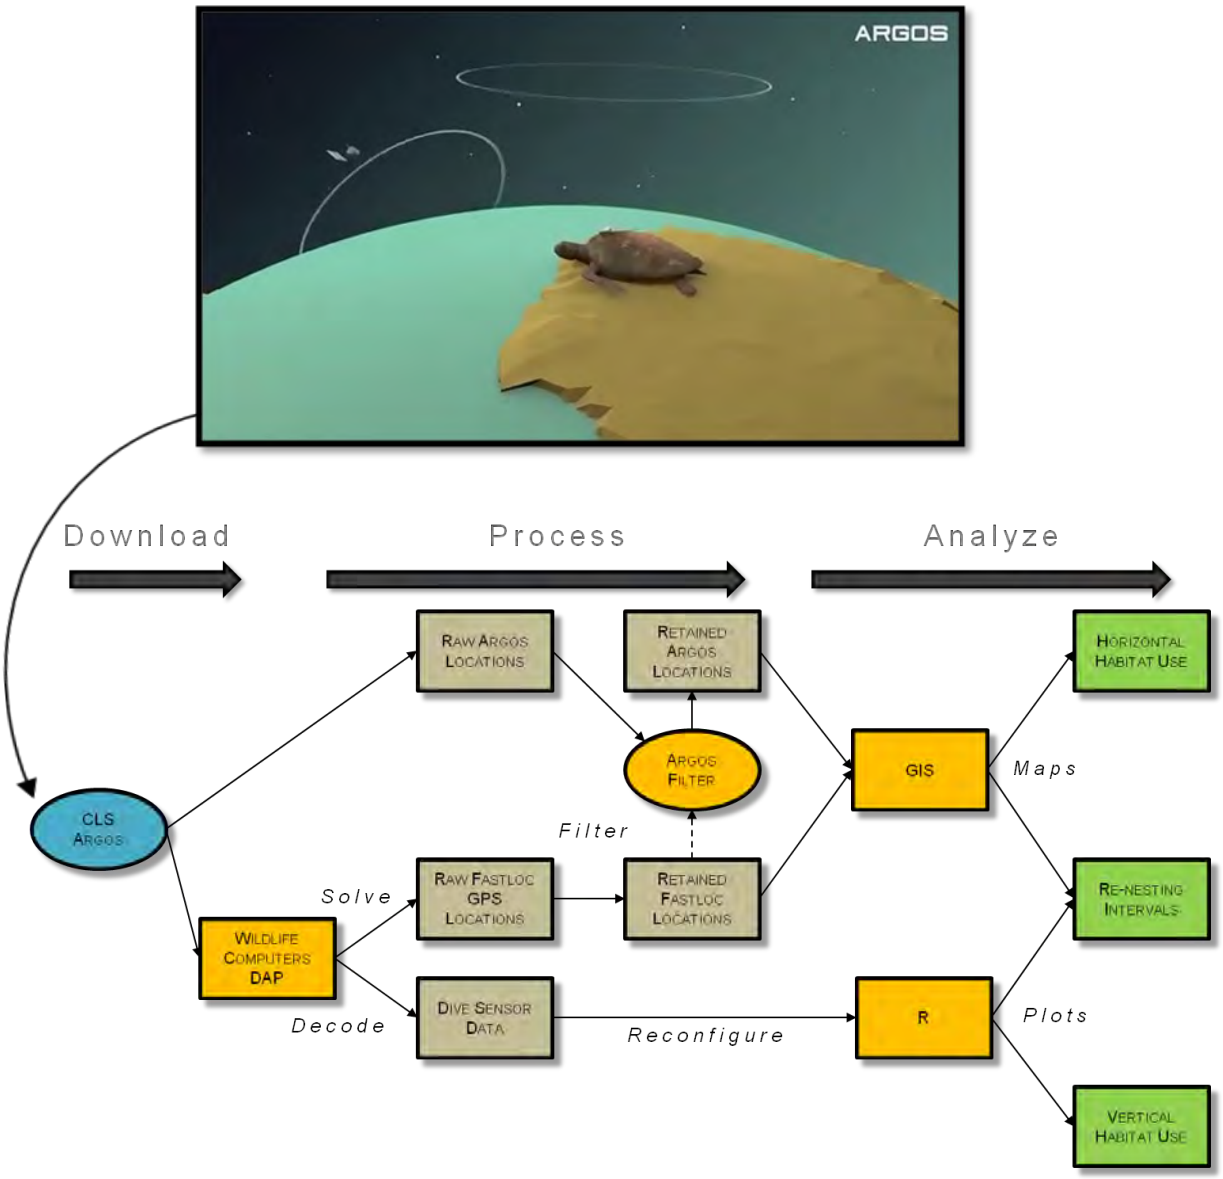
Between 7 and 17 May 2019, five adult female leatherback turtles were tagged with pretreated satellite transmitters. As described above, attachment of tags was done during egg deposition (Figure 2-3B). The entire process from encounter to attachment completion took an average of 1 hour (+/- 0.39) per turtle and occurred between 2045 and 0515 hours. As in the 2018 Expedition, the turtles were not always observed through the point of entering the water, but field workers did confirm later each night that each turtle had returned to the water successfully.

2.3. Data Acquisition, Processing, and Analyses

The satellite tracking and data relay system is operated by Collecte Localisation Satellites (CLS) Argos. The information collected by the satellite tag was transmitted as encoded, fixed-frequency radio signals each time the turtle surfaced to breathe. Data were only received if one of the polar-orbiting satellites equipped to receive Argos messages was passing overhead during this narrow window of time. Unlike GPS, which employs a constellation of fixed satellite positions to determine location, the Argos System uses Doppler Shift (i.e., the change in sound frequency) to calculate the estimated location of the signal. The Argos method resolves positions faster, but it is not without measurement error, resulting in varying levels of accuracy. Raw sensor data, such as dive profiles and Fastloc GPS locations, were also transmitted through the Argos System, but required additional processing through tag-manufacturer-specific software to decode the data (Figure 2-4). The best practices for wildlife tracking require filtering the raw location estimates through statistical algorithms before further analysis to remove implausible positions based on movement rates and turning angles. In this case, the high-precision GPS data were used to calculate site- and species-specific movement thresholds for setting the Argos location filtering algorithm. Fastloc GPS data were first filtered to remove locations derived from fewer than six satellites and with high residual errors. The hybrid Douglas Argos-Filter (Douglas et al. 2012) was then used on Argos locations, which optimally retains locations based on maximum redundancy thresholds (5 kilometers) and speed (5 kilometers per hour) and turning angle thresholds (25°) for migratory animals. Argos location estimates with error classes 2 and 3[5] were always retained, as were the first and last locations, and default parameter values were used for the hybrid method. Data were then analyzed in the Albers Equal Area coordinate system using geographic information system (ArcGIS) and statistical (R) software programs (Figure 2-4). Monthly mean ocean altimetry images[6] from the Global Ocean 1/12° Physics Analysis and Forecast dataset were downloaded from the Copernicus Marine Environment Monitoring Service website to evaluate movements in context with geostrophic[7] ocean currents. The final datasets were downloaded after all the tags had ceased transmissions.

[5] CLS Argos uses location class error codes that classify location estimates within a given distance from the true location. Location classes 2 and 3 have the highest estimated accuracy (less than 500 meters).
[6] Sea surface height, meridional, and zonal velocity
[7] Currents resulting from a balance between pressure gradients and Coriolis forces. Coriolis forces pertain to the rotation of currents that are deflected to the right in the northern hemisphere and to the left in the southern hemisphere.

Figure 2-4: Flow and Treatment of Sea Turtle Satellite Tracking Data for Addressing Specific Research Objectives



3. RESULTS

3.1. Tag Performance

3.1.1. 2018 Expedition

The quantity and quality of data received during satellite tracking is strongly influenced by the animal's behavior. For example, individual sea turtles undergoing long-distance forays spend more time at the surface due to physiological requirements (i.e., the physical exertion required to sustain swimming for long periods requires more rapid and deeper breathing), and they typically produce more frequent and higher-quality location fixes than those individuals remaining within a smaller area and making vertical dives. This pattern was evident among the seven turtles tagged in 2018 (Table 3-1 and Table 3-2).

Given the satellite coverage at Guyana's low latitude, data reception from all seven transmitters deployed in 2018 exceeded expectations. Variability in data acquisition from green turtles appeared to be related to movement behavior, producing similar numbers of locations (Table 3-1), sensor data messages (Table 3-2), and tag durations (163 +/- 19 days [mean +/- 1 standard deviation (SD)]; Table 3-1 and Table 3-3). Leatherback turtle data were more variable among individuals (Table 3-1 and Table 3-2); this variation is likely to be directly related to the wider range in total tracking days (60 +/- 44 days [mean +/- 1 SD]; Table 3-1 and Table 3-3).

Green turtle transmissions produced an average of 14.1 +/- 0.7 (mean +/- 1 SD) Argos location estimates and 6.1 +/- 0.7 (mean +/- 1 SD) Fastloc GPS locations per day per turtle over the tracking period (Table 3-1). Only 9 percent of green turtle Argos positions were classified as high quality (i.e., location classes 1, 2, or 3); however, most Argos locations were retained after the filtering process due to a less-conservative hybrid algorithm (95.3 +/- 0.5 percent [mean +/- 1 SD]). For leatherback turtles, there were an average of 11.5 +/- 2.6 (mean +/- 1 SD) Argos location estimates and 4.7 +/- 0.1 (mean +/- 1 SD) Fastloc GPS locations received per day per turtle over the tracking period (Table 3-1). Leatherback Argos positions had a greater proportion of high-quality locations (16 percent), but fewer Argos locations were retained after the filtering process (62.3 +/- 31 percent [mean +/- 1 SD]). The difference between the Argos locations received and retained by the filtering between species is likely due to the animals' movement behaviors and the number of satellites available by latitude (more at higher latitudes, fewer at lower latitudes). The number of Fastloc GPS locations retained after filtering was similar between green and leatherback turtles (76 +/- 4.2 percent and 73.5 +/- 9.2 percent [mean +/- 1 SD], respectively), reflecting the static availability of GPS satellites across the globe. Ultimately, movement metrics based on the filtered Argos locations were only slightly greater than those based on Fastloc GPS locations (Table 3-1).

Table 3-1: 2018-tagged Turtle Location Data and Movement Summary Statistics for Comparison among Individuals and between Location Estimation Methodologies

Turtle ID	Days of Tracking Data	Location Estimation Method	Total # of Locations Received	% of Locations Filtered Out	Convex Hull of Retained Locations (km^2)	Total Distance Traveled (km) [a]	Maximum Displacement (km)	Maximum Offshore Distance (km)

BR = Brazil; GF = French Guiana; GY = Guyana; km = kilometer; SR = Suriname; TT = Trinidad & Tobago; VE = Venezuela.

Note: Behavioral intervals were characterized by a change in heading and movement rates calculated from tracking data. “Clutches” indicates the total number of nests laid. “Days” indicates the number of days during the respective behavioral period (inter-nesting, migrating, and foraging) within the tracking period. “km Countries” indicates the approximate distance of coastline that was covered during the behavioral period and the countries whose territorial waters were involved.

[a] One of the green turtles and all of the leatherbacks did not reach foraging grounds during their tracking periods. It is generally believed that turtles do not feed during inter-nesting and migration periods.

Dive sensor information was received for a minimum of 76 percent of the data-days possible and included daily histogram summaries for depth and temperature, hourly summaries of percent dry time, and time series of dive and temperature profiles (Table 3-2). Haul-out information was received for each of the four green turtles and the three leatherback turtles via either haul-out or status messages[8]; this was a critical parameter for determining re-nesting events.

Tracking durations for the tags deployed in 2018 were shorter than what was projected by battery life and programming alone for both tag models. This could be due to a variety of factors, not limited to animal behavior, biofouling, predation, incidental capture of the animal, antenna damage, discharged battery, or attachment failure. It is impossible to positively identify the root cause of tag failure in each case; however, the data provided were examined in the status messages over the lives of the tags and the manufacturer was consulted to try to identify indications or rule out potential causes of the shorter-than-anticipated tracking durations. Examination of the data revealed no degradation in battery voltage, power of signal strength, or number of GPS satellite fixes in any of the tags, and all tags had made fewer than half of the total transmissions possible, allowing those issues to be ruled out.

There was some evidence from the wet/dry sensors that biofouling might have occurred, especially for Arleen, but perhaps also for Becky and Karin. Tags and epoxy affixed to green turtles were coated with antifouling paint during the attachment process. Leatherback tags were not painted because they typically swim faster and range farther offshore than green turtles, which tends to result in less biofouling in leatherbacks compared to green turtles. Sometimes, in cases of biofouling, a tag will stop transmitting for a period of time but then start up again when the fouling organism falls off or is scraped off on reefs, pilings, etc. However, none of the tags in this study started transmitting again once going offline.

All of the green turtle tags showed an increase over time in the minimum wet/dry sensor values, which has never been seen before by the tag manufacturer; they are currently consulting with the engineers for possible explanations. This did not occur with the leatherback tags.

Incidental capture of the animal can probably be ruled out as a cause, as there was no sudden increase in a series of high-quality locations that are typically associated with an animal being on land or in a boat. There was an indication given by a PAC ranger that one of the leatherback tags was having attachment issues (R. DeFreitas, personal communication). Only one of the two lanyards was still attached when the turtle came ashore to nest again, and an attempt was made to re-secure the tag at that time; however, we cannot be sure which animal it was since the leatherbacks were not flipper tagged. The first leatherback to stop transmitting was Julie, so it is reasonably likely that Julie was the animal with the attachment issues. More potential explanations associated with individual behavior are discussed in Sections 3.2 through 3.4.

[8] Wildlife Computers' tags send encoded information through the Argos System that indicate the health and overall condition of the tag based on a set of diagnostic data (e.g., battery voltage, thermistor status, timekeeping errors). These are called "status messages". Status messages are transmitted separately from the tracking data transmissions that occur on a pre-defined schedule. Both types of messages can indicate haul outs.

3.1.2. 2019 Expedition

Similar to the 2018 Expedition, data reception from all seven transmitters deployed in 2019 exceeded expectations given the satellite coverage at Guyana's low latitude. Variability in data acquisition appeared to be related to movement behavior among green turtles, producing similar numbers of Argos locations (2,378 ± 362; mean ± 1 SD; Table 3-4), sensor data messages (Table 3-5), and tag durations (173 ± 5 days; mean ± 1 SD; Table 3-4 and Table 3-6). Leatherback data were more variable among individuals for Argos locations (2,915 ± 1,578; mean ± 1 SD; Table 3-4) and sensor data (Table 3-5) and were likely to be directly related to the wider range in total tracking days in leatherbacks (218 ± 120 days; mean ± 1 SD; Table 3-4 and Table 3-6).

Green turtle transmissions produced an average of 13.8 (± 2.5; mean ± 1 SD) Argos location estimates and 5.4 (based on one tracker) Fastloc GPS locations per day per turtle over the tracking period (Table 3-5). Only 9 percent of green turtle Argos positions were classified as high-quality (i.e., location classes 1, 2, or 3); however, most Argos locations were retained after the filtering process due to a less-conservative hybrid algorithm (91 ± 0.0 percent; mean ± 1 SD). For leatherback turtles, there were an average of 13.4 (± 0.8; mean ± 1 SD) Argos location estimates and 4.4 (± 0.0; mean ± 1 SD) Fastloc GPS locations received per day per turtle over the tracking period (Table 3-4). Leatherback Argos positions had a higher number of high-quality locations (32 percent), but fewer Argos locations were retained after the filtering process (86.8 ± 2.9 percent; mean ± 1 SD). The difference between the Argos locations received and retained by the filtering between species is likely due to the animals' movement behaviors and the number of satellites available by latitude (more at higher latitudes, fewer at lower latitudes). The number of Fastloc GPS locations retained after filtering was similar between green and leatherback turtles (64 percent and 65 percent, respectively), reflecting the static availability of GPS satellites across the globe. Ultimately, movement metrics based on the filtered Argos locations were only slightly greater than those based on Fastloc GPS locations (Table 3-4).

Dive sensor information was received for a minimum of 84 percent of the data-days possible and included daily histogram summaries for depth and temperature, hourly summaries of the percent dry time, and time series of dive and temperature profiles (Table 3-5). Haul-out information was received for all green turtles and three out of five leatherback turtles in either haul-out or status messages.

BS = Bahamas; BR = Brazil; CA = Canada; GF = French Guiana; GP = Guadeloupe; GY = Guyana; SR = Suriname; TT = Trinidad & Tobago; US = United States; VE = Venezuela

Note: “Clutches” indicates the total number of nests laid. “Days” indicates the number of days during the respective behavior period (inter-nesting, migrating, and foraging) within the tracking period. “km Countries” indicates the approximate distance in kilometers of coastline that was covered during the period and the territorial waters of the countries involved.

Although shorter than projected by battery life and programming alone, transmitter endurance improved for the 2019-tagged turtles over the 2018-tagged turtles for both green turtles (2018: 163.5 ± 15.4 days, 2019: 172.5 ± 5 days; mean ± 1 SD) (χ^2= 0.214, df = 1, p = 0.643)[9] and leatherback turtles (2018: 60.3 ± 44.5 days, 2019: 218.4 ± 119.9 days; mean ± 1 SD) (χ^2= 3.756, df = 1, p = 0.053). For the 2019-tagged turtles, all satellite tags were pretreated (rather than just the green turtle tags, as in the 2018 Expedition) with a high-quality commercial antifouling paint (Interlux® Micron 66), and the leatherback attachment technique was changed to a single wire from a double wire, which resulted in a tighter attachment. Tracking losses could be due to a variety of factors, including animal behavior, biofouling, predation, incidental capture of the animal, antenna damage, discharged battery, or attachment failure. As in the case of the 2018-tagged turtles, the data provided in the status and Argos messages and the number of satellites available over the life of the tags deployed in 2019 were examined to determine or rule out potential causes. In all but one turtle (Teij), there was no degradation in battery voltage and all tags had made fewer than half of the total transmissions possible, so issues related to battery life may be ruled out. Similar to the 2018-tagged turtles, there was evidence of biofouling from the wet/dry sensors on the tags deployed in 2019 on green (Michelle and Sadie) and leatherback (Teij, Kari, and Rhoda) turtles. This was further indicated by decreases in the number of GPS satellites seen over time (Michelle and Teij) and in the power of the Argos signal strength (Rhoda).

Even though all tags were coated with antifouling paint, as was the epoxy during attachment for green turtles, the GPS antenna remains obligatorily exposed and the efficacy of the antifouling paint degrades over time and with ablation. As described above, a tag affected by biofouling will sometimes stop transmitting for a period of time but then start up again; however, none of the 2019-deployed tags came back online after ceasing transmissions (similar to the 2018-deployed tags). The tag information from the two turtles with the shortest tracking durations (Christine and Regina) did not indicate biofouling or any other problems. Although both turtles' final locations occurred in regions of known high fisheries activities in both United States and Canadian waters, respectively, we can also probably rule out incidental capture of these animals, as there was no sudden increase in a series of high-quality locations that are typically associated with an animal on land or on a boat. Christine was last recorded in the western edge of the Gulf Stream, which could have added shear stress on her transmitter.

Despite the fact that the actual transmitting period was shorter for both the 2018- and 2019-deployed tags than predicted by battery life and programming, the actual tracking durations of the turtles in this study are within the range of those published in the scientific literature.

[9] χ^2=Chi-squared value, df = degrees of freedom, p = p value

3.2. Inter-nesting Period

3.2.1. 2018 Expedition

Three types of inter-nesting movement behaviors were identified for the 2018-tagged turtles (Figure 3-1):

1. Remained in the immediate vicinity of Almond Beach, making small near-shore loops (Sibille and Becky);
2. Moved moderate distances up and down the Guyana-Venezuela coastline, making small near-shore loops (Violet); and
3. Moved large distances, making small near-shore loops in the vicinity of Almond Beach and larger offshore loops between Venezuela, Trinidad, and Guyana (Karin, Julie, Denise, and Arleen).

Turtles nested between two and seven times each, exclusively on Almond Beach, typically at intervals of approximately 12 days, with the exception of one animal (Violet), who also nested across the Barima-Waini river mouth and nested at longer time intervals than the other turtles (Figure 3-2, Figure 3-3, and Figure 3-4; Table 3-3). Green turtles (13 +/- 1.7 days [mean +/- 1 SD]) demonstrated longer re-nesting intervals than leatherback turtles (9.5 +/- 0.5 days [mean +/- 1 SD]) (χ^2= 12.492, df = 1, $p < 0.001$; Figure 3-4). The distances of green turtle nests from their initial capture locations ranged from 0 to 33.7 kilometers (Figure 3-4) with significant differences among individuals (χ^2= 33.017, df = 3, $p < 0.001$). Most of this variability stemmed from Violet and Karin; if their nests are removed from the data set, the remaining nests were all within 1 kilometer of the respective original capture locations. Leatherback turtle nests were within 1.9 kilometers of their respective original capture locations (Figure 3-4), but also showed individual differences in nest dispersal (χ^2= 7.593, df = 2, $p = 0.022$), driven by Denise's slightly more diffuse nesting, as compared to that of Julie or Arleen. All turtles demonstrated remarkable nesting-site fidelity irrespective of their maximum displacements between nesting events (Table 3-1). With respect to the size of the area used by the turtles during the inter-nesting period, there were no significant differences between species or among individuals; however, the leatherback turtles occupied waters at a farther distance from shore during inter-nesting than did the green turtles (χ^2= 4.500, df = 1, $p = 0.034$; Figure 3-4).

Figure 3-1: Spatial Footprints of 2018-tagged Green and Leatherback Turtle Inter-nesting Movements from Almond Beach

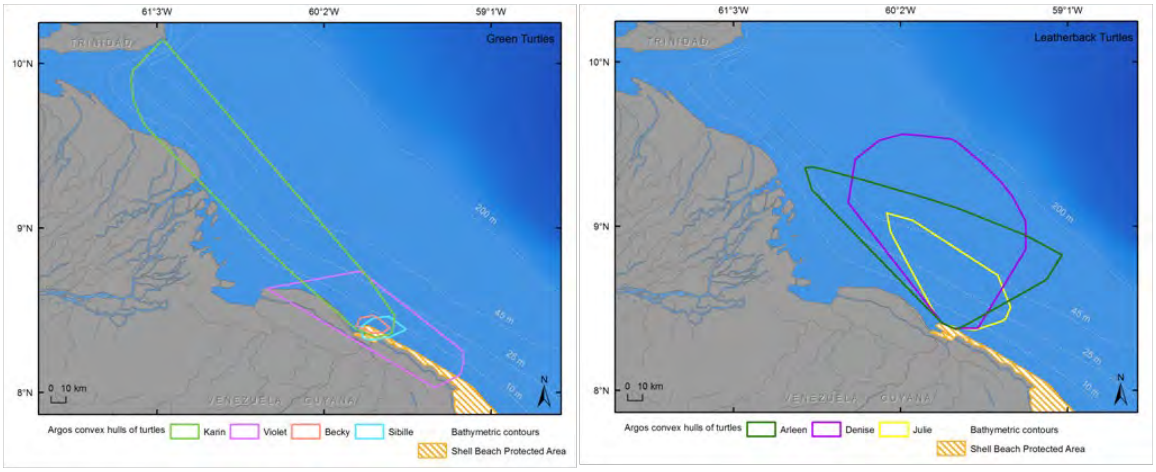

Figure 3-2: Re-nesting Locations and Spatial Footprints of 2018-tagged Green Turtles during Inter-nesting

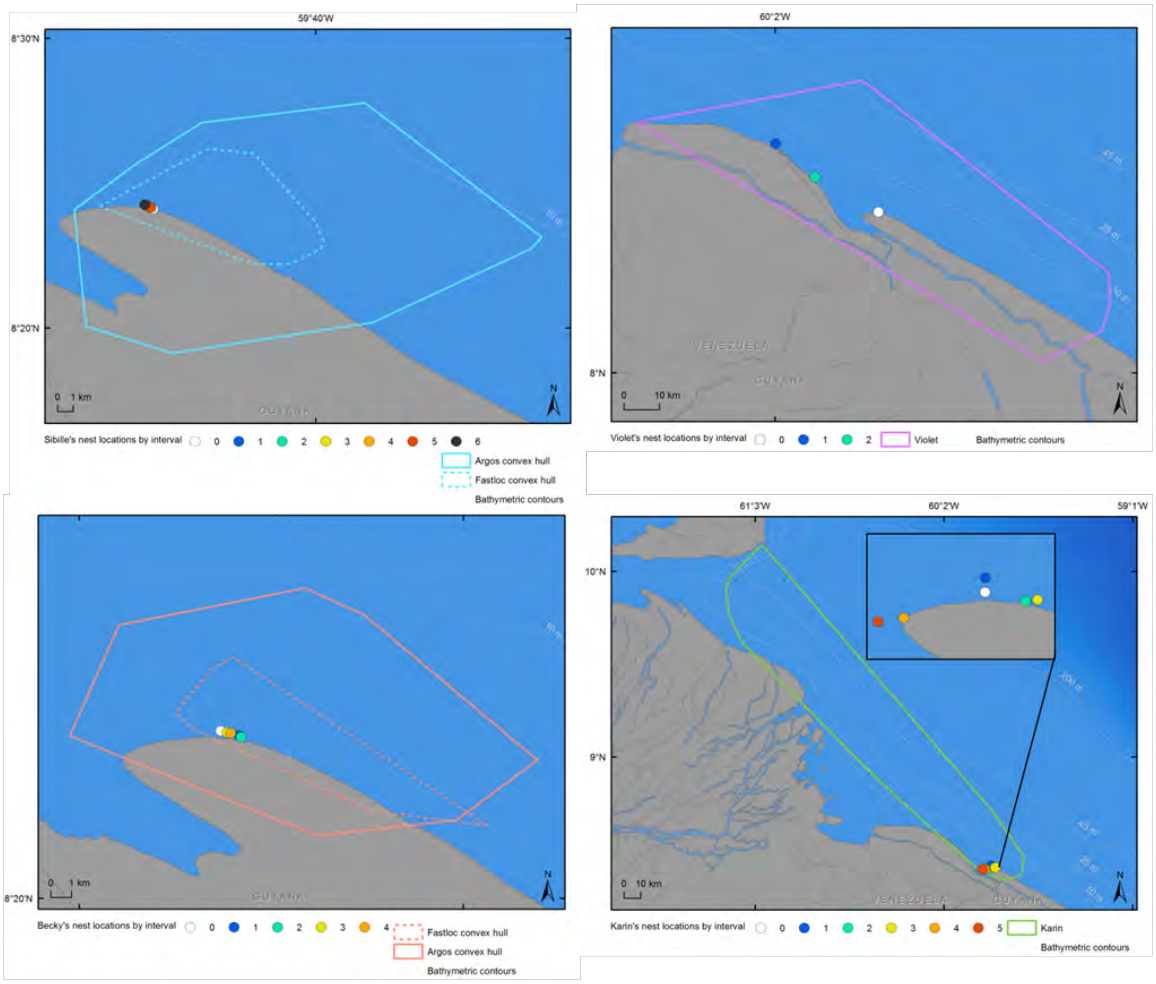

Figure 3-3: Re-nesting Locations and Spatial Footprints of 2018-tagged Leatherback Turtles during Inter-nesting

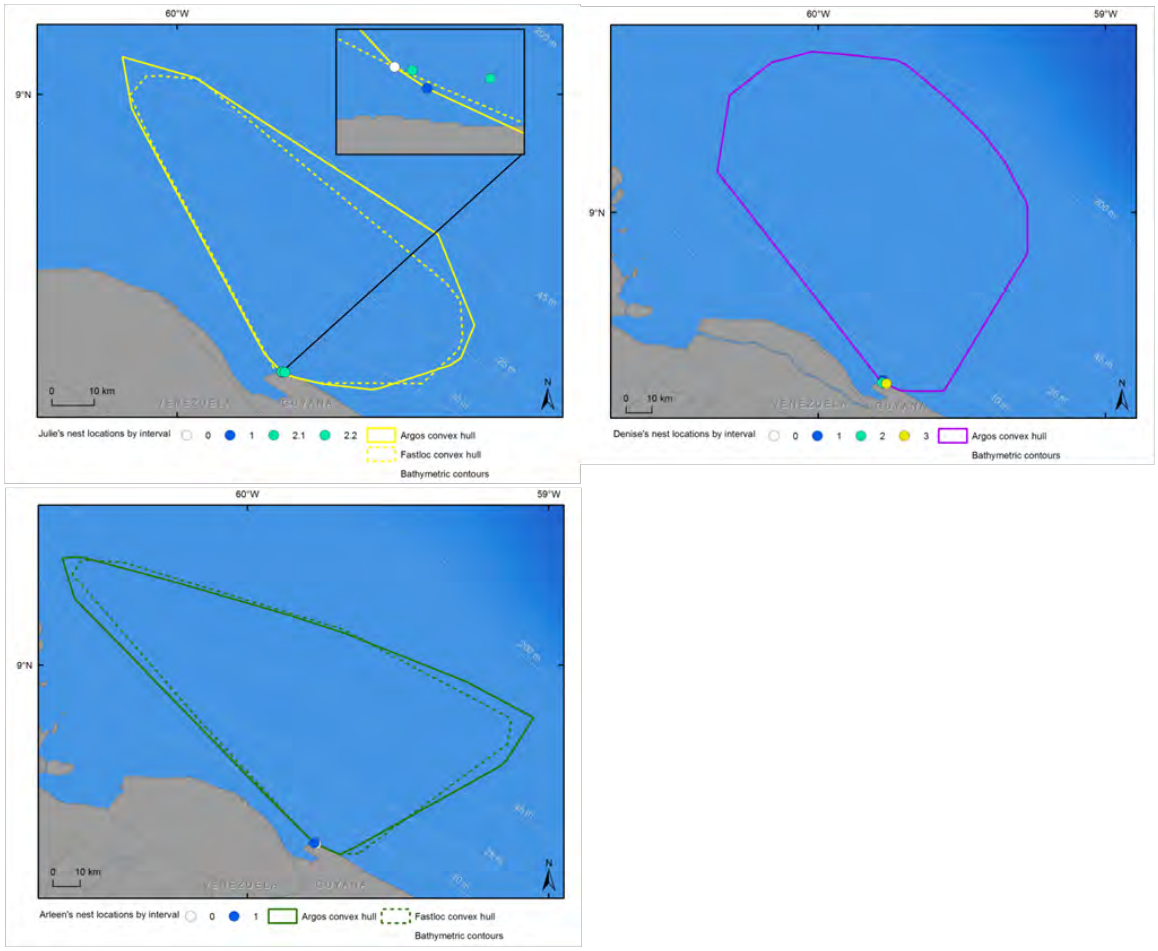
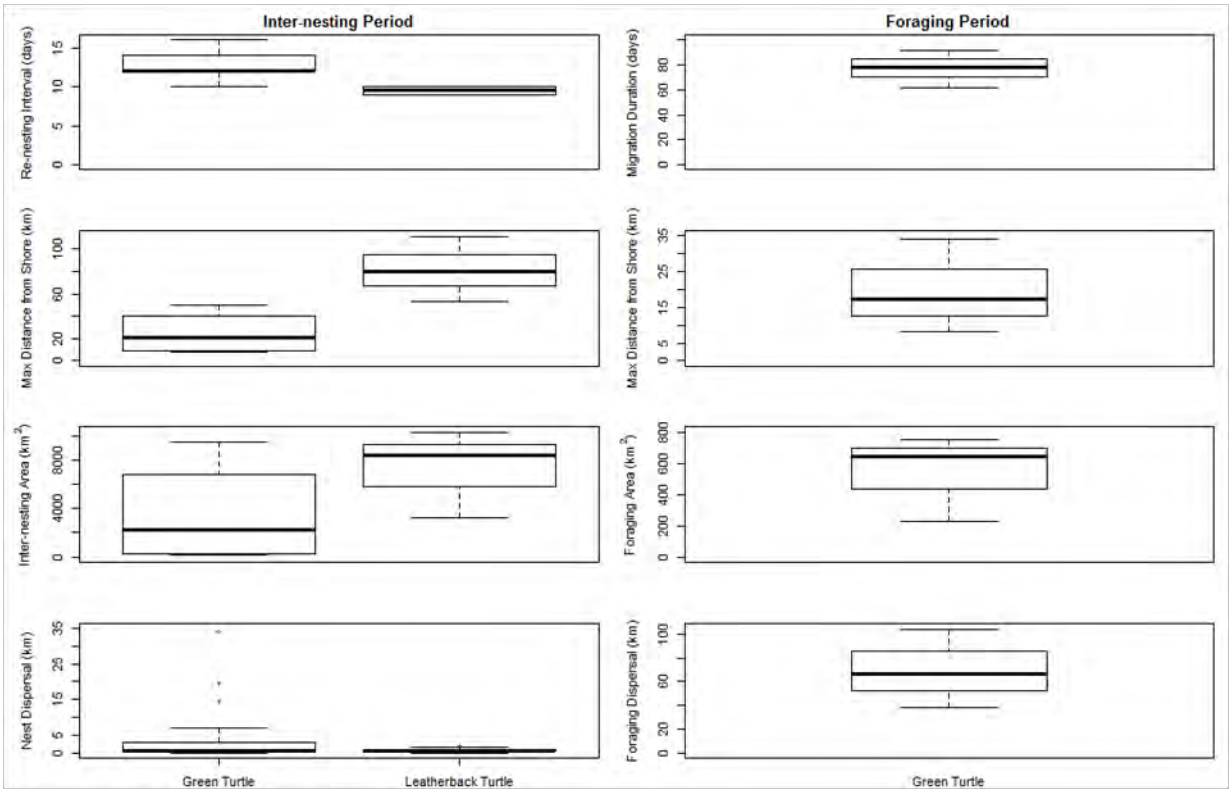


Note: Re-nesting periods with more than one point with the same color symbol (numbered with decimal labels) represent multiple attempts (i.e., false crawl) as indicated by the haul-out or percent dry time data.

Figure 3-4: Box and Whisker Diagrams Comparing Habitat Use Metrics between Species and between Inter-nesting and Foraging Periods for 2018-tagged Turtles



Note: The thick line represents the median value, the box shows the values between the upper and lower quartiles, the whiskers indicate the range, and the points show outliers.

Leatherback turtles occupied deeper water (34.9 +/- 35.8 meters [mean +/- 1 SD]) than green turtles (6.8 +/- 7.2 meters [mean +/- 1 SD]) during the inter-nesting period (Figure 3-5). The greatest density of green turtle locations occurred in less than 5 meters of water depth (Figure 3-6); the greatest density of leatherback turtle locations occurred in less than 10 meters of water depth (Figure 3-7). There were individual differences in depth use during this period for both green turtles and leatherback turtles. The two green turtles with depth sensors recorded maximum dives of 16.7 meters during this period, but data indicated that the majority of their dives were within the upper 5 meters of the water column (Figure 3-8A and Figure 3-9A). The one leatherback turtle with a depth sensor tag recorded a maximum dive of 134.5 meters during the inter-nesting period, but data indicated that most dives were within the upper 10 meters of the water column (Figure 3-10A). Details on the vertical habitat use of turtles during their entire tracking period are summarized in Table 3-7 and Figure 3-11, Figure 3-12, and Figure 3-13.

Table 3-7: 2018-tagged Turtle Daily Vertical Habitat Use

Turtle ID	Water Depth (m)		Turtle Depth (m) [a]		Maximum Dive Depth (m) [b]	
	Mean (SD)	Range	Mean (SD)	Range	Mean (SD)	Range
Green Turtles						
173290 Sibille	10.5 (9.1)	1.0–42.0	-	-	-	-
173293 Violet	9.9 (6.9)	1.0–42.0	6.9 (5.4)	0.0–34.0	12.5 (6.1)	1.8–33.8
173291 Becky	12.2 (11.1)	1.0–69.0	-	-	-	-
173294 Karin	9.1 (9.1)	1.0–48.0	6.0 (5.1)	0.5–37.0	10.3 (6.8)	2.8–37.0
Leatherback Turtles						
173284 Julie	58.9 (198.4)	1.0–1,065.0	-	-	-	-
173288 Denise	1,400.9 (1,961.8)	1.0–5,437.0	22.7 (33.5)	0.5–560.5	108.3 (100.0)	7.3–560.5
173285 Arleen	3,909.9 (1,932.3)	1.0–5,963.0	-	-	-	-

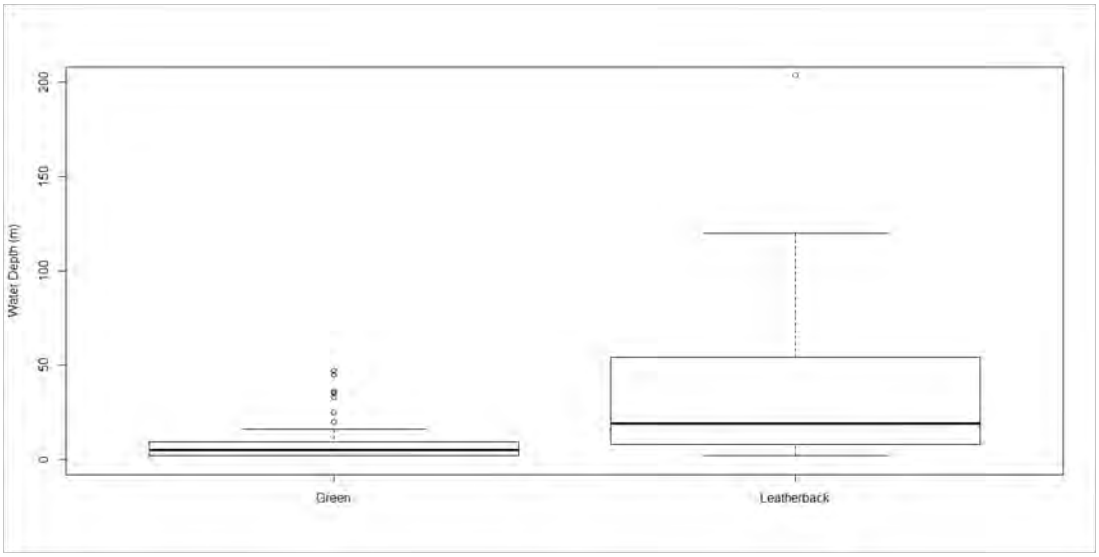
m = meter

Note: Turtle daily vertical habitat use (i.e., depth) was inferred from sampling bathymetric maps (see Figure 3-5 and Figure 3-6) and from dive data collected by the turtle tags. Sibille, Becky, Julie, and Arleen were not equipped with dive recorders.

[a] Turtle Depth values are calculated from separate data files than Maximum Dive Depth, so in some cases the deeper limit of the Turtle Depth range does not coincide with the Maximum Dive Depth. In most cases, the difference in these numbers is small, but for each individual turtle, the actual maximum depth that turtle was documented to have reached is the largest of these two numbers.

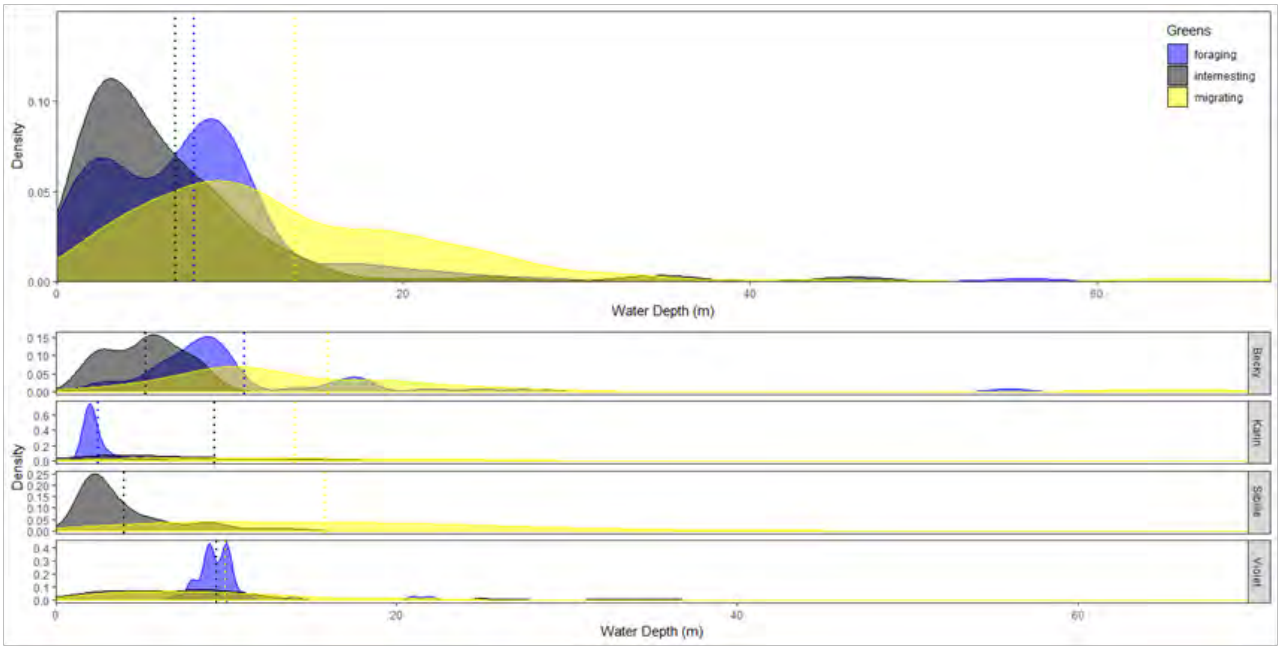
[b] This table shows the mean and standard deviation as well as the range. For example, the maximum depth of a given dive was on average 10 to 13 meters for green turtles. Maximum dives of 30 to 40 meters were rare but are captured in the range column of the table. The same logic applies to leatherbacks.

Figure 3-5: Box and Whisker Diagram Showing Water Depth Use for 2018-tagged Green and Leatherback Turtles during the Inter-nesting Period



Note: The thick line represents the median value, the box shows the values between the upper and lower quartiles, the whiskers indicate the range, and the points show outliers.

Figure 3-6: Density Distribution of Water Depths Occupied by 2018-tagged Green Turtles Combined Together (Top Panel) and Individually (Bottom Panels) during Different Tracking Periods (Indicated by Color)



Note: Mean values for the sampling period are indicated by a vertical dotted line. Water depth values were extracted from a GEBCO-14 global bathymetry raster at the single best Argos location per day in a GIS to facilitate comparisons among animals. Points falling on land were excluded from this analysis.

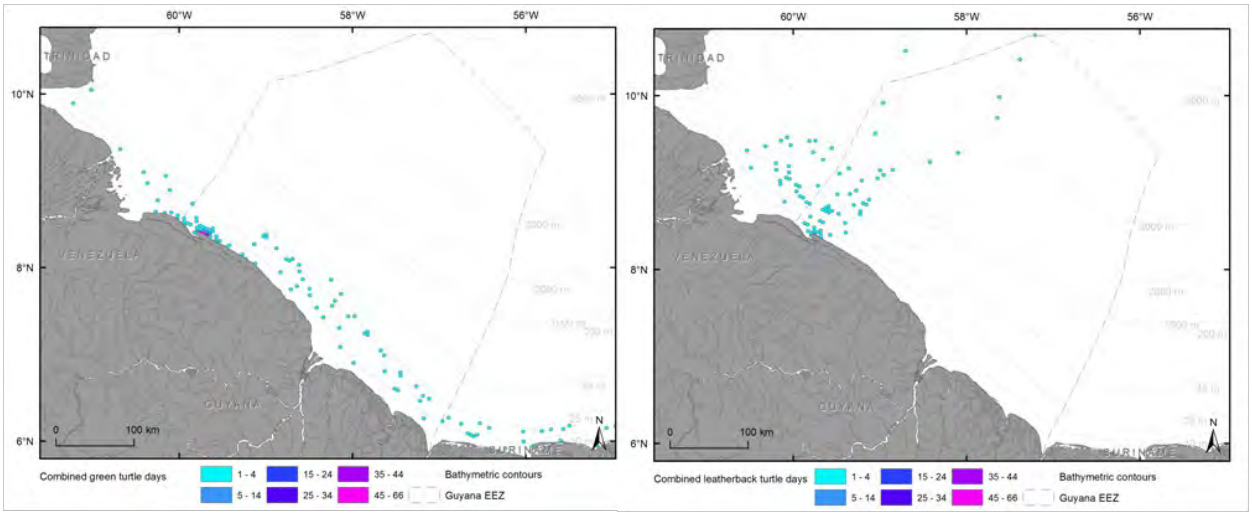
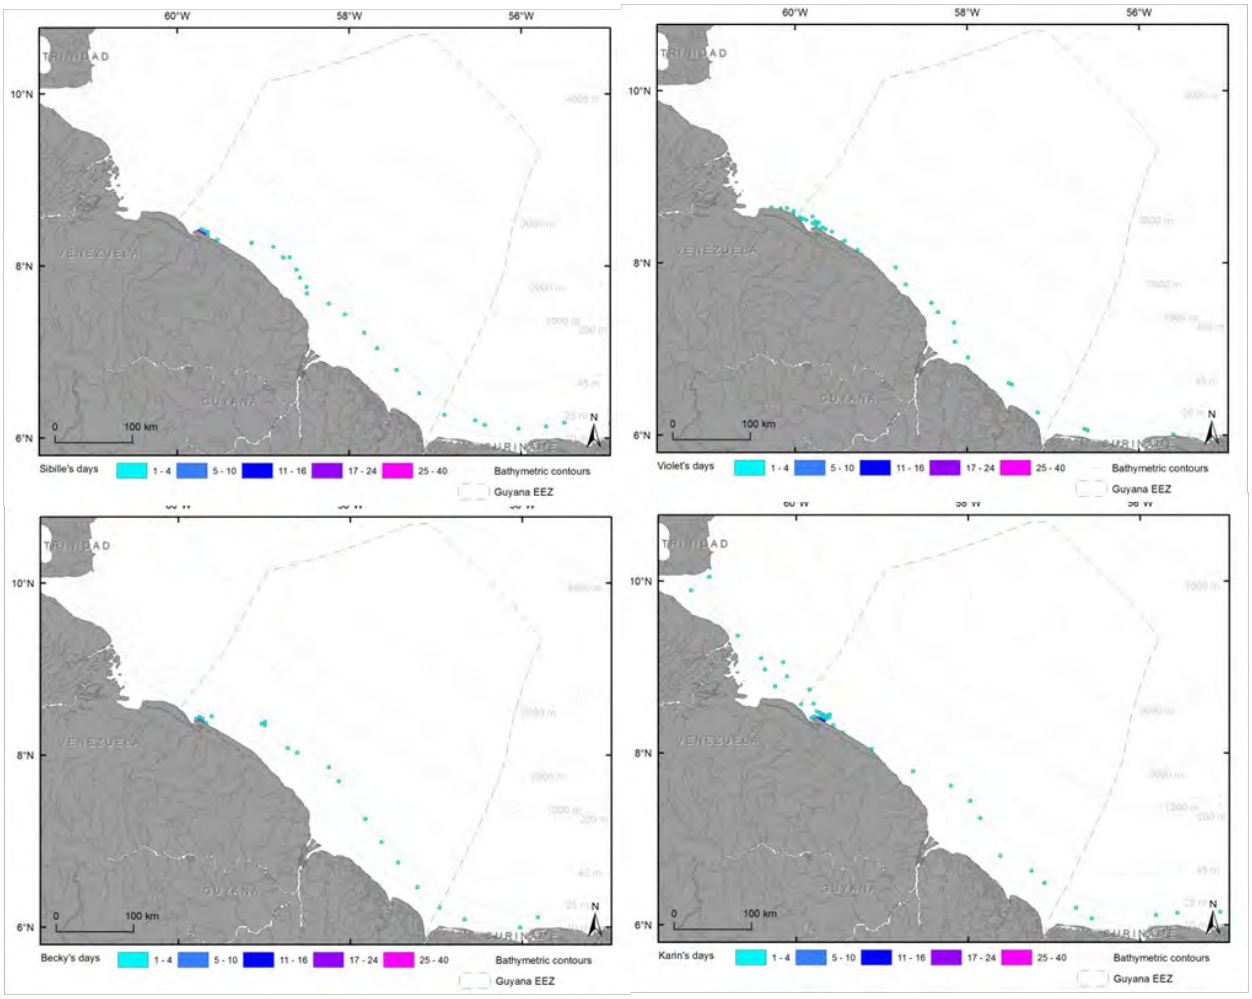
As highlighted above, three types of inter-nesting movement behaviors were characterized among the tagged turtles; despite these differences, the center of inter-nesting activity for all turtles was immediately adjacent to the nesting beach (Figure 3-1). Generally, the turtles' inter-nesting habitat use was concentrated within the territorial seas of Guyana—within the direct vicinity of Almond Beach (Figure 3-1, Figure 3-14), but also included the territorial seas of Venezuela and Trinidad & Tobago (Table 3-3). Sibille and Becky (Figure 3-2, Figure 3-15) remained near their capture locations, spanning 16.7 kilometers and 17.8 kilometers of coastline, respectively, circling within the 10-meter bathymetric contour, and never traveling more than 11 kilometers from shore. Both of these animals' tags were equipped with Fastloc GPS capability. While there is some variability in the tracks generated from their Argos and Fastloc GPS data, both demonstrated similar patterns, with Fastloc data falling within the Argos convex hulls (Figure 3-2).

Figure 3-14: Synopsis of Habitat Use of 2018-tagged Turtles, Centered within Guyana's Exclusive Economic Zone



Note: A synopsis of habitat use of turtles centered within Guyana's Exclusive Economic Zone, presented as the number of days that turtles occupied individual hexagons of approximately 16.25 square kilometers. This encompassed the turtles' inter-nesting periods and part of their migration period.

Figure 3-15: Synopsis of Habitat Use of Individual 2018-tagged Green Turtles, Centered within Guyana's Exclusive Economic Zone

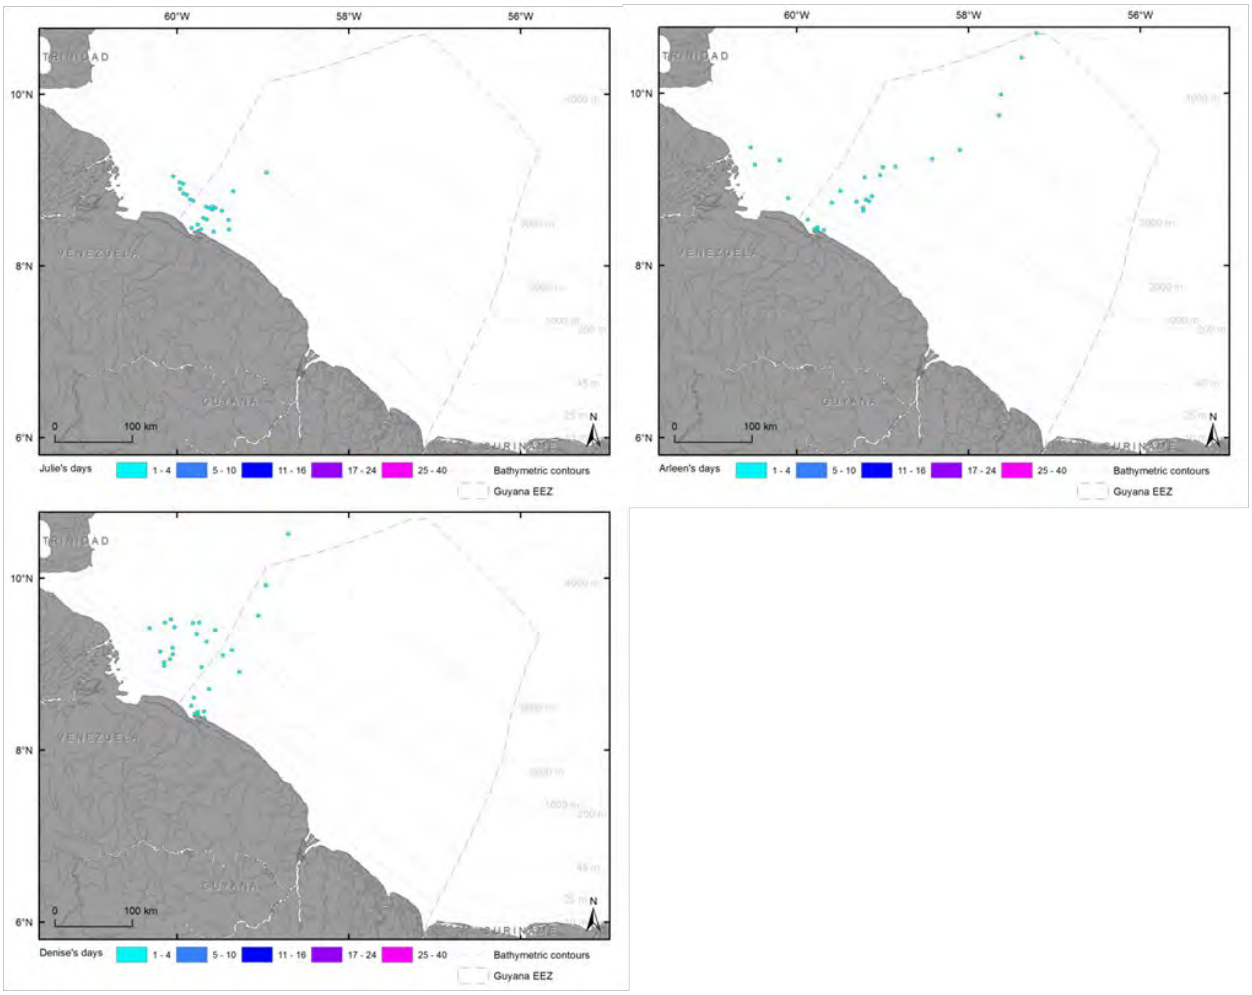


Note: A synopsis of habitat use of individual green turtles centered within Guyana's Exclusive Economic Zone, presented as number of days that turtles occupied individual hexagons of approximately 16.25 square kilometers. This encompassed the turtles' inter-nesting periods and part of their migration period.

Violet and Karin (Figure 3-15) and the three leatherbacks (Julie, Denise, and Arleen [Figure 3-16]), demonstrated more itinerant movement behaviors as compared to Sibille and Becky (Figure 3-15). Violet's movements extended 106.5 kilometers laterally northwest and southeast along the coastline, where she made similar but more extensive loops offshore, primarily within the 10-meter bathymetric contour (Figure 3-2 and Figure 3-15) and within 30 kilometers of Guyana and Venezuela (Figure 3-2 and Figure 3-15; Table 3-3). This turtle was identified as a new nester at the SBPA (not already having flipper tags at capture). Her elaborate forays, disparate nesting attempts, and extended inter-nesting intervals may reflect her inexperience in selecting a nest site. Violet presented an interesting example of unusual inter-nesting behavior (Figure 3-8C). During her second re-nesting period, she was apparently stranded on the Venezuela shoreline for a nearly 22-hour period. This area is characterized entirely by mud banks (R. DeFreitas, personal communication), so when the turtle came up to nest, she apparently got stuck in the mud and was unable to return until the tide came in and released

her. This stranding event is visible in the data by looking at the combined characteristics of the time-series graphs, specifically: (a) a positive depth (i.e., higher than sea level), (b) a maximum temperature peak of 38°C, and (c) a wide peak in the 100 percent dry time (Figure 3-8). The event occurred across the channel from the SBPA, where the turtle would not have been visible to PAC rangers conducting nightly patrols (Figure 3-1), but the turtle was eventually able to re-enter the water and successfully started her migration southward just days later. She was the first to leave the SBPA (Table 3-3).

Figure 3-16: Synopsis of Habitat Use of Individual 2018-tagged Leatherback Turtles Centered within Guyana's Exclusive Economic Zone



Note: A synopsis of habitat use of individual leatherback turtles centered within Guyana's Exclusive Economic Zone, presented as number of days that turtles occupied individual hexagons of approximately 16.25 square kilometers.

Karin exhibited the farthest movements during her inter-nesting period of all the green turtles, extending along 261.7 kilometers of coastline, venturing 50 kilometers offshore of the Orinoco River Delta, Venezuela on one of her loops, and reaching the Port of Galeota on the Trinidad coastline on another (Figure 3-2 and Figure 3-15; Table 3-3). She also made five shorter loops within the 10-meter bathymetric contour. This turtle had previously nested at the SBPA (already possessing flipper tags) and the precision of her returns after forays may demonstrate her

previous experience nesting at this area. Karin also presented an interesting example of what first appeared to be an unusually high number of erroneous points on land on the east end of Almond Beach between 8 and 29 May 2018 (Figure 3-17). Upon close inspection in Google Earth for more recent shoreline profiles, the points still seemed unlikely, albeit some are in swampland and several have high-quality location classes. More recent photos from the air (see Figure 3-17) illustrate clearly that extreme coastal erosion had facilitated seawater intrusions across the beach and into the large swampland behind the beach. Increased erosion was observed in June, making parts of Almond Beach inaccessible at high tides. Evidently, Karin swam into the swamp area and either had difficulties finding her way out, or was content to go back and forth between the ocean and swamp during the 10-day period. Karin and Sibille were the last to leave the SBPA, only 1 day apart (Table 3-3).

Figure 3-17: Satellite View of Karin's Locations between 8 and 29 May 2018

Photos by R. DeFreitas

Note: A satellite view of Karin's locations between 8 and 29 May 2018 showing an unusual concentration of high-quality positions falling in series on what appeared to be land. Low-quality positions are shown in black and high-quality positions are in red. Photos of the area from the air in March 2018 show that due to large amounts of coastal erosion, the sea had breached the shore in several places, making the swamp in the background accessible. The turtle was therefore determined to indeed be inhabiting these "inland" regions for a 10-day period.

Julie was the only leatherback with a flipper tag scar, and so was not a neophyte nester. She displayed the most moderate offshore movements (54 kilometers from shore) among the leatherback turtles during the nesting season, traveling 104.9 kilometers of coastline between Guyana and Venezuela and staying within the 50-meter bathymetric contour (Figure 3-3 and Figure 3-16; Table 3-3). This turtle most likely made a false crawl on her second re-nesting

attempt. There were several false crawls associated with the 2018-tagged turtles, presumably due to the large amount of debris covering the nesting beach at that time (Figure 3-18).

Figure 3-18: Extensive Debris Present on Almond Beach in June 2018

Photo by C. McClellan

Denise moved the farthest distance from shore (111 kilometers), crossing the 100-meter bathymetric contour during three inter-nesting loops (Figure 3-3 and Figure 3-16) that spanned 120.4 kilometers of shoreline including both Guyana and Venezuela (Table 3-3). It was these highly visible and equally timed loops that indicated Denise's third re-nesting event, which was not captured in the time-series or haul-out records (Figure 3-10C).

Arleen made only one offshore inter-nesting loop into 50 meters of water before being the first of the tagged leatherback turtles to leave the SBPA (Figure 3-3 and Figure 3-16; Table 3-3). This movement stretched across the Orinoco River Delta approximately 80 kilometers from land, comprising a total span of 204.6 kilometers along the coast.

Time-series information was useful for visualizing vertical movements and identifying re-nesting events for animals that generally displayed complicated horizontal movements. Lower temperatures occurred during deeper dives, while the highest temperatures typically occurred during periods when the animals were hauled-out on land to nest (Figure 3-8B, Figure 3-9B, and Figure 3-10B), but occasionally also when they encountered warm water masses (see Figure 3-8B and below). Similarly, the 100 percent dry times coincided with zero-depths and changes in temperature (Figure 3-8, Figure 3-9, and Figure 3-10). Karin's discrete re-nesting periods were readily visible when looking at these time-series graphs together (Figure 3-9), for example, even though they were less obvious in the horizontal movement data.

3.2.2. 2019 Expedition

While all individuals tagged in 2019 showed strong nesting-site fidelity to their capture locations throughout the inter-nesting period, three inter-nesting movement behaviors were identified:

1. Immediately departing from the nesting region (Michelle);
2. Remaining in the immediate vicinity of Almond Beach making small near-shore loops (Sadie);
3. Moving large distances, making offshore loops between Venezuela, Trinidad and Tobago, and Guyana (Teij, Kari, Christine, Regina, and Rhoda) (Figure 3-19, Table 3-4).

Turtles returned to nest between zero and four times exclusively on Almond Beach at approximately 12-day intervals (Figure 3-20, Figure 3-21, and Figure 3-22; Table 3-6). Green turtles (11.7 ± 0.5 days; mean ± 1 SD) demonstrated similar re-nesting intervals to leatherback turtles this season (11.8 ± 3.6 days; mean ± 1 SD) (χ^2= 0.950, df = 1, p = 0.331; Figure 3-22). The distance of subsequent green turtle nests from the initial capture location (Sadie only) ranged from 0.5 to 1.5 kilometers (Figure 3-22). Leatherback turtle nests were within 8.3 kilometers of the original capture locations (Figure 3-22) and did not show individual differences in nest dispersal (χ^2= 6.418, df = 4, p = 0.170). All turtles demonstrated remarkable nesting-site fidelity irrespective of their maximum displacements from Almond Beach (Table 3-4). With respect to the sizes of the areas used by the turtles during the inter-nesting period, there were no significant differences between species or among individuals; however, leatherback turtles occupied waters at a farther distance from shore than green turtles (χ^2= 2.143, df = 1, p = 0.143; Figure 3-22).

Figure 3-19: Spatial Footprints of 2019-tagged Green and Leatherback Turtle Inter-nesting Movements from Almond Beach

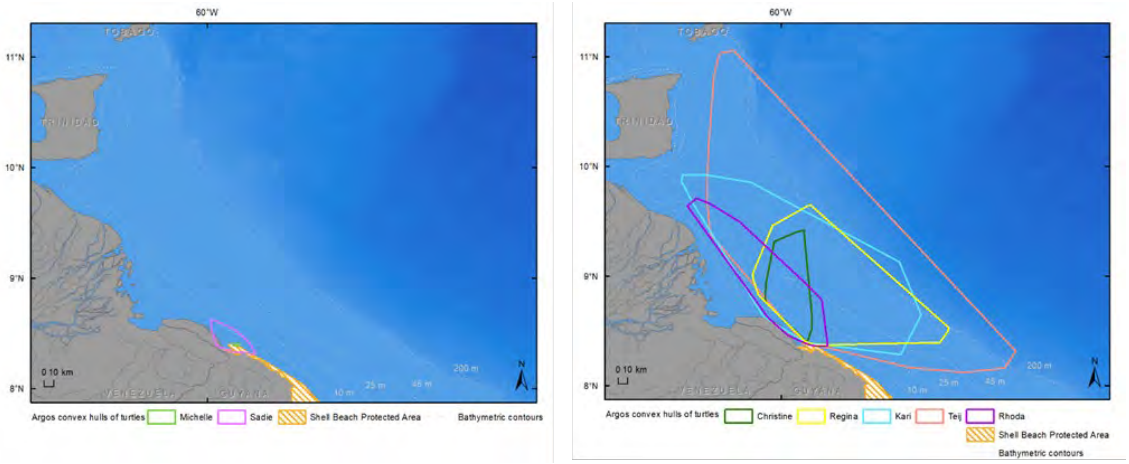


Figure 3-20: Re-nesting Locations of 2019-tagged Green Turtles and Spatial Footprints Generated from Argos and Fastloc Satellite Tracking Data, Respectively

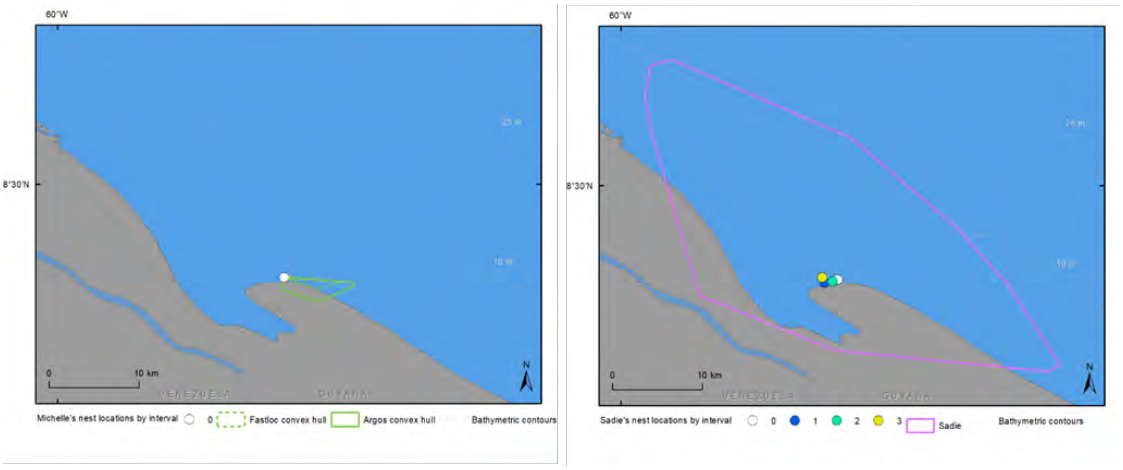

Figure 3-21: Re-nesting Locations of 2019-tagged Leatherback Turtles and Spatial Footprints Generated from Argos and Fastloc Satellite Tracking Data, Respectively

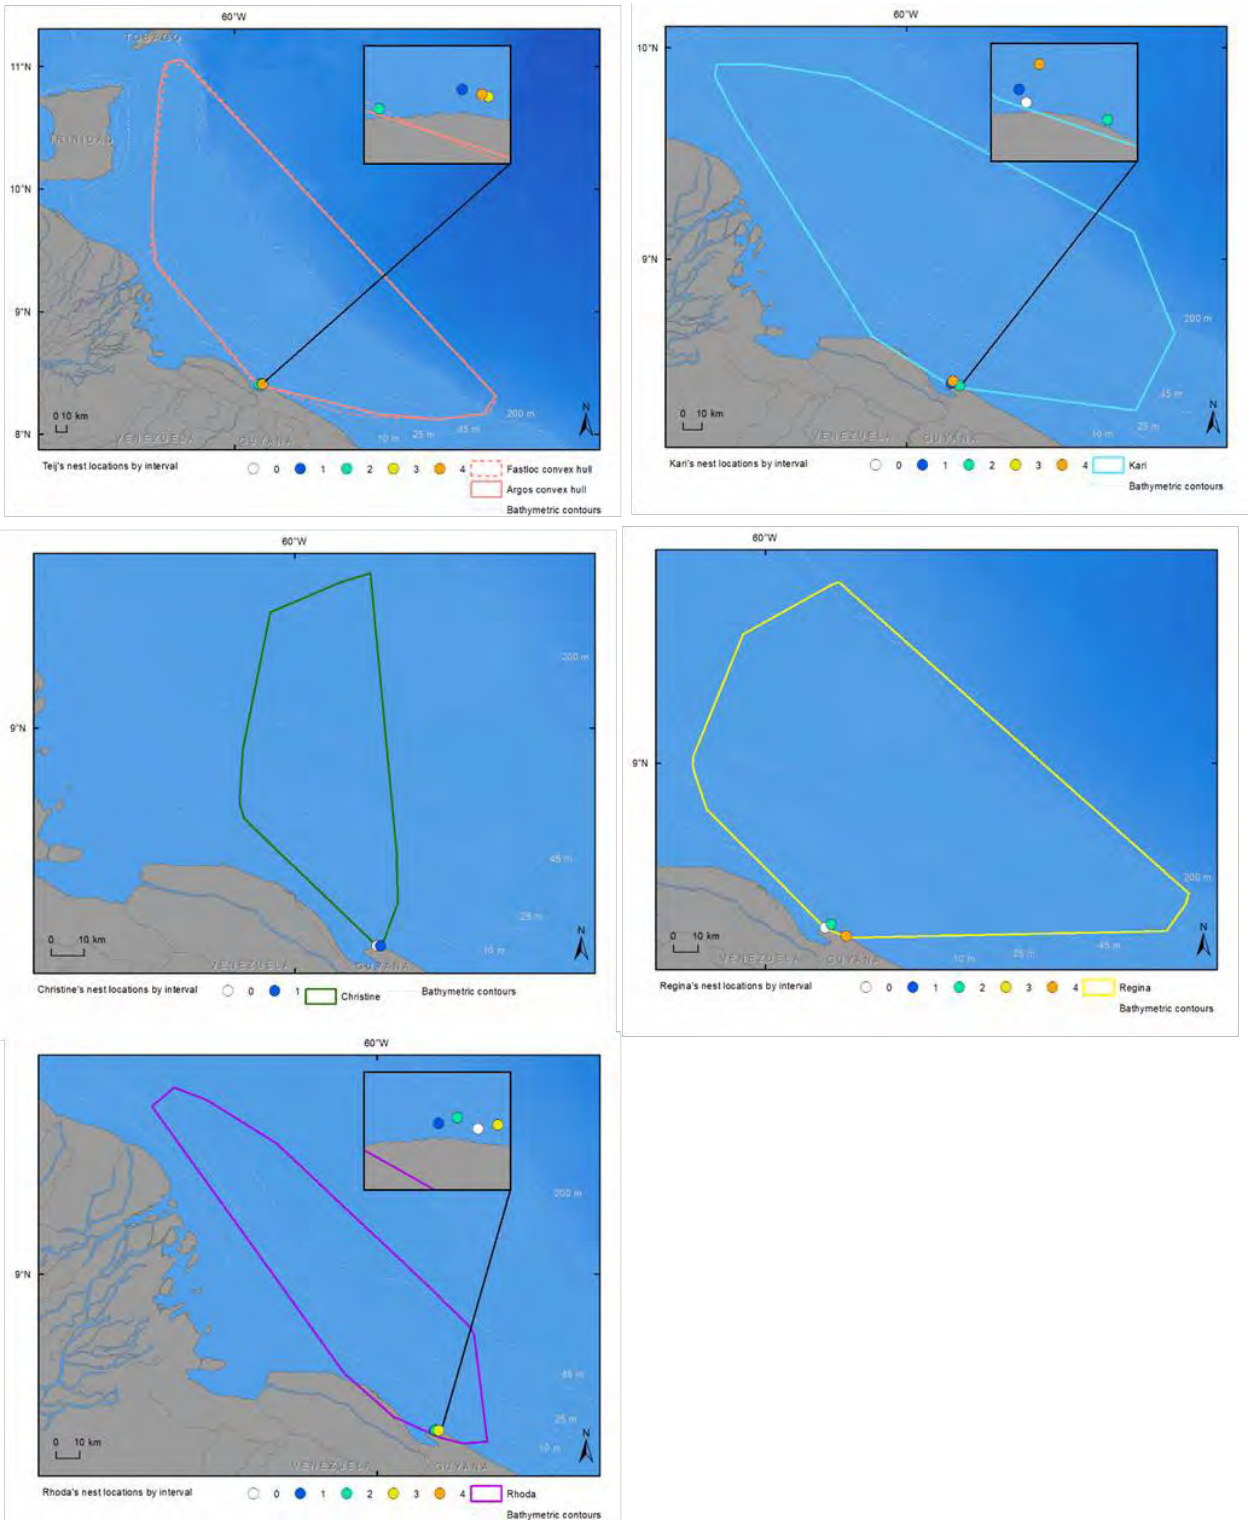
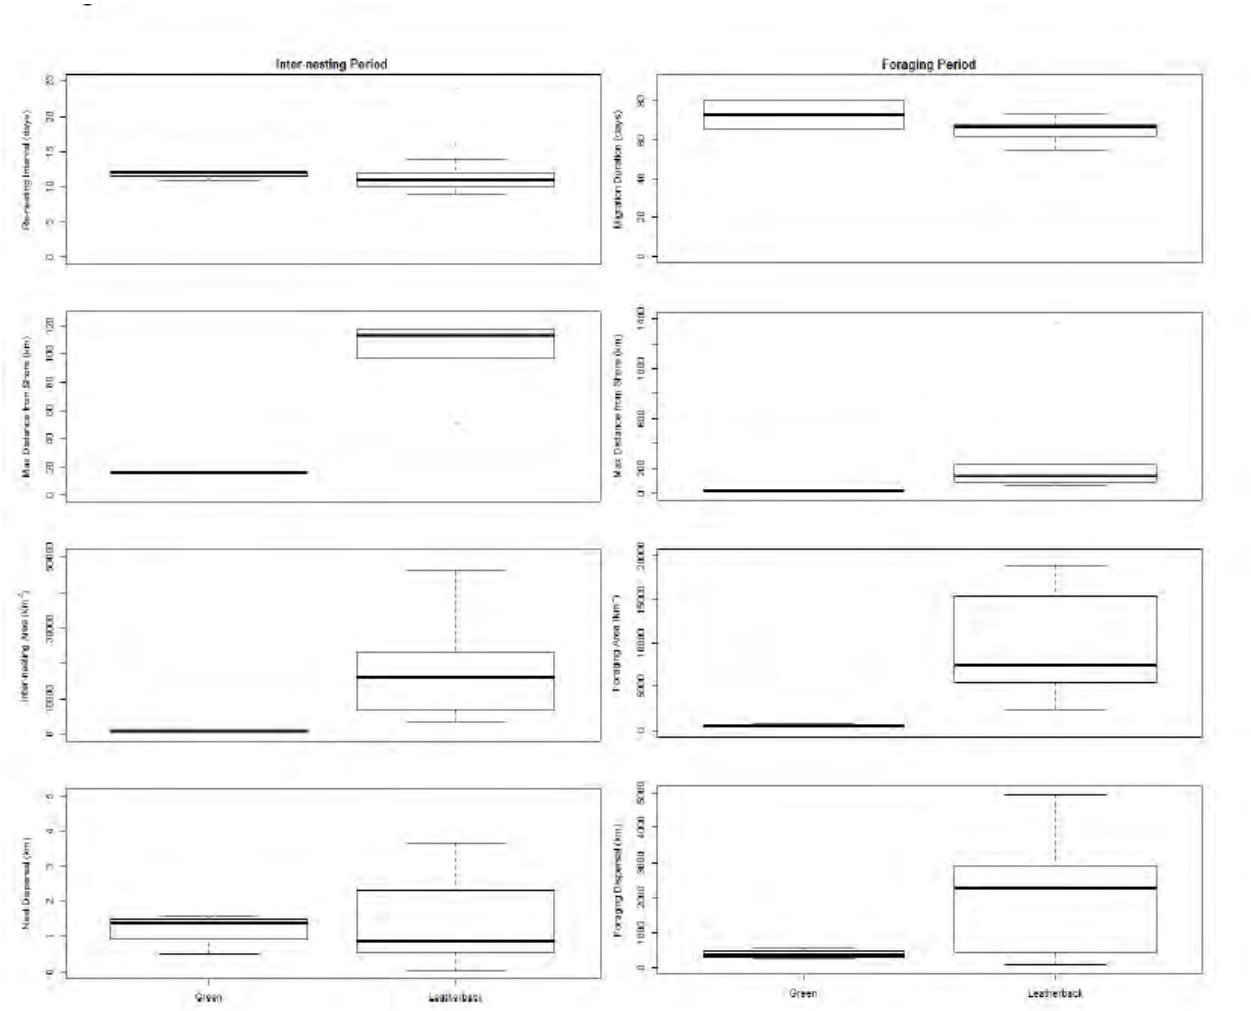


Note: Kari, Regina, and Rhoda had missing locations for some re-nesting intervals.

Figure 3-22: Box and Whisker Diagrams Comparing 2019-tagged Turtle Habitat Use Metrics between Species and between Inter-nesting and Foraging Periods

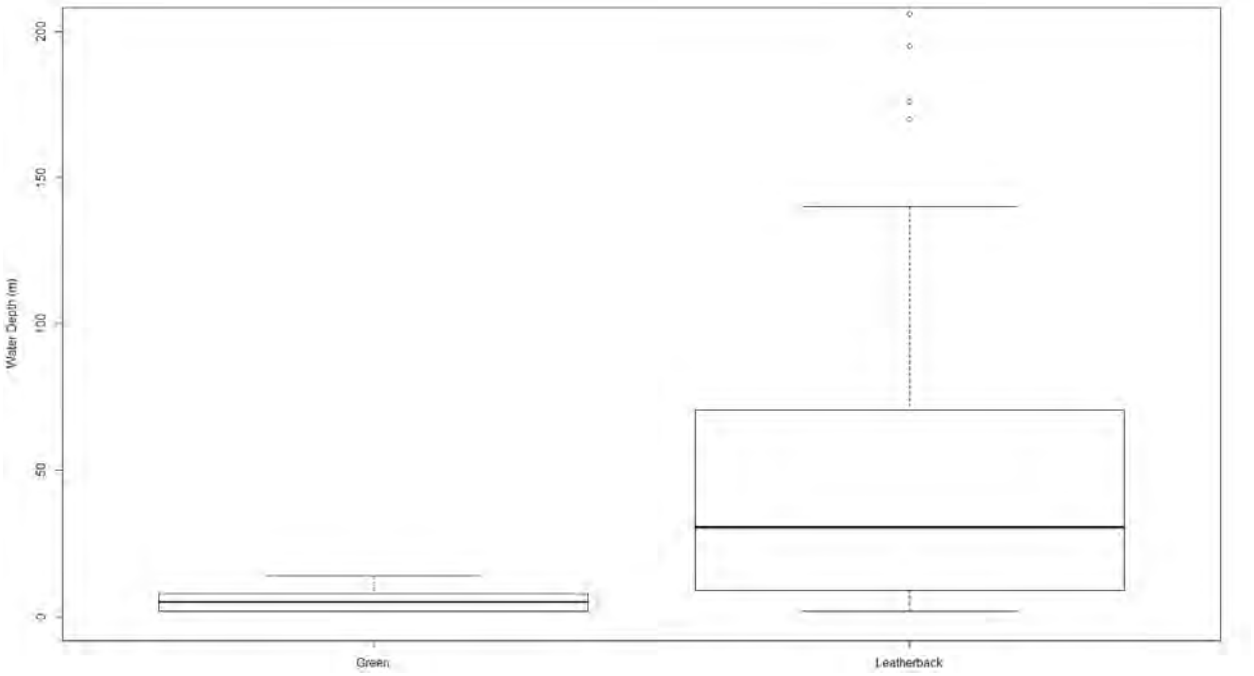


Note: The thick line represents the median value, the box shows the upper and lower quartiles, the whiskers indicate the range, and the points show outliers.

Leatherback turtles occupied deeper water than green turtles in the inter-nesting period (Figure 3-23). The greatest density of green turtle locations occurred in less than 5 meters of water (Figure 3-24) and less than 10 meters for leatherback turtles (Figure 3-25). There were individual differences in depth use during this period as well for leatherback turtles. The one green turtle with a depth sensor (Sadie) recorded maximum dives of 8 meters during this period, but data indicated that most of her dives were within the upper 5 meters of the water column (Figure 3-26A). The four leatherback turtles with depth sensor tags recorded maximum dives of 202 meters during the inter-nesting period, but data indicated that most dives were within the upper 20 meters of the water column (Figure 3-27A, Figure 3-28A, Figure 3-29A, and Figure 3-30A). Details on the vertical habitat use of turtles during their entire tracking period are summarized in Table 3-8 and Figure 3-31, Figure 3-32, Figure 3-33, Figure 3-34, and Figure 3-35. As highlighted above, three general types of movement behaviors were characterized, but despite these differences the center of activity for all turtles was immediately adjacent to the

nesting beach (Figure 3-36). Generally, the turtles' inter-nesting habitat use was split between the territorial seas of Guyana and Venezuela (Figure 3-36), but also included the territorial seas of Trinidad and Tobago (Table 3-8). While Michelle left the nesting region right away after nesting, Sadie remained near her capture location, spanning 56.8 kilometers of Guyana's coastline (Figure 3-37) and circling within the 10 meter bathymetric contour, and was never more than 16 kilometers from shore (Figure 3-37, Table 3-6).

Figure 3-23: Box and Whisker Diagram Showing Differential Depth Use between 2019-tagged Green and Leatherback Turtles during the Inter-nesting Period



Note: The thick line represents the median value, the box shows the upper and lower quartiles, the whiskers indicate the range, and the points show outliers.

Note: Mean values for the sampling period are indicated by a vertical dotted line. Water depth values were extracted from a GEBCO-14 global bathymetry raster at the single best Argos location per day in a GIS to facilitate comparisons among animals. Points falling on land were excluded from this analysis.

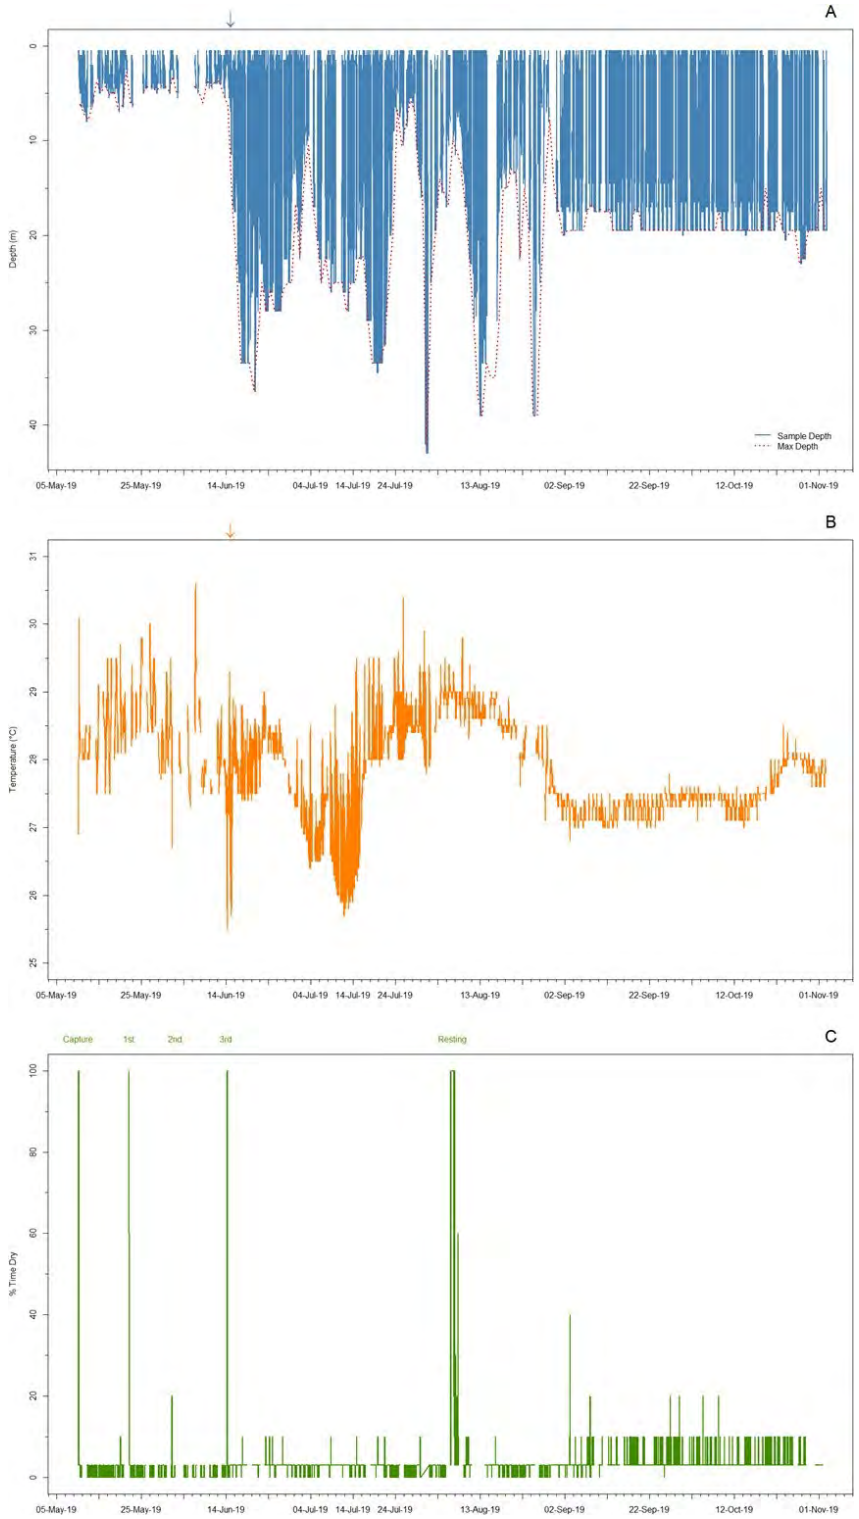
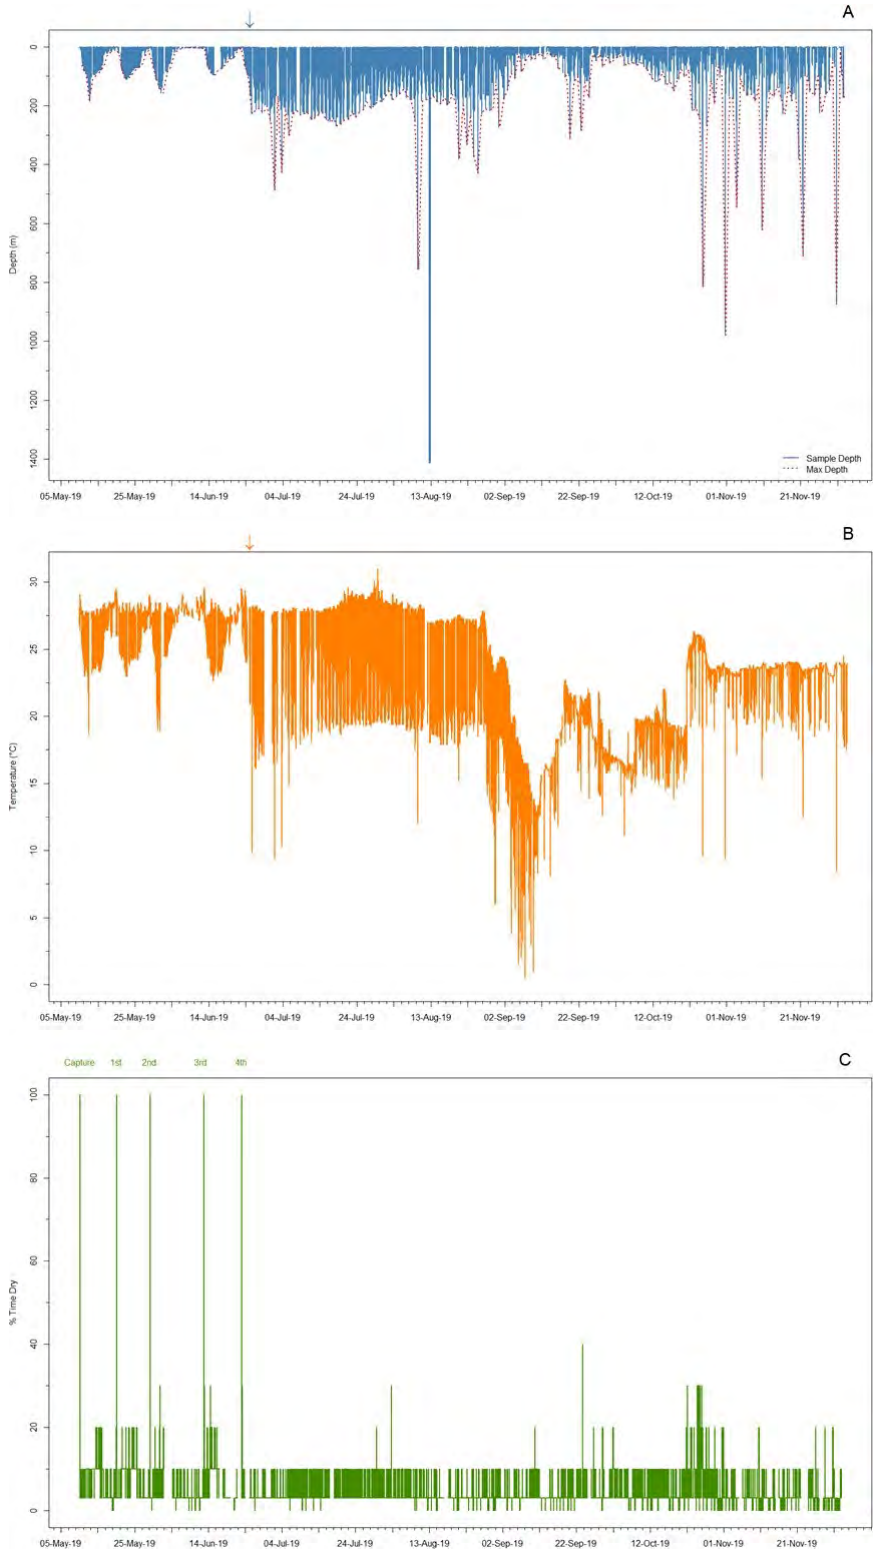
Figure 3-26: Time-Series Plots of Sadie's Dive Data



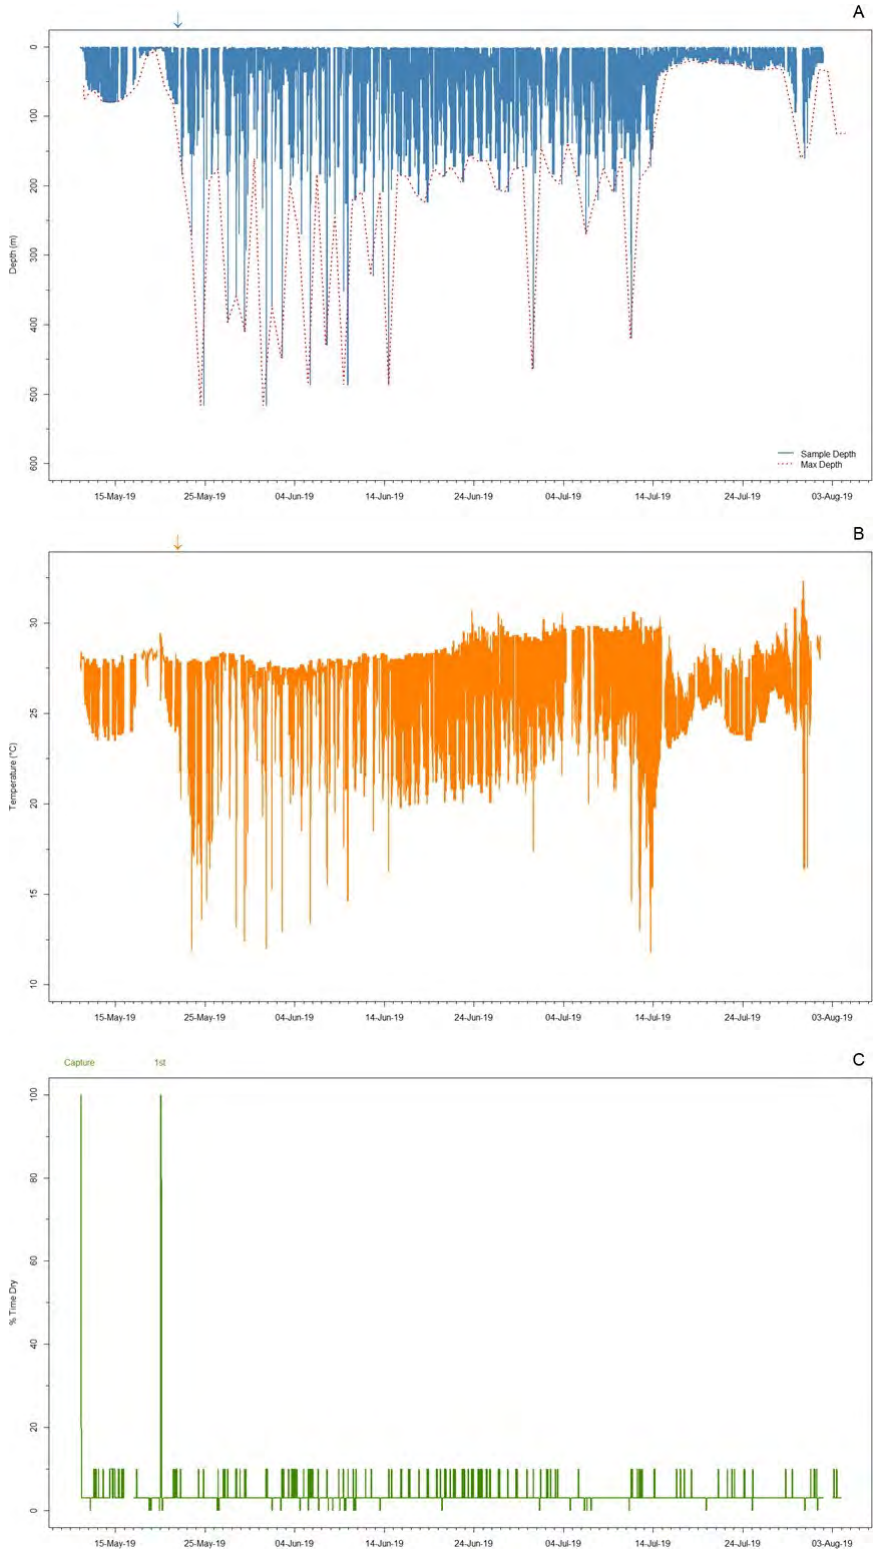
A. Depth; B. Temperature; C. % Dry Time. Arrows indicate the start of Sadie's migration period. Note the synchronous 100 percent dry times marking individual re-nesting events, while the asynchronous 100 percent dry time in early August is a probable resting period at the surface as she crossed the Amazon River. The flattening off of dives in September indicates the onset of her foraging period.

Figure 3-27: Time-Series Plots of Kari's Dive Data



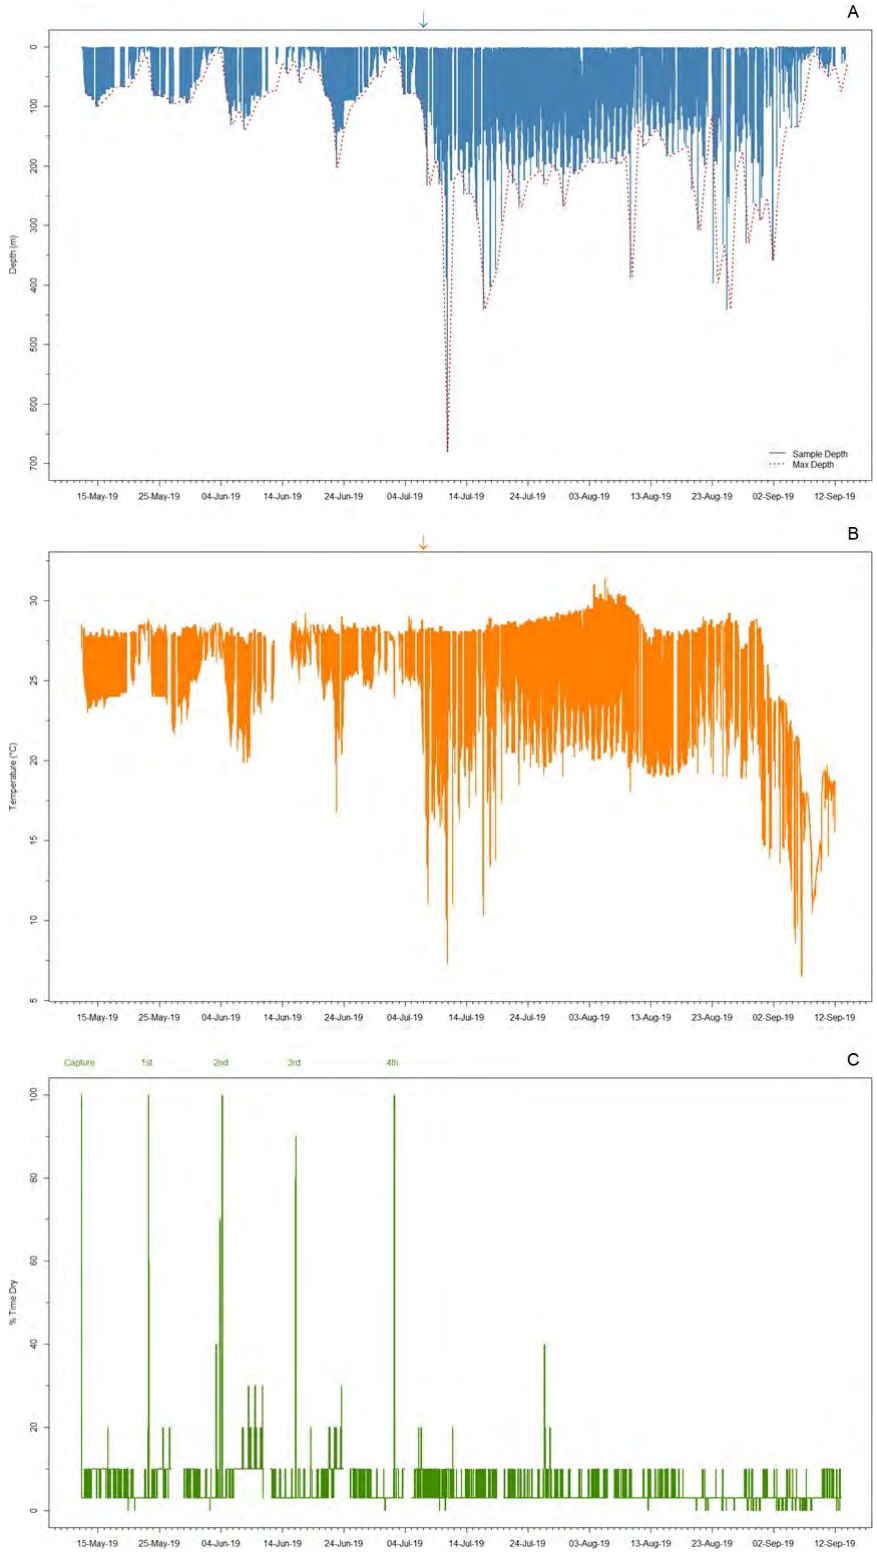
A. Depth; B. Temperature; C. % Dry Time. Arrows indicate the start of Kari's migration period. Note the synchronous 100 percent dry times marking individual re-nesting events. The large drop in temperature coincides with her arrival in cold Canadian waters in September.

Figure 3-28: Time-Series Plots of Christine's Dive Data



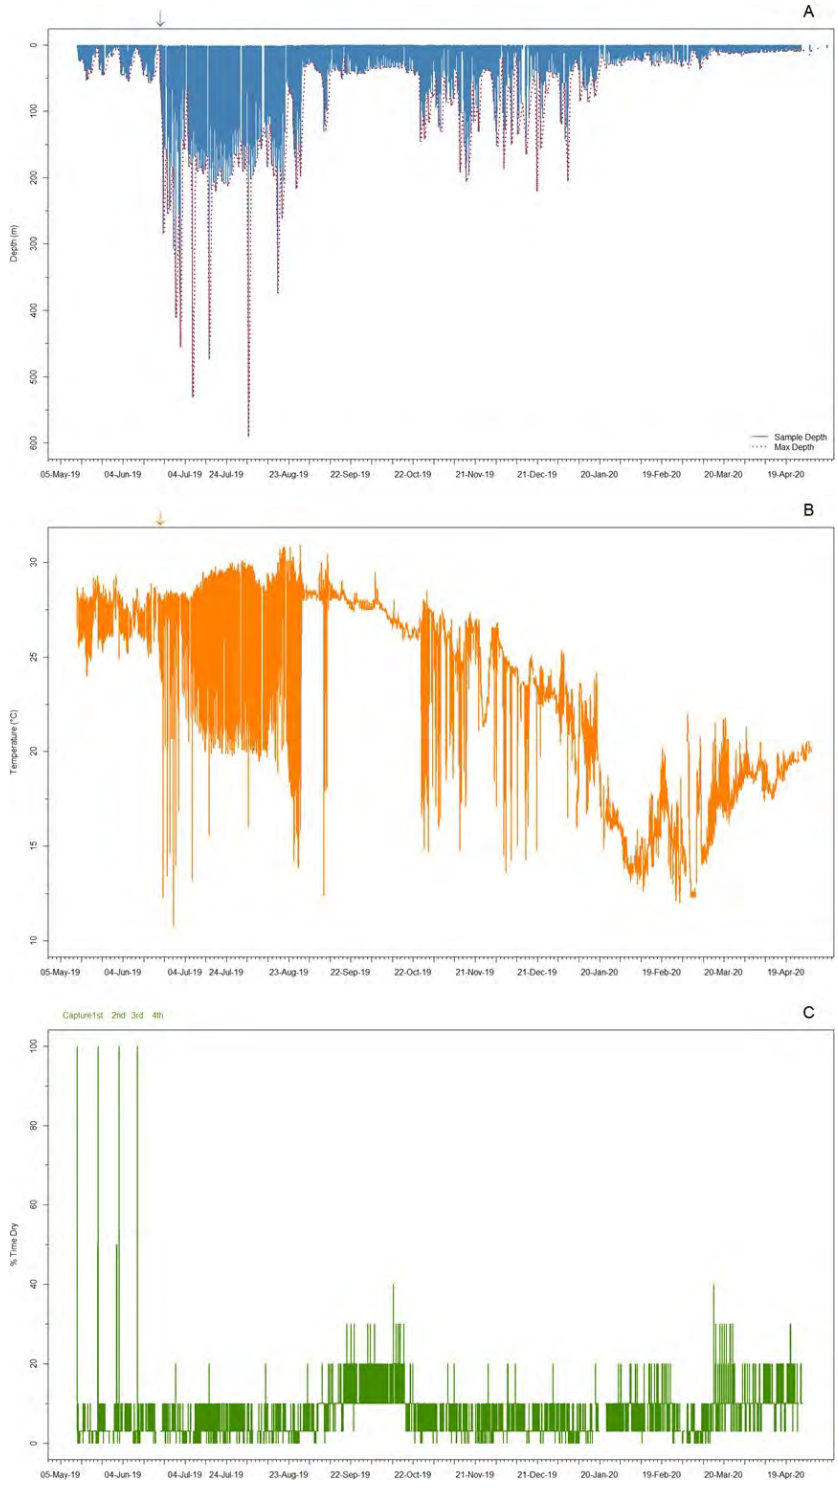
A. Depth; B. Temperature; C. % Dry Time. Arrows indicate the start of Christine's migration. Note the synchronous 100 percent dry times marking a single re- nesting event. The shallowing of dives in mid-July indicates she began foraging in northern Florida.

Figure 3-29: Time-Series Plots of Regina's Dive Data



A. Depth; B. Temperature; C. % Dry Time. Arrows indicate the start of Regina's migration period. Note the synchronous 100 percent dry times marking individual re-nesting events. The large drop in temperature coincides with her arrival in cold Canadian waters in September.

Figure 3-30: Time-Series Plots of Rhoda's Dive Data



A. Depth; B. Temperature; C. % Dry Time. Arrows indicate the start of Rhoda's migration period. Note the synchronous 100 percent dry times marking individual re-nesting events, and the gap in the data that misses the fourth event in mid-June. The decline in temperature marks seasonal changes in her environment, while foraging behavior is evident in the shallowing of dives in late September/October and again in January/February.

Table 3-8: 2019-tagged Turtle Daily Vertical Habitat Use (i.e., Depth)

Turtle ID	Water Depth (m)		Turtle Depth (m)		Maximum Dive Depth (m)	
	Mean (SD)	Range	Mean (SD)	Range	Mean (SD)	Range
Green Turtles						
173292 Michelle	8.7 (7.5)	2.0–43.0	-	-	-	-
173295 Sadie	14.9 (12.4)	2.0–75.0	11.4 (7.5)	0.5–43.0	18.0 (8.9)	2.8–42.0
Leatherback Turtles						
173286 Teij	3,823.2 (2,131.9)	2.0–6,286.0	-	-	-	-
173287 Kari	3,535.7 (2,236.8)	2.0–5,814.0	33.3 (59.8)	0.5–1413.5	161.1 (146.1)	3.8–1413.5
173289 Christine	2,349.2 (2,486.0)	2.0–7,093.0	32.5 (46.7)	0.5–516.0	179.0 (135.8)	4.8–515.8

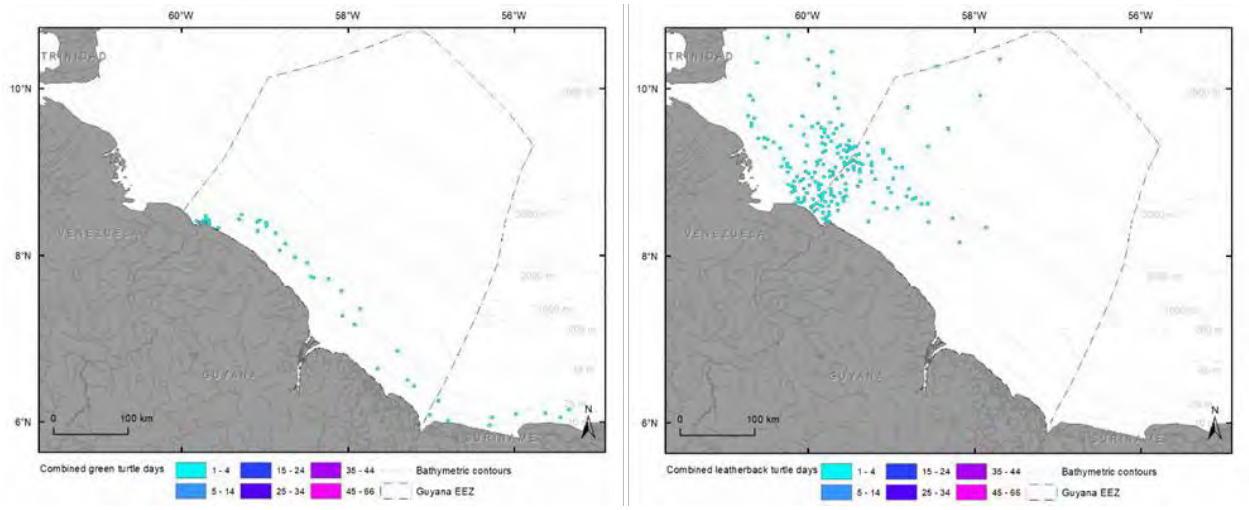
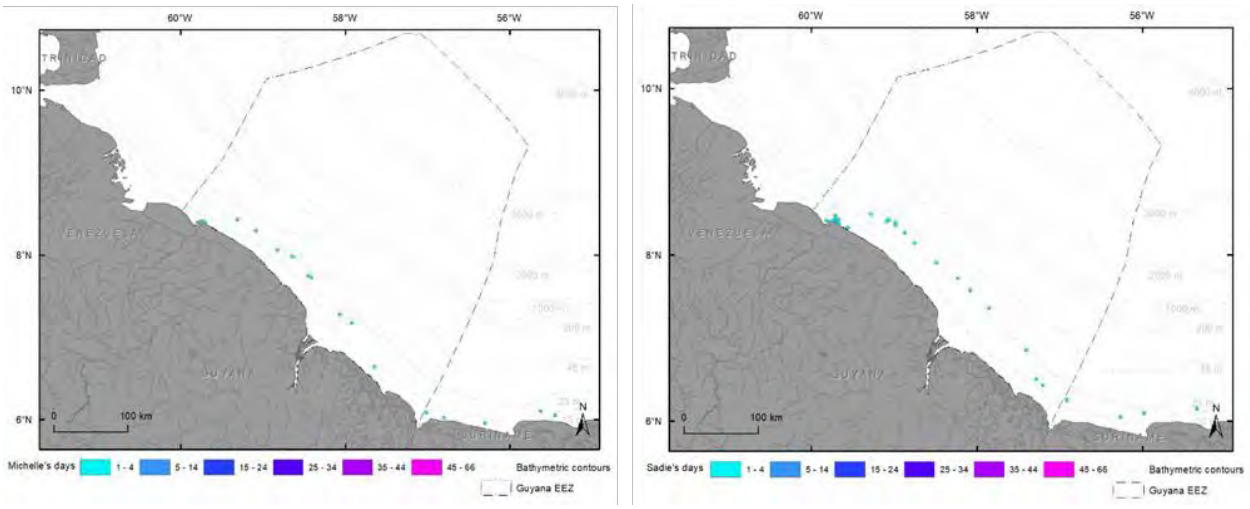
Figure 3-36: Synopsis of Habitat Use by 2019-tagged Turtles, Centered within Guyana's Exclusive Economic Zone—2019



Note: Presented as the number of days that turtles occupied individual hexagons of approximately 16.25 square kilometers in area. This encompassed the turtles' inter-nesting periods and part of their migration period.

Figure 3-37: Synopsis of Habitat Use of Individual 2019-tagged Green Turtles Centered within Guyana's Exclusive Economic Zone



Note: Presented as number of days that turtles occupied individual hexagons of approximately 16.25 square kilometers in area. This encompassed the turtles' inter-nesting periods and part of their migration period.

All of the leatherback turtles (Teij, Kari, Christine, Regina, and Rhoda) (Figure 3-38), demonstrated itinerant movement behaviors. Teij's inter-nesting movements were the most extensive, spreading 560 kilometers between Guyana and Tobago, where she made a large loop offshore, taking her almost 150 kilometers from the coastline and just off the continental shelf break (i.e., 200 meters depth) (Figure 3-22 and Figure 3-38; Table 3-6). During this 24-day loop, she missed one of her expected nesting intervals (i.e., her second to last)[10]. The rest of

[10] Leatherbacks tend to develop an inter-nesting routine and return to the beach to re-nest after a set number of days. Their re-nesting intervals vary from turtle to turtle, but tend to be predictable for each individual.

the time, she made three smaller offshore loops out to the edge of the continental shelf between nesting events, making one false crawl the day before her second nest, as observed through haul-out records. This animal's tag was equipped with Fastloc GPS capability. While there is some variability in the appearance in her tracks generated from Argos and Fastloc GPS data, both demonstrate similar patterns, with Fastloc data falling within the Argos convex hulls (Figure 3-21).

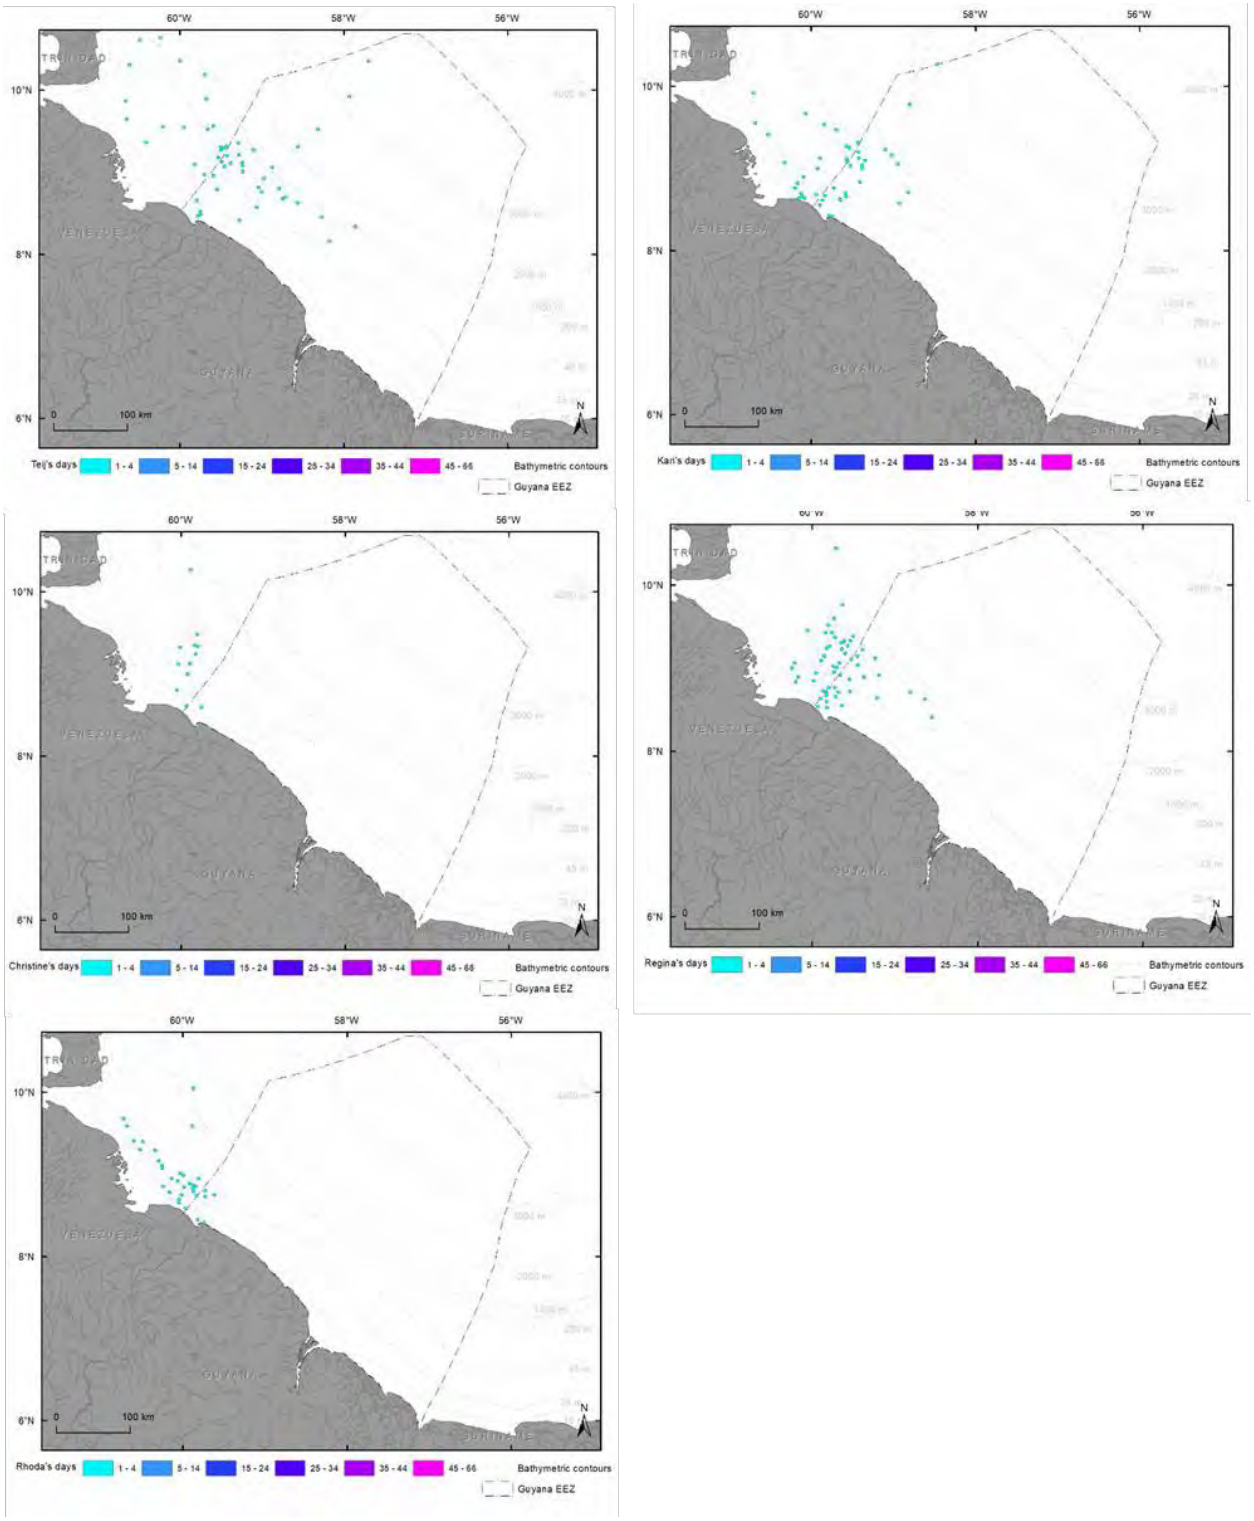
Christine made a single loop offshore (97 kilometers from land from the Venezuelan coast) spanning a lateral shoreline distance of 70.1 kilometers between her two nests (Figure 3-22 and Figure 3-38; Table 3-6). She made an 80-meter-deep dive (Figure 3-28A) at the furthest extent of this loop and another just before leaving on her migration from the nesting region.

Regina's inter-nesting movements included four offshore loops (at most 117 kilometers from shore) split between Guyana and Venezuela (covering 244 kilometers coastline distance) (Figure 3-22 and Figure 3-38; Table 3-6). She also made some deep dives while along the edge of the continental shelf break (100 to 200 meters; Figure 3-29A).

Rhoda's inter-nesting movements were the closest to shore among the leatherback turtles, staying within 51 kilometers of the coastline (Figure 3-22) and primarily within the 50-meter bathymetric contour. She made two elongated loops offshore of the Orinoco River Delta, Venezuela and two offshore loops closer to Almond Beach, but still in Venezuelan waters, covering a shoreline distance of 222 kilometers (Figure 3-22 and Figure 3-38; Table 3-6). Her deepest dives were also at the outer reaches of these inter-nesting forays, but were much shallower than the other turtles (54 to 55 meters; Figure 3-30A).

As in the case of the 2018-tagged turtles, the 2019-tagged turtles displayed complex horizontal movements and time-series information was useful for visualizing vertical movements and identifying re-nesting events. Lower temperatures occurred during deeper dives, while the highest temperatures typically occurred during periods when the animals were hauled-out on land to nest (Figure 3-26B, Figure 3-27B, Figure 3-28B, Figure 3-29B, and Figure 3-30B), but occasionally also when they hit warm water masses. Similarly, the 100 percent dry times coincided with zero-depths and changes in temperature (Figure 3-26, Figure 3-27, Figure 3-28, Figure 3-29, and Figure 3-30). Discrete re-nesting periods were readily visible when looking at these time-series graphs together, even though they were less obvious in the horizontal movement data; see for example Kari and Regina who had missing location data during some nesting events (Figure 3-27C and Figure 3-29C). Rhoda also had missing location data, time-series data, and haul-out data for her last nest, so her last re-nesting event was inferred based on previous nesting intervals and the turtles' consistent behavior of leaving the nesting region within a day or two of their last nests.

Figure 3-38: Synopsis of Habitat Use of Individual 2019-tagged Leatherback Turtles, Centered within Guyana's Exclusive Economic Zone



Note: Presented as number of days that turtles occupied individual hexagons of approximately 16.25 square kilometers in area

3.3. Migration Period

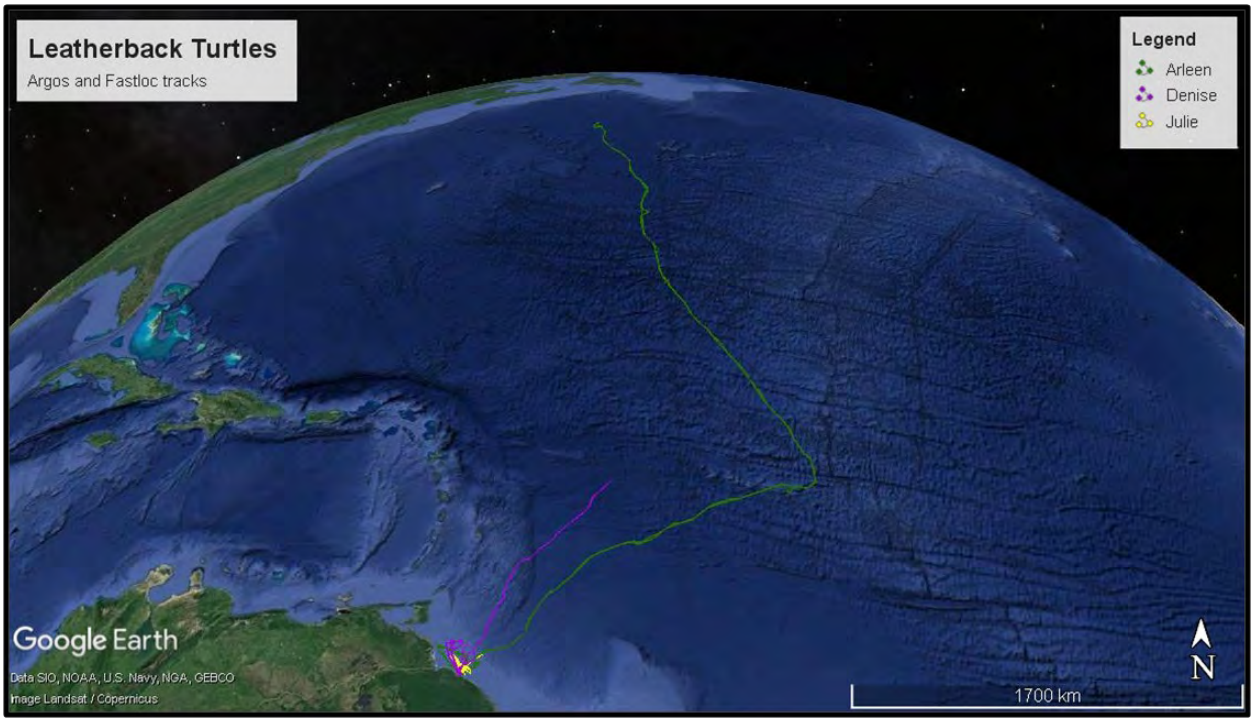
3.3.1. 2018 Expedition

The study was able to capture the onset of one turtle's migration, a partial route for four turtles, and the complete migration route to the foraging grounds for three turtles that were tagged on Almond Beach in 2018. Migratory movements were characterized by a consistent heading and an increase in movement rates. All the green turtles tagged in 2018 headed southeast to Brazil, following a near-shore corridor across an average distance of 2,485 +/- 526 kilometers (mean +/- 1 SD) (Figure 3-39, Table 3-3). All the leatherback turtles initially headed directly out to sea in a northeasterly direction (Figure 3-40, Table 3-3). However, the tracking durations once they left the nesting beach were highly dissimilar and none of the leatherbacks had definitively arrived at their foraging grounds (which would have been indicated by a change in movement parameters) before their transmissions ceased. Both green and leatherback turtles used deeper waters during their migration period as compared to water depths used in other tracking periods, and leatherbacks used significantly deeper waters than green turtles, the latter remaining on the continental shelf (Figure 3-6 and Figure 3-7).

Figure 3-39: Migration Routes of 2018-tagged Green Turtles Tracked from SBPA

Note: Where double lines appear for a given turtle, this indicates deviations between the tracks derived from Argos and Fastloc location data. In most cases the difference is unapparent.

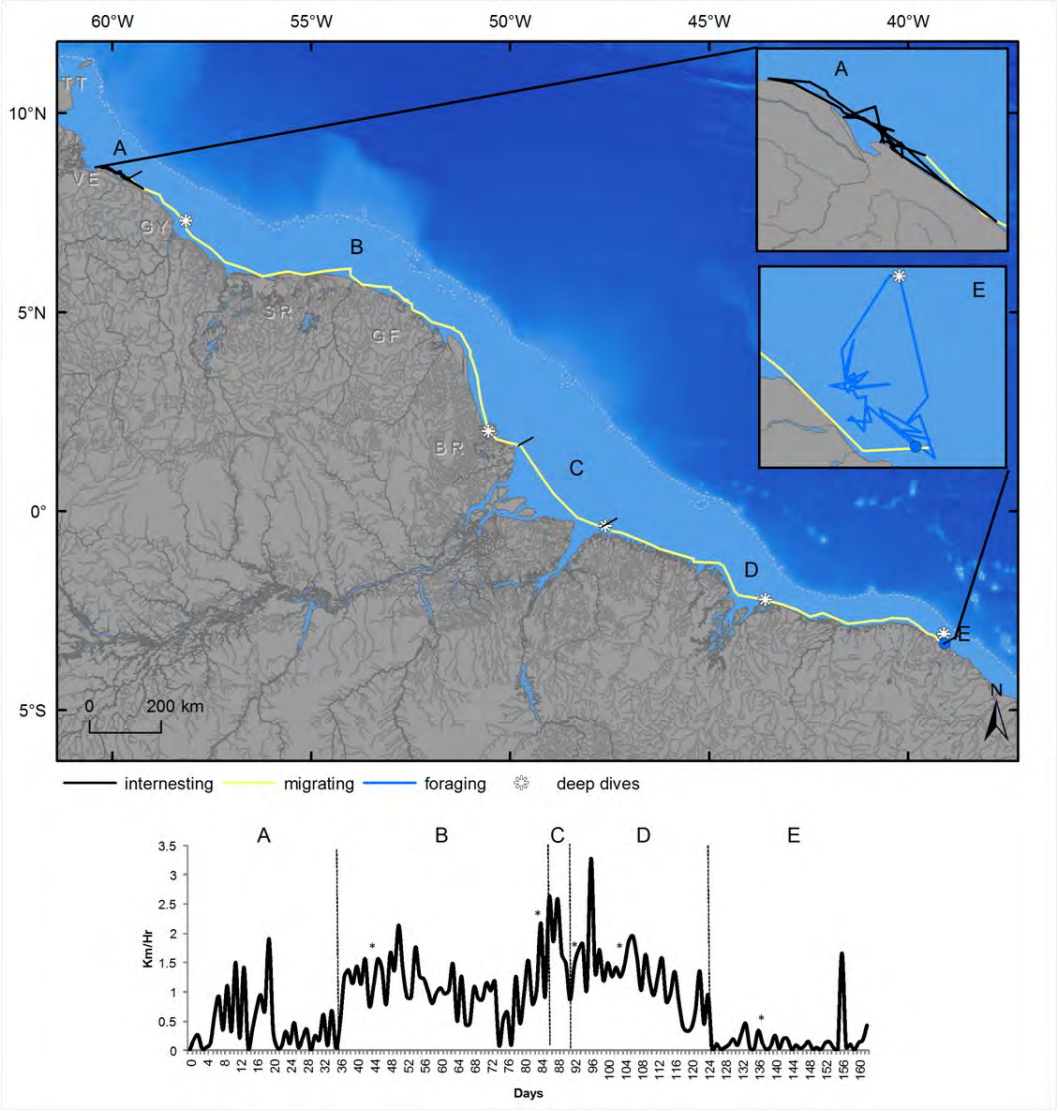
Figure 3-40: Migration Routes of 2018-tagged Leatherback Turtles Tracked from SBPA



Note: Where double lines appear for a given turtle, this indicates deviations between the tracks derived from Argos and Fastloc location data. In most cases the difference is unapparent.

Violet was the first green turtle to start her migration, on 28 April 2018, and took the longest to complete it (91 days; Table 3-3). Figure 3-41 shows the different behavioral periods of Violet's journey and the associated changes in speed. It appears that Violet's deepest dives occurred in the vicinity of (prior to or after crossing) major river mouths (i.e., the Essequibo River, Guyana; the Amazon and Pará rivers and the Mearima River/Arraial Bay, Brazil) (Figure 3-8A and Figure 3-41), which may be an energetic strategy to avoid turbulence and current flows associated with these rivers. The turtle's speed steadily increased as it crossed into Brazil, passed inshore of Maracá Island, and traversed the mouths of the Amazon and Pará rivers (17 to 25 June 2018), and showed a brief spike at the mouth of the Mearima River, after which it declined. Although there are gaps in the time-series data, it appears that Violet rested at the surface on several occasions during her migration, but particularly during her crossing of the Amazon River between deep dives on either side (Figure 3-8A, Figure 3-8C, and Figure 3-41). The dive data indicated that Violet spent most of her time in the upper 10 meters of the water column and never went deeper than 60 meters (Figure 3-11A). More than 80 percent of her dives were less than 10 meters and all dives lasted under 1.6 hours, with most being less than 20 minutes in duration (Figure 3-11B and Figure 3-11C).

Figure 3-41: Map of the Reconstructed Movement Track for Violet, by Behavioral Intervals

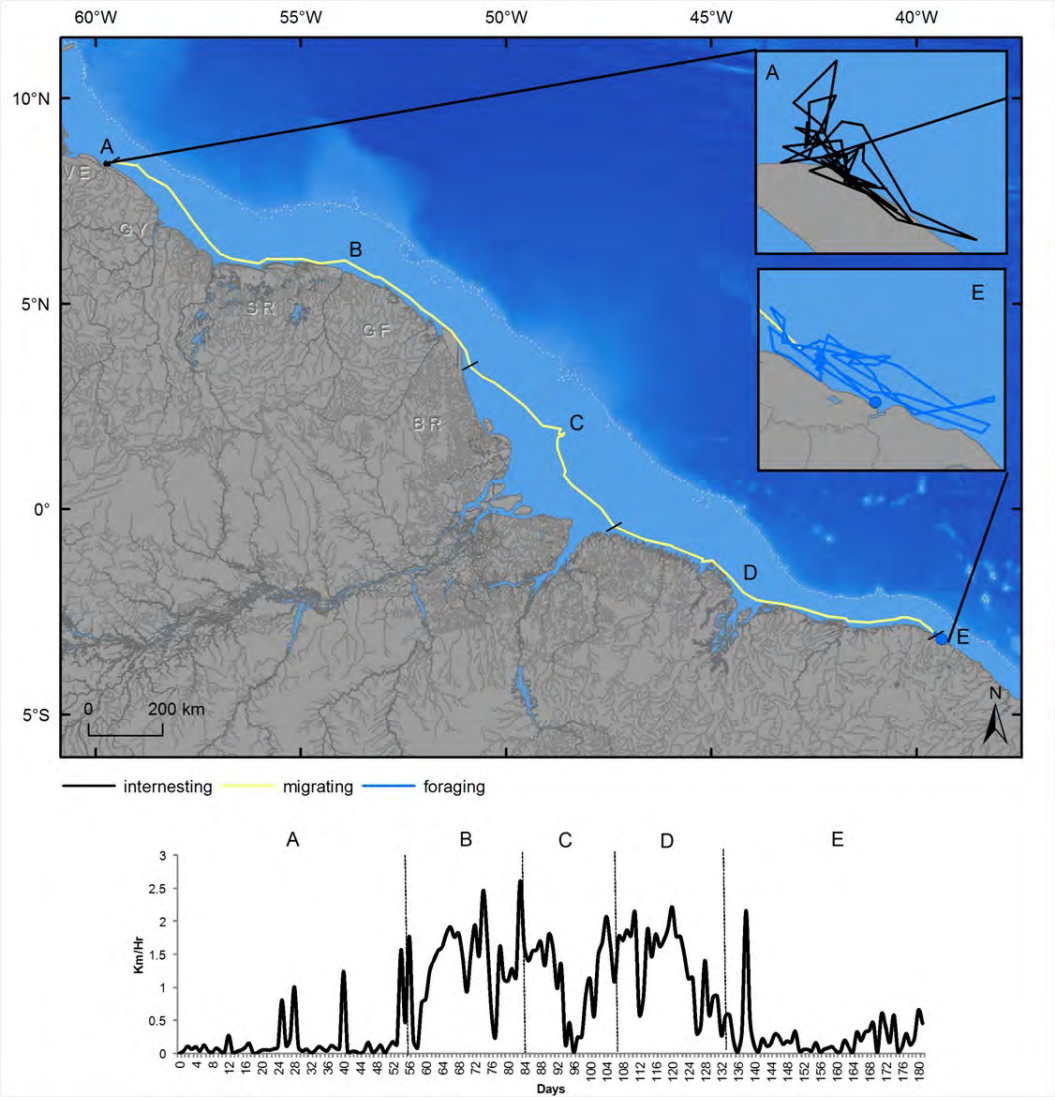


Note: Approximate locations of deep dives are marked with an *. Changes in movement rates plotted below the map indicate behavioral intervals along the movement track and are denoted with letters in both the map and graph. The inset boxes are close-up versions of the inter-nesting and foraging areas.

Becky was the next green turtle to migrate from the SBPA, beginning on 17 May 2018. She took 78 days to cover the distance between nesting and foraging sites (Table 3-3). As with the other green turtles, her journey was marked by changes in movement speeds, but these were even more marked than those of the other green turtles, with peaks and valleys that were likely related to changing currents encountered during her migration. There was a dip in movement rates just prior to her crossing from French Guiana into Brazil, and again prior to her crossing the Mearima River (Brazil) (Figure 3-42). She started her crossing of the Amazon and Pará river mouths just 1 day after Violet, but differed in that she moved directly across so that she was farther offshore and took longer to transit (18 June to 9 July 2018; Figure 3-39 and Figure 3-42). As a result, she was farther away from the river plume, but closer to the edge of the swift-moving North Brazil western boundary current. Becky's movement rates plummeted mid-

crossing. There were no dive data associated with this tag to determine if she navigated this zone at depth or near the surface.

Figure 3-42: Map of the Reconstructed Movement Track for Becky, by Behavioral Intervals

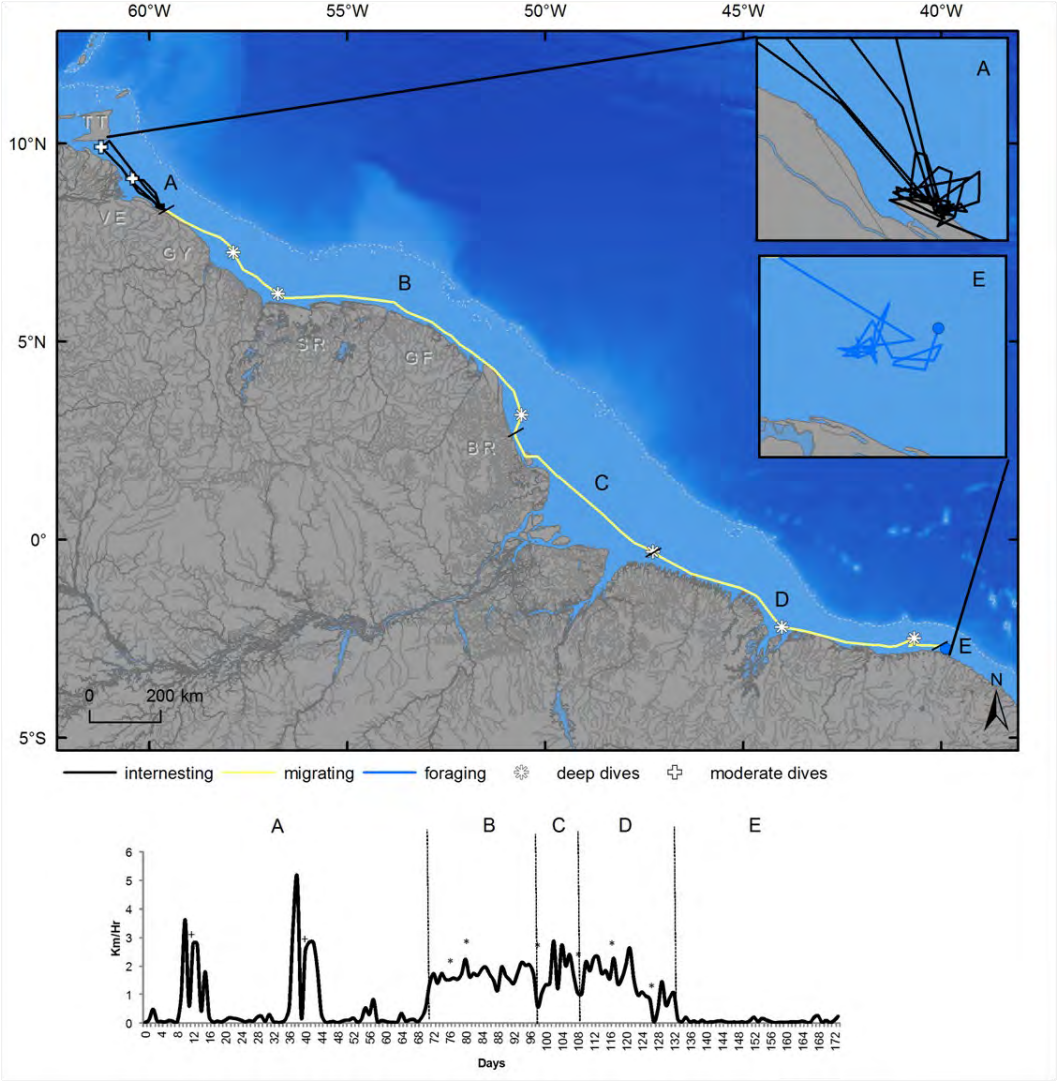


Note: Changes in movement rates plotted below the map indicate behavioral intervals along the movement track and are denoted with letters in both the map and graph. The inset boxes are close-up versions of the inter-nesting and foraging areas.

Karin was the next green turtle to migrate, leaving the SBPA on 2 June 2018. She migrated the fastest of the green turtles, making the trip in only 62 days (Table 3-3). Her journey and behavior were nearly identical to Violet's: she made deep dives before or after major river mouths (i.e., the Essequibo River, Guyana; the Corentyne River, Suriname; and the Amazon and Pará rivers, the Mearima River/Arraial Bay, and the Parnaíba River, Brazil), and her speed increased as she crossed the Amazon and Pará river mouths, then steadily declined (Figure 3-9A and Figure 3-43). However, she crossed later than the other turtles (30 June to 11 July 2018) and although she took the near-shore route, she traveled offshore of Maracá Island.

Analogous to Violet's dive profiles, Karin demonstrated resting periods at the surface during and after the Amazon River crossing, as well as spikes in temperature of surface waters prior to entering and exiting the crossing, which may delineate the different water masses within the plume (Figure 3-9A, Figure 3-9B, and Figure 3-9C). Karin's dive record indicates that she spent most of her time in the upper 10 meters of the water column, never going deeper than 40 meters, and more than 80 percent of her dives were less than 10 meters (Figure 3-12A and Figure 3-12B). All her dives were less than 2 hours in duration and most were less than 20 minutes (Figure 3-12C).

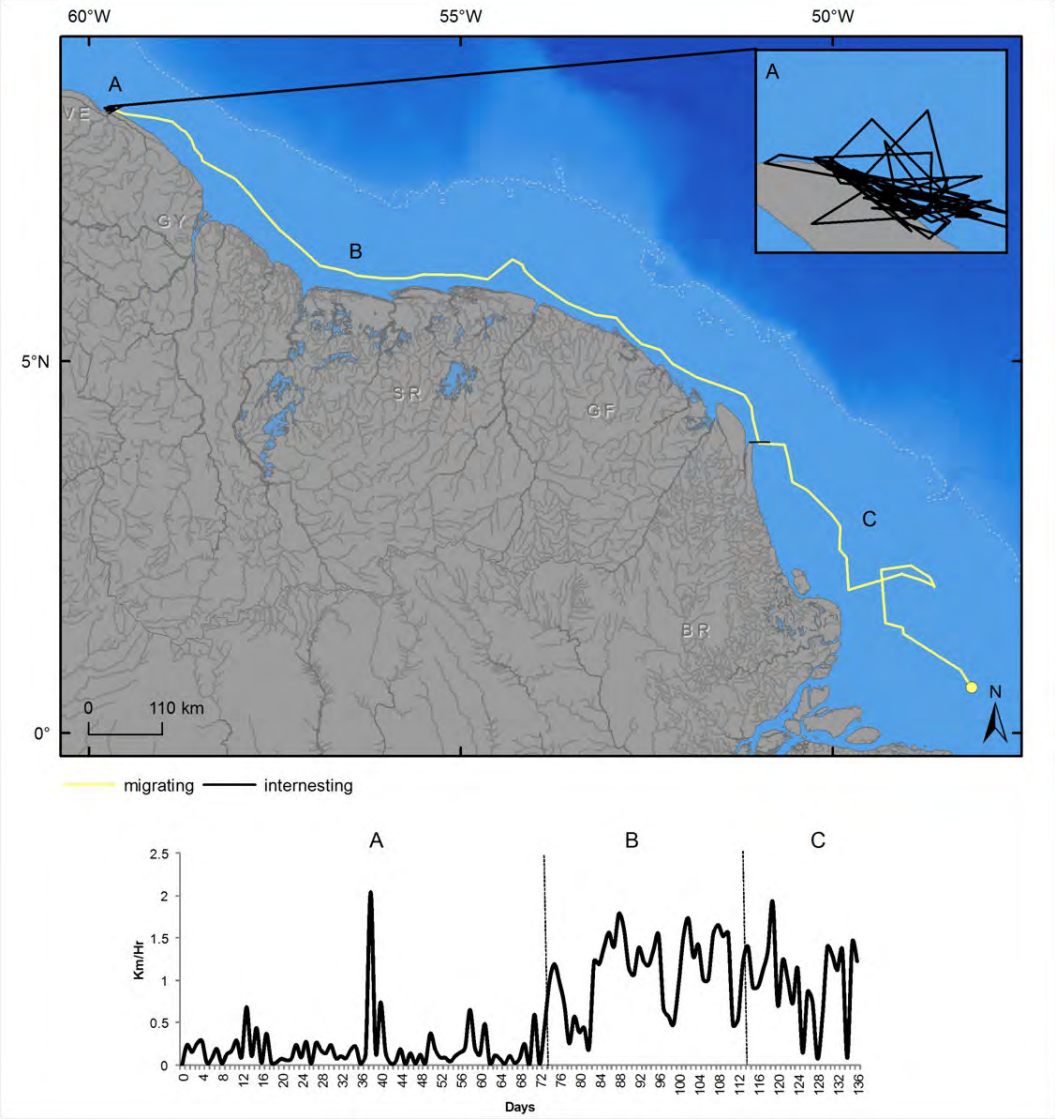
Figure 3-43: Map of the Reconstructed Movement Track for Karin, by Behavioral Intervals



Note: Approximate locations of deep dives are marked with an *. The moderately deep dives occurring during the inter-nesting period are marked with a + and occurred at the outer limits of the two furthest inter-nesting loops and were flanked by peak movement rates. Changes in movement rates plotted below the map indicate behavioral intervals along the movement track and are denoted with letters in both the map and graph. The inset boxes are close-up versions of the inter-nesting and foraging areas.

Sibille was the last green turtle to leave the nesting beach, on 3 June 2018. She was tracked for 69 days during her migration to the foraging grounds, but her transmissions stopped before arriving (Table 3-3). Her route and movement characteristics were very similar to Becky's, with troughs and peaks in movement rates as she crossed into Brazil (Figure 3-44). On 28 July 2018, Sibille also began crossing the Amazon farther offshore, but she veered inland and then turned back offshore, making a loop that was coincident with dips in the movement speed mid-way through. She continued on a straight course to the other shoreline, but transmissions ceased just as she was approaching the Pará River mouth. There were no dive data associated with this tag.

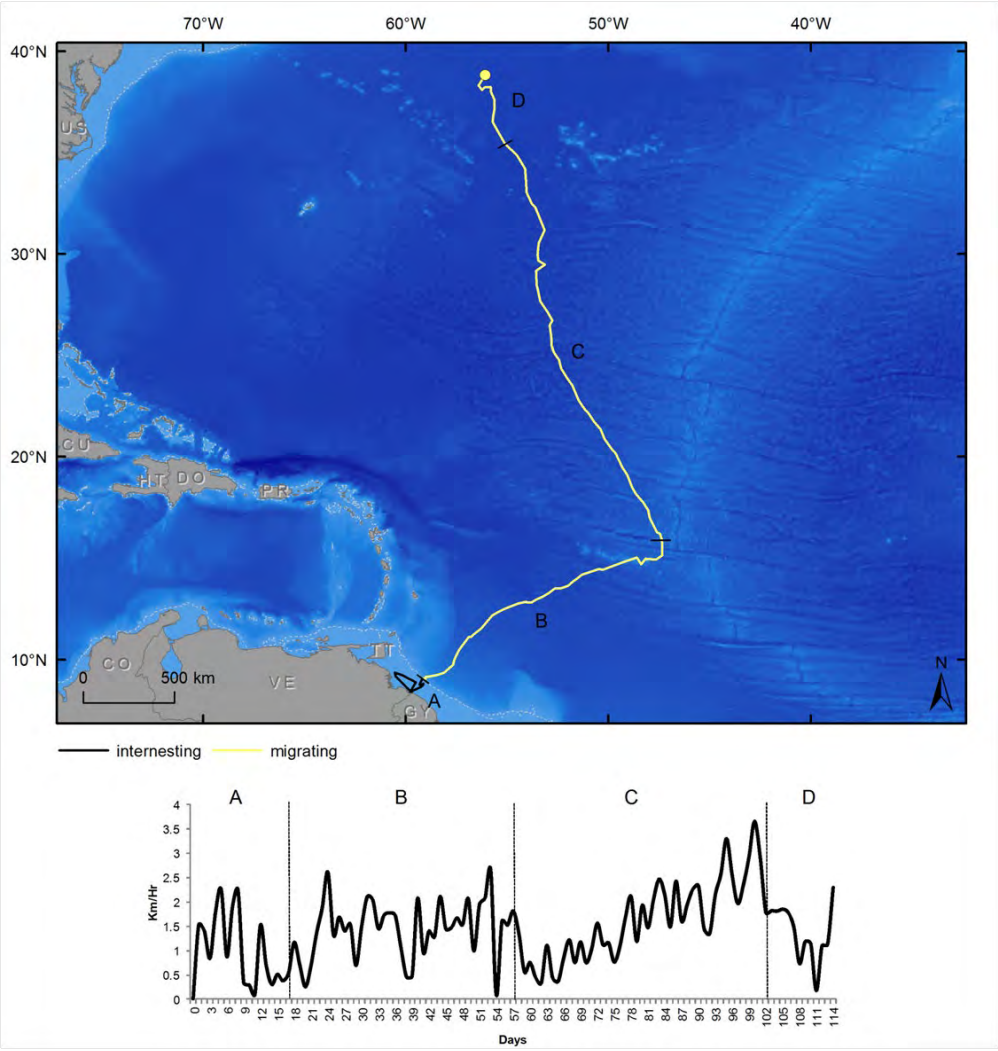
Figure 3-44: Map of the Reconstructed Movement Track for Sibille, by Behavioral Intervals



Note: Changes in movement rates plotted below the map indicate behavioral intervals along the movement track and are denoted with letters in both the map and graph. The inset box is a close-up version of the inter-nesting area.

The first leatherback to start her migration was Arleen. She left the SBPA on 1 July 2018 and traveled for 96 days into the North Atlantic, covering a remarkable distance of 4,634 kilometers before her transmissions ceased (Figure 3-25, Table 3-3). Her migration path was divided into three behavioral intervals (movement rate and directional phases) (Figure 3-45). In interval B, she moved offshore to the northeast until reaching the Mid-Atlantic Ridge, after which she headed north-northwest (interval C), gradually gaining speed within the Sargasso Sea until she passed between the Corner Rise and New England Seamounts, where her progress slowed (interval D). It appeared as though she was heading for the Laurentian Channel when her tag stopped transmitting. Canadian waters off Nova Scotia, Cape Breton, and Newfoundland have been previously described as critical foraging habitat for leatherback turtles (James et al. 2005, 2006) and indeed capture studies in this area have previously confirmed flipper tag recoveries from the Guianas (James et al. 2007).

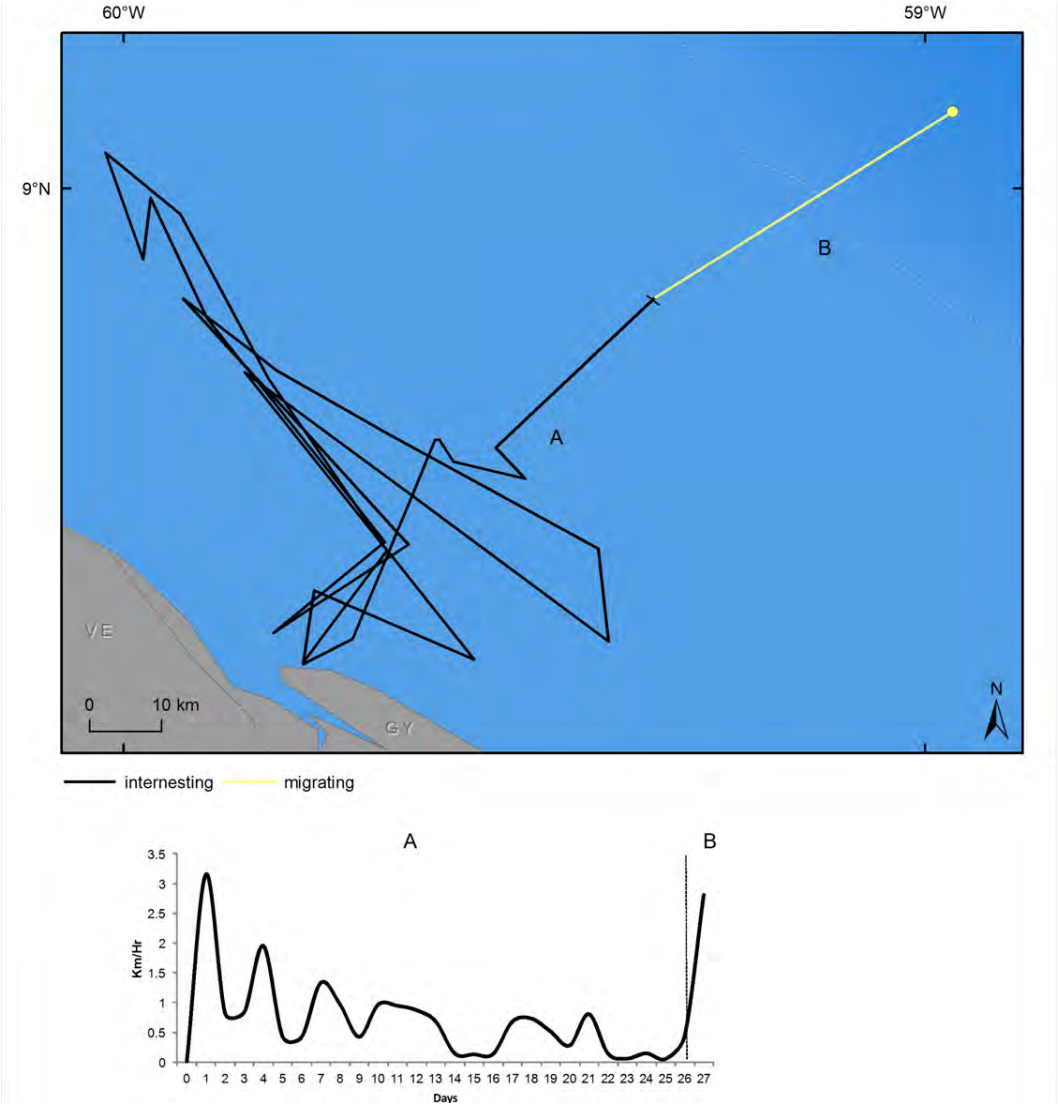
Figure 3-45: Map of the Reconstructed Movement Track for Arleen, by Behavioral Intervals



Note: Changes in movement rates plotted below the map indicate behavioral intervals along the movement track and are denoted with letters in both the map and graph.

Julie was the second leatherback to leave the nesting beach, on 10 July 2018 (Table 3-3). Unfortunately, she ceased transmitting 1 day later, just as her movement rates increased (Figure 3-46).

Figure 3-46: Map of the Reconstructed Movement Track for Julie, by Behavioral Intervals

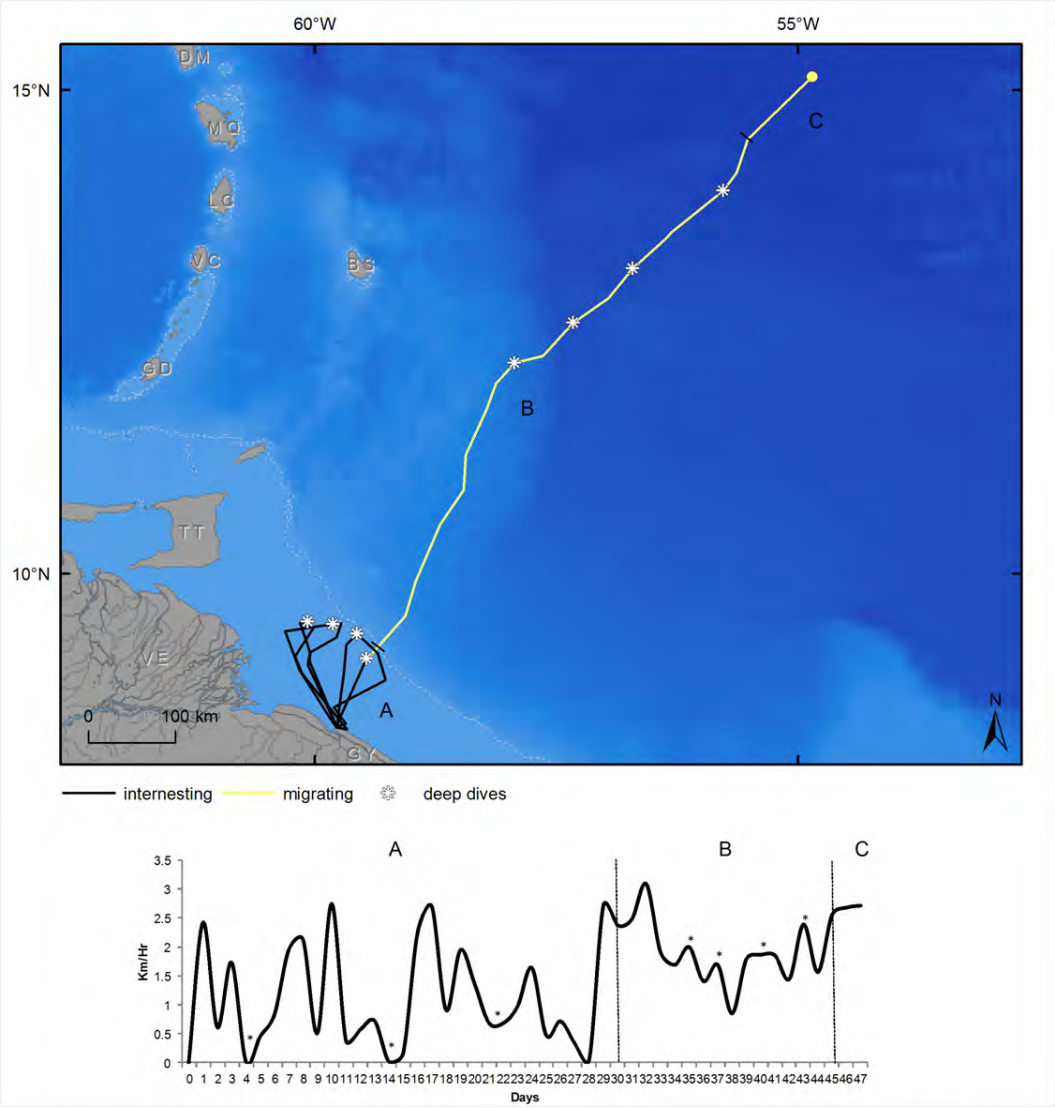


Note: Changes in movement rates plotted below the map indicate behavioral intervals along the movement track and are denoted with letters in both the map and graph.

Denise was the final turtle to leave the SBPA during this study. She began migrating on 14 July 2018 and continued transmitting for 26 days, maintaining a northeasterly course offshore of Guyana (Figure 3-47, Table 3-3). A week after she began migrating, she started making deep dives every 2 or 3 days (Figure 3-10), the deepest of which (560.5 meters) was the day before her last transmission—where she was in water depths exceeding 5,000 meters (Figure 3-7 and Figure 3-10A). Denise spent most of the time in the upper 20 meters of the water column, making more than 75 percent of her dives within 50 meters, and making few dives more than

100 meters (Figure 3-13A and Figure 3-13B). All of her dives were less than 1 hour in duration and most were less than 30 minutes (Figure 3-13C)

Figure 3-47: Map of the Reconstructed Movement Track for Denise, by Behavioral Intervals



Note: Approximate locations of deep dives are marked with a *. Note that deep dives also occurred during the inter-nesting period at the outer limits of the inter-nesting loops and were flanked in peak movement rates just like the green turtle, Karin. Changes in movement rates plotted below the map indicate behavioral intervals along the movement track and are denoted with letters in both the map and graph.

A key consideration in the analysis of tracking marine species is the effect that oceanography plays in their movements. Both green and leatherback turtles are strong swimmers, with specific habitat requirements related to physiology and foraging behaviors. Adult green turtles are neritic[11] and typically remain within the continental shelf (i.e., 200 meters) of the tropics and Equator unless they are migrating from oceanic islands to the mainland, as is the case for Ascension Island turtles (Hays et al. 2003). Leatherback turtles are generally oceanic and may

[11] Relating to the shallow part of the sea near the coast and overlying the continental shelf.

cross entire ocean basins between nesting grounds in tropical waters and their foraging grounds in the temperate and subarctic waters. They are also deep-diving specialists that can behaviorally—and physiologically—regulate environmental conditions.

To examine the influence of ocean currents on their movements, the turtles' tracks were overlaid on monthly-averaged geostrophic current imagery, which included sea surface height (SSH) and velocity. The North Brazil Current and the Guiana Current are regional components of the South Equatorial Current near shore, forming strong northward flow along the South America coastline that can be seen in satellite altimetry data. This is counter-directional to the movements of the green turtle migrations. Similarly, the North Atlantic gyre is readily visible as a mound in the SSH data and Northern Equatorial and Gulf Stream Currents in the velocity data, which leatherback turtles would have to cross to migrate to northern foraging zones. In each case, there is the potential for large energetic costs during migration.

Superimposing the green turtle migrations on the altimetry data suggests that the turtles remain in a very narrow band close to the shore where current magnitudes are relatively low and where SSHs are lowest, except around the major river mouths in Brazil where SSH is elevated (Figure 3-48). This effect was strongest and most extensive in May and weakened in June and July when the turtles crossed these zones. Baudouin et al. (2015) illustrated this narrow migratory corridor for post-nesting green turtles traveling from Suriname and French Guiana to Brazil. Similarly, Chambault et al. (2015) described the Amazon River plume as most turbulent in the upper surface layers and suggested that a strategy of short, deep dives would help green turtles migrating south to avoid the energetic costs of navigating those forces. Their study found the same two spatial patterns used by green turtles crossing the Amazon River that this study has, either close to shore or farther offshore, and suggested that animals that crossed farther offshore would initiate foraging sooner than those that crossed near to shore. These scenarios, with respect to depth or distance to foraging site, were not found to be the case within the small sample size of this study.

Leatherback turtles initiated migrations in early to mid-July, when altimetry indicated onshore movement of the Guiana Current near the SBPA and a large divergent zone forming approximately 200 kilometers offshore (Figure 3-49). The slightly spatially and temporally offset, but nearly identical, tracks of Arleen and Denise indicated that they may have been traveling along the edge of a convergent zone. Leatherbacks have been documented to maintain remarkably consistent headings traveling through the North Atlantic subtropical gyre, with negligible drift associated with ocean currents (Dodge et al. 2015). Arleen showed similar consistency and essentially swam "uphill" into the North Atlantic toward Canada. It is interesting to note that she stopped transmitting just as she headed into the meandering Gulf Stream current at a point of strong convergence. It is possible that the forces created by strong western boundary currents and pressure forces experienced in leatherback deep dives were too great for the lanyard attachments of the satellite transmitters.

3.3.2. 2019 Expedition

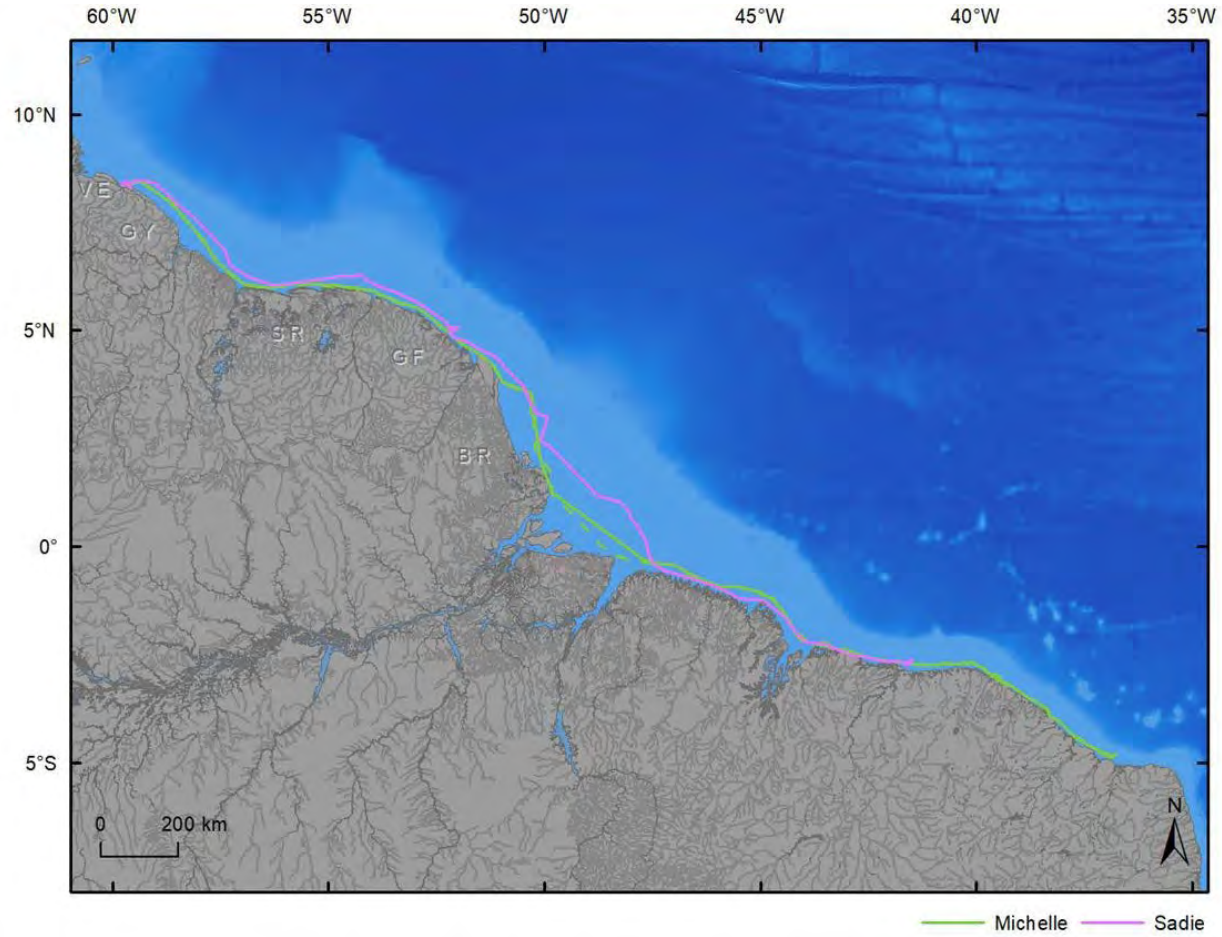
The 2019 Expedition was able to capture the migration of all seven turtles from their nesting sites on Almond Beach to their foraging grounds. The onset of migration was characterized in both species by a consistent heading and an increase in movement rates. Both green turtles tagged in 2019 headed southeast to Brazil by following a near-shore corridor across an average distance of 2,696.5 kilometers (± 125.1; mean ± 1 SD) (Figure 3-50, Table 3-6), while two leatherback turtles initially headed directly out to sea in a northeasterly direction and the three others headed due north (Figure 3-51, Table 3-6). Two of the leatherbacks (Christine and Rhoda) migrated to the southeastern United States (4,184.8 ± 688.8 kilometers; mean ± 1 SD) and remained in near-shore waters moving up and down the coast. The rest of the leatherbacks (Teij, Kari, and Regina) migrated to the continental shelf waters of Canada (4,500.3 ± 183.7 kilometers; mean ± 1 SD) before turning and heading south again into the open ocean. Both green and leatherback turtles used deeper waters during their migration period than in other tracking periods, and leatherbacks used significantly deeper waters of the open ocean than green turtles, which remained exclusively on the continental shelf (Figure 3-24 and Figure 3-25).

Michelle was the first turtle to start her migration, on 11 May 2019, taking 66 days (Table 3-6) to reach the same foraging grounds used by the green turtles tagged in 2018, where she remained for 3 weeks before migrating further south for another 13 days. Figure 3-52 shows the different behavioral periods of Michelle's journey and the associated changes in speed. The largest spikes in her movement rates coincided with major river mouths (i.e., the Essequibo River, Guyana; the Maroni River, Suriname/French Guiana; and the confluence of the Cayenne and Mahury rivers, the Amazon and Pará rivers, the Acarau River, and in the bay off Baleia, Brazil) (Figure 3-52). She traversed the Amazon and Pará rivers from 15 to 19 June 2019, passing offshore of Maracá Island, but then moving nearer to shore and the river's mouth. There were several days during the crossing without location fixes, suggesting she spent little time at the surface enabling satellite transmissions. The same issue was observed in both Argos and Fastloc GPS records. There were no dive data associated with this tag.

The other green turtle, Sadie, left the nesting beach a month later, on 15 June 2019. She took 80 days to cover the distance between nesting and foraging sites (Table 3-6). As with the other turtles, her journey was marked by changes in movement speeds that were likely related to adjustments to the flow of water. Increased movement rates occurred as she passed by the Corentyne River, Suriname; the Maroni River, Suriname/French Guiana; the Sinnamary River, French Guiana; and the Mahury River, the Amazon and Pará rivers, the Turiacu River, and the Mearima River/Arraial Bay, Brazil (Figure 3-53). She followed a similar route as Michelle to cross the Amazon and Pará river mouths, but differed in that she moved farther offshore and took longer to transit (5 to 15 August 2019; Figure 3-50 and Figure 3-53). As a result, she was farther away from the river plume, but in closer proximity to edge of the swift moving North Brazil western boundary current (Figure 3-48). There were a few days at the start of the crossing lacking location data, as in the case of Michelle. Sadie's movement rates were initially elevated upon crossing, then dipped mid-way through, increased again, and then remained lower until reaching the other side. Dive data revealed that she was in the near surface waters (less than 8 meters) in the initial part of this crossing, but then began diving deeper (to a

maximum depth of 39 meters) at the point where her forward movements slowed (mid-crossing) (Figure 3-26A). She also made deep dives like this at other points along her migration, at the onset and particularly at some large river mouths (i.e., the Corentyne River, Suriname; the Sinnamary River, French Guiana; and the Amazon and Pará rivers, the Turiacu River, and the Mearima River/Arraial Bay, Brazil) (Figure 3-26A and Figure 3-53). The remainder of her dives were typically within 20 meters of the surface and most frequently between 10 and 20 meters (Figure 3-31A and Figure 3-31B). Her dives were always less than 2 hours in duration, but most were less than 30 minutes (Figure 3-31C). Data from the temperature records documented some of these water masses as well. Specifically dips in temperature were noticeable as she passed the Maroni River that divides Suriname and French Guiana and then the largest dip as she passed the Sinnamary River in French Guiana, after which the temperatures increased again past Brazil's Amazon and Pará rivers and then gradually declined and leveled off when she settled into her foraging ground (Figure 3-26B).

Figure 3-50: Migration Routes of 2019-tagged Green Turtles Tracked from SBPA



Note: Where double lines appear for a given turtle, this indicates deviations between the tracks derived from Argos and Fastloc location data. For the most part, the difference is unapparent.

The first leatherback to start her migration was Christine. She left Almond Beach on 22 May 2019 and traveled for 55 days to the coast of Florida, in the southeastern United States (Figure 3-54, Table 3-6). Her migration path was divided into three movement rate and directional phases (Figure 3-54). She began by heading north, passing between Barbados and Saint Vincent and the Grenadines. Then she turned northwest, skirting the lower Caribbean archipelago until approximately 19° 01″ N latitude, where she moved farther out to sea and turned west-northwest until passing through the Grand Bahamas islands and crossing the Gulf

Stream current onto the continental shelf of the United States, upon which she moved north and south between central and northern Florida. The largest peaks in her movement rates were associated with her locations in the Gulf Stream (Figure 3-54). Christine made deep dives (200 to 516 meters) during this journey up through her passage of the Gulf Stream (Figure 3-28A); these dives had lower documented temperatures relative to her shallower dives (Figure 3-28B). The deepest dives (more than 400 meters) occurred east of Tobago, east of Guadeloupe, east of Anguilla, north of the British Virgin Islands, north of Puerto Rico, north of the Bahamas, and west of the Grand Bahamas (Figure 3-24). Other dives occurred at a range of depths but she spent the most time swimming near the surface (Figure 3-34A) and most dive depth records occurred at less than 20 meters (Figure 3-34B). All her dives were less than an hour in duration (Figure 3-34C). Again, it is interesting to note the change in water masses in the temperature data. Once Christine cleared the influence of the Caribbean, the temperature records began to rise as she moved through the warm North Atlantic waters (Figure 3-28B). Other noticeable changes occurred as she approached and moved through the Bahamas (increased), crossed the Gulf Stream current (increased), and moved close to shore off Jacksonville (decreased) and Cape Canaveral (increase), Florida, the latter of which was concurrent with westerly movement of the Gulf Stream toward shore (Figure 3-28B, Figure 3-54, and Figure 3-60).

Rhoda, the second leatherback to depart the nesting beach (22 June 2019), made a nearly identical migration path to the southeastern coast of the United States, only shifted farther north and taking 68 days (Figure 3-55, Table 3-6). She too swam north, passing between Barbados and Saint Vincent and the Grenadines, but arced away from the Caribbean island chain and continued heading north until she turned west-northwest at approximately the same latitude of 19° 01″ N where Christine had made her turn. Rhoda made her way through the Blake Canyon, onto the continental rise, where she entered the Gulf Stream and traveled north, crossing it to the other side, and exiting off of Charleston, South Carolina. In between foraging periods (see Section 3.4.2 for details), she moved between the coastal waters of Jacksonville, Florida, and Cape Hatteras, North Carolina, staying near the continental shelf break during the autumn months and hugging the shoreline during the winter and spring months. Her highest movement rates were seen out in the open ocean traveling in frontal convergence zones and while in the Gulf Stream (Figure 3-55 and Figure 3-60). Rhoda consistently made dives in the upper 150 meters of the water column during this migration, with a few deep dives at points along her journey to a maximum depth of 590 meters (Figure 3-30A). Her deepest dives (more than 400 meters) occurred east of Saint Lucia, east of Guadeloupe, north Barbados, north of Antigua, and north of the Dominican Republic (Figure 3-54). While on the continental shelf, her deepest dives occurred east of Charleston and Myrtle Beach, South Carolina, and east of Ocracoke Island, North Carolina (Figure 3-55). Although she did make a few very deep dives, Rhoda's dive profile consisted primarily of shallow dives (less than 20 meters) with most time spent swimming in depths less than 2 meters (Figure 3-35A and Figure 3-35B). All of her dives were less than 2 hours in duration, but most were less than 5 minutes (Figure 3-35C). Her entrance into the warm North Atlantic gyre was visible in the temperature data, as was her crossing the Gulf Stream. There was a latitudinal dip in temperature along her migration track around 30°0″ N and declines and elevations associated with seasonal changes in temperature while she was

on the continental shelf; the lowest non-dive-related temperatures (12°C) occurred in Onslow Bay, North Carolina, during February 2020 (Figure 3-30B and Figure 3-55).

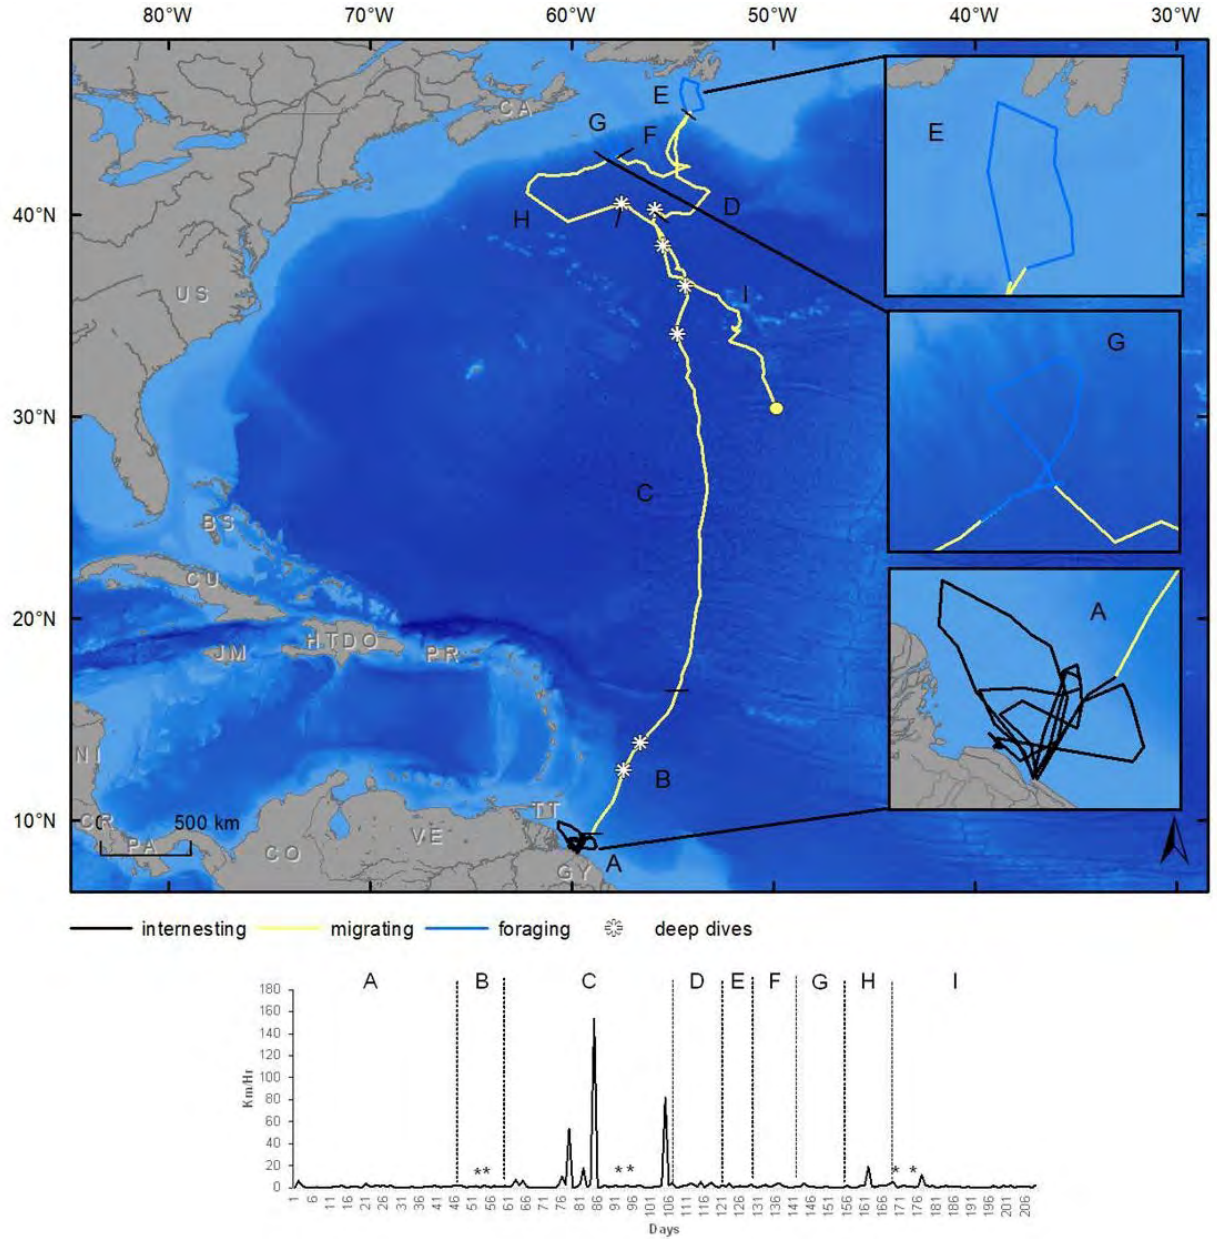
Kari left the nesting beach a few days after Rhoda, on 25 June 2019, swimming northeast into the North Atlantic and heading directly for foraging grounds in Canadian waters (Figure 3-56). Her migratory journey took 73 days to reach the coast of Newfoundland (Table 3-6). She made a slight course correction northward east of Guadeloupe, traveled through the Sargasso Sea, passed between the Corner Rise and New England Seamounts, turned east at 40° 0″ N latitude making a counterclockwise arc facilitated by the Gulf Stream current extension and then continued north at 41° 2″ N latitude onto the continental shelf waters of the Southern Grand

Banks of Newfoundland, Canada. Here she made a clockwise loop (see Section 3.4.2 for details). She then returned the way she came, again making a counterclockwise arc, this time to the west, traveling in and crossing out of the Gulf Stream extension, and heading south. At 37° 0″ N latitude she turned southeast and went through the Corner Rise seamounts and then continued traveling southward into the mid-Atlantic. Spikes in movement speeds occurred in the open ocean portions of her migration track and were associated with dynamic geostrophic flow, including ephemeral (i.e., oceanographic fronts and rings) and semi-permanent features (i.e., the Gulf Stream extension) (Figure 3-56 and Figure 3-60). Kari was the deepest recorded diver of the tagged turtles from the study, reaching a depth bin of 1,400 meters, but her migratory dives were most frequently in the upper 100 to 200 meters of the water column (Figure 3-27A and Figure 3-32B). She made two deep dives (more than 400 meters) in the early days of her migration, east of Barbados and Martinique, and then again in the passage between the seamount chains, as well as her entry and departure points of the Gulf Stream extension (Figure 3-27A and Figure 3-56). As with Rhoda, her dives did not last longer than 2 hours, but were more variable in duration (Figure 3-27C). She also spent most of the time swimming near the surface (Figure 3-27A). The peaks in the time-series of temperature records showed her entering the warm North Atlantic gyre, passing through a convergence zone in the mid-Atlantic, and twice crossing the Gulf Stream extension, while the valleys showed her moving onto the Canadian shelf waters influenced by the cold Labrador Current, where she experienced her lowest non-dive temperature (0°C) just off of Placentia Bay, Newfoundland, as well as cool waters in Shortland Canyon near the Gulf of Saint Lawrence (Figure 3-27B and Figure 3-56). The extent of the foray she made off the continental shelf of Canada encircled a Gulf Stream meander during that period (Figure 3-39), providing relatively warm water and active frontal activity.

Kari’s 1,400-meter dive was unique among the turtles in this study. Leatherbacks have previously been known to make dives deeper than 1,000 meters, but dives to these depths are rare and the reasons for them are unknown. Three possibilities have been proposed including thermoregulation, predator avoidance, and scouting prey than migrate vertically on a diurnal pattern. The “prey scouting” theory has emerged as the most credible of the three possibilities, and assumes that the turtles use these dives to locate concentrations of prey items and then return to the surface to wait for them to rise through the water column at night, when the turtles can consume them at their leisure, closer to the surface (Houghton et al. 2008).

Figure 3-56: Map of the Reconstructed Movement Track for Kari Colored by Behavioral Intervals



Note: Approximate locations of deep dives are marked with a *. Changes in movement rates plotted below the map indicate behavioral changes along the movement track and are denoted with letters in both the map and graph. The inset boxes are close-up versions of the inter-nesting and foraging areas.

Regina was the fourth leatherback turtle to leave the SBPA during this study. She began migrating on 7 July 2019, heading due north to Canada, taking 62 days to reach the Scotian Shelf just east of Sable Island, Nova Scotia (Figure 3-57, Table 3-6). Her course was similar to Kari's, passing between Barbados and Saint Vincent and the Grenadines, just as Christine and Rhoda did, but she then adjusted her direction east of Martinique and continued northward straight through the New England seamounts, crossing the Gulf Stream extension, and moving briefly onto the continental shelf, before turning and heading offshore into Shortland Canyon, where she stopped transmitting. The two largest peaks in her migratory movement rates were in

proximity to a cold core ring south of the chain of seamounts and her crossing the Gulf Stream extension just north of the seamounts (Figure 3-57 and Figure 3-39). Most of Regina's deep dives (more than 400 meters) took place early in her journey, the deepest of which was 680 meters, east of Grenada; she made another deep dive just prior to entering the New England seamounts (Figure 3-29A and Figure 3-57). She continued to make some moderately deep dives (more than 200 meters) through the chain of seamounts and across the northern side of the Gulf Stream extension. The rest of her dives were primarily within 150 to 200 meters depths (Figure 3-29A). Regina's dives were all less than an hour, but she made longer dives than the other leatherbacks (up to 40 minutes being the highest percentage) (Figure 3-34C). She most frequently dove to 50 meters (Figure 3-34B), but she also spent a significant portion of her time in the surface waters (Figure 3-34A). Like the other turtles, there was a rise in her temperature data observed as she moved into the open ocean water of the North Atlantic, followed by a decline in temperature as she passed through a convergence zone southwest of Bermuda, another dip immediately before she crossed the Gulf Stream extension, followed by a steady decline to 10°C when she moved onto the Scotian Shelf, and finally a slight rise as she moved back out to sea (Figure 3-29B and Figure 3-57).

Teij was the last of the tagged turtles to leave the nesting beach, just 1 day after Regina, on 8 July 2019. Her migration route was nearly identical to that of Kari's, but taking her a week's less time to reach the Southern Grand Banks of Newfoundland, Canada, in just 67 days (Figure 3-50 and Figure 3-58; Table 3-6). She similarly made a slight course correction northward east of Guadeloupe, traveled directly through the Sargasso Sea, passed between the Corner Rise and New England Seamounts, but made no deviation in crossing the Gulf Stream current extension before moving onto the continental shelf and turning around outside of Placentia Bay, Newfoundland (see Section 3.4.2 for details). Teij then moved southward and offshore along the Laurentian Fan and then turned west at 43° 0″ N latitude, making a counterclockwise arc to the south, again crossing the Gulf Stream extension and heading southeast into the mid-Atlantic. Her track continued onward to 15° 01″ N, where she adjusted her course slightly to a due south direction until she reached 8° 0″ N and turned around and headed north-northwest again, presumably because of the cues from the strong westward flowing North Equatorial Current. The greatest peaks in her movement speeds were also in the open ocean and northwest-most extent of her migration track and were likely associated with dynamic geostrophic flow, including ephemeral (i.e., oceanographic fronts and eddies) and semi-permanent or permanent features (i.e., the Gulf Stream extension and its meanders, the North Equatorial Current) (Figure 3-58 and Figure 3-60). The Gulf Stream extension meander encompassed by Kari's track was also encompassed by Teij's track, which occurred from late September to mid-October 2019. There were no dive data associated with this tag.

As with the turtles tagged in 2018, the movements of turtles tagged in 2019 were overlaid on monthly-averaged geostrophic current imagery to examine the influence of ocean currents on their movements while at sea. Similar to the turtles tagged in 2018, the green turtles tagged in 2019 migrated in a very narrow band close to the shore where current magnitudes were minimal and where SSHs are lowest, except around the major river mouths in Brazil where SSH is elevated (Figure 3-59). This effect was strongest and most extensive in June, weakening in July and August during most of their migration. As with the turtles tagged in 2018, the movements of

green turtles tagged in 2019 were consistent with the corridor first identified by Baudouin et al. (2015) and with the energetic strategy proposed by Chambault et al. (2015).

Leatherback turtles initiated migrations between late May and early July when altimetry indicated strong northwest movement of the Guiana Current near the SBPA. Christine, Rhoda, and Regina followed the current initially toward the Caribbean, while Kari and Teij traversed it directly moving across the prevailing flow. Leatherbacks have been documented to maintain remarkably consistent headings traveling through the North Atlantic subtropical gyre, with negligible drift associated with ocean currents (Dodge et al. 2015). The small bumps observed in their tracks were minor deviations reflecting these ocean dynamics, while larger arcs and jumps indicated more significant deviations specifically related to the Gulf Stream current and its extension and meanders (Figure 3-60).

Warmer colors indicate higher magnitude or height, respectively.

3.4. Foraging Period

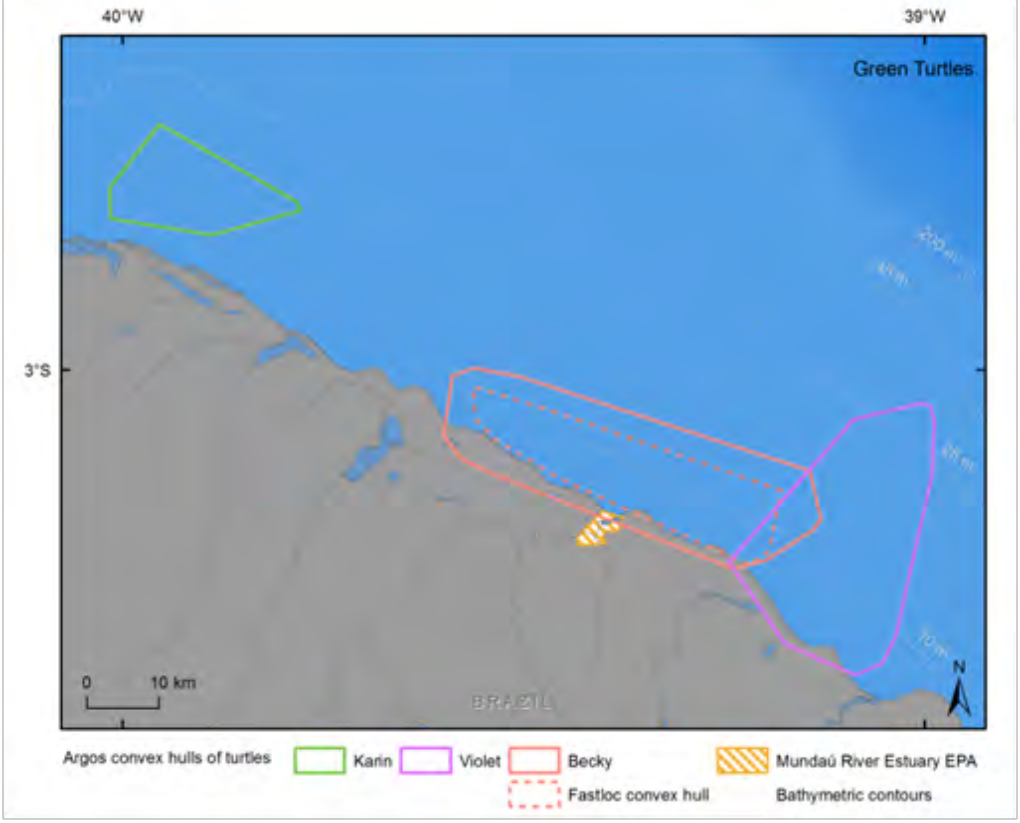
When using remote tracking technologies, foraging sites are typically identified by changes in the movement behaviors of the individuals being monitored. These behaviors include area-restricted search and dive patterns. These behavior metrics are inferences for foraging, not direct evidence, but are standard methodologies used in the field of research. Area-restricted search is based on the premise that food is spatio-temporally uneven in distribution in the environment and, as a consequence, a predator will increase the frequency of its changes in direction and decrease its speed of movement when it encounters a patch of food (Kareiva and Odel 1987). This is observed as sinuous versus straight lines along an animal's movement track. We used these components (changes in speed and turning angles; Figure 3-52 through Figure 3-58) along with changes in the depths of dives (Figure 3-26 through Figure 3-30), when possible, to identify foraging locations for the turtles in this study. This is much more straightforward for green turtles than for leatherbacks because the former feed primarily on seagrass, which is stationary, benthic, and somewhat predictable (Short et al. 2007), and they tend to settle into a foraging ground and set up residency for extended periods of time. Leatherbacks, on the other hand, feed on gelatinous prey, which is both mobile and sporadic (i.e., less predictable) in the environment, so these turtles must move among disparate patches to feed and search throughout the water column to find their food (Duron and Duron 1980; Eisenberg and Frazier 1983). Frontal zones aggregate planktonic organisms (Mann and Lazier 2006), therefore, migrating to regions with predictable frontal features would be a good foraging strategy for leatherback turtles and has indeed been observed in both coastal and offshore environments (Houghton et al. 2006; Eckert 2006).

3.4.1. 2018 Expedition

None of the leatherback turtles were tracked to their ultimate foraging grounds in 2018. Three green turtles were tracked to their ultimate destination, the foraging grounds in the State of Ceará, Brazil. This region was first described as a green turtle foraging area by Pritchard (1976) based on tag returns of turtles from the Guianas. Since that time, molecular techniques and satellite tracking have provided further evidence supporting a well-established, mixed-stock foraging aggregation of green turtles at Almofala, Brazil (Naro-Maciel et al. 2007; Godley et al. 2003), which attracts animals from Ascension Island and the lower Caribbean. As far as is known by the authors of this report, no satellite tagging study has been published documenting the foraging grounds of green turtles from Guyana. The turtles in this study settled in the vicinity of Almofala, Brazil, and were tracked for an average of 43 +/- 6.2 days (mean +/- 1 SD) (Figure 3-41, Figure 3-42, Figure 3-43; Table 3-3). Two of the three turtles overlapped geographically in area, adjacent to the Mundaú River Estuary Environmental Protection Area (Figure 3-61). The three green turtles displayed similar habitat use (area) and movements (dispersal from foraging centroid) among individuals and their locations were at similar distances from shore as during the inter-nesting period (Figure 3-2). For all individuals except Karin, turtles used slightly deeper water depths than during the inter-nesting period (7.9 +/- 6.7 meters [mean +/- 1 SD]) (Figure 3-6). The coastline between the Orinoco River in Venezuela and the Amazon River in Brazil is one of the world's muddiest due to high suspended-sediment discharge from the Amazon River

being transported westward along shore as mud banks (Anthony et al. 2010). The region to the east is therefore the nearest habitat permitting the growth of seagrass, the primary food source for green turtles, which requires adequate light transmission to grow (Short et al. 2007).

Figure 3-61: Spatial Foraging Footprints of 2018-tagged Green Turtles near Almofala, Brazil



3.4.2. 2019 Expedition

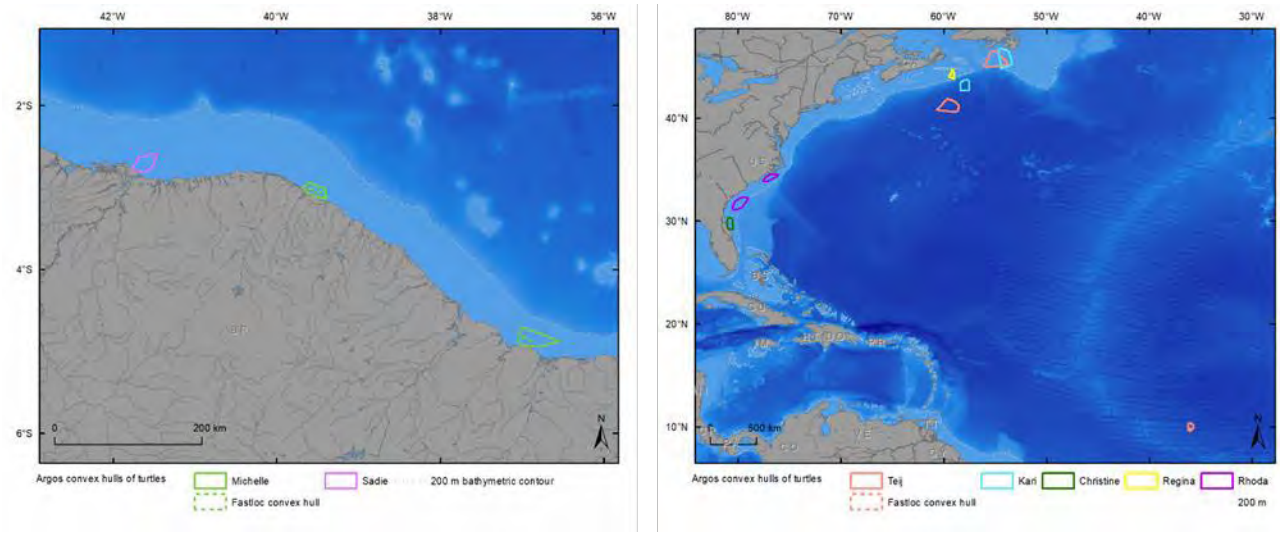
Similar to 2018, both green turtles tagged in 2019 traveled to foraging grounds located in the State of Ceará, Brazil (Figure 3-61) and were tracked for an average of 77 days once they had arrived (± 21.2; mean ± 1 SD) (Figure 3-50, Table 3-6). Michelle initially stopped in the well-known green turtle foraging ground (Naro-Maciel et al. 2007; Godley et al. 2003) near Almofala. Michelle foraged in this area for 24 days, but then moved farther down the coast and settled into another site in the state of Rio Grande do Norte, where she remained for 68 days when her transmissions ceased (Figure 3-52, Table 3-6).

Sadie settled into a foraging ground farther north, in the State of Piauí near Parnaíba, Brazil, where she was tracked for her final 62 days of transmissions (Figure 3-53, Table 3-6). The time-series plot of her dive depths shows a flattening off at 20 meters, consistent with benthic diving behavior within the 20 meters isobath – which is ideal for grazing upon seagrass (Figure 3-26A). Both green turtles used slightly deeper water depths than during the inter-nesting period (8.2 meters ± 4.8; mean ± 1 SD) and displayed similar habitat use (area) and movements (dispersal

from foraging centroid) among sites, and their locations were at similar distances from shore as during the inter-nesting periods (Figure 3-22).

For the first time in this study, we identified both coastal and oceanic foraging habitats for the leatherbacks that they occupied for 3 to 58 days (Figure 3-54 and Figure 3-62, Table 3-6). The indicators for these periods were area-restricted search movement, coupled with a change in dive behavior marked by a progression of shallow dives; this behavior was consistent in both types of habitats. All five leatherbacks used at least one coastal foraging site, and two turtles (Teij and Kari) also had one or more oceanic foraging sites.

Figure 3-62: Spatial Foraging Footprints of 2019-tagged Green and Leatherback Turtles in the North Atlantic



Canadian waters off Nova Scotia, Cape Breton, and Newfoundland have been previously described as critical foraging habitat for leatherback turtles (James et al. 2005, 2006) and indeed capture studies in this area have previously confirmed flipper tag recoveries from the Guianas (James et al. 2007). Between early September and mid-October 2019, Kari, Regina, and Teij displayed foraging behavior in this region. Kari and Teij spent 9 and 13 days foraging in the coastal zone, respectively, outside Placentia Bay, Newfoundland, and another 15 and 16 days, respectively, foraging over abyssal depths (more than 3,000 meters) off of Nova Scotia (Figure 3-56, Figure 3-57, Figure 3-58; Table 3-6). Kari's data showed that her dives were mostly in the upper 30 meters of the water column during these periods (Figure 3-8A). Regina's foraging site was in nearby coastal water, adjacent to Sable Island, Nova Scotia (Figure 3-58) where she remained for only 3 days (Table 3-6). Her dives were also confined to the upper 30 meters during this behavioral phase, although potential depths were down to 200 meters (Figure 3-29A).

The coastal zone of the southeastern United States has also been identified as important foraging habitat for leatherbacks (Eckert et al. 2006; Fossette et al. 2014; Stewart et al. 2016). We observed three foraging periods and locations here, interspersed from late July 2019 to the end of February 2020.

Christine demonstrated foraging behavior off northern Florida for 12 days in July (Figure 3-54, Table 3-6). Her dives were less than 20 meters during this time, indicating that she was diving near to the seafloor (approximately 30 meters) (Figure 3-28A). Meanwhile, Rhoda displayed foraging behavior around Onslow Bay and Cape Lookout, North Carolina, for 58 days beginning in late August, and then again off of Georgia/South Carolina border for 40 days beginning in late January (Figure 3-55, Table 3-6). Her dives were mostly to 35 meters in the North Carolina foraging site, which was approximately the depth of that site, and less than 20 meters in the Georgia/South Carolina site, which was a deeper site extending to continental shelf break (i.e., 200 meters) (Figure 3-30A). Altimetry data showed that these positions kept the turtles outside of the Gulf Stream current influence during these periods (Figure 3-60).

Finally, we also identified a leatherback foraging event in the open ocean halfway between the east coast of South America and the west coast of Africa (Figure 3-58). Teij appeared to be foraging near a zone of divergent circulation (i.e., upwelling) spawned from the North Equatorial Current during a 15-day period in January (Figure 3-60, Table 3-6). There were no dive data associate with this tag, but water depths are approximately 5,000 meters at this location.

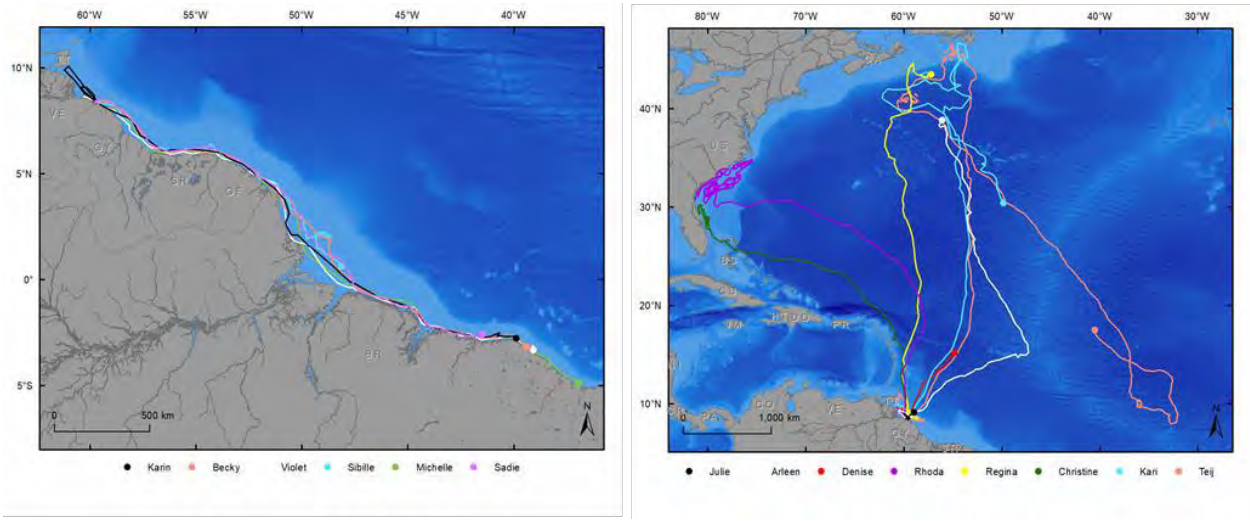
Leatherback turtles used deeper water depths during foraging than during the inter-nesting period (1,159.1 meters $\pm$ 954.6; mean $\pm$ 1 SD) and turtles foraging in Canadian waters occupied deeper waters than turtles foraging in the southeastern United States (2,955.5 meters $\pm$ 2,154.3; mean $\pm$ 1 SD and 32.2 meters $\pm$ 14.1; mean $\pm$ 1 SD, respectively) ($F_{1,177} = 203.2$, $p < 0.001$). Habitat use (area) and distances from shore were similar between inter-nesting and foraging periods for leatherbacks, but movement (dispersal from foraging centroid) among sites was greater than during the inter-nesting period ($\chi^2 = 11.740$, df = 1, $p < 0.001$; Figure 3-22). Although these metrics were somewhat larger for turtles foraging in Canadian waters than for turtles foraging in the southeastern United States, they were not statistically different.

3.4.3. Interannual Variation

For turtles tagged in 2018 and 2019, inter-nesting habitat-use patterns were quite similar within species, with turtles staying relatively close to the SBPA, but for turtles tagged in 2019, the study tracked more turtles during their migrations to foraging areas (Figure 3-63).

Leatherbacks tagged in 2019 traveled to waters off Canada (three turtles) and the southeast United States (two turtles) for foraging following their nesting season. Only one of the three leatherbacks tagged in 2018 was on track to reach its foraging grounds off Canada when transmissions ceased. Both of the green turtles tagged in 2019 traveled to Brazil foraging sites following the nesting season. They followed very similar paths along the coastline southeast of the SBPA and this was similar to the paths taken by all four green turtles tagged in 2018.

Figure 3-63: Satellite Tracks of All Six Green (left) and Eight Leatherback (right) Turtles Tagged in 2018 and 2019 Tracked from Shell Beach Protected Area through Their Inter-nesting Intervals and to Their Foraging Grounds



4. CONCLUSION

The results of this study provided a wealth of new information about Guyana's nesting sea turtles. Although sample sizes were small, they provided the first look into the at-sea behaviors of green and leatherback turtles in this region. They expanded our knowledge on the at-sea behaviors of green and leatherback turtles in this region in a manner not possible by other methods. The SBPA is an important yet under-described nesting area for green and leatherback sea turtles that migrate to disparate foraging grounds in Brazil and the North Atlantic, respectively. Within the inter-nesting period, important similarities between species and year are evident. The study shows that turtles may remain in the inter-nesting zone for several months, venturing northwest into the territorial seas of Venezuela and Trinidad and Tobago, laying multiple clutches of eggs, and displaying strong site fidelity. Green turtles tended to stay near the nesting beach, generally within the 5-meter isobath, while leatherbacks tended to range farther offshore, generally on the continental shelf (depths less than 200 meters) with occasional forays over the continental slope (to depths around 1,000 meters). During this period, turtles remained primarily in the upper 10 meters of the water column near to shore, but leatherbacks made occasional deep dives during their forays within the continental shelf between nests. During migration, green turtles consistently followed a narrow corridor along the coastline, avoiding the effects of the opposing Guiana and North Brazil western boundary currents to arrive at shallow water seagrass foraging sites in northern Brazil where they remained for extended but undefined periods. Leatherback turtles dispersed into the high seas, taking remarkably similar routes across the North Atlantic gyre to distant foraging grounds in the southeastern United States, Canada, and mid-Atlantic, where they are known to search for jellyfish on which to feed. In some cases, they remained in these areas for prolonged periods, but in others they moved to other sites quickly, presumably depending upon the availability of prey resources that they encountered. Although they occasionally made very deep dives – in one case to the astounding depth of 1,400 meters, the leatherback turtles in this study generally concentrated their foraging dives in the upper 30 meters of the water column.

While significant efforts were made to maximize tag retention and life (as well as data quality and quantity), transmitter life was the primary limitation in this study. For the 2019 Expedition, all tags were prepared with a coat of high-quality antifouling product prior to deployment, which appears to have helped preserve the tags' structural integrity and extend transmitter life as compared to tags deployed in the 2018 Expedition.

APPENDIX R

List of Marine Fishes in Guyana

Resubmitted without changes

March 2022

-Page Intentionally Left Blank-

Scientific Name
Acanthocybium solandri
Acanthostracion quadricornis
Acanthurus hepatus
Achirus achirus
Achirus declivis
Achirus lineatus
Ahlia egmontis
Albula vulpes
Allocyttus verrucosus
Alutera monoceros
Alutera schoepfi
Alutera ventralis
Aluterus monoceros
Aluterus scriptus
Amphiarius phrygiatus
Amphiarius rugispinis
Anableps anableps
Anarchias similis
Anchoa spinifer
Anchovia clupeoides
Anchovia surinamensis
Anchoviella brevirostris
Anchoviella cayennensis
Anchoviella lepidentostole
Anisotremus surinamensis
Anisotremus virginicus
Antennarius scaber
Anthias asperilinguis
Anthias nicholsi
Antigonia capros
Antigonia combatia
Apionichthys dumerili
Aplatophis chauliodus
Archosargus probatocephalus
Archosargus rhomboidalis
Ariosoma balearicum
Arius quadriscutis
Aspistor quadriscutis
Aspredinichthys filamentosus
Aspredinichthys tibicen
Aspredo aspredo
Auxis rochei
Auxis thazard
Bagre bagre
Bagre marinus
Bairdiella ronchus
Balistes capriscus
Balistes carolinensis
Balistes vetula
Bathystoma aurolineatum
Bathystoma rimator
Bathystoma striatum

Scientific Name
Batrachoides surinamensis
Bellator militaris
Belone sp.
Bollmania sp.
Bothus robinsi
Bothus ocellatus
Brachyplatystoma filamentosum
Brachyplatystoma vaillantii
Brama dussumieri
Calamus pennatula
Calamus proridens
Caranx crysos
Caranx hippos
Caranx latus
Carcharhinus acronatus
Carcharhinus brevipinna
Cathorops arenatus
Cathorops melanopus
Cathorops spixii
Caulolatilus guppyi
Centropomus ensiferus
Centropomus pectinatus
Centropomus unidecimalis
Ceratoscopelus maderensis
Chaetodipterus faber
Chaetodon bimaculatus
Chaetodon ocellatus
Chilomycterus antillarum
Chloroscombrus chrysurus
Coloconger meadi
Colomesus psitacus
Conodon nobilis
Coryphaena hippurus
Ctenosciaena gracilicirrhus
Cubiceps pauciradiatus
Cyclopsetta chittendeni
Cyclopsetta fimbriata
Cynoponticus savanna
Cynoscion acoupa
Cynoscion arenarius
Cynoscion jamaicensis
Cynoscion microlepidotus
Cynoscion nothus
Cynoscion similis
Cynoscion steindachneri
Cynoscion virescens
Dactylopterus volitans
Dasyatis geijskesi
Dasyatis guttata
Decapterus punctatus
Decapturus macarellus
Diaphus brachycephalus

Scientific Name
Diaphus mollis
Diapterus auratus
Diapterus rhombeus
Diplectrum formosum
Diplectrum radiale
Echeneis naucrates
Eleotris pisonis
Elops saurus
Elops smithi
Engyophrys senta
Epinephelus morio
Eqeus lanceolatus
Etropus crossotus
Etrumeus teres
Eucinostomus argenteus
Eucinostomus gula
Euthynnus alletteratus
Exocoetus sp
Fistularia petimba
Fontitrygon geijskesi
Gempylus serpens
Genyatremus luteus
Gobioides broussonnetii
Gobionellus oceanicus
Gobionellus sp.
Gymnothorax ocellatus
Gymnura micrura
Haemulon aurolineatum
Haemulon boschmae
Haemulon carbonarium
Haemulon melanurum
Haemulon sciurus
Haemulon steindachneri
Haemulopsis corvinaeformis
Halieutichthys aculeatus
Harengula clupeola
Harengula jaguana
Hemicaranx amblyrhynchus
Heteroconger longissimus
Hippocampus longirostris
Holocanthus tricolor
Holocentrus ascensionis
Holocentrus bullisi
Hoplias malabaricus
Hoplunnis macrura
Hypanus guttatus
Hypopthalmus edentatus
Hypostomus plecostomus
Ichthyapus ophioneus
Isopisthus parvipinnis
Katsuwonus pelamis
Kyphosus incisor

Scientific Name
Lactophrys tricornis
Lagocephalus laevigatus
Lampadena anomala
Lampadena luminosa
Lampadena urophaos atlantica
Lampanyctus alatus
Lampanyctus nobilis
Larimus breviceps
Lepidophanes guentheri
Lepophidium brevibarbe
Leptocephalus spp.
Lestidiops mirabilis
Lobotes surinamensis
Lonchurus elegans
Lonchurus lanceolatus
Lutjanus analis
Lutjanus aya
Lutjanus purpureus
Lutjanus synagris
Lycengraulis batesii
Lycengraulis grossidens
Macrodon anciclos
Macrodon ancylodon
Menticirrhus americanus
Menticirrhus littoralis
Micropogonias furnieri
Micropogonias undulatus
Monocanthus ciliatus
Monocanthus hispidus
Mugil cephalus
Mugil curema
Mugil incilis
Mugil liza
Mustelus higmani
Myctophum obtusirostris
Myliobatis goodie
Myrophis punctatus
Myxine c.f. robinsorum
Narcine bancroftii
Naucrates ductor
Nealotus tripes
Nebris microps
Negaprion brevirostris
Nematopalaemon schmitti
Neoconger mucronatus
Nesiarchus nusutus
Notarius grandicassis
Odontognathus mucronatus
Ogligopites palometa
Ogocephalus vespertilio
Oligophites saurus
Oligoplites palometa

Scientific Name
Ophichthus puncticeps
Opisthonema oglinum
Orthopristis ruber
Oxyporhamphus micropterus similis
Paralichthys sp.
Paralonchurus brasiliensis
Paralonchurus elegans
Pareques acuminatus
Parexocoetus brachypterus
Pellona fharroweri
Peprilus paru
Pimelodus blochii
Plagioscion squamosissimus
Plagioscion surinamensis
Poecilia reticulata
Polydactylus oligodon
Polydactylus virginicus
Pomacanthus arcuatus
Pomacanthus paru
Pomadasys corvinaeformis
Porichthys plectrodon
Potamarius sp.
Priacanthus arenatus
Prionodes phoebe
Prionotus beanii
Prionotus ophyras
Prionotus punctatus
Prionotus stearnsi
Pristipomoides aquilonaris
Pseudauchenipterus nodosus
Pseudobatos percellens
Pseudocaranx dentex
Ptereleotris helenae
Pterengraulis atherinoides
Pterois lunulata
Pterois volitans
Rachycentron canadum
Remora brachyptera
Rhinobatos percellens
Rhinoptera bonasus
Rhomboplites aurorubens
Rhynchoconger flavus
Saurida normani
Sciades couma
Sciades herzbergii
Sciades parkeri
Sciades passany
Sciades proops
Scoliodon terrae-novae
Scomberomorus brasiliensis
Scomberomorus cavalla
Scombrolabrax heterolepis
Scorpaena agassizii
Scorpaena bergii
Scorpaena brasiliensis
Scorpaena plumieri
Selar crumenophthalmus
Selene setapinnis
Selene vomer
Seriola rivoliana
Spariosoma aqualidum
Sphoeroides dorsalis
Sphoeroides marmoratus
Sphoeroides testudineus
Sphyraena barracuda
Sphyraena borealis
Sphyraena guachancho
Stellifer brasilensis
Stellifer chaoi
Stellifer microps
Stellifer rastrifer
Stephanolepis hispidus
Syacium gunteri
Syacium papillosum
Symphurus plagusia
Symphurus tessellatus
Synodus foetens
Synodus intermedius
Synodus poeyi
Thunnus alalunga
Thunnus albacares
Thunnus lepturus
Trachinocephalus myops
Trachinotus carolinus
Trachinotus cayennensis
Trachurus lathami
Trichiurus lepturus
Trinectes paulistanus
Upeneus maculatus
Upeneus parvus
Urotrygon microphthalmum

EXECUTIVE SUMMARY

In 2016, ExxonMobil's affiliate Esso Exploration and Production Guyana Limited (EEPGL) applied to the Guyana Environmental Protection Agency (EPA) for an Environmental Authorisation for the Liza Phase 1 Development Project in the Stabroek Block, offshore Guyana. On June 1, 2017, the Guyana EPA approved the Environmental Impact Assessment (EIA) submitted as part of the Application for Environmental Authorisation and issued an Environmental Permit for the Phase 1 Development Project. As a condition of the Environmental Permit, the EPA required EEPGL to conduct field studies to verify (i.e., ground truth) selected shoreline and coastal habitat classifications contained in the coastal sensitivity maps provided in the approved EIA. The specific focus on ecosystem services was a direct request from the EPA during post-permit alignment meetings held in August 2017. Although oil spill modeling scenarios do not suggest the potential for impacts to shorelines along the coast of Guyana when standard response and mitigation measures are employed, EEPGL agreed to provide a baseline of ecosystem services for coastal communities for Regions 1–4.

Ecosystem services are typically defined as the benefits that people obtain from the natural environment, including natural resources that underpin basic human health and survival needs, support economic activities and provide cultural fulfilment.

There are four standard categories of ecosystem services: *provisioning, regulating, cultural* and *supporting* services, defined as follows:

- **Provisioning services:** The goods or products obtained from an ecosystem such as food, freshwater, timber, fiber and other goods.
- **Regulating services:** The benefits obtained from an ecosystem's control of natural processes such as climate, water flow, disease regulation, pollination, and protection from natural hazards.
- **Cultural services:** The non-material benefits obtained from an ecosystem such as recreation, spiritual values, and aesthetic enjoyment.
- **Supporting services:** The natural processes such as erosion control, soil formation, nutrient cycling, and primary productivity that maintain other services.

Despite the environmental importance of ecosystems and the biodiversity that underpins them, they are often undervalued and their importance underestimated in terms of the benefit they provide to human welfare. Therefore, in order to full understand the relationship between people and nature, it is critical to utilize a methodology that involves participation by the individuals who interact with the ecosystems under study.

In October 2017, a workshop was held by Environmental Resources Management (ERM) and Environmental Management Consultants (EMC) to discuss with key stakeholders (including Government, non-governmental organizations (NGOs), academics, indigenous community representatives, and civil society) the purpose of the ecosystem services study, the schedule,

and the proposed methodology for conducting the study. It was determined that a Community Based Participatory Research (CBPR) approach with local communities would be utilized in order to conduct a screening and scoping of ecosystem services. The CBPR approach is a partnership approach to research that equitably involves researchers, expert organizations, and community members in all aspects of a research process.

The methodology agreed upon using the CBPR approach comprised a data collection effort broken down into two parts. The first part was a screening exercise, through which local specialists from EMC, accompanied by an ERM socioeconomic expert, conducted stakeholder interviews with coastal community leadership and members to identify a comprehensive list of the ecosystem services that are potentially present along those coastal communities. The second part was a scoping exercise, involving field observations with representatives of the same group of community leadership and members who contributed to screening, with the objectives of establishing a complete list of ecosystem service beneficiaries; defining the value of ecosystem services to beneficiaries; identifying (through field verification) habitats and resources that provide ecosystem services; and assessing the existing condition and trends of these habitats and resources. The Study Area was defined as the coastal area throughout Regions 1 through 4, up to a distance of 500 meters from the shoreline.

After finalizing the screening and scoping protocols, in November and December 2017, the EMC/ERM specialists met with 25 coastal Neighborhood Democratic Councils (NDCs) and town councils in Regions 2, 3, and 4 to learn first-hand about their activities related to ecosystem services. Over 164 local community members participated in the meetings and many accompanied the team into the field after each meeting to help visually observe and map the ecosystem services. In April 2018, the same team of specialists met with 14 Community Development Councils (CDCs)/Village Councils (VCs)/Town Councils (TCs) in Region 1, during which 205 community members participated in the screening and scoping exercises. Given the high population of indigenous peoples throughout Region 1, a representative from the National Toshaos Council (NTC) participated in the entire exercise for Region 1. Each NDC/CDC/VC/TC interview and subsequent field engagement lasted for approximately one-half day.

The team entered data at each meeting and in the field directly into handheld tablets linked to the Liza Project Geographic Information System (GIS) database, and also took notes on general comments and observations. Based on the findings of the study, provisioning services were determined to be the primary service provided by the coastal ecosystem in Regions 1-4, accounting for 69 percent of the location-specific services identified in the four regions; cultural, regulating, and supporting services accounted for 20 percent, 9 percent, and 2 percent, respectively, of the location-specific services identified in the four regions. The detailed results of the study, including data at each NDC/CDC/VC/TC level are captured in this report, as well as in the Liza Project GIS database. The findings of the ecosystem services assessment were used primarily to: (1) validate assessments made in the Liza Phase 1 EIA; (2) provide baseline data for the Liza Phase 2 and Payara EIAs; and (3) provide detailed mapping for use in prioritizing oil spill response activities.

1. INTRODUCTION

1.1. Overview

This report provides an introduction to the concept and treatment of ecosystem services along the coastal communities in Regions 1, 2, 3, and 4 of Guyana. Ecosystem services are typically defined as the benefits that people obtain from the natural environment, as further defined and described in Section 1.2. The report was prepared by Environmental Resources Management (ERM) and Environmental Management Consultants (EMC). The work described herein corresponds with the Liza Phase 1 Post-Permit Studies requested by the Guyana Environmental Protection Agency (EPA) in the Environmental Permit issued to Esso Exploration and Production Guyana Ltd. (EEPGL) for its Liza Phase 1 Development Project[1].

Along with the **Enhanced Coastal Sensitivity Mapping—Biodiversity (Regions 1-4)** report and related geospatial mapping (submitted under separate cover), this report fulfils the Permit requirement in clause 1.5 to conduct field studies to verify (i.e., ground truth) selected shoreline and coastal habitat classifications contained in the coastal sensitivity maps provided in the approved Liza Phase 1 Development Project ("the Project") Environmental Impact Assessment (EIA). The focus on ecosystem services was a direct request from the EPA during post-permit alignment meetings held in August 2017. Although oil spill modeling scenarios do not suggest the potential for impacts to shorelines along the coast of Guyana when standard response and mitigation measures are employed, EEPGL agreed to provide a baseline of ecosystem services for coastal communities from Region 1 to Region 4.

The information presented in this report specifically provides for the screening, scoping, and validation of ecosystem services utilizing an internationally recognized ecosystem services methodology combined with geospatial analysis, as described in Section 2. The purpose is to further validate the ecosystem services findings in the Liza Phase 1 EIA, as well as provide specific details on coastal communities and their use of coastal resources to better inform EEPGL's oil spill response planning.

1.2. Scope Development

ERM and EMC held a coordination and planning workshop in October 2017 in Georgetown, with key stakeholders including Government, non-governmental organizations (NGOs), academics, indigenous community representatives, and other expert entities to discuss the purpose of the ecosystem services study, the applicability and the proposed methodology. It was determined that a Community Based Participatory Research (CBPR) approach with local communities would be utilized in order to conduct a screening and scoping of ecosystem services. The objective of the study was to provide data to establish a baseline of the relationship between coastal communities and the natural environment. The results of the study are captured in this report, as well as in the Liza Project Geographic Information System (GIS) database, and Liza

[1] Environmental Permit No. 20160705-EEDPF, dated June 1, 2017

Project Stakeholder Engagement Plan. The Study Area was defined as the immediate coastal area throughout Regions 1 through 4, up to a distance of 500 meters from the shoreline.

In November and December 2017, local specialists from EMC, accompanied by an ERM socioeconomic expert, conducted stakeholder meetings with 25 coastal Neighborhood Democratic Councils (NDCs) and town councils in Regions 2, 3, and 4 to learn first-hand about their activities related to ecosystem services. A total of 164 local community members participated in the meetings, and many from each NDC accompanied the team into the field after each meeting to help visually observe and map the activities.

In April 2018, the same team of specialists met with 14 Community Development Councils (CDCs)/Village Councils (VCs)/Town Councils (TCs) in Region 1, during which 205 community members participated in the meetings. Given the high population of indigenous peoples throughout Region 1, a representative from the National Toshaos Council (NTC) participated in the entire exercise. The NTC participation was to ensure all the engagements were fair and impartial and the concerns of the Indigenous communities were raised and addressed. The participation of the NTC was beneficial to the exercise, since communities were more comfortable during the engagements as a result of the presence of the representative of the NTC and, as such, had more confidence in the process and participated freely in the discussions.

The team entered data at each meeting directly into handheld tablets linked to the Liza Project GIS database, and also took notes on general comments and observations. The results of these meetings and field observations are described in this report, along with Ecosystem Service-specific maps for each NDC/CDC/VC/TC. Map books have been created from the GIS information contained in the database, and are provided under separate cover. Additionally, integrated map books (including both ecosystem service and biodiversity information) will be included in EEPGL's Oil Spill Response Plan.

During May to July 2019, following the screening, scoping, and assessment exercise, the same team of socioeconomic experts conducted a validation effort of the ecosystem services baseline data collected during the previous assessment phase. The team visited the same coastal NDCs, CDCs, VCs, and TCs (Haimokabra and Waramuri in Region 1 were visited simultaneously since Haimokabra is considered a satellite village of and shares leadership with Waramuri). This additional validation step enhances the accuracy of the original effort by allowing stakeholders to review and comment on the results of the screening, scoping, and assessment exercise. Any changes or additions to individual ecosystem services from the exercise were documented and larger trends that could have occurred over time as a result of specific ecosystem management interventions (e.g., mangrove programs) or extrinsic factors (e.g., population changes) were identified.

1.3. Definition of Ecosystem Services

Ecosystem services are typically defined as the benefits that people obtain from the natural environment, including natural resources that underpin basic human health and survival needs, support economic activities and provide cultural fulfilment.

There are four standard categories of ecosystem services: *provisioning, regulating, cultural and supporting* services, defined as follows.[2]

- **Provisioning services:** The goods or products obtained from ecosystems such as food, freshwater, timber, fiber and other goods.
- **Regulating services:** The benefits obtained from an ecosystem's control of natural processes such as climate, water flow, disease regulation, pollination, and protection from natural hazards.
- **Cultural services:** The non-material benefits obtained from ecosystems such as recreation, spiritual values, and aesthetic enjoyment.
- **Supporting services:** The natural processes such as erosion control, soil formation, nutrient cycling, and primary productivity that maintain other services.

Additional details about the types of services under each category are provided in Appendix A.

[2] Millennium Ecosystem Assessment (MA). 2005. Synthesis Report. Island Press, Washington DC.

2. METHODOLOGY

2.1. Ecosystem Services Screening

A screening exercise was undertaken with the NDCs/CDCs/VCs/TCs prior to field observations in order to identify a comprehensive list of the ecosystem services that are potentially present along coastal communities in Regions 1, 2, 3, and 4. This step does not attempt to consider the importance of the services to beneficiaries or the likelihood of the Project impacting them in the event of an unplanned oil spill; it simply asks whether a service is likely to be present or not in each costal area.

For a service to be considered present, it must meet two criteria:

1. Habitats present in the Study Area are believed to provide this service or are similar to habitats elsewhere that provide this service; and
2. People are believed to benefit from the service, either at the local, national, or global level, and/or the Project is expected to benefit from this service.

Appendix A provides the screening checklist that was used by the team when interviewing. The table uses a standard list of ecosystem services adapted from internationally accredited sources.[3] All services identified as present or potentially present were then "screened in" to be considered when going into the field for observation, data collection, and mapping of the exact locations where such services exist.

For Region 1, the team supplemented the standard screening checklist with Region 1-specific questions derived from the Shell Beach Protected Area (SBPA) Management Plan[4], and questions developed by the Sea Turtle Census Initiative/Chelonian Research Institute turtle experts conducting the sea turtle telemetry work at Shell Beach Protected Area (also as part of the Liza Phase 1 Post-Permit Studies). These Region 1-specific topics are called out in the screening checklist.

PHOTO 1: INTERVIEWS WITH VILLAGE LEADERS AND VILLAGERS (REGION 1)

BY ORDER OF MANAGEMENT

PHOTO 2: INTERVIEWS WITH NDC MEMBERS AND LOCAL COMMUNITY (REGIONS 2-4)

2.2. Ecosystem Services Scoping

Following completion of the screening exercise, the team and members of the local community used the ecosystem services that were identified as present or potentially present as a guide for the field observations. This step aimed to:

- Establish a complete list of ecosystem service beneficiaries;
- Establish the value of ecosystem services to beneficiaries;
- Identify the habitats and resources that provide ecosystem services in the Study Area; and
- Identify the existing condition and trends of natural resources providing ecosystem services.

The descriptions and examples of "scoped-in" services for the Study Area, based on stakeholder input and field verification information, are provided in the scoping tables and broken down by NDC/CDC/VC/TC. During the engagements, the team, where appropriate, also asked for baseline data at the NDC/CDC/VC/TC level, including population statistics, numbers of beneficiaries utilizing each service or partaking in various livelihoods, incomes generated from livelihoods, and other socioeconomic baseline data. These data, when available, are captured in the overview of each Region, as well as in the detailed scoping tables. This information can also be found in the Liza Project GIS Database.

PHOTO 3: FIELD OBSERVATIONS WITH CDC/VC/TC MEMBERS AND LOCAL COMMUNITY (REGION 1)

PHOTO 4: FIELD OBSERVATIONS WITH NDC MEMBERS AND LOCAL COMMUNITY (REGIONS 2-4)

2.3. Ecosystem Services Prioritization

The ecosystem services prioritization has been designed to be consistent with international best practice, using the 2012 International Finance Corporation (IFC) Performance Standards (PS) as guidance. The prioritization process focuses on identifying services which that are important to local stakeholders and difficult to replace, where loss or degradation of the service could adversely affect local communities. The prioritization process considered the following criteria:

a) **Importance of ecosystem services** to beneficiaries was assessed according to the following criteria and assigned a rating from low to essential based on:

- Intensity of use – e.g., daily, weekly or seasonal use; quantitative data were used if available and relevant;
- Scope of use – e.g., household versus community level, commercial use only, subsistence only or both;
- Degree of dependence – e.g., contribution of fish to total protein in the diet; contribution of fishing to employment in the community; and
- The importance expressed by stakeholders and beneficiaries, including cultural and historical importance.

The weight given to each of these components varied slightly depending upon the service, but the importance to stakeholders and beneficiaries took precedence over other criteria with respect to the ultimate rating. Where a service was of greater or lesser importance to different stakeholder groups, two (or more) ratings were assigned so that impacts on these groups can be assessed individually.

b) **Availability of alternatives (replaceability):** Understanding the availability of spatial alternatives is critical to assessing the extent to which a community will be adversely impacted if that service declines due to Project activities. The 'replaceability' of a service was assessed according to the following criteria and assigned a rating from high (many alternatives) to low (few or no alternatives):

- The existence of spatial alternatives, including both natural replacements (e.g., the replacement of one type of wild food with another) and man-made substitutes (e.g., availability of man-made items as an alternative to handicrafts);

- The accessibility, cost and sustainability of potential alternatives, including a consideration of other users and the existing status and threats to the resource(s) providing natural alternatives to the service; and
- Preference / appetite for and cultural appropriateness of alternative services.

After compiling information on the importance and replaceability of each service, these ratings were combined to assign a priority rating to the service (see Figure 2-1 below). **Ecosystem services *with high or critical* priority ratings are considered to be 'priority' ecosystem services.** As noted above, some services may have different importance ratings for different beneficiary groups, and therefore may be rated 'priority' services for some beneficiaries but not for others.

FIGURE 2-1: ASSIGNING A PRIORITY RATING TO ECOSYSTEM SERVICES

		Replaceability of Service		
		High *(many spatial alternatives)*	**Moderate** *(some spatial alternatives)*	**Low or Not Replaceable** *(few to no spatial alternatives)*
Importance of Service to Beneficiaries	**Essential**	*High*	*Critical*	*Critical*
	High	*Medium*	*High*	*Critical*
	Moderate	*Low*	*Medium*	*High*
	Low	*Low*	*Low*	*Medium*

2.4. Ecosystem Services Validation

Following completion of the above described steps, it was decided to revisit each of the NDCs, VCs, CDCs, and TCs to:

- Validate that the information compiled was correct;
- Verify that the Coastal Resources Maps were accurate;
- Collect any new data relating to ecosystems benefits since the previous engagements; and
- Collect updated socioeconomic data.

During the validation exercises, the team presented the findings and maps and asked the stakeholders a series of questions, as detailed below:

- Is the information presented for your district (NDC/TC/CDC/VC) correct?
- If not, what do we need to change/adjust?
- Are the locations for the various services presented on the map correct?

- Are the main economic activities/livelihoods in the area the same as one year ago? If not, what has changed?
- Has there been any notable growth or decline in any particular sector? What sector? What has changed?
- Has there been any increase in coastal resources over the past year? What purpose and where?
- Has there been any new use of coastal resources within the area over the past year? What purpose and where?
- Has there been any change to previous mapped points?
- What is the general description of the change?
- What is the current population estimate or trend (increased or decreased over past year)? What is contributing to the trend?
- Are there any other notable socioeconomic data that you wish to have documented?

The responses received during the validation exercise are incorporated below, presented by region. Raw data as it was recorded can be found in Appendix G: Validation Data Summary. References within the data to changes over time (e.g., increase in population, decrease in fishing) refer to the time elapsed between the 2017/2018 original data collection and the 2019 validation exercise.

3. ECOSYSTEM SERVICES FINDINGS AND PRELIMINARY CONCLUSIONS

3.1. Overview of Findings

Based on the findings of the assessment, provisioning services were the primary service provided by the coastal ecosystem in Regions 1-4, accounting for approximately 51.5 percent of the location-specific services identified in the four regions. The most common provisioning services identified include:

- Fish, shrimp, and crabs caught for subsistence or commercial sale;
- Annual and permanent cultivated crops grown for subsistence use and commercial sale;
- Agricultural and grazing, including livestock farming supported by coastal grassland and plants;
- Traditional resource use in Region 1, including traditional medicine;
- Animals hunted primarily for food (recreational hunting is covered separately under cultural services);
- Aquatic transportation in remote areas where no alternative methods exist and commercial transportation facilities; and
- Income generators or services supporting income generation (e.g., boat building, repairs, transportation services).

Cultural services were the second most prevalent ecosystem service, representing approximately 35 percent of the location-specific services identified in the four regions. The most common cultural services identified include:

- Cultural value placed on traditional practices such as use of a location for prayer services;
- Use of natural spaces and resources for local tourism or local recreation, such as use of coastal walls for walking, coastal parks for relaxing, and beaches for recreational fishing; and
- Value placed on the aesthetics provided by landscapes and seascapes.

Regulating services were the third-most prevalent ecosystem services, representing approximately 8.5 percent of the location-specific services identified in the four regions. The most common regulating services identified include:

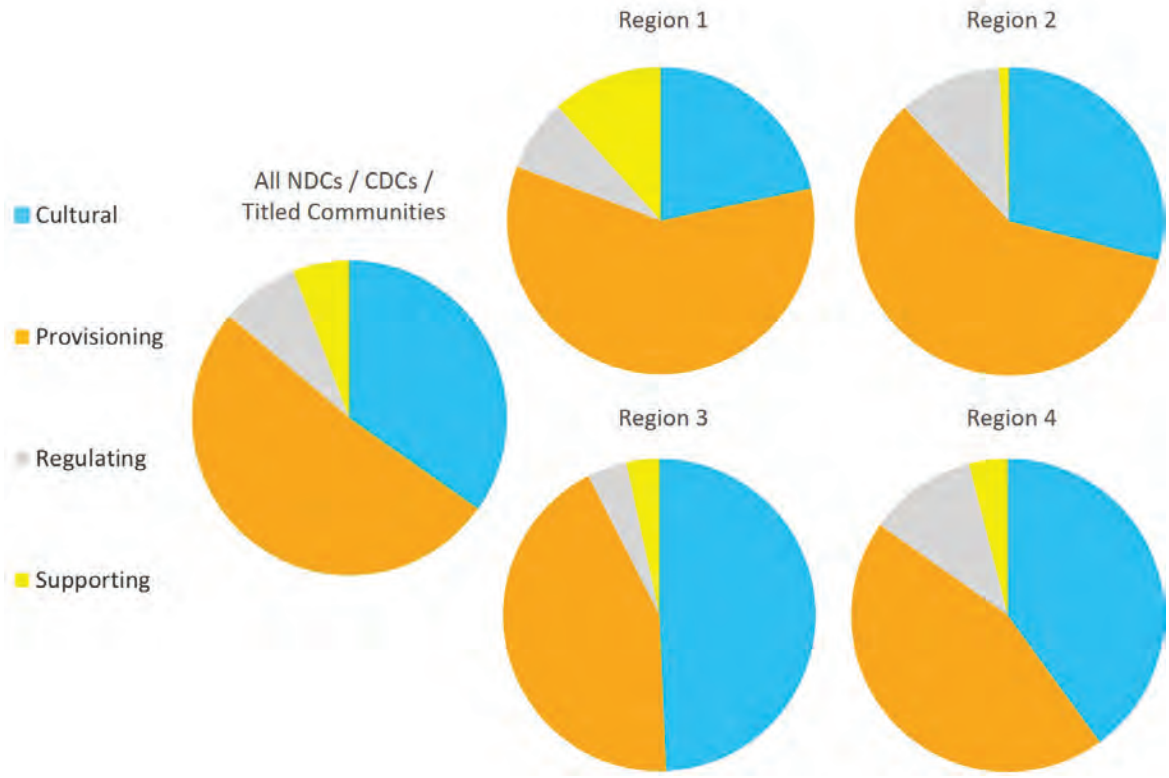
- Shoreline and riverbank protection and the role of mangroves in protecting crops, buildings, recreation areas from waves, wind and flooding; and
- Erosion protection and the role of vegetation in regulating erosion on slopes.

Supporting services are intermediate ecological outcomes that are not directly used, but rather support other ecosystem services. The service “Habitat Provision” is typically an exception, which is sometimes valued as an “end-use” service by stakeholders in addition to its supporting

role. Therefore, the relatively low prevalence of identified supporting services, representing approximately 5 percent of the location-specific services identified for the three regions, is not atypical; the services identified relate primarily to the fact that some stakeholders value mangroves for their maintenance of species populations and their ability to allow ecological communities to recover from disturbances, in addition to their regulating role of shoreline protection.

Figure 3-1 summarizes the distribution of identified ecosystem services across the four ecosystem service categories.

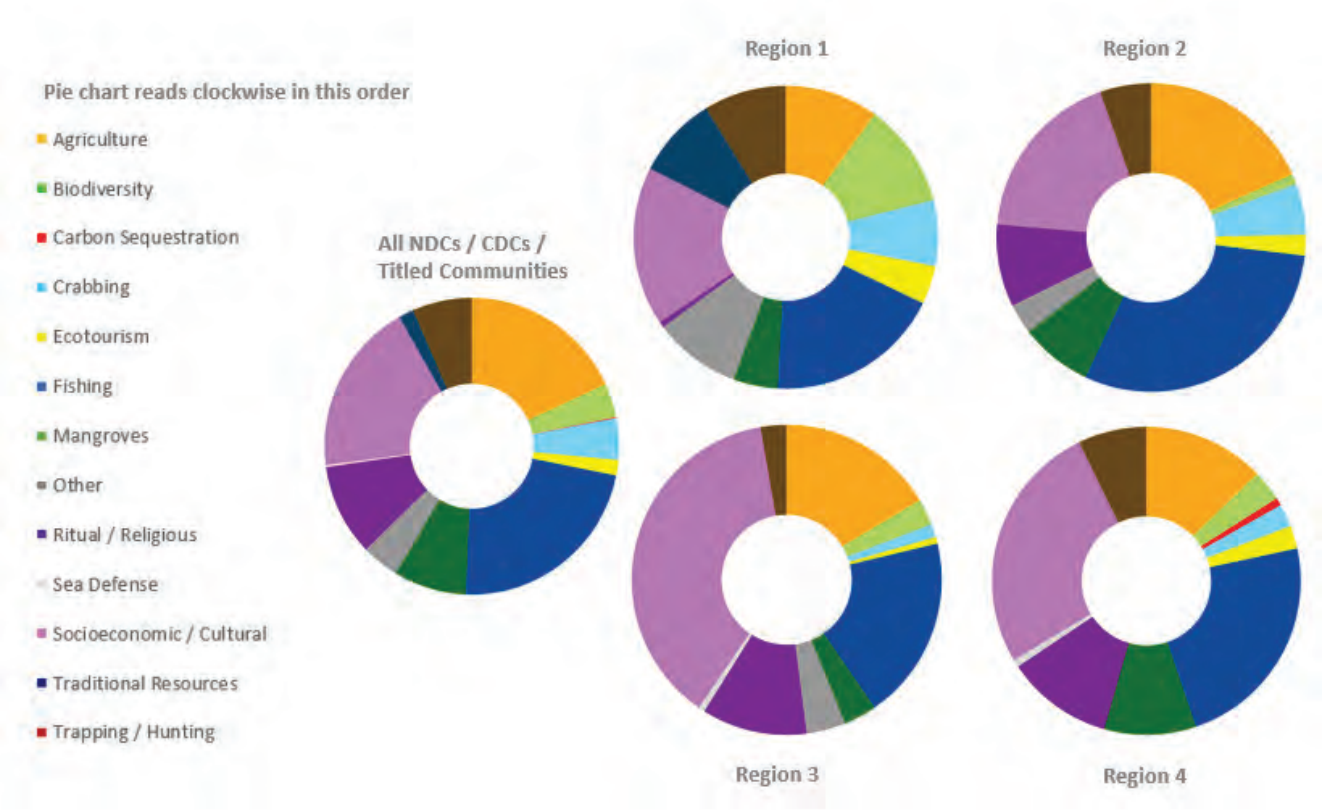
FIGURE 3-1: DISTRIBUTION OF ECOSYSTEM SERVICE CATEGORIES



NOTE: "All NDCs" pie chart includes Regions 1 through 6, which, when combined, indicates provisioning at 55.5 percent, cultural at 31 percent, regulating at 9.5 percent, and supporting at 4 percent.

Figure 3-2 summarizes the distribution of specific ecosystem service types across the categories. The service types match those used in the map books described herein.

FIGURE 3-2: DISTRIBUTION OF ECOSYSTEM SERVICE TYPES



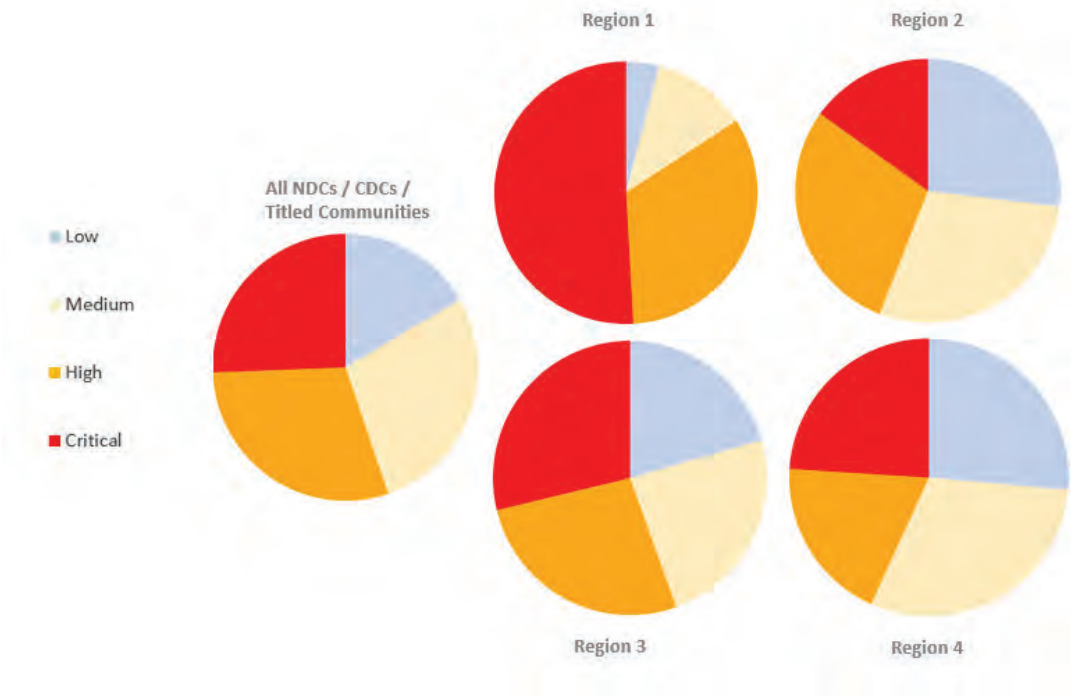
NOTE: "All NDCs" includes Regions 1 through 6 which, when combined, indicates fishing at 23 percent, socioeconomic/cultural at 19 percent, agriculture at 18 percent, ritual/religious at 10 percent, mangroves at 8 percent, trapping/hunting at 7 percent, crabbing at 5 percent, other at 4 percent, ecotourism and traditional resources each at 2 percent, and sea defense and carbon sequestration each at under 1 percent.

3.2. Summary of Findings by Region

Detailed findings for each identified ecosystem service, as well as priority ratings, are provided in Appendices B, C, D, and E and are summarized in Sections 4 to 7. As one of the primary goals of this study was to understand the relationship between coastal communities and the natural environment along the entire coast in Regions 1-4, the ratings vary widely depending upon the responses from each NDC/CDC/VC/TC. For example, in one NDC in Region 2, livestock farming along the coastal wall was reported to be low priority, whereas in an adjacent NDC, the same service was considered a critical priority - since a larger number of families rely on the livestock and there are no other locations for livestock to graze. Furthermore, some services may have different importance ratings for different beneficiary groups, and therefore may be rated as high priority services for some beneficiaries but not for others.

Figure 3-3 summarizes the distribution of priority ratings for the location-specific ecosystem services identified.

FIGURE 3-3: DISTRIBUTION OF ECOSYSTEM SERVICE PRIORITY RANKINGS



NOTE: "All NDCs" includes Regions 1 through 6, which, when combined, indicates critical at 26 percent, high at 28 percent, medium at 28 percent, and low at 18 percent.

For overview and general comparison purposes only, the **highest priority rating for each service in each Region is included in the table below.** As described in the methodology, services with *high* or *critical* priority ratings are considered to be 'priority' ecosystem services and would be a primary focus in the event of oil spill response. The overview table also helps to visualize which services did not feature as having importance to beneficiaries across the regions.

Table 3-1 summarizes the highest priority rating assigned in each region for each ecosystem service and Figure 3-4 shows a map of where all of the 'priority' (i.e., critical or high rating) ecosystem services are located, regardless of type or region.

TABLE 3-1: HIGHEST ECOSYSTEM SERVICE PRIORITY RATINGS FOR EACH REGION

Ecosystem Service Type	Region 1	Region 2	Region 3	Region 4
Provisioning Services				
Marine aquaculture and wild-caught fish & shellfish, including crab (food)	Critical	Critical	Critical	Critical
Cultivated crops	Critical	Critical	Critical	High
Livestock farming	High	High	High	High
Food: wild plants and honey	*	N/A	N/A	Medium
Food: wild meat	High	High	Low	Medium
Biomass fuel	*	N/A	N/A	N/A

Ecosystem Service Type	Region 1	Region 2	Region 3	Region 4
Timber and wood products	*	N/A	Low	N/A
Non-wood fibers and resins	*	N/A	Low	N/A
Traditional Resource Use/ Traditional Medicine	High	N/A	N/A	N/A
Freshwater for household use	Critical	N/A	High	N/A
Freshwater for irrigation use	N/A	N/A	Critical	N/A
Aquatic transportation/ports	Critical	Critical	Critical	Critical
Social/Economic commercial activity	Critical	Medium	Critical	Critical
Social/Housing	High	N/A	High	Critical
Regulating Services				
Global climate regulation	N/A	N/A	N/A	N/A
Regulation of water timing and flows	N/A	N/A	N/A	N/A
Flood regulation	N/A	N/A	N/A	N/A
Erosion regulation	Critical	Critical	Critical	Critical
Shoreline protection / Mangroves / River defense	Critical	High	Low	High
Pest regulation	N/A	N/A	N/A	N/A
Pollination	N/A	N/A	Medium	N/A
Disease regulation	N/A	N/A	N/A	N/A
Cultural Services				
Cultural, religious, or spiritual value	Low	Critical	Critical	Critical
Aesthetic value of natural landscapes, historical landmarks	N/A	Medium	Low	High
Tourism and recreation	High	High	Critical	Critical
Non-use value of biodiversity	N/A	N/A	N/A	N/A
Supporting Services				
Habitat provision, coastal protection	High	Critical	Critical	Medium
Primary production, biodiversity	Critical	N/A	N/A	Critical
Nutrient cycling	N/A	N/A	N/A	N/A
Water cycling	N/A	N/A	N/A	N/A
Soil formation	N/A	N/A	N/A	N/A

N/A – Not applicable; service not identified in the region
* - Service identified in the region but as part of Traditional Resource Use/Traditional Medicine

FIGURE 3-4: IDENTIFIED LOCATIONS OF CRITICAL AND HIGH PRIORITY ECOSYSTEM SERVICES – REGION 1

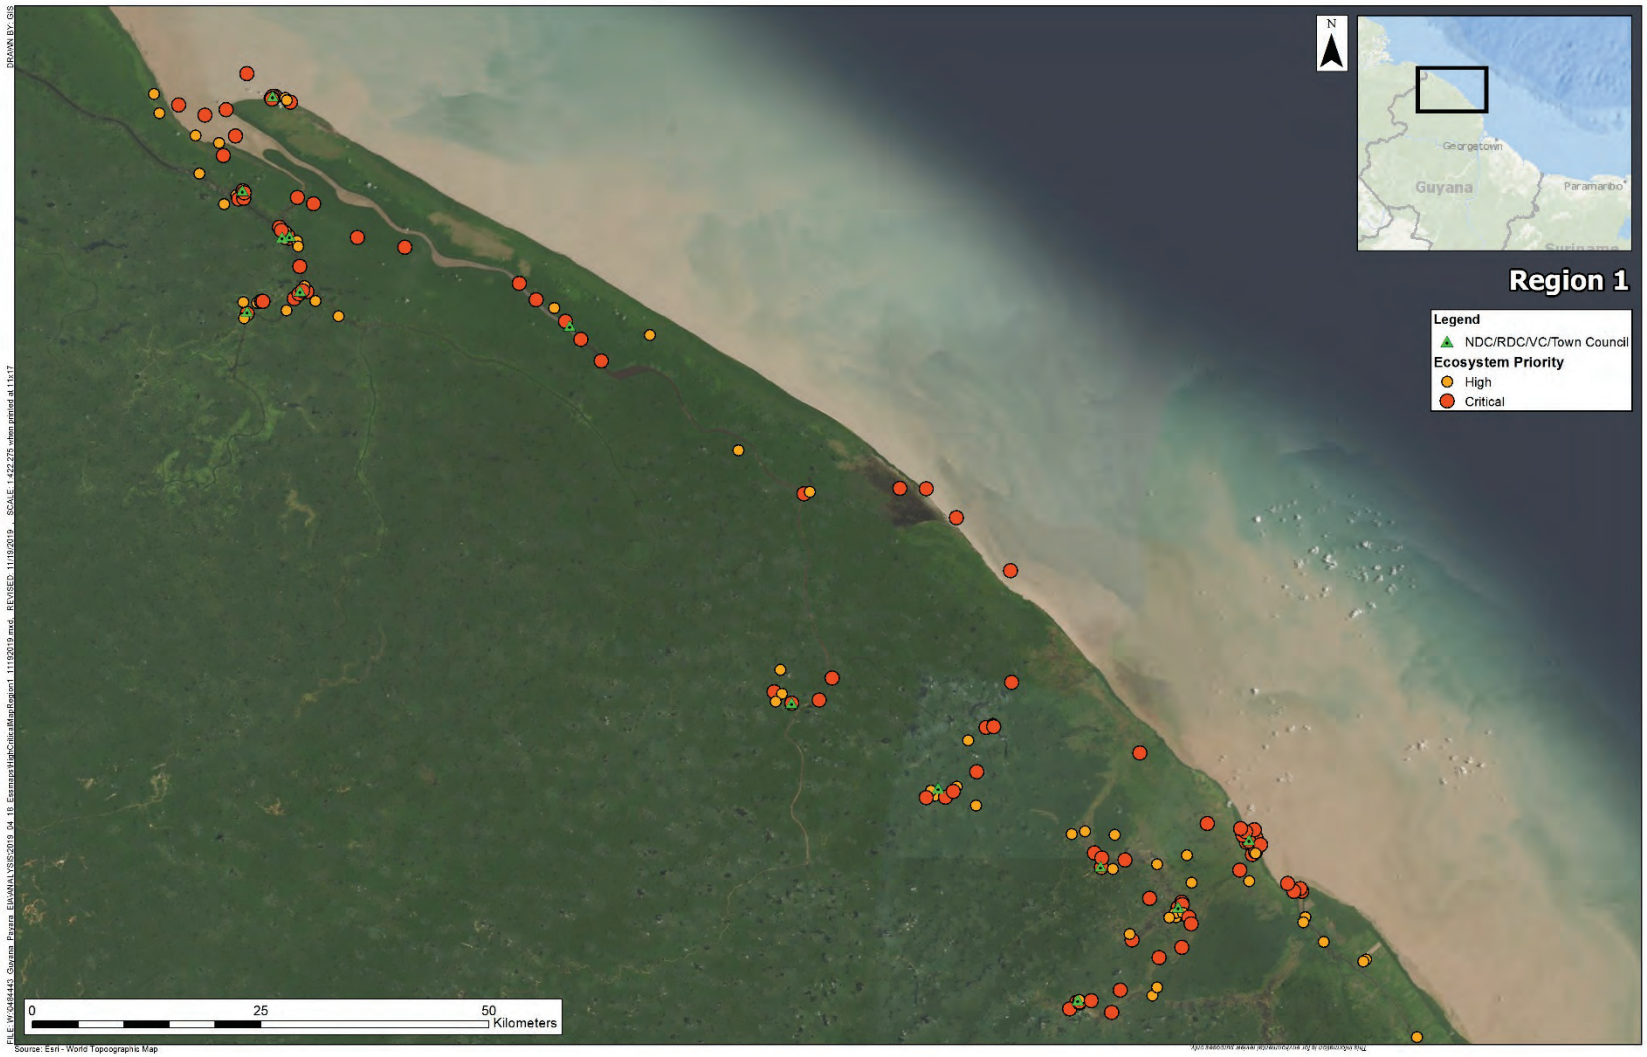


FIGURE 3-5: IDENTIFIED LOCATIONS OF CRITICAL AND HIGH PRIORITY ECOSYSTEM SERVICES – REGIONS 2-4

3.3. Use of Findings

The findings of the ecosystem services assessment will be used primarily to: (a) validate assessments made in the Liza Phase 1 EIA; and (b) provide detailed mapping for use in prioritizing oil spill response activities. In addition, the data can be leveraged for future EIAs and for ethnographic analysis, where understanding how stakeholders view their relationship with the natural environmental may be required.

The data described in the Liza Phase 1 EIA came from a variety of primary and secondary sources, including stakeholder engagement with government entities, fisherfolk, civil society, commercial businesses, NGOs, and academics. Based upon the data in hand at the time of the Liza Phase 1 EIA, it was determined that the Project's only potential impact on ecosystem services would be as a result of an unplanned event, where various environmental and socioeconomic resources could be negatively impacted in the event of a Tier III oil spill (and assuming no spill response and mitigation measures). The Liza Phase 1 EIA discusses various aspects of ecosystem services and related socioeconomic resources along the coastal communities, including:

- Mangroves are important providers of a number of ecological services upon which fish, wildlife, and humans rely (Section 7.4.3.2) and loss of such could weaken a critical component of the country's sea defense system and expose the coastal population to increased coastal flooding hazard (Section 7.4.4.7).
- Decreased fishery and agricultural yields as a result of an oil spill could potentially impact the fishery and agriculture sectors that currently account for a large part of the country's GDP (Section 7.4.4.1).
- Fishing, cultivation of traditional crops such as vegetables and fruits, crabbing, shrimping, and hunting of coastal game are important for subsistence and an oil spill could have a negative impact on food availability, and thus health, in coastal communities (Section 7.4.4.2).
- The coast is important for religious and traditional ceremonies for religious and ethnic groups in Guyana (Section 7.4.4.7).

As depicted in Table 3-1, the findings of the ecosystem services assessment are consistent with the assessment in the Liza Phase 1 EIA regarding potential resources that could be affected by an oil spill. Specifically, the findings corroborate that according to residents of the coastal communities, fishing, agriculture, farming, marine transport, marine related commercial activity, erosion regulation, mangrove protection, recreation, religious practices, and historical landmarks are priority services that should be accounted for when assessing potential impacts of an oil spill.

For Region 1 specifically, the findings also validate aspects of the SBPA Management Plan[5], specifically Section 2.3, which states, "Currently and historically, these communities have

[5] PAC and EPA. 2014. Shell Beach Protected Area Management Plan 2015 – 2019 Volume 1, FINAL – DECEMBER 15, 2014

utilized natural resources found in the area. Fishing, crabbing, hunting, manicole palm and timber harvesting are common among communities. Communities also engage in farming, mostly for subsistence to meet household needs but farm products may also be sold to others within the community."

The data in this report may also help the scientific community and government agencies fulfill some of the Shell Beach research needs as outlined by the PAC and EPA in Section 5 of the SBPA Management Plan, specifically:

- Baseline inventory of ecosystems (high priority need);
- Survey of impact of traditional resource uses within and at the periphery of SBPA (urgent priority need); and

Community inventory and mapping exercise to identify cultural aspects and places of importance and protection for Amerindian communities within and in areas surrounding the SBPA (high priority need). Additionally, the findings of the ecosystem services assessment provide an improved understanding of the specific locations where priority ecosystem services are present along the coast, and this information will be used to support the update of EEPGL's OSRP (i.e., with respect to prioritizing response activities in the event of an oil spill).

4. REGION 1 COASTAL ECOSYSTEM SERVICES FINDINGS

4.1. Population

Figure 4-1 shows the location of the communities in Region 1 with which the team engaged to perform the work.

FIGURE 4-1: AMERINDIAN COMMUNITIES IN REGION 1

Source: EMC

Population estimates for these communities are based upon data provided by the communities' leadership and community health workers during the ecosystem services-related engagements. Population was on the increase in almost all of the communities due to migration from Venezuela.

TABLE 4-1: POPULATION ESTIMATES - REGION 1

CDC/VC/TC Name	Population Estimate
Fathers Beach	23
Manawarin	2,000
Waramuri and Haimakabra	3,100
Santa Rosa	10,500

CDC/VC/TC Name	Population Estimate
Assakata	473
Warapoka	650
Three Brothers	120
Mabaruma Town Council	8,000
Aruka Mouth	300
Morawhanna	100
Smith's Creek	248
Imbotero	353
Almond Beach	51

4.2. Summary of Findings

The services rated as "critical" or "high" priority (which constitute Priority Services) services within the CDCs/VCs/TCs are summarized below:

TABLE 4-2: SERVICES RATED AS "CRITICAL" OR "HIGH" PRIORITY WITHIN THE VCs/CDCs – REGION 1

CDC/VC/TC Name	Type of Service	Brief Description
Father's Beach	Regulating	Mangrove forest on the shoreline provides critical defense from the impacts of the sea and along the banks of the Moruca River.
	Provisioning	Farmers utilize land along the seashore in the mangroves and in some coastal areas for cash crop farming, including coconuts.
		Commercial and subsistence fishing conducted between the Pomeroon River Mouth and Father's Beach, including crabbing.
		Mangroves are used for crafting and construction. Many plants (including mangroves) are used for medicinal purposes. Shells are used in agriculture and for construction.
		Freshwater from wetlands is used for domestic purposes.
		The area supports commercial and other activities such as boat repairs, fuel sale, etc.
		Transportation is only by boats through a canal from the ocean.
Manawarin	Provisioning	There is an abundance of wildlife within the forests and rivers; hunting of wildlife is done for local use and some birds are caught for commercial purposes.
		All households engage in subsistence farming. Some produce is sold.
		Fishing in the sea between the Pomeroon Mouth and Father's Beach and at different locations in freshwater streams; most residents conduct crabbing.
		Freshwater from rivers and creeks is used for domestic purposes and drinking.
		Many plants are used for medicinal purposes, cooking, and crafting.
		Commercial activities and transportation services are located in the village landing area.
		Commercial activities including numerous small shops, fuel sales, and transportation services are located in the village landing area.
		Access to the community is only via boats through the river network.
	Regulating	Extensive vegetation covering rivers protects the river banks from motor boats and water currents.

CDC/VC/TC Name	Type of Service	Brief Description
	Supporting	There is an abundance of wildlife in the forest and rivers including a feeding area for giant river otters feeding in the river.
Waramuri and Haimakabra	Provisioning	Commercial fishing on both sides of the Moruka River mouth between Iron Punt and Cozier Canal. Crabbing is done seasonally in the main crabbing areas of Father's Beach to east of Pomeroon Mouth. Villagers fish throughout the year in the creeks, savannas, and lagoons behind the beach.
		Numerous species of animals are found in the rivers and environment. A few people are involved in trapping for trade. Some hunting of wildlife and duck egg collection.
		Some timber species are harvested for lumber in the area.
		All households undertake subsistence and commercial farming.
		Freshwater from rivers and creeks is used for domestic purposes and drinking. The river network is critical for fishing and transportation.
		Access to the community is only via boats through the river network.
	Regulating	Extensive vegetation covering rivers protects the river banks from motor boats and water currents.
Santa Rosa	Provisioning	Commercial fishing is done daily between the Pomeroon River and Iron Punt. And in the rivers at Dog Creek and Luri Creek. Almost all villagers seasonally catch crabs. A few people regularly do commercial crabbing.
		Cattle and some pigs are grazed in the savannas close to the village.
		Some hunting for sustenance is done at Luri Creek and Baramani Lake.
		Freshwater from creeks and rivers is used for domestic purposes and drinking. The rivers are critical for transportation.
		The village is the trading hub for the Moruca Sub District of Region 1.
		Traditional plants and resources are used for domestic and cultural purposes.
		Access to the community is only via boats through the river network.
	Regulating	Extensive vegetation covering rivers, including mangrove forest at Moruca mouth, protects the river banks from motor boats and water currents.
	Supporting	The village and surrounding areas are populated by numerous species of birds, fishes, and mammals, including jaguars. Ite palms, which also provide habitats for birds, are found throughout the community.
Assakata	Provisioning	Fishing on at least a monthly basis by most residents. Commercial fishing is done along the shore at Iron Punt, and at Baramannie Lake and Luri Creek.
		Locals engage in cash crop farming and cultivation of cassava for sustenance.
		Community depends on freshwater from rivers and creeks for domestic use and drinking. Some villagers use groundwater from water wells.
		Some plants are used for medicinal purposes and forest resources are collected for household items.
		Many fishes and birds are found in the wetlands.
		Iguanas, tapirs, labba, deer powis, and wild ducks are caught on the seashore on fishing and hunting trips.

CDC/VC/TC Name	Type of Service	Brief Description
		Small businesses with people actively involved in the village cash economy.
		Access to the community is via boats through the river network.
	Regulating	Extensive vegetation covering rivers protects banks from motor boats and water currents.
	Cultural	The village has a freshwater lake that can be used as a tourist attraction, along with some shell mounds.
Warapoka	Provisioning	All households engage in farming and some of the produce is sold.
		The village has numerous small businesses and a tourism center. There are also government/administrative facilities. These provide employment to people who contribute to the cash economy
		The villagers fish throughout the year in rivers, creeks, and lakes. Commercial fishing is done at Baramanni Lake and Luri Creek. Shrimp is caught in the rivers around the village.
		Some animals are caught on the seashore on fishing and hunting trips. Duck and other bird eggs are collected. Trapping and sale of wildlife is done.
		Many plants are used for medicinal purposes and honey is gathered from bees for sale. Cabbage sticks are cut in combination with fishing and other exercises.
		Access to the community is via boats through the river network.
	Regulating	Extensive vegetation covering the rivers protects the banks from boats and water currents.
	Supporting	Numerous species of birds, fishes, and mammals, including harpy eagles, river otters, tapir, deer, acouri and labba, are found in the rivers and environment.
Three Brothers	Provisioning	Fishing along the coast between Waini Point and Iron Point. Commercial fishing in Luri Creek and Baramini Lake. Sea turtles enter the river in the dry season.
		Numerous species of animals in the rivers and mangrove forests. Sea turtles, jaguars, giant otters, and harpy eagles are present in the area.
		All families have farms. Crops are grown for home use and sale.
		Mangrove is used for building and in farms. Medicinal plants are collected from the beach. Cabbage palm is cut and sold.
		Freshwater from creeks and rivers used for domestic purposes and drinking water. Waterways are used for transportation.
		Access to the community is only via boats through the river network.
	Regulating	Extensive vegetation covering rivers protects the river banks from boats and water currents.
	Supporting	Numerous species of birds, fishes, and mammals, including crabs, are found in the rivers and mangrove forests. There are plenty of ducks in the wetlands bordering with SBPA.
Mabaruma Town Council	Provisioning	The Kumaka waterfront and Mabaruma is used for transportation, commerce (including boat building) and administrative; it is the main transportation hub for the Region
		Shrimp is caught in a limited manner in the shrimp season. There are daily fishing trips to Waini point. There are several fishing sites. Crabs are also sold daily at the Kumaka waterfront.
		60% of people have farms and cultivate cassava, ground provision, and cash crops.

CDC/VC/TC Name	Type of Service	Brief Description
		Freshwater from rivers, creeks, and natural springs is used for domestic purposes and drinking by the outlying community. Water wells are also used.
		Cabbage sticks are cut for sale. Medicinal plants are harvest from beach. Mangroves are used in tanning, and construction.
		Iguanas, labba, agouti, and wild ducks are the main animals hunted. Many bird species, including toucan, macaws, parrots, and small rodents such as anteaters are also trapped.
		Sawmill, lumberyard, and boat building enterprise.
	Cultural	Shell mound within the town, and several hotels for tourists.
	Supporting	The town covers six villages and has a high diversity of flora and fauna, including rubber trees that line the main road. Numerous species of birds, fishes, and mammals are found in the rivers and inland environment.
Aruka Mouth	Provisioning	Fishing in the sea at Waini Point. Some people catch shrimp in the shrimp season. Fishing in the rivers and creeks on a daily basis. Freshwater fishes are found nearby in the rainy season when the waters are fresh.
		Numerous species of birds and fishes along with monkeys are found in the area. There are no wildlife traders in the village.
		Some families have farms that are impoldered[6]. Cassava, plantains, and ground provisions are the main crops.
		The crab catchers utilize forest products for the crab quakes. Mangrove is used for building, in farms and also for firewood.
		The entire community depends on freshwater from the rivers and creeks for bathing, washing, cooking, and drinking.
		Access to the community is mainly via boats through the river network.
	Regulating	The rivers are protected by extensive mangroves growing on the river banks. The mangroves protect the river from the impacts of the motor boats and water current.
	Supporting	Numerous species of birds and fishes, along with monkeys, can be seen in the area.
Morawhanna	Provisioning	Most fish are caught in the sea. Most of the fresh catch is sold to vessels from Venezuela. Freshwater fish are caught in the river in the rainy season when the water is fresh. Fish are also found in the wetlands and creeks.
		The entire community depends on freshwater from the rivers and creeks for bathing, washing, cooking, and drinking. Bottled drinking water is purchased from Mabaruma.
		Wharf facilities provides a hub for trade in the area increasing economic activities to the settlement.
		Access to the community is mainly via boats through the river network.
	Regulating	The banks of the Barima River are covered by extensive mangroves protecting the banks from the impacts of the motor boats and water current.
	Supporting	The area has a roosting spot with scarlet ibises and egrets roosting for the night. Numerous species of other birds, fishes, mammals, and crabs are found in the rivers and mangrove forests.

[6] Made (an area of the seabed) into a piece of low-lying land by reclaiming it from the sea or a river

CDC/VC/TC Name	Type of Service	Brief Description
Smith's Creek	Provisioning	Villagers conduct commercial fishing along the coast and in the Barima River and Smith's Creek throughout the year. Crabbing popular at the markets on Tuesdays and Saturdays. Crabs are also sold to hucksters on the ferry to Georgetown
		Some households have farms for subsistence and local use.
		The community depends on freshwater from the rivers and creeks.
		Access to the community is mainly via boats through the river network.
	Regulating	The rivers are covered by mangroves protecting the banks from the impacts of the motor boats and water current. The mangroves also act as roosting habitats for many birds.
	Supporting	There are many species animals in the forests and lake. Many ducks and egrets are seen in the area but not hunted.
Imbotero	Provisioning	Each household has a boat that they can use with either with outboard engine or by paddling to the fishing ground.
		Some households have farms for subsistence and local use.
		The villagers fish throughout the year in the rivers, creeks, and lakes mainly for saltwater fishes.
		There are numerous species of animals including tapir, deer, acouri, and labba found in the rivers and forest.
		The village can facilitate tourism activities such visit to the border with Venezuela and Shell beach.
		Access to the community is mainly via boats through the river network.
	Regulating	The creeks and rivers are covered by extensive mangroves and palms protecting the banks from the impacts of the motor boats and water current.
	Supporting	There are numerous species of birds, fishes, and mammals including tapir, deer, acouri, and labba found in the rivers and forest. Jaguars and black caiman are also seen in the area.
Almond Beach	Provisioning	The entire community resides along the beach and all households have farms located on the beach which grow food for subsistence and commercial purposes.
		Commercial fishing done from Waini Mouth to Tiger Beach in the sea. Freshwater fish are caught in the wetlands beyond the beach throughout the year; hassar contributes significantly to fisherfolk income.
		Supports eco-tourism activities through collaboration with the PAC.
		There are numerous species of birds, fishes, and mammals including jaguars present in the area. Iguanas and some mammals are hunted for food.
		Access to the community is mainly via boats through the river network and ocean.
	Supporting	There are numerous species of birds, fishes, and mammals, including agouti, tapir, deer, acouri, and labba, found in the areas close to the beach. Leatherback turtles nest on the beach and harpy eagles are also sighted.

4.2.1. Provisioning Services

The primary ecosystem service along the coastal zones in Region 1 is fishing in the rivers and creeks, the ocean, and the mangroves of the riverine floodplains. Along the coast, fishing is

particularly active at the westernmost end of Shell Beach at the mouth of the Waini River, and easternmost end at the mouth of the Moruca River. However, most communities use an area along the Beach referred to as Iron Punt for these activities. This area can be accessed from the ocean, as well as from inland via the Luri Creek. By using Luri Creek, the communities also have access within this area to fish, birds, and crabs, particularly in the dry season, and some hunting in the wet season. The main commercial products from the ocean include many types of catfish, curass, gillbacker, snapper, bangamary, butterfish, mullet, snook, queriman, and trout. There is almost no shrimping in the region, as the waters are rough and only a handful of people have access to the type of equipment needed (Chinese seine). The long stretches of mangrove in the salty sections of the waterways provide an important nursery function for a number of commercial fish and shellfish species. The natural ponds and swamps, particularly those behind Shell Beach, collect seawater from the spring tide, catching the young shrimp and fish that are looking to migrate into lesser salty water until they mature into adulthood. The numerous rivers, creeks, and swampy areas throughout Region 1 have an abundance of freshwater fish including huri, yarrow, patwa, peacock bass, imary, casi, sunfish, wabrea, and many others that are caught and eaten on a regular basis and also sold in the local markets. The fish are caught with hooks and nets and also trapped in the vegetation that is pulled to the shore.

There are vast savannahs along the banks of many of the rivers and creeks which flood with the onset of the rainy seasons (May/June and November/December/January), so most daily freshwater fishing occurs in the dry season, when fish are in the rivers and not in the outlying savannahs. At the onset of the rainy seasons, many fisherfolk will burn the savannahs to ensure easier catching of fish as they migrate from the rivers to the bush islands[7]. The migrating fish are spotted in the shallow waters of the burned savannahs and are “chopped” with knives or caught by hand.

Crabbing is a significant activity for communities in Region 1. Crabbing in mangroves along the beach area is common, especially during the crab seasons. Residents from the coastal communities within the region, as well as from some areas of Region 2, venture to the beach during the crab season. Crabbing is done for both subsistence and small-scale commercial sale throughout the year. For some communities, especially those further north in the region, most adults (including women) are involved in crabbing throughout the year as a major economic activity.

A majority of the households in the region have multiple farms growing cassava as the main staple for daily subsistence, as well as other crops (such as ginger and coconuts) for sale in local markets. Cash crop cultivation is a main feature in this region, with much of the produce consumed by the family or sold to the local school or the local market. Some agricultural farming occurs directly on the coast at Father’s Beach and Almond Beach.

The communities depend on various types of wild meat (including iguana, labba, deer, turtle, wild ducks, etc.) for subsistence, which they hunt themselves. In some of the areas, the trapping of animals for trade is prohibited by the village or is not a popular activity. However,

[7] The bush islands refer to the high grounds in the flooded savannahs where families have their households and farms. Some of these islands have been occupied by the same family for over two hundred years.

hunting/trapping is prevalent in some communities, such as in the Luri Creek area, in the Baramani Lake, and within some communities' private lands.

Wood is collected for use as firewood by some households, particularly for the principal cooking tasks such as making of cassava bread or pepper pot. Driftwood is collected on the beach and from some of the river banks to be used for cooking. A small number of people use wood and non-wood fibers, including mangrove trees and coconut shell, for handicrafts and household items. A limited amount of mangrove bark is shipped to Georgetown by the ferry for use in tanning operations. The bark is also used for medicinal purposes by the Amerindians. Mangroves are used widely in the construction of houses and other household structures. Some mangrove poles are used by farmers to support their plantain trees and by fisherfolk as seine poles. In Region 1, mangroves are considered a community resource and are therefore legal for traditional community use.

Palms and vines, including Ite, Kufa, Nibbi, and Kufra, are utilized for making craft and household items. Manicole palm is harvested for commercial purposes by most communities and is sold to a factory based in the region. Medicinal plants, especially noni, are collected from the beach for use by the communities.

The communities depend on the waterways for potable and domestic water supply, and in most cases, they are the only form of transportation available.

Wild bees provide a critical service of pollination for the farmers. Wild bees are found in the mangroves and sometimes in the villages. While most locals avoid beehives, they are often raided by experienced individuals who can turn a good profit on honey sales at local markets.

A few people in some villages rear chickens and other birds in order to sell bird meat. However, there is generally a marked absence of livestock such as sheep, goats, and cattle in the villages, except for in the town of Mabaruma. It was reported that jaguars often feed on livestock and therefore livestock rearing is not popular. Attacks by jaguars on hunting dogs have also restricted the hunting capacity of many households.

4.2.2. Regulating Services

The entire shoreline of Region 1 is covered with mangroves with mudflats or shell deposits leading to the ocean. These mangroves contribute to erosion prevention along the shoreline by protecting it from waves, wind, and flooding. Mangroves are also found along the banks of the many coastal rivers within the region, thus also protecting the riverbanks from erosion. These were noted by stakeholders as critical services.

It should be noted that although many stakeholders commented that burning the savannahs assisted with pest control, they did not see this as a regulating service and so therefore, it was not captured as such in the data tables or on associated maps.

4.2.3. Cultural Services

The only cultural service observed on the beach is by a single Hindu family of Mabaruma that uses the Waini Beach a few times per year. The beach and coastlines are considered living

heritage by the Amerindians, but not for spiritual reasons. The local people, particularly of the Mabaruma Town Council, utilize Waini Point and Shell Beach for recreation, including kite flying and picnics, particularly at Easter.

Cultural heritage sites were also identified by local villagers, including shell mounds near Haimacobra Village, Waramuri Village, and Assakata Village, as well as a sacred site (200-year-old church) near Santa Rosa Village.

4.2.4. Supporting Services

The only supporting service identified through the engagement process was habitats for biodiversity. The region is rich in biodiversity, with villagers reporting numerous species of birds, fishes, and mammals. Leatherback turtles use the beach in the Almond Beach area for nesting. Harpy eagles are sighted in Almond Beach, and nesting areas for harpy eagles are located in Warapoka and Three Brothers villages. Jaguars are also common in some villages and black caiman have been sighted by villagers in Imbotero. In addition, there is a roosting area for scarlet ibises along the main rivers.

4.3. Detailed Findings

Detailed information on all ecosystem services scoped in for the Study Area are listed by CDC/VC/TC and provided in the scoping tables located in Appendix B.

Figure 4-1 shows the ecosystem service locations, by type, identified by the Region 1 village leaders and villagers during the engagement process and which were mapped during the field observations. They are displayed by ecosystem service (color of symbol) and priority (size of symbol)—critical, high, medium, or low—utilizing the methodology outlined in Figure 2-1. Detailed maps by CDC/VC/TC are provided in the Coastal Mapping mapbook (separate from this report).

Figure 4-2 shows the ecosystem service “general areas,” by type, identified by Region 1 village leaders and villagers during the engagement process. This mapping to show general areas is provided for only Region 1 due to the fact that some areas identified by village leaders and villagers could not be field-verified (based on limitations to access along the SBPA and Region 1 coast). The general areas are intended to provide additional context for the location of ecosystem services in the region.

FIGURE 4-2: IDENTIFIED LOCATIONS OF ECOSYSTEM SERVICES—REGION 1

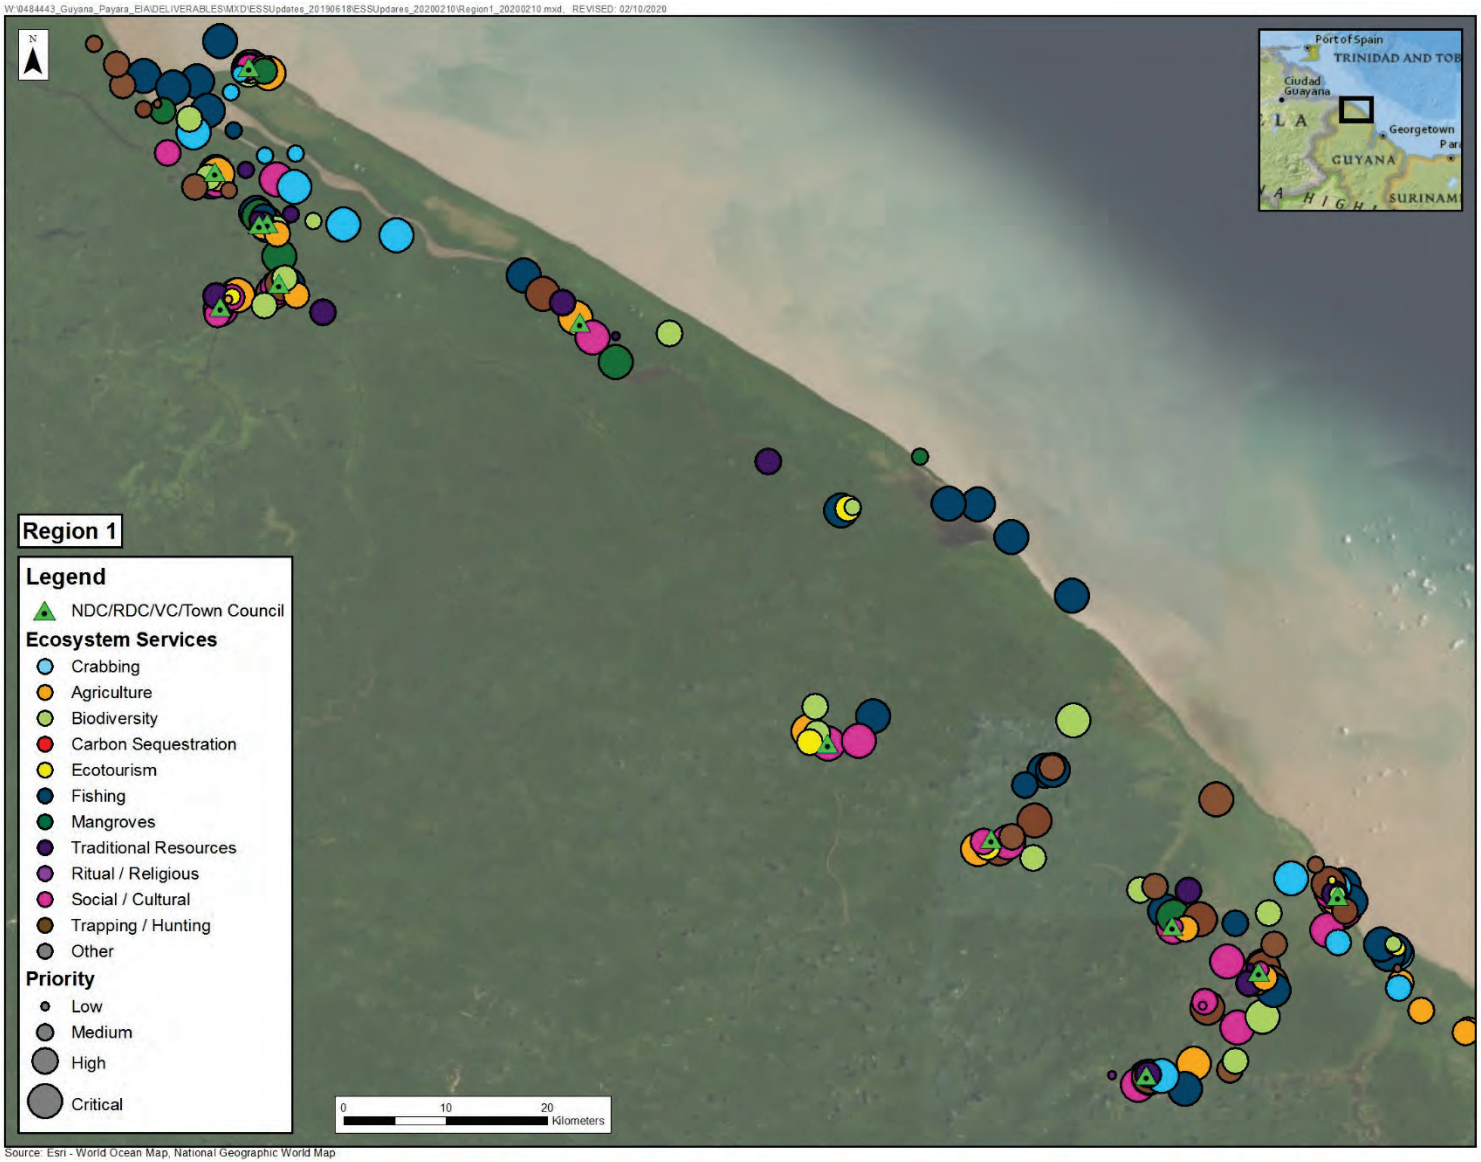

FIGURE 4-3: IDENTIFIED GENERAL AREAS OF ECOSYSTEM SERVICES TYPES—REGION 1

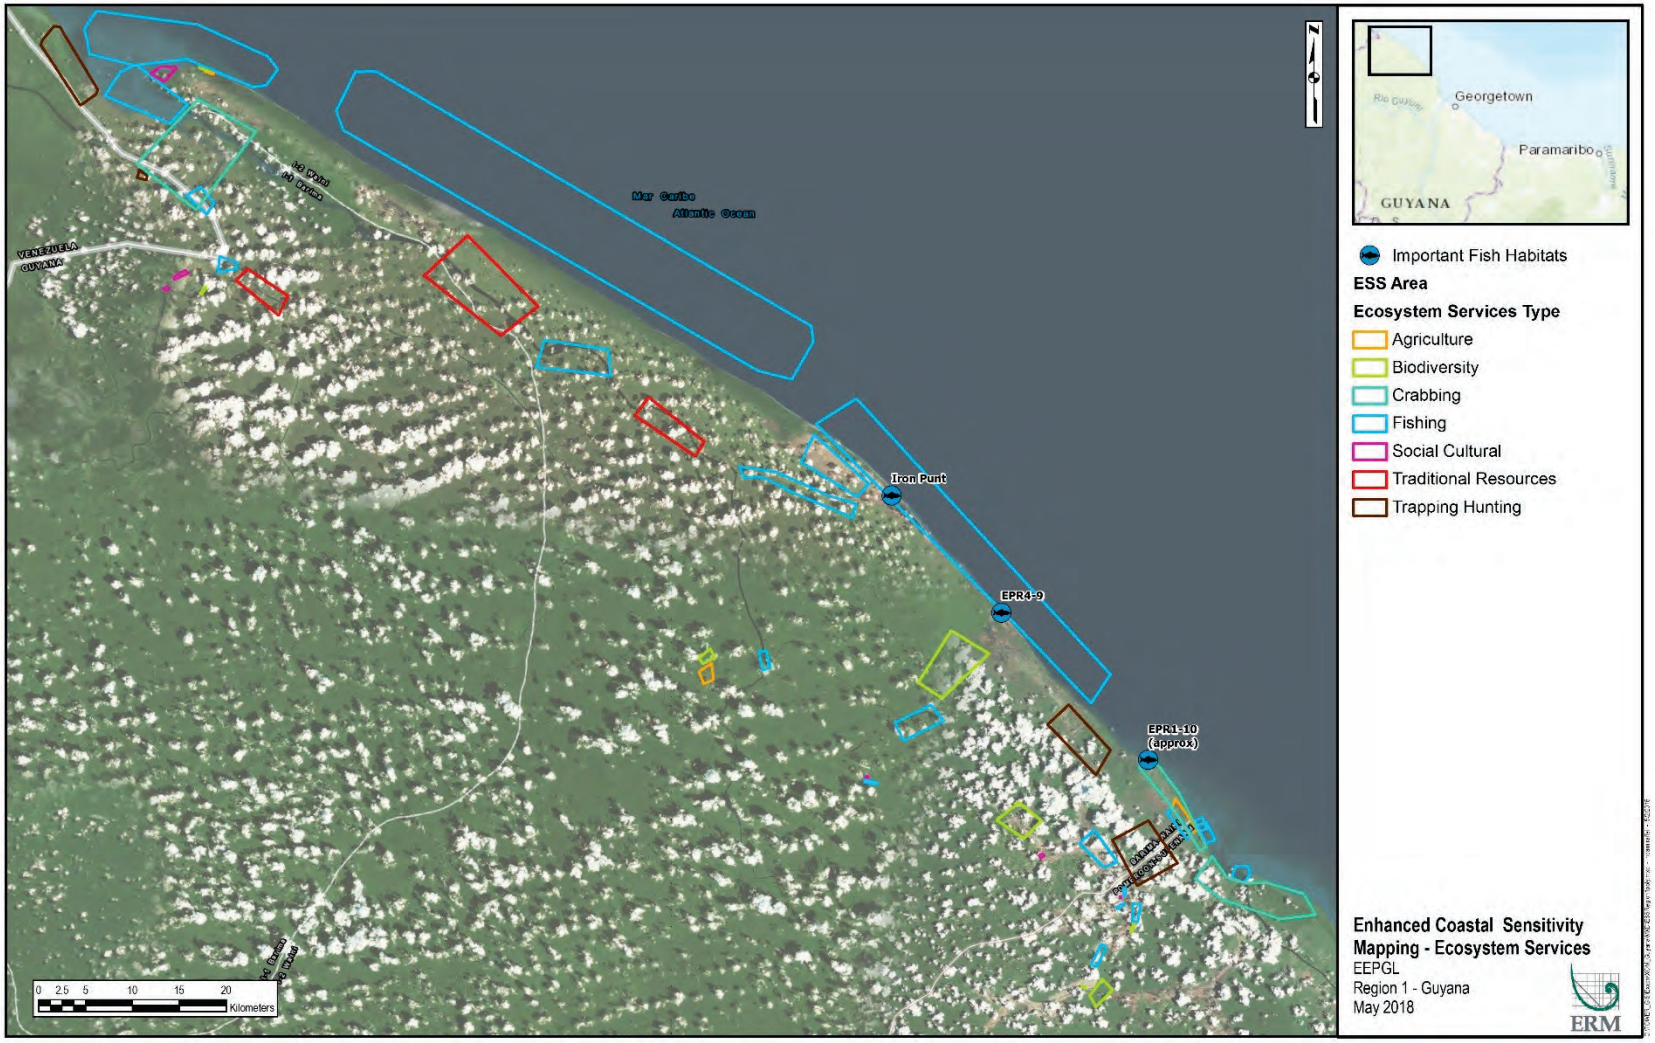


5. REGION 2 COASTAL ECOSYSTEM SERVICES FINDINGS

5.1. Population

Population estimates are based upon data provided by NDC leadership during the ecosystem services-related engagements.

TABLE 5-1: POPULATION ESTIMATES - REGION 2

NDC Name	Population Estimate	Other Details
Charity/Urasara	7,800	Population relatively stable
Evergreen/Paradise	7,500	High Hindu population
Aberdeen/Zorg-en-Vlygt	6,000	In Queenstown alone, which is largest village on coast
Anna Regina Town Council	22,000	Close to 50% Hindu population; population increasing due to Venezuelan migrants
Annandale/Riverstown	10,840	Population increasing due to Venezuelan migrants
Good Hope/Pomona	10,000	Population increasing due to Venezuelan migrants and Amerindians moving from inland areas of Region 2

5.2. Summary of Findings

The services rated as “critical” or “high” priority (which constitute Priority Services) within the NDCs are summarized below:

TABLE 5-2: SERVICES RATED AS “CRITICAL” OR “HIGH” PRIORITY WITHIN THE NDCs – REGION 2

NDC Name	Type of Service	Brief Description
Charity/Urasara	Provisioning	Families and farmers utilize land along coast for crop cultivation
	Provisioning	Commercial fishing at mouth of and within Pomeroon River, especially crabbing
	Provisioning	The Big Bird Fish Complex is a major facility that serves as a landing for large-scale artisanal fishing and processes fish for export
	Supporting	Mangroves provide habitats for birds, crabs and other wildlife and protect the shoreline
Evergreen/Paradise	Provisioning	Families and farmers utilize land along seawall for cash crops and subsistence farming as well as livestock farming
	Provisioning	Commercial fishing at Andrews Koker, including crabbing
Aberdeen/Zorg-en-Vlygt	Provisioning	Commercial fishing at Capoey Koker, including crabbing and livestock farming along seawall
	Provisioning	Hunting of iguanas for meat and sale

NDC Name	Type of Service	Brief Description
	Regulating	New mangrove growth provides shoreline protection and a habitat for iguanas, crabs and birds
	Regulating	Bamboo groynes have been installed at various points along the shoreline
	Cultural	Recreation along the seawall and cremation site along the shoreline
Anna Regina Town Council	Provisioning	Farmers utilize land along the seawall for subsistence farming. Coconuts, bananas, plantains and cash crops are planted
	Provisioning	Commercial fishing landing sites in Hampton Court, Walton Hall, Lima, Sparta, and Anna Regina
	Cultural	Daily visits to a popular hotel close to the seashore for recreation, including softball cricket matches on the beach behind the hotel
Annandale/Riverstown	Provisioning	Main port is essential for access to other areas, including the islands; the ferry dock is used for businesses and trade
	Provisioning	Fishing landing sites at several locations including Abram Zuil
	Cultural	Religious activities along beach primarily at Golden Fleece temple
	Cultural	Recreation along the seawalls at Perseverance, Golden Fleece, Cullen Beach and Suddie
Good Hope/Pomona	Provisioning	Ports, wharfs and shipyards at Vilvoorden and Riverside are essential to commercial business; speedboat ferry at Supenaam is a major port
	Provisioning	Commercial fishing at Vilvoorden, Pomona, and Riverstown
	Provisioning	Large-scale cultivation of crops on Tiger Island
	Regulating	Tiger Island is a critical sea defense to erosion and flooding
	Cultural	Recreation on Tiger Island

5.2.1. Provisioning Services

The primary ecosystem service along the coastal zones in Region 2 is fishing. The main commercial products include catfish, snapper, snook, and crabs in the summer season. Some catching of shrimp also occurs. Mangroves provide an important nursery function and provide habitat for a number of commercial fish and shellfish species. This is a priority service in Anna Regina, which is one of the only towns in Region 2.

Crop cultivation is present in many communities along the coast, and ranges in scale from subsistence farming of staple grains, including rice, to export-oriented farming of coconuts and watermelons.

The scale of livestock farming ranges considerably within communities in Region 2. Some households keep a few chickens, pigs, and cattle in their yards for household consumption and sale of any excess product. Larger operations can have dozens of heads of cattle and may be

either dual purpose or specialize in dairy or beef. Beef is generally not consumed on a regular basis by the local population.

Some households in Region 2 collect wild plants, fruits, berries, mushrooms, other wild plants, honey, and nuts, primarily for subsistence use. This practice is limited in the Study Area and while mangroves provide the habitat for honey production, it is not common in Region 2 despite the fact that many people interviewed understood how honey production could be a major source of income.

A small number of households report depending on various types of meat (including iguana, etc.) for subsistence, whether they hunt it themselves or purchase it. Although hunting iguana is illegal, reports of hunting for meat increased during the validation exercise. Nonetheless, it is not likely a major source of food or income in the area.

Some wood and non-wood fibers, including mangrove trees and coconut husks, are used in handicrafts and household items in some of the coastal communities, although this is not extensive.

Potable water sources for communities include the Pomeroon River, rainwater, and groundwater. Households in larger communities are serviced by the national public water system. However, private wells are the most common source of potable water in the NDC. In rural areas, water is obtained from the lake or private wells excavated on household properties.

Region 2, especially in the northern coastal communities adjacent to the Pomeroon River, is significantly reliant on aquatic transport. Waste and pollution in the Pomeroon River and coastal habitats presents one of the biggest challenges for coastal communities.

Commercial activities abundant in these areas include those supporting the marine industry such as boat building, ship repairs, fuel services, and products needed by sailors and fisherfolk. It is quite evident that at almost all landing areas used by fisherfolk, including Supenaam, there are shops in close proximity selling alcohol and other consumable products.

5.2.2. Regulating Services

Shoreline protection is a major consideration along the entire Region 2 coastal area. Mangroves and coastal vegetation play a critical role in maintaining coastal stability and protecting inland areas from waves, wind, and flooding from storms. Mangroves along Region 2 are in various stages of growth, with many areas along NDC 1, 2, and 3 having undergone natural erosion cycles over the past 20 years.

The Ministry of Agriculture's National Agricultural Research & Extension Institute's (NAREI's) re-growth programs are most active in the Evergreen/Paradise NDC and Annandale/Riverstown NDC areas. The mangrove restoration projects in Walton Hall, Richmond, and Lima are reported by stakeholders to be doing considerably well. However, with all of the new mangrove plantings, there are now concerns over the nuisance of sand flies and mosquitoes as well as the noise from new species of birds in the area. This has been especially challenging in Anna Regina.

Natural shoreline protection services can be replaced by man-made engineering solutions, if needed. However, these are generally expensive to build and maintain over time.

Tiger Island is a critical ecosystem service in Good Hope/Pomona NDC to prevent erosion and flooding considering there is no other manmade or natural sea defense.

5.2.3. Cultural Services

Natural spaces or species with cultural, spiritual, or religious importance are considered "living heritage." The most prominent of these is the Hindu tradition of planting prayer flags at various points along the shoreline – most typically associated with shore access.

Locals utilize the areas along the seawalls for recreation, including walking, running, kite flying, and general recreation. Views of natural landscapes and landscape features, including river and ocean views, are highly valued by local communities and visitors.

5.2.4. Supporting Services

The natural processes of soil formation, nutrient recycling and accretion have contributed to ideal locations for commercial activities including, ports, wharfs, and dwelling places. The port at Supenaam is critical to the local economy, housing numerous ships offloading and loading their cargo. The primary wharves are at Paradise and Vilvoorden while other landing sites are used on the beaches where boats can land safely during the high tide.

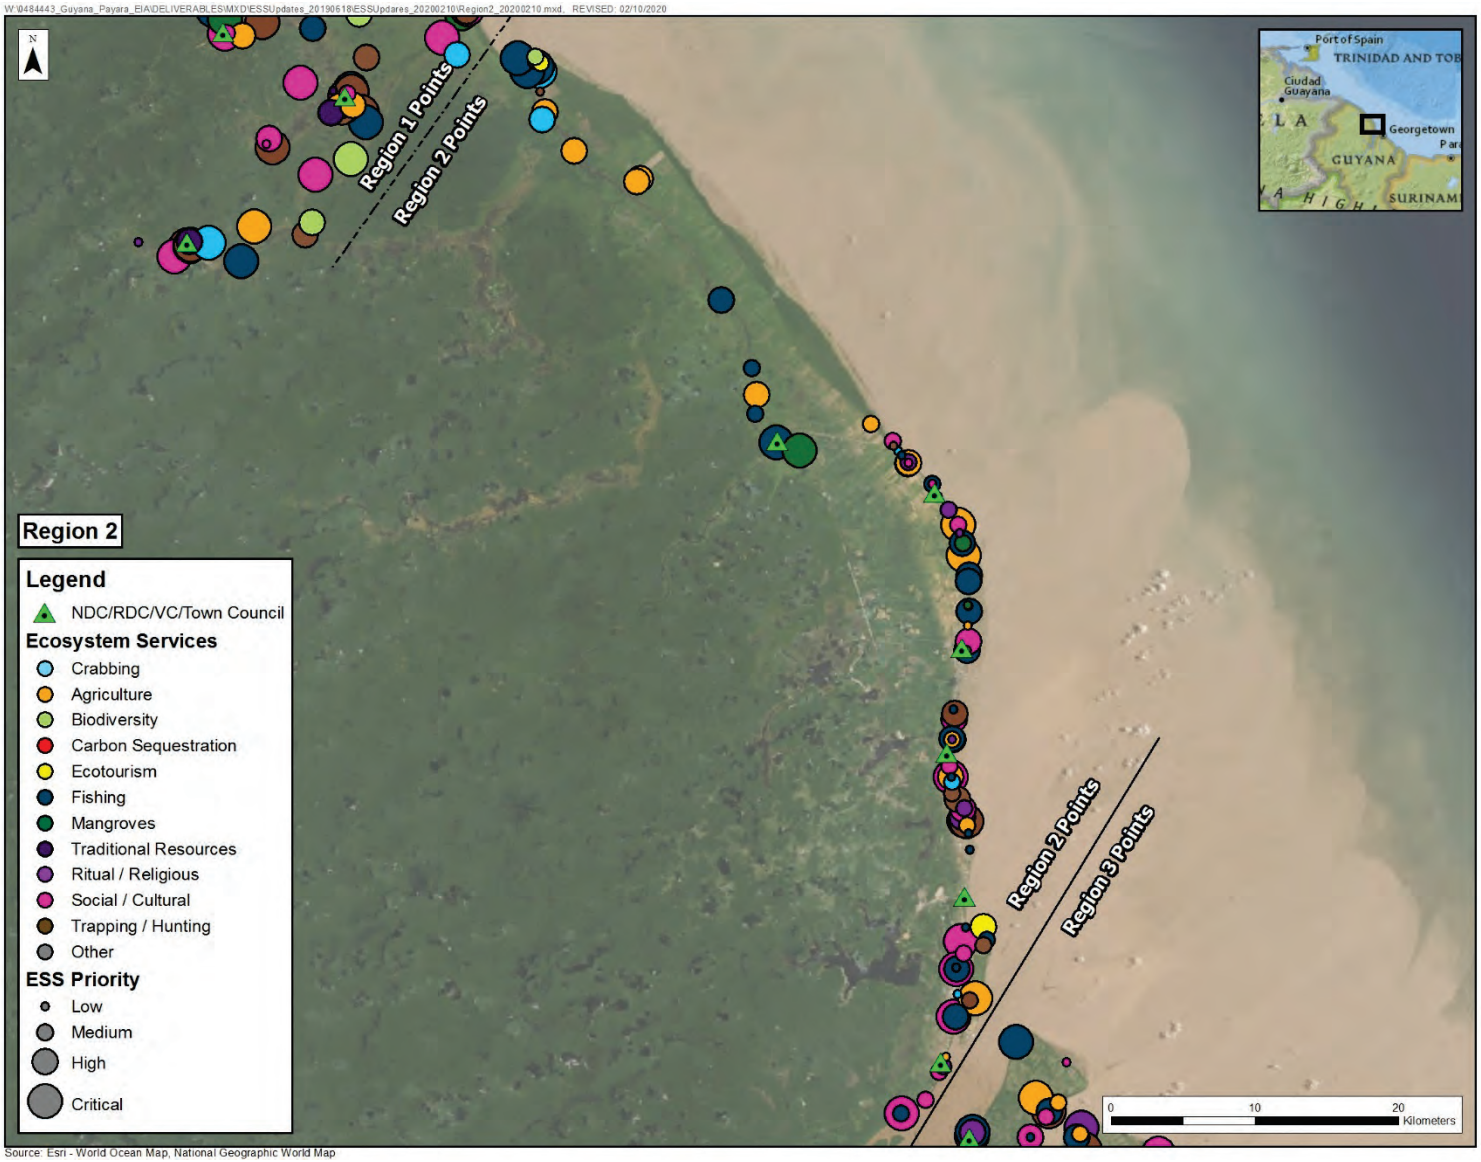
Along the Pomeroon River, mangroves provide habitat for biodiversity including scarlet ibis.

5.3. Detailed Findings

Detailed information on all ecosystem services scoped in for the Study Area are listed by NDC and provided in the scoping tables located in Appendix B.

Figure 5-1 shows the ecosystem service locations identified by the Region 2 NDC members and local communities during the engagement process and which were mapped during the field observations. They are displayed by ecosystem service (color of symbol) and priority (size of symbol) – critical, high, medium, or low – utilizing the methodology outlined in Figure 2-1. Detailed maps by NDC are provided in the ecosystem services map book (appended to this report).

FIGURE 5-1: IDENTIFIED LOCATIONS OF ECOSYSTEM SERVICES – REGION 2



6. REGION 3 COASTAL ECOSYSTEM SERVICES FINDINGS

6.1. Population

Population estimates are based upon data provided by NDC leadership during the ecosystem services-related engagements.

TABLE 6-1: POPULATION ESTIMATES - REGION 3

NDC Name	Population Estimate	Other Details
Wakenaam (island)	3,300	Decreasing due to migration
Leguan	2,700	Decreasing due to migration to Region 3 and North America
Mora/Parika	12,000	Growing due to migration to the NDC
Hydronie/Good Hope	4,200	Growing
Greenwich Park/Vergenoegen	2,600	
Tuschen/Uitvlugt	35,500	Increasing due to the growing housing schemes in several villages
Stewartville/Cornelia Ida	30,000	
Hague/Blankenburg	4,200	
La Jalousie/Nouvelle Flanders	5,500	Population increasing due to new housing schemes
Best/Klien/ Pouderoyen	25,000	Population increasing due to migration to the area

6.2. Summary of Findings

The services rated as “critical” or “high” priority (which constitute Priority Services) within the NDCs are summarized below:

TABLE 6-2: SERVICES RATED AS “CRITICAL” OR “HIGH” PRIORITY WITHIN THE NDCs – REGION 3

NDC Name	Type of Service	Brief Description
Wakenaam (island)	Provisioning	Commercial fishing at mouth of and within Essequibo River
	Provisioning	Freshwater from the Essequibo River is relied on island-wide for its irrigation of rice paddies and other crops during the dry season
	Provisioning	Crop cultivation is present in most areas of the island along the river dam and reserves
	Provisioning	Ports, wharfs, and shipyards, inclusive of boat building, on the river dam; commercial wharf at San Sousi for transport of fuels, rice, and other products that are shipped or imported to the island
	Provisioning	Speed boat landing site at Maria’s Pleasure for passenger transport to Parika and Leguan

NDC Name	Type of Service	Brief Description
Leguan	Provisioning	Transportation services to Parika and other areas
	Provisioning	Commercial fishing at Waterloo and Success
	Provisioning	The entire island depends on freshwater from the Essequibo River
	Cultural	Organized tours to historic sites including St. Peters Church
	Cultural	Hindu religious activities along the seashore and the presence of a cremation site
	Regulating	Erosion regulation as the island is at risk to erosion and much of the shore is not protected by manmade concrete defense
Mora/Parika	Supporting	Marine transport services and related economic activities at Parika stelling and saw mill
	Provisioning	Economic activity at fisheries wharf where boats load, refuel and discharge catch
	Provisioning	Residents squat along the river dam and use freshwater for domestic purposes
	Supporting	Biodiversity Reserve where locals protect two small islands that are roosting areas for hundreds of birds in the Essequibo River
	Cultural	Big Kiss temple on the river dam for worship activities
Hydronie/Good Hope	Provisioning	Economic activity from fishing at Ruby Koker and wharf supporting sea going vessels at Bushy Park, including ship repairs
	Provisioning	Livestock farming in the Ledestein to Good Hope area
	Provisioning	Two new wharfs established along the shoreline
	Cultural	Recreation at Bushy Park Beach, a popular tourist attraction for locals and people from other parts of the country
	Cultural	Hindu religious activities along the sea dam and the presence of a mosque at Ruby Koker
Greenwich Park/Vergenoegen	Provisioning	Fishing at Vergenoegen Outfall and cash crop cultivation along the coast
	Provisioning	Informal housing at Barnwell
	Cultural	Recreation at the seawall and Hindu religious activities along the shoreline
Tuschen/Uitvlugt	Provisioning	Fishing from the Zeeburg Seawall and Boeraserie Koker
	Provisioning	Shrimp processing at Zeeburg and Uitvlugt
	Supporting	Coastal protection from concrete sea defense
	Cultural	Recreation at Cinderella Park at Zeelugt Temple on the sea defense reserves at Uitvlugt
	Provisioning	Grazing of Animals at Zeelugt and Uitvlugt

NDC Name	Type of Service	Brief Description
Stewartville/Cornelia Ida	Provisioning	Fishing at Leonora boat landing area and farming along coast
	Supporting	Shrimp and fish processing on the Anna Catherina and Leonora seawall/reserve
	Supporting	Coastal protection from concrete sea defense
	Cultural	Religious practices at Cornelia Ida
	Provisioning	Informal housing at Anna Catherina sea defense reserves
Hague/Blankenburg	Provisioning	Fishing boat landing area at Hague seawall
	Provisioning	Crop cultivation and livestock farming along the sea shore
	Cultural	Recreation at the seawall and Hindu religious activities along the shoreline
La Jalousie/Nouvelle Flanders	Provisioning	Fishing from Windsor Forest Koker
	Cultural	Religious rituals at cremation site at Ruimzeigt and religious activity at La Jalousie
	Cultural	Recreation along seawall Windsor Forest
Best/Klien/ Pouderoyen	Provisioning	Transportation at Transport Wharf, GPL Wharf, Sawmill and Speedboat stelling; waterway used by boat builders
	Provisioning	Informal housing at Phoenix Park and Best Village
	Provisioning	Waterway is used by boat builders for access to launch boats built on the riverbank

6.2.1. Provisioning Services

The primary ecosystem services along the coastal zones in Region 3 are fishing and farming on the islands. The main commercial fish catch includes various types of catfish, snapper, bangamary, snook, mullet, and shrimp. The smaller boats catch shrimp and fish, while some boats change to catch shrimp in the season when it is abundant.

Crabs are caught during the period of July and August during spawning season. Mangroves provide an important nursery function and provide habitat for a number of commercial fish and shellfish species. Some people catch crabs throughout the year by hunting them in the mangroves. The system of inland rivers is also critical to the growth of the rich biodiversity of the sea. Rivers provide spawning grounds, shelter, and nutrients for the rich aquatic life.

Crop cultivation is present in many communities along the coast, and ranges in scale from subsistence farming of staple grains, including rice, to export-oriented growing of coconuts and plantains on the islands. Cash crops are grown on the sea defense reserves by residents who live in the area adjacent to the reserves. Several people squat on the reserves and make ample use of the land for crops, fruits, and grazing grounds for livestock.

The intensity of livestock farming ranges considerably within the NDCs of Region 3. Generally, the communities have more sheep and goats, as this is consumed by a wider range of individuals than cows. Hindus do not eat beef but use cow's milk for many purposes including

religious activities. Some households keep a few chickens, pigs, and cattle in their yards for household consumption and sale of any excess product. Larger operations can have dozens of heads of cattle and may be either dual purpose or specialize in dairy or beef.

Households in Region 3 rarely collect wild plants, fruits, and honey, for subsistence use or commercial use. While mangroves provide the habitat for honey production, it is not common in Region 3. One tanner uses the mangrove bark for his leatherwork on a limited basis. Some wood and non-wood fibers, including mangrove trees and coconut husks, are used in handicrafts and household items in some of the coastal communities, although this is not extensive.

Small groups of individuals will catch iguanas found living among the mangroves or thick vegetation of the sea dam. These reptiles are captured for sale and can attract G$6,000 for a large adult. Some people catch the birds on the seashore but on a limited basis. The shore is rapidly changing due to natural erosion and accretion and thus the bird population is constantly on the move. Since it is illegal to hunt some species of birds, hunting is likely underreported; in any case, it is likely not a major source of food or income in the region. The existence of various islands of large bird colonies where birds roost peacefully is testimony to the attitudes of the locals to the birds.

Potable water is available for communities from groundwater and many residents harvest rainwater. A few people rely on the fresh water from the river and irrigation canals for household purposes. The people squatting are more likely to use the seawater for some tasks. They have to fetch water some distance from their homes for drinking or cooking purposes. Transportation is mainly land based along the coast except for a few instances when the seacoast is used.

Commercial activities abundant in these areas include those supporting the marine industry, such as boat building, ship repairs, fuel services, and products needed by sailors and fisherfolk. It is quite evident that at almost all landing areas used by fisherfolk, there are shops in close proximity selling alcohol and other consumable products.

6.2.2. Regulating Services

Almost the entire shoreline is protected by rocks or concrete structures. Short lengths of earthen dams exist that are strengthened by rocks (riprap). Mangroves and coastal vegetation play a minor role in maintaining coastal stability and protecting inland areas from waves, wind, and flooding from storms. The migrating mud flats are on the move and consequently areas rich in mangroves are being washed away while new beaches are built elsewhere.

The NAREI re-growth program was most active in the La Jalousie/Nouvelle Flanders NDC but those mangroves are now almost completely washed away. With all of the new mangrove plantings and natural growth in the Best/Klien/Pouderoyen NDC, there are now concerns over the nuisance of sand flies and mosquitoes. The new mangrove growth will provide allow for pollination, which is essential to the agricultural coastland.

The shallowness of the natural shoreline makes protection services susceptible to change and these must be replaced by man-made engineering solutions before the natural protection is washed away. However, these are generally expensive to build and maintain over time.

6.2.3. Cultural Services

Natural spaces or species with cultural, spiritual, or religious importance are considered "living heritage." The most prominent of these is the Hindu tradition of praying and the planting of prayer flags at various points along the shoreline – most typically associated with shore access. African religious practices are almost nonexistent in the area and are generally done in secret. In some areas, temples or temporary structures are built for the main worship days. On Sundays, many families visit the sea early in the morning to pray and swim.

Locals utilize the areas along the seawalls for recreation, including walking, running, kite flying, and general recreation. Views of natural landscapes and landscape features, including river and ocean views, are highly valued by local communities and visitors. There is a cremation site in the La Jalousie/Nouvelle Flanders NDC that is used daily by the Region 3 population.

6.2.4. Supporting Services

The sea and river dam, inclusive of the reserves, houses a number of commercial and household activities. The natural processes of soil formation, nutrient recycling and accretion have contributed to ideal locations for commercial activities including, ports, wharfs, and dwelling places. The port at Parika is critical to the local economy, housing numerous ships offloading and loading their cargo. The primary wharves are at Parika, Vreed-en-Hoop and other landing sites are used on the beaches where boats can land safely during the high tide.

6.3. Detailed Findings

Detailed information on all ecosystem services scoped in for the Study Area are listed by NDC and provided in the scoping tables located in Appendix C.

Figures 6-1 and 6-2 show the ecosystem service locations identified by the Region 3 NDC members and local communities during the engagement process and which were mapped during the field observations. They are displayed by ecosystem service (color of symbol) and priority (size of symbol) – critical, high, medium, or low – utilizing the methodology outlined in Figure 2-1. Detailed maps by NDC are provided in the ecosystem services map book (appended to this report).

FIGURE 6-1: IDENTIFIED LOCATIONS OF ECOSYSTEM SERVICES – REGION 3 (1 OF 2)

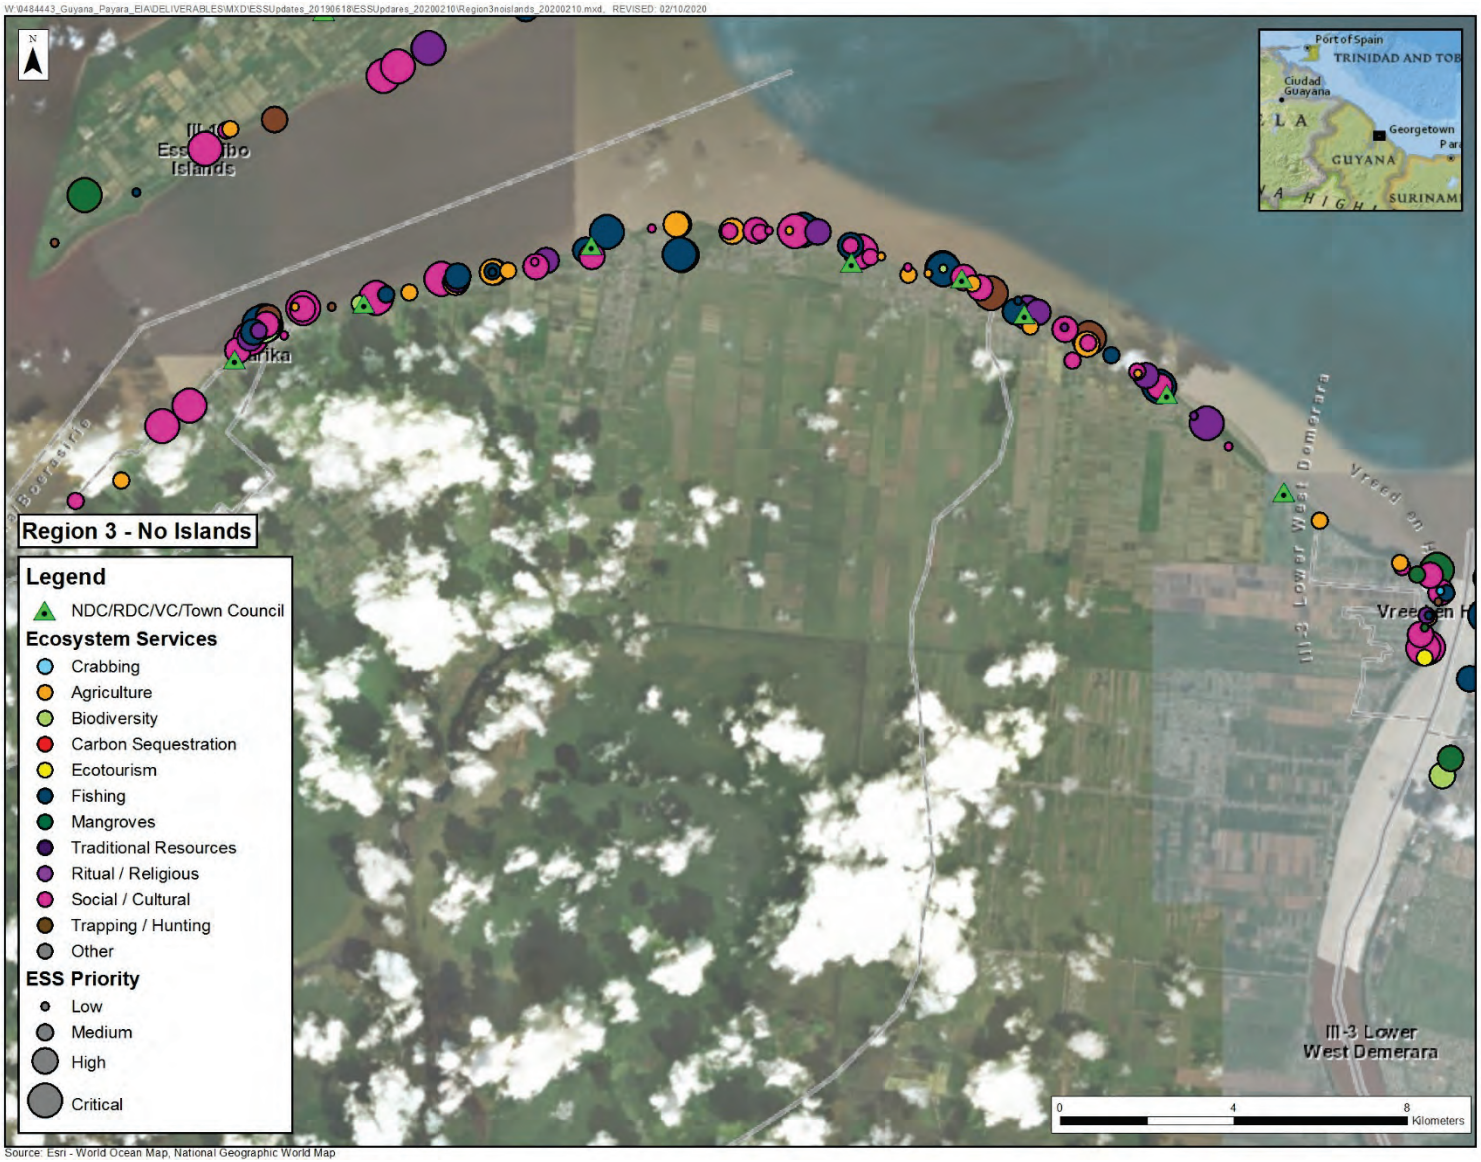


FIGURE 6-2: IDENTIFIED LOCATIONS OF ECOSYSTEM SERVICES – REGION 3 (2 OF 2)

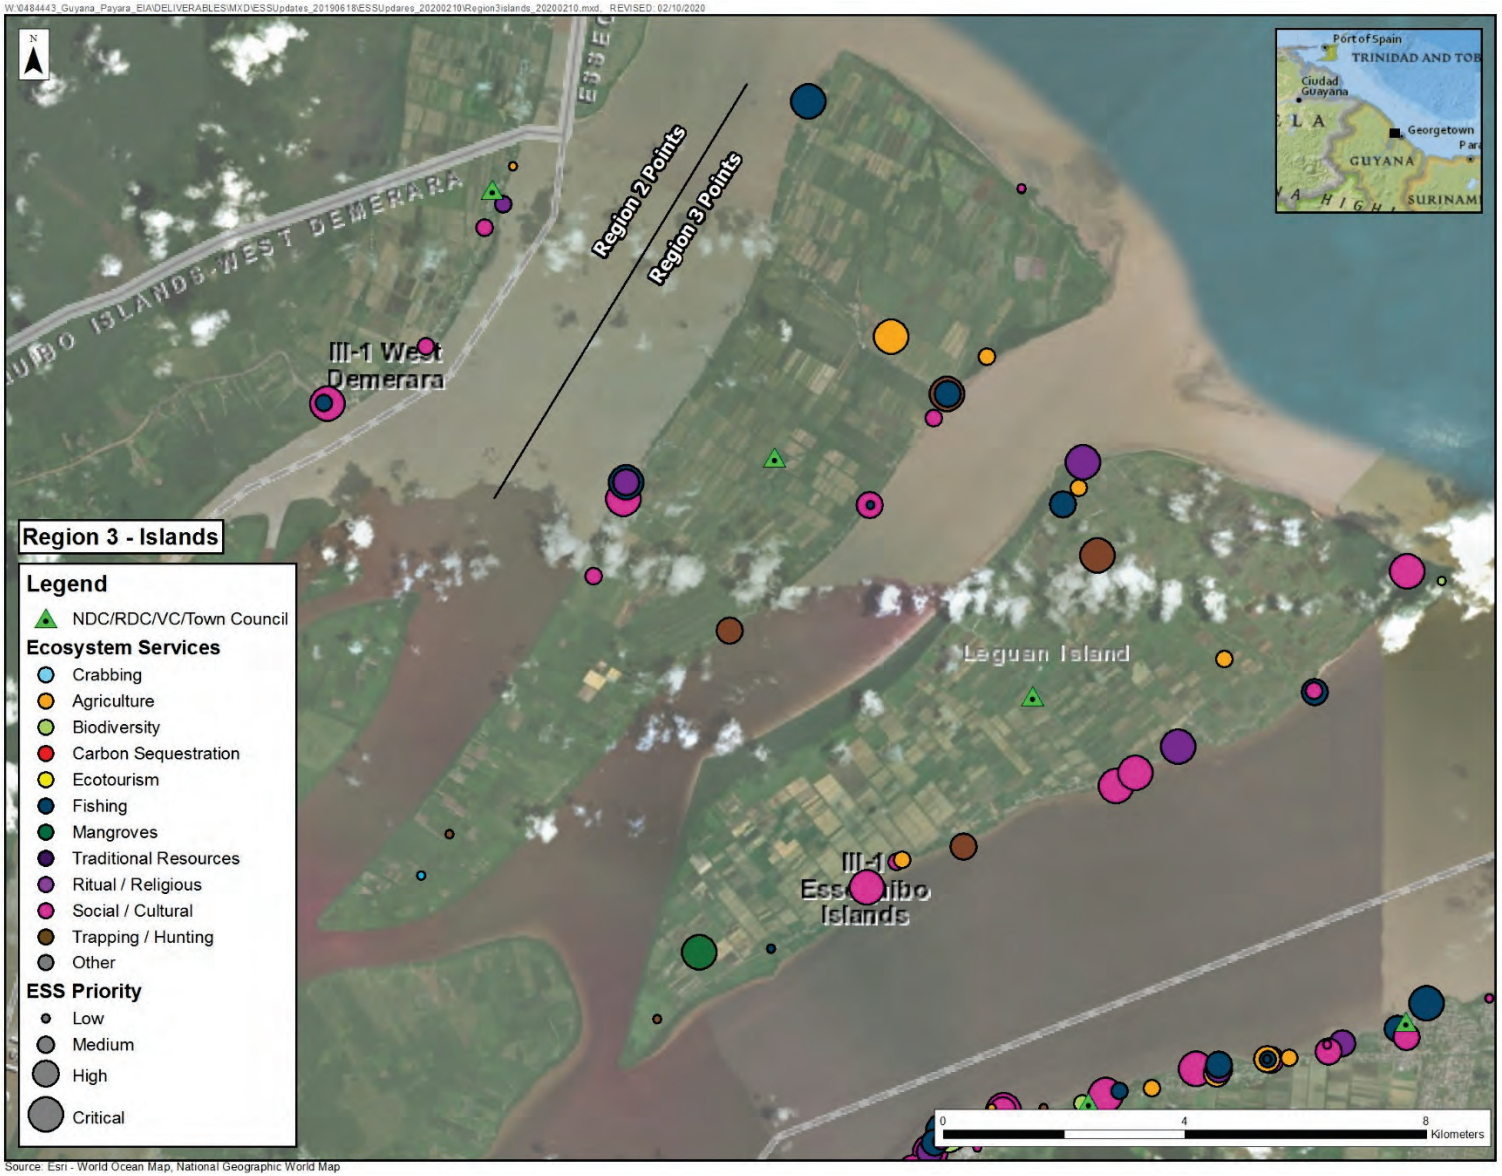

7. REGION 4 COASTAL ECOSYSTEM SERVICES FINDINGS

7.1. Population

Population estimates are based upon data provided by NDC leadership during the ecosystem services-related engagements.

TABLE 7-1: POPULATION ESTIMATES - REGION 4

NDC Name	Population Estimate	Other Details
Georgetown City	132,000	Increasing in suburban housing areas
Industry/Plaisance	25,000	Should be increasing due to new housing schemes
Better Hope/ LBI	30,000	Increasing due to natural population growth
Beterverwagting/Triumph	7,000	
Mon Repos/ La Reconnaissance	40,000	Increasing
Buxton/Foulis	7,000	
Unity/Vereeniging	13,000	
Haslington/Grove	27,000	Population increasing due to new housing schemes
Enmore/Hope	8,000	

7.2. Summary of Findings

The services rated as "critical" or "high" priority (which constitute Priority Services) within the NDCs are summarized below:

TABLE 7-2: SERVICES RATED AS "CRITICAL" OR "HIGH" PRIORITY WITHIN THE NDCs – REGION 4

NDC Name	Type of Service	Brief Description
Georgetown City	Supporting	Economic and social benefits from Port Georgetown and associated wharfs
	Provisioning	Commercial and subsistence fishing along the shore throughout the city
	Regulating	Erosion regulation as the coastland is at risk to erosion, although protected by concrete defense
	Cultural	Recreation from Kingstown along seawall
	Cultural	Tourism - two of the main hotels in Guyana are located on the sea shore
	Provisioning	Birds roost in the mangroves close to the Demerara Harbour Bridge
	Cultural	Religious activities at the Kingston shore/beach
Industry/Plaisance	Provisioning	Commercial fish landing site at Industry and Plaisance
	Cultural	Recreation, exercise and Hindu religious practices along the Cummings Lodge–UG Road area

NDC Name	Type of Service	Brief Description
Better Hope/ LBI	Provisioning	Fishing and salt fish drying from Montrose, Success and Better Hope
	Regulating	Erosion regulation as the coastland is at risk to erosion, although protected by concrete defense
	Provisioning	Locals utilize land along the sea wall at Better Hope for grazing livestock
Beterverwagting/Triumph	Provisioning	Fishing landing area in Triumph
	Cultural	Locals use the Triumph end of the NDC to exercise, recreate, or socialize.
Mon Repos/ La Reconnaissance	Provisioning	Fishing at fisheries landing areas in Mon Repos Koker and Lusignan Koker
	Cultural	Religious activities at Mon Repos
	Provisioning	Boat building & repairs
	Regulating	Mangrove cover is increasing and providing shoreline protection
Buxton/Foulis	Provisioning	Fishing at Stratsphey
	Provisioning	Informal housing at Bladen Hall in the mangroves
	Cultural	Recreation, exercise and Hindu religious activities at the Melanie to Non Pariel seawall
	Regulating	NAREI plots at Mon Repos and Vigilance for mangrove restoration.
Unity/Vereeniging	Provisioning	Fishing areas at Unity shoreline and Helena Koker, and wharfs in the Mahaica River supporting trade and the local economy
	Provisioning	Agriculture and grazing at Unity shoreline
	Supporting	Coastal defense, as the concrete sea defense is supported by natural vegetation including mangroves
	Cultural	Unity beach is frequented for recreation and aesthetic value of landscapes
	Cultural	Daily bird tours in the Mahaica River to spot numerous bird species
	Provisioning	Coconut estates encroach on the reserves along with some cash crops
	Cultural	Aesthetic value of natural landscapes throughout the area
Haslington/Grove	Provisioning	Fishing at landing areas Greenfield, Hope, Haslington and Victoria, including at mudflats
	Supporting	Mangrove Reserve supporting conservation, apiculture
	Cultural	Mangrove Reserve supporting ecotourism
	Cultural	Cove & John to Victoria seawalls for recreation and religious activities; Cove & John attracts thousands for the special religious days
	Provisioning	Grazing of animals at Hope Sea

NDC Name	Type of Service	Brief Description
Enmore/Hope	Provisioning	Fishing at the Enmore Koker
	Cultural	Enmore shoreline is a popular place for Hindu religious activities

7.2.1. Provisioning Services

The primary ecosystem service along the coastal zone of Region 4 is fishing. The main fish caught include various types of catfish, trout, paggy, snapper, bangamary, snook, mullet, and shark. Some fisherfolk catch shrimp, particularly those launching from the Demerara River and lower East Coast of Demerara. The fisherfolk from the coast switch to shrimp in the season when it is abundant.

Crabs are caught in the period July to August during their spawning season in areas where they are available. Some people catch crabs throughout the year by hunting them in the mangroves. The sea crabs are found in small puddles left on the mudflat when the water recedes. Mangroves provide an important nursery function and provide habitat for a number of commercial fish and shellfish species. The system of rivers is also critical to the growth of the rich biodiversity of the sea. The Demerara and Mahaica Rivers provide spawning grounds, shelter, and nutrients for aquatic life.

Housing is the main activity on the coastland, followed by agriculture. Communities along the coast engage in subsistence farming of vegetables and fruits. Commercial farms grow sugarcane, staple grains (including rice), coconuts, and cash crops. Cash crops are also grown on the sea defense reserves by residents who live in the area adjacent to the reserves. A number of people who squat on the reserves make ample use of the land for crops, fruits, and grazing grounds for livestock. Mangroves are an important ecosystem service provider for the agricultural economy in this region as they house numerous pollinators.

The intensity of livestock farming increases as one leaves the city of Georgetown and progresses to the Mahaica area. Generally, the communities have more sheep and goats, as opposed to cows, as these are consumed by a wider range of individuals. Some households living in close proximity to the sea defense keeps a few chickens, pigs, and cattle in their yards for household consumption and sale.

Households in Region 4 rarely collect wild plants, fruits, berries, mushrooms, honey, and nuts, for subsistence use or commercial use mainly because they are in limited supply. This practice is limited in Region 4, although mangroves provide the habitat for honey production. Honey is known to be produced by two people using the mangroves on the coastland; these individuals agreed that honey production could be a major source of income. Honey is sold at G$3,500 per liter, and these individuals reportedly sell approximately four liters daily. Some wood and non-wood fibers, including mangrove trees and coconut husks, and driftwood are used in handicrafts and household items in some of the coastal communities, although this is not extensive.

Small groups of individuals will catch iguanas found living among the mangroves or thick vegetation of the sea dam. These reptiles are captured for sale and can attract G$6,000 for a

large adult. Some people shoot the birds on the seashore, but on a limited basis as the shotgun attracts police attention. It is illegal to hunt some species of birds, so hunting is not encouraged by the police. Birds do not constitute a major source of food or income in the region.

Potable water is available for communities from groundwater and many residents harvest rainwater. A few people rely on the canals for household purposes. The people squatting are more likely to use the salt water or water from the drainage canals for some tasks. The people squatting have to fetch water some distance from their homes for drinking or cooking purposes. Transportation is mainly land based along the coast except for a few instances when the seacoast is used.

Commercial activities dominate Georgetown, inclusive of fishing by commercial trawlers and large boats. Supporting services in the area offered to the industry include boat building, ship repairs, fuel services, entertainment and household products needed by sailors and fisherfolk. Specialized businesses offer services to the crews of visiting vessels, including food, beverages, transportation, and entertainment.

7.2.2. Regulating Services

Almost the entire shoreline is protected by rocks or concrete structures. Short lengths of earthen dams exist in a few NDCs that are strengthened by rocks (riprap). Mangroves and coastal vegetation play an increasing role in maintaining coastal stability and protecting inland areas from waves, wind, and flooding from storms. The migrating mud flats are being deposited in this region and they provide substrate for new mangroves to thrive. The new mangrove growth will provide regulating services, of which pollination is essential to the agricultural coastland. The mangroves will also promote a more diverse biodiversity and increase in the abundance of fishes in the ocean.

The NAREI re-growth program was most active in Region 4 compared to Regions 2 and 3, although some replanted areas have now almost completely washed away. The new mangrove plantings in Better Hope/ LBI, Beterverwagting/Triumph, and Haslington/Grove NDCs and natural growth in Better Hope/ LBI, Beterverwagting/Triumph, Unity/Vereeniging, Haslington/Grove, and Enmore/Hope NDCs have increased concerns over the nuisance of sand flies and mosquitoes.

The mangroves help with flood regulation and sea defense on the shore. These services are essential to the coastal communities and the natural defense must be replaced by man-made engineering solutions before the natural protection is washed away.

7.2.3. Cultural Services

Natural spaces or species with cultural, spiritual, or religious importance are considered “living heritage.” These natural spaces are highly valued by the local communities, the most prominent of these being the Hindus. The believers practice the tradition of bathing, praying, and the planting of prayer flags at various points along the shoreline, particularly at the kokers. In some areas, temples or temporary structures are built for the main worship days. On Sundays, many

families visit the sea early in the morning to pray and swim. African religious practices are almost nonexistent in the area or are generally done in secret.

Locals utilize the areas along the seawalls for recreation, including walking, running, kite flying, and general recreation. At popular locations such as the Kitty Seawall in Georgetown, people from many other regions of Guyana visit for recreation purposes. Views of natural landscapes and landscape features, including river and ocean views, are highly valued by local communities and visitors. Birding tours are held daily in the Mahaica River for locals and overseas visitors. Mangrove Tours are held monthly in the Mangrove Reserves and as often as three times per day in the school tour season.

7.2.4. Supporting Services

Georgetown is the Capital City of Guyana and a historical port. The activities of the city based on the river and ocean systems are essential to the wellbeing of the nation. The sea defense and river dam, inclusive of the reserves, house a number of commercial and household activities. The natural processes of soil formation, nutrient recycling, and accretion have contributed to ideal locations for commercial activities including, ports, wharfs and commercial houses. The numerous wharves facilitate various services for ships, with docks utilized by passenger and fishing vessels. The mangroves are roosting areas for birds, with the area next to the Demerara Harbour Bridge being a particularly important site.

7.3. Detailed Findings

Detailed information on all ecosystem services scoped in for the Study Area are listed by NDC and provided in the scoping tables located in Appendix D.

Figure 7-1 shows the ecosystem service locations identified by the Region 4 NDC members and local communities during the engagement process and which were mapped during the field observations. They are displayed by ecosystem service (color of symbol) and priority (size of symbol)—critical, high, medium, or low—utilizing the methodology outlined in Figure 2-1. Detailed maps by NDC are provided in the ecosystem services map book (appended to this report).

FIGURE 7-1: IDENTIFIED LOCATIONS OF ECOSYSTEM SERVICES – REGION 4

APPENDIX A

Screening Checklist

-Page Intentionally Left Blank-

Ecosystem Service	Description, Examples
Provisioning Services	
Food: wild-caught fish and shellfish & aquaculture	Fish caught for subsistence or commercial sale; Fish, shellfish, and/or plants that are bred and reared in ponds, enclosures, and other forms of freshwater or saltwater confinement for harvesting
Food: wild plants, nuts, mushrooms, fruit, honey	Fruit, nuts, wild plants, etc. collected in natural areas for consumption or sale
Food: wild meat	Animals hunted primarily for food (recreational hunting is covered separately under cultural services); extent of wildlife trapping and trade (Region 1)
Food: cultivated crops	Annual and permanent crops grown for subsistence use and commercial sale
Biomass for livestock production	Sedentary and nomadic livestock farming supported by native forage plants
Biomass fuel	Wood, dung and plant matter collected for charcoal or fuel
Timber and wood products	Wood collected for local use or for sale as timber, wood pulp, paper – wood is used in house construction (importance varies by community)
Non-wood fibers and resins	For example, cane, palm, straw, cotton, hemp, twine and rope, natural rubber
Freshwater - household use	Freshwater for bathing, drinking, laundry, household use
Freshwater - irrigation & industry	Freshwater for irrigation or industrial use
Natural medicines, pharmaceuticals	Natural medicines, biocides, food additives, pharmaceuticals and other biological material for commercial or domestic use
Ornamental resources	For example, pelts, carved or decorative animal products, live animal trade
Genetic resources	Genes and genetic information used for animal breeding, plant improvement, and biotechnology
Transportation	In remote areas no alternative methods of transport; commercial transportation facilities such as wharfs, ferry stellings, etc.
Social / Economic	Income generators or services supporting income generation (e.g., boat building, repairs, transportation services)
Traditional Resource Use (Region 1)	Traditional medicine, manicole and morocut harvesting, logging, non-wood fibers and resins for sustenance and crafts, biomass for fuel, gathering wild plants and honey, turtle/wildlife trappings, and harvesting of shells
Regulating Services	
Regulation of air quality	The influence ecosystems have on air quality by extracting chemicals from the atmosphere (i.e., serving as a “sink”) or emitting chemicals to the atmosphere (i.e., serving as a “source”)
Climate regulation: global	Vegetated areas sequester CO_2, with implications for global climate change
Climate regulation: local	Regulation of temperature, shade air, and quality by vegetated areas
Regulation of water timing and flows (including flood regulation)	Influence ecosystems have on the timing and magnitude of water runoff, flooding, and aquifer recharge
Water purification and waste treatment	Role played by vegetation in the filtration and decomposition of organic wastes and pollutants and the assimilation and detoxification of compounds

Ecosystem Service	Description, Examples
Shoreline protection	Role of natural habitats (e.g., wetlands, beaches, reefs) in protecting crops, buildings, recreation areas from waves, wind and flooding from coastal storms
Fire regulation	Regulation of fire frequency and intensity (e.g., dense forest can provide firebreaks)
Pest regulation	Predators from forests, grassland areas, etc. may control pests attacking crops or livestock
Disease regulation	Influence ecosystems have on the incidence and abundance of human pathogens
Erosion regulation	Role of vegetation in regulating erosion on slopes and riparian areas
Pollination	Birds, insects and some small mammals pollinate certain flora species, including some agricultural crops
Cultural Services	
Spiritual or religious value	Natural spaces or species with spiritual or religious importance
Traditional practices	Cultural value placed on traditional practices such as hunting, fishing, crafts and use of natural resources
Tourism and recreation	Use of natural spaces and resources for tourism or local recreation (e.g., swimming, boating, fishing); tourism potential and infrastructure needs (Region 1)
Aesthetic value	Cultural value placed on the aesthetic value provided by landscapes, natural landmarks
Educational and inspirational values	Information derived from ecosystems used for intellectual development, culture, art, design, and innovation
Non-use value of biodiversity (e.g. existence, bequest value)	Species and areas valued globally as of high conservation value
Cultural Services (Region 1)	Cultural aspects and places of importance and protection for Amerindian communities
Supporting Services [a]	
Habitat provision	Natural spaces that maintain species populations and protect the capacity of ecological communities to recover from disturbances
Primary production	Formation of biological material by plants through photosynthesis and nutrient assimilation
Nutrient cycling	Flow of nutrients (e.g., nitrogen, sulfur, phosphorus, carbon) through ecosystems
Water cycling	Flow of water through ecosystems in its solid, liquid, or gaseous forms.
Soil formation	Natural soil-forming processes throughout vegetated areas

[a] Supporting Services are intermediate ecological outcomes that are not directly used but rather support other ecosystem services. An exception is made for Habitat Provision, which is sometimes valued as an "end-use" service by stakeholders in addition to its supporting role.

APPENDIX B

Identified Ecosystem Services and Priority Ratings: Region 1 Coastal

-Page Intentionally Left Blank-

TABLE B-1: IDENTIFIED ECOSYSTEM SERVICES AND PRIORITY RATINGS: REGION 1 COASTAL

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
0101 Father's Beach - Population Estimate - 23 people							
Shoreline Protection; River Defense	Regulating Services	Extensive area of mangrove forest on the shore line protecting the sea shore from the impacts of the sea and along the banks of the Moruca River. The oldest coconut farms in the area (established in the 1950s) have been reclaimed by mangroves. There are mature mangroves and new mangrove growth in other areas. Erosion of mangroves is observed in some areas. There was a significant shell beach, which has eroded over the years. Shell is being used for construction in place of stone and is also used for landfilling and to provide nutrients for plants (fruit trees).	Mangrove Forests	Commercial and subsistence fishing along the coast and in mangroves **ES Linkages:** Agriculture, sea defense, settlements.	High	Low	Critical
Biodiversity - Habitats	Supporting Services	There are lots of animals within the mangroves including mammals, birds, crabs, fish, and reptiles. Jaguars are a common sighting and macaws and parrots are plentiful in the area eating the crops. Hunting is prohibited in the village and small animals are caught in the swamp for meat.	Mangroves, shoreline	Local people **ES Linkages:** Hunting, recreation	Moderate	Moderate	Medium
Food: Wild Meat	Provisioning Services	There are lots of birds, crabs, fish, and reptiles in the mangroves with crabs and fishes caught for commercial purposes. Some iguanas are caught on the seashore along with sea birds including curi and wild ducks for meat on a limited basis by a few people in the swamps behind the farms. Hunting by outsiders is banned.	Mangroves, shoreline	Local people	Moderate	Moderate	Medium
Agriculture, Cultivated Crops	Provisioning Services	Cash crops with coconuts, plantains, cassava, vegetables, and fruits are under cultivation in a stretch of twenty (20) acres along the sea shore in the mangroves. Some of the abandoned farmlands in the area have been reclaimed by the mangroves.	Sea dam, cultivated areas	Local farmers, residents	Essential	Moderate	Critical
Agriculture, Cultivated Crops	Provisioning Services	Coconut is the main crop grown by the community. A dry coconut sells for $ 45 and a water coconut sells for $ 50 at Charity. Copra sells for $45. Currently, coconut cockles are affecting the coconut grove.	Cultivated lands	Local communities (general population)	Essential	High	High
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	Most people fish for food with three households who fish on a commercial basis in the sea between the Pomeroon River Mouth and Fathers Beach. They each sell about 200 lb. of fish on a weekly basis at $200-$300 per pound.	Marine habitat and Mangrove Forests	Commercial and subsistence fishing along the coast and in mangroves	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabbing in mangroves along the beach area is common especially during the crab seasons. Residents from several villages, including as far as Pomeroon and Warapoka come into Fathers Beach to crab. Crap marching is disruptive to the community as the crabs tend to damage the dams which are critical for flood prevention and drainage. Other people catch crab throughout the year for both subsistence and commercial purposes.	Marine environment; Mangroves;	Local people	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Traditional Resource Use	Provisioning Services	Almost all plants including noni, mangroves, and others that are used by the locals for medicinal and spiritual purposes. These plants are plentiful on the beach. Mangroves are used for building construction plantain poles, seine poles, etc. Red mangrove is used to make craft and household items and buttonwood bark is used to make quake strings and shovel sticks. Residents also used the shell on the beach to provide nutrients for plants, use for construction of foundation for buildings, and use for fillings of yards. Shells are used for construction by the residents.	Biodiversity, Agriculture	Local people	Essential	High	High
Tourism and Recreation	Cultural Services	Community members and people from other areas use sections of the beach including Gwennie Beach, Papaya Beach and Bolton Area for recreation purposes.	Coastland	Local people	Low	Moderate	Low
Freshwater - Household Use	Provisioning Services	The community depends on rain water and some freshwater from the wetlands behind the farms. Water is used for bathing, washing, cooking, and drinking.	Coastal wetlands	Father's Beach	Essential	Moderate	Critical
Social/Economic Settlements	Provisioning Services	An entire community resides along the beach. Access to this community is from the beach only via a small channel in the high tide. This also supports commercial activities including fuel sales, boat building and repairs, engine repairs and the local bar is on the shore. People live on their farms in houses on stilts. In addition to the sale of fuel and conduct of boat repairs onshore, the community also provides these services offshore to stranded fisherfolk and other travelers. Persons in need of fuel or repairs can call and the personnel will respond.	Coastland	Father's Beach	Essential	Low	Critical
Aquatic Transportation	Provisioning Services	Access to the community is mainly via boats.	Rivers	Local People **ES Linkages:** Settlements, agriculture and socioeconomic	Essential	Low	Critical
0102 Manawarin – Population Estimate 2,000 people							
Biodiversity- Habitat	Supporting Services	There is an abundance of wildlife within the forest and rivers. Giant river otters feeding area was observed in the river.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Wildlife – Hunting and Trapping	Provisioning Services	There are lots of birds, fish, mammals, and reptiles in the area with few birds caught for commercial purposes. Hunting and trapping is very limited in the area with more people focused on fishing and agriculture. However, about 25% of the population is engaged in some form of hunting. Species such as boas, anacondas, parrots, and macaws are caught and sold at Charity.	Coastal wetlands, Forested areas, Bush Islands	Local people	High	Moderate	High
Agriculture, Cultivated Crops	Provisioning Services	All households have farms with plantains, cassava, vegetables, and fruits. Crops are for household use and some are sold to the school and other villages or in limited extent at Charity or Santa Rosa. More persons are farming but the market for the produce is lacking and it costs too much to transport the produce to Charity or Kumaka.	Forested areas, Bush Islands	Local farmers, residents	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	25% of the population fish in the sea between Pomeroon Mouth and Father's Beach targeting the Moruca Mouth area in seasons. Fishing has declined due to the lack of fishing vessels and supplies.	Marine habitat and Mangrove Forests	Commercial and subsistence fishing along the coast and in mangroves	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Almost the entire village accesses the shoreline to catch crabs during the crab season. In addition, a few people catch crabs all year round and bring back to the village for sale.	Marine environment; Mangroves;	Local people	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	All villagers fish for food throughout the year at different locations following the movement of the fishes. In the dry season fishing is concentrated in the creeks and rivers.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Freshwater - Household Use	Provisioning Services	The community depends on freshwater from the rivers and creeks. Some people harvest rainwater for domestic purposes and others use the groundwater from water wells. Freshwater in the creeks and rivers is used for bathing, washing, cooking, and drinking.	Coastal wetlands, river ecosystems	Local Communities **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
Traditional Resource Use	Provisioning Services	There are lots of plants including noni and others that are used by the locals for medicinal purposes. Some people cook the cabbage palm and also use the forests to gather materials for household items. Palms and vines including Ite, Kufa, Nibbi, and Kufra are utilized for making craft and household items. The community cuts wood for its internal construction and for sale. The current dispute with the village of Wakapao over the ownership of the resources has reduced the level of this activity.	Biodiversity, Cultural Heritage	Local people	Essential	High	High
Cultural Resources	Cultural Services	Rockstone is an old spiritual site that is far inland and away from the village. This site is used a few people in an infrequent manner.	Cultural	Locals	Low	Low	Low
Social/Economic	Provisioning Services	Commercial activities including numerous small shops, fuel sales, and transportation services are located in the village landing area used by more than 100 people daily.	Coastal wetlands, river ecosystems	Manawarin & Regions 1 & 2	Essential	Low	Critical
River Defense - Erosion Regulation	Regulating Services	The rivers are covered by extensive vegetation protecting the banks from the impacts of the boats and water current.	Coastal wetlands, river ecosystems	Transportation **ES Linkages:** Agriculture, sea defense	High	Low	Critical
Transportation	Provisioning Services	Access to the community is via boats through the river network entering the Moruka River and the Manawarin River. Numerous dirt road networks provide access from various points to the village.	Rivers	Local People **ES Linkages:** Settlements, agriculture, and socioeconomic	Essential	Low	Critical
0103 Haimakabra – Population estimate 600 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	Approximately 50% of the male population is involved in fishing. 20 people catch fish in the sea on a fortnightly basis making two trips per month to catch snook, basha, bangamary, gillbacker, curass, etc., between Moruka Mouth to Iron Punt where they will camp. Fish is dried at the camps on the beach when ice is unavailable for storage.	Marine habitat and Mangrove Forests	Commercial fishing along the coast	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught seasonally by almost everyone in the village, as well as regularly by a 10-12 people for sale at the weekly market at Santa Rosa.	Marine environment; Mangroves	Local people	Essential	High	High

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Biodiversity – Habitat Provision	Supporting Services	Numerous species of birds, fishes, mammals including manatees and river otters are found in the rivers. Giant river otters spotted in the area.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Wildlife Hunting and Trapping	Provisioning Services	Several people in the village trap birds and other wildlife for trade. These are sold to a buyer who takes it to Charity for sale. Hunting of ducks and iguanas is done along the coast for meat by people who visit these areas. Timber species present in the area is utilized with lumbering prevalent, with about 20 chainsaws operating within the community. Each chainsaw operation employs about six people.	Coastal wetlands, Forested areas, Bush Islands	Local people	High	Moderate	High
Cultivated Crops	Provisioning Services	Cassava is the main crop grown by the community for their staple. Fresh vegetables and fruits are grown for home use and for sale in the village. All households have multiple farms at different locations.	Cultivated lands	Local communities (general population)	Essential	High	High
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	All villagers fish for food throughout the year in areas close to their homes. In the dry season fishing is concentrated in the creeks and rivers. Special fishing trips are made to areas far from the village for commercial purposes.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Traditional Resource Use	Provisioning Services	Traditional resources are harvested in a limited manner and cabbage palm is only cut for cooking at home. Many people do not make traditional furniture or craft.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Social/Economic	Provisioning Services	The village in located on highland and is populated by houses, administrative buildings and village shops. The village has a sports ground.	Commercial, Administrative	Local people **ES Linkages:** Hunting, fishing	High	Moderate	High
Freshwater - Household Use	Provisioning Services	The community depends on freshwater from the rivers and creeks that are critical for fishing and transportation. Freshwater in the creeks and rivers is also used for bathing, washing, cooking, and drinking.	Coastal wetlands, river ecosystems	Local Communities **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
Cultural Resources	Cultural Services	The village has a shell mound that can be used for tourist attraction in addition to its cultural value.	Cultural	Locals	Low	Moderate	Low
Aquatic Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture, and socioeconomic	Essential	Moderate	Critical
0104 Waramuri – Population estimate 2,500 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	Approximately 30% of the males are commercial fisherfolk catching curass, snapper, gillbacker, highwater, cufum, and banga mainly on both sides of the Moruka River mouth between Iron Punt and Cozier Canal. Most of the fisherfolk lives in Haimakabra, a satellite of Waramuri.	Marine environment; Mangroves; river ecosystem	Local people	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabbing is done seasonally with every family making at least two trips to the main crabbing areas of Fathers Beach to east of Pomeroon Mouth.	Marine environment; Mangroves;	Waramuri villagers	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	The villagers fish throughout the year in the creeks and savannas and lagoons behind the beach. In the dry season fishing is concentrated in the creeks and rivers with fishing trips to areas far from the village for commercial purposes. Some fish is sold fresh in the village. Some is dried and sold at Santa Rosa and Charity.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Biodiversity – Habitat Provision	Supporting Services	Numerous species of birds, fishes, mammals including river otters, tapir, deer, and labba are found in the rivers and environment. Many ducks are seen but not caught. Many birds are seen in the savannas but not hunted.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Food: Wild Meat	Provisioning Services	A few people are involved in trapping. Along the beach wild animals are hunted including tapir, deer, iguana, wild ducks (muscovy), etc., with agouti and caiman caught. Snakes are caught and sold to visiting traders or sold at Charity. Duck eggs are also collected. Turtles were previously hunted but not anymore due to conservation efforts. Shore birds can be used for bait by the fisherfolk.	Coastal wetlands, Forested areas, Bush Islands	Local people	High	Moderate	High
Agriculture, Cultivated Crops	Provisioning Services	Cassava is the main crop grown by the community for their staple by all households. Fresh vegetables and fruits are grown for home use and for sale to the school. Coconut cultivation is increasing in the village and water nuts are sold at Charity. Copra is sold at Pomeroon.	Cultivated lands	Local communities (general population)	Essential	High	High
Tourism and Recreation	Cultural Services	Shell mounds are located in the village that can be used for tourist attraction as a heritage site. This site is expected to be developed into a leading tourist attraction in the future as part of the village's plan to enhance eco-tourism activities.	Cultural	Locals	Moderate	Moderate	Medium
Traditional Resource Use	Provisioning Services	Traditional resources are harvested in a limited manner with the villagers embracing modernity. Most people cook with cooking gas using firewood in a limited manner. Noni is used for many medicinal remedies by villagers. Honey is gathered from wild bees along the beach and sells for 250 ml for $1000. Lumber is cut for domestic purposes and sometimes sold in the village. The ite palm is recognized by the village as the tree of life providing tibisiri for craft and hammocks, clothing, household items, roof material, fruit for drink making, and tacoma worm. The village has deposits of stone that are used in construction. Stone is mined and sold locally with some villagers selling to contractors in Santa Rosa.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	Moderate	High	Low
Social/Economic	Provisioning Services	The village in located on bush island (highland) and is populated by houses, administrative buildings, churches and over 20 village shops. The village has a sports ground and an internet service provider.	Commercial, Administrative	Local people **ES Linkages:** Hunting, fishing, tourism	High	High	Medium
Freshwater - Household Use	Provisioning Services	The community depends on freshwater from the rivers and creeks. The river network is critical for fishing and transportation. Freshwater in the creeks and rivers is also used for bathing, washing, cooking, and drinking.	Coastal wetlands, river ecosystems	Local Communities **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Shoreline Protection/River Defense	Regulating Services	The rivers are covered by extensive vegetation protecting the banks from the impacts of the motor boats and water current. The shoreline area is preferred for farming since it is more fertile. However, large cultivated areas and the fisherfolk's camp were washed away. A lot of mangroves and other lands are also eroded from Shell Beach.	Coastal wetlands, river ecosystems	Transportation **ES Linkages:** Fishing, transport	High	Low	Critical
Transportation	Provisioning Services	Access to the community is via boats through the river network. Extensive networks of dirt roads exist connecting Waramuri and other settlements.	Rivers	Local People ES Linkages: Settlements, agriculture and socioeconomic	Essential	Low	Critical
0105 Santa Rosa – Population estimate 10,500 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	50 -100 people are fishing on a daily basis with some people making 2-3 trips per month. Fish is sold at $ 300 – 500 per pound at Moruca. One fisherfolk reports to sell over 1000 lb. of fish per trip making 2 trips per month. Fishing is done along the coast from Pomeroon River all the way to Waini Point, but mainly between the Pomeroon River and Iron Punt. Other fishing areas include Manawarin, Moruca, Baramanni, Biara, and Waini rivers. Dog Creek and Luri Creek are also visited in the dry season.	Marine habitat and Mangrove Forests	Commercial and subsistence fishing along the coast and in mangroves	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught seasonally by almost everyone in the village, as well as regularly by a few people for sale. About 20 people catch crabs for the market on Tuesdays and Saturdays. Out of season crabs are sold at $100 for one.	Marine environment; Mangroves;	Local people	Essential	Moderate	Critical
Livestock Farming	Provisioning Services	A small group of <10 people have a few heads of cattle and some pigs. These are grazed in the savannas close to the village and do not reach the coastland.	Animal Husbandry	Local communities (general population)	Essential	High	High
Biodiversity - Habitats	Supporting Services	The village and its surrounding area are populated by numerous species of birds, fishes, mammals including numerous jaguars. Ite palms are found throughout the community and are used by the villagers. Ite palms also house numerous birds.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Wildlife – Trapping & Hunting	Provisioning Services	Wildlife trade is banned in the village but some people keep animals as pets. However, people hunt wildlife for sustenance. Luri Creek and Baramani Lake are important areas where villagers conduct hunting of animals for meat. There is a ban on all hunting within the village. Deer is scarce but iguanas are plentiful. Recently many saki monkey were trapped by a wildlife trader.	Coastal wetlands, Forested areas, Bush Islands	Local people	High	Moderate	High
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	All villagers fish for food throughout the year and more so in the dry season. Special fishing trips are made to Dog Creek and Luri Creek for commercial purposes.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Traditional Resource Use	Provisioning Services	Traditional resources are harvested in a limited manner and cabbage palm is only cut for cooking at home. Many people do not make traditional furniture or craft but rely on household items made exclusively from wood. Turtle shells are used for spiritual practices. The mangroves are part of the cultural heritage of the community and must be protected. The Moruca Mouth is part of the ancestral lands of the Amerindian people of Santa Rosa. Plants are gathered from the beach and throughout the community for medicinal and other purposes.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Social/Economic	Provisioning Services	The village in located on highland and is populated by houses, regional and village administrative buildings and numerous shops. The village has three sports ground used on a daily basis by the youths.	Commercial, Administrative	Local people **ES Linkages:** Recreation, Administration	High	Moderate	High
Freshwater - Household Use	Provisioning Services	The community depends on freshwater from the rivers and creeks for bathing, washing, cooking, and drinking. The rivers are critical for transportation with 100 -200 people travelling on a daily basis to Charity or Mabaruma.	Coastal wetlands, river ecosystems	Local Communities ES Linkages: Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
Cultural Resources; Tourism, and Recreation	Cultural Services	The village has a sacred site that can be used for tourist attraction in addition to its native culture. The village also has a 200 year old church that can be cites as a heritage site. There is an historical site call Lalancha along the Barabara River where there was a battle between the Indigenous communities and the Venezuelans. The Moruca River and its numerous waterways are used for swimming, cultural acts, fishing, recreation, sports, and some spiritual practices.	Cultural	Locals Villagers, Region 1, Guyana	Moderate	Moderate	Medium
Commercial, Social/Economic	Provisioning Services	The village in the trading hub for the Moruca Sub District of Region 1. Numerous boats and small vessels arrive in the village to ply their trade two times weekly. Over 100 people leave/arrive in the area daily.	Commercial, Administrative	Local people **ES Linkages:** Recreation, Administration	Essential	Low	Critical
River Defense / Erosion Protection	Regulating Services	The rivers are covered by extensive vegetation protecting the banks from the impacts of the motor boats and water current.	Coastal wetlands, river ecosystems	Transportation **ES Linkages:** Fishing, transport	High	Low	Critical
Shoreline Protection	Regulating Services	Extensive area of Mangrove forest at Moruca Mouth protecting the river banks and shoreline. The mangroves keep the banks of the river intact and the shoreline is constantly eroding and rebuilding.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination	High	Moderate	High
Aquatic Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture and socioeconomic	Essential	Moderate	Critical
0106 Assakata – Population Estimate 473 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	50 of the 57 households participate in fishing activities on at least a monthly basis. The fisherfolk use Biara and Bara Rivers, Luri Creek, and Dog Creek as their main fishing ground to catch many types of fishes for sale in the village and at Santa Rosa. Currently no boats fish in the ocean.	Marine environment; Mangroves; Rivers, Creeks & Lakes	Villagers **ES Linkages:** Commerce, transport	Essential	Moderate	Critical
Agriculture, Cultivated Crops	Provisioning Services	Cassava is the main crop used as the local staple along with fish for a daily meal. Cash crop includes bananas, coconuts, fruits, vegetables, and vine crops.	Bush Islands, Forests	Local farmers, residents	Essential	Moderate	Critical
Freshwater - Household Use	Provisioning Services	The community depends on freshwater from the rivers and creeks. Villagers harvest rainwater for domestic purposes and others use the groundwater from hand dug water wells. Freshwater in the creeks and rivers is used for bathing, washing, cooking, and drinking.	Coastal wetlands, river ecosystems	Local Communities **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Traditional Resource Use	Provisioning Services	About 30 villagers cut approximately 2500 cabbage sticks per trip making at least a trip per month. Noni and other plants are used by the locals for medicinal purposes. Some people cook the cabbage palm and also use the forests to gather materials for household items. Lumber is cut for household and community projects.	Biodiversity, Cultural Heritage	Local people **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	High	High
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught seasonally along the rivers, shore, and beach by almost everyone in the village, as well as regularly by a few people for sale. Every family makes about 2 trips per season. A few people catch crabs on the fishing trips for food and sale.	Marine environment; Mangroves;	Local people	Moderate	Moderate	Medium
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	The villagers fish throughout the year in the rivers, creeks, and lakes. In the dry season fishing is concentrated in the creeks and rivers with fishing trips to Baramanni Lake, and Luri Creek for commercial purposes. Some fish is sold fresh in the village. Some is dried and sold at Mabaruma, Santa Rosa, and Charity. Morocut is caught in the freshwater rivers for sale.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Biodiversity	Supporting Services	Numerous species of birds, fishes, mammals including river otters, tapir, deer, acouri, and labba are found in the rivers and environment. Many ducks are seen but not caught. The rich biodiversity is known to be along Luri Creek.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Wildlife Trapping & Hunting	Provisioning Services	Iguanas, tapirs, labba, deer powis, wild ducks are caught on the seashore on fishing and hunting trips, or along Luri Creek and Baramani Lake. Nobody from the village is a wildlife trader. Conservation efforts have paid off, with a reduction in wildlife trapping and trade within the community.	Mangroves, shoreline	Local people **ES Linkages:** Tourism, Commerce	High	Moderate	High
River Defense	Regulating Services	The rivers are covered by extensive vegetation protecting the banks from the impacts of the motor boats and water current. A lot of the vegetation has been burnt by the fisherfolk.	Coastal wetlands, river ecosystems	Transportation **ES Linkages:** Fishing, transport	High	Low	Critical
Tourism and Recreation	Cultural Services	The village has a freshwater lake that can be used as a tourist attraction along with some shell mounds in the village. The community will develop an ecotourism plan and seek funding from the government for the initiative.	Cultural	Locals Villagers, Region 1, Guyana	High	Moderate	High
Commercial, Social/Economic	Provisioning Services	The village has numerous small businesses with people actively involved in the cash economy. The village had its school and other government facilities that employ over ten people who contribute to the cash economy along with the pensioners.	Commercial, Administrative	Local people **ES Linkages:** Recreation, Administration	Essential	Low	Critical
Aquatic Transportation	Provisioning Services	Access to the community is mainly via boats through the freshwater river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture and socioeconomic	Essential	Low	Critical
0107 Warapoka – Population estimate 650 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	There are 20 people who fish in the sea at least two times per month. Catch includes queriman, bangamary, butterfish, curass, gillbacker, cufum, basha, and others. Shrimp is caught in the rivers around the village.	Marine environment; Mangroves; river ecosystem	Local people **ES Linkages:** Economic shrimping & Crabbing	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Agriculture, Cultivated Crops	Provisioning Services	All households have farms located in the forests or on the bush islands. Small gardens are found at the homes of the villagers. Cassava is the main crop grown along with vegetables, fruits, and vine crops. Some of the food is sold locally to the school and the tourist center.	Forests, Bush Islands	Local farmers, residents **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
Shoreline Protection	Regulating Services	Extensive area of mangrove forest at Iron Punt, Luri Beach, and Waini Point protecting the coast from the ravages of the sea. These area are used by the fisherfolk in different seasons.	Mangrove Forests	Local communities **ES Linkages:** Fishing, hunting, Erosion regulation, Pollination	High	Moderate	Medium
Cultural Resources	Cultural Services	The village has cultural sites used as tourist attraction along with key biodiversity sites. The tourism product of the village is developing and will grow with the success of the country.	Cultural	Locals Villagers, Region 1, Guyana	High	Moderate	Medium
Social/Economic/Commercial	Provisioning Services	The village has numerous small businesses including a growing tourism center with people actively involved in the cash economy. The village had its school and other government facilities that employ over fifteen people who contribute to the cash economy along with the pensioners.	Commercial, Administrative	Local people **ES Linkages:** Recreation, Administration	Essential	Low	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught seasonally to Waini Point and Moruca Mouth by almost everyone in the village, as well as regularly by a few people for sale.	Marine environment; Mangroves;	Local people	Moderate	Moderate	Medium
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	The villagers fish throughout the year in the rivers, creeks, and lakes. Fishing trips to Baramanni Lake, and Luri Creek for commercial purposes with fish sold fresh in the village and at Mabaruma and Santa Rosa.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Low	Critical
Biodiversity	Supporting Services	Numerous species of birds, fishes, mammals including harpy eagles, river otters, tapir, deer, acouri, and labba are found in the rivers and environment. Many birds are seen but not hunted. The entire environment has rich biodiversity with numerous species. Four river turtles are found within the area (red neck, side neck, jumbie head, and black turtle). Manatees are also observed in Luri and Muribu Creeks. The village has two harpy eagles nesting sites, with once currently active.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Wildlife Trapping & Hunting	Provisioning Services	Iguanas, tapirs, labba, deer, powis, wild ducks are caught on the seashore on fishing and hunting trips. Duck eggs are collected for use. Within the village birds eggs are collected seasonally (blue tiger bird and qak). Many people are involved in trapping of wildlife for sale. People will come to the village to purchase wildlife including snakes, parrots, macaws, turtles, etc. Prices fluctuates are generally around $1,000 for parrot, $10,000 for macaw and $2,500 for a Boa.	Mangroves, shoreline, Savannas, Forest	Local people **ES Linkages:** Tourism, Commerce	High	Moderate	High
Tourism and Recreation - Ecotourism	Provisioning	The village has an ecotourism house that has six rooms and space for hammocks. Tourists can visit historic sites, experience the Amerindian culture, and see the Harpy eagle amongst many species of birds. The community hopes to develop sport fishing as an ecotourism option in the many fishing sites close to the village at Luri Creek. About 20 persons are now employed in the tourism activities, increasing from 10 in 2018.	Forests, River, Savannas	Local communities **ES Linkages:** Commerce, Agriculture, Guides	High	Moderate	High

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Traditional Resource Use	Provisioning Services	Approximately 20 households or 80 men cut cabbage sticks at least once in combination with fishing and other resource use exercises per month. Noni and many plants are used by the locals for medicinal purposes and are gathered from the beach. Morocut is caught in the freshwater rivers for sale. People gather honey from wild bees at the beach and honey is sold at $1,000 per liter. Beekeeping is done by one individual within the community.	Biodiversity, Cultural Heritage	Local people **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	High	High
Aquatic Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture and socioeconomic	Essential	Low	Critical
0108 Three Brothers – Population estimate 120 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	More than 100 men from the three villages that make up the Three Brothers community catch fish in the sea making two trips per month to catch snook, basha, banga, gillbacker, curass, queriman etc. at Waini Point to Iron Punt. Some people use the Luri Creek to reach Iron Punt. The main fishing season for the sea is May-August.	Marine habitat and Mangrove Forests	Commercial fishing along the coast	Essential	Moderate	Critical
Biodiversity	Supporting Services	Numerous species of birds, fishes, mammals including crabs are found in the rivers and mangrove forests. There are plenty of ducks in the wetlands bordering with SBPA. River dolphins were prevalent in the past but have not been sighted recently. This may be as a result of speed boats operating within the area and fuel spills in waterways. Both the neo-tropical and giant river otters are found within the area. There is a high presence of jaguars which take the dogs and livestock. Some sea turtles would also be observed up river. There are harpy eagle nesting sites within the area.	Coastal wetlands, Forested areas, Mangroves	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Food: Wild Meat	Provisioning Services	There are no wildlife traders in the village and no person from the village is involved in trapping but people from other villages will conduct this from time to time. Wild ducks and other birds are hunted for food. Iguanas and land turtles are utilized or sometimes sold. The dogs and chickens in the area are hunted by jaguars.	Coastal wetlands, Forested areas, Mangroves	Local people	Low	High	Low
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught in the season in the village by all households. There are crabs in the village that can be caught on a daily basis as some people do on occasions. People from outside the area are seen catching crabs at Waini Point on a weekly basis for the market.	Marine environment; Mangroves;	Three Brothers, Imbotero, Smiths Creek, Mabaruma villagers	Moderate	Moderate	Medium
Agriculture, Cultivated Crops	Provisioning Services	All families have farms that are impoldered. Cassava, plantains, and ground provisions are the main crops. Vegetables and fruits are also grown for home use and for sale in the village. The crabs can be a pest destroying the dams. There are a few commercial farms in the area but farming is generally on the decline, despite successes with ginger and other root crops.	Cultivated lands	Local communities (general population) **ES Linkages:** Transportation, Commerce	Essential	High	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	Fish is the main source of protein for the villagers who fish throughout the year in areas. Fishing trips are made to Luri Creek and Baraminni Lake for commercial purposes. Sea turtles enter the river in the dry season with the salt water as the fishes more inland.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Traditional Resource Use	Provisioning Services	Approximately 90% of the village cuts cabbage palm for sale to the company. Many people do not make traditional furniture or craft any longer. Mangrove is used for building and in the farms. Few people cook with firewood. Medicinal plants are collected from the beach.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Freshwater - Household Use	Provisioning Services	The entire community depends on freshwater from the rivers and creeks for bathing, washing, cooking, and drinking. There are no groundwater wells in the area and people depend on rain as a safe source of drinking water. The waterways are also used for transportation of people and food.	Coastal wetlands, river ecosystems	Local Communities **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
Traditional Resource Use	Cultural Services	The village has a Crabwood Forest that is an important cultural resource and can be used for tourist attraction in addition to its native Warrau culture. This is being used to produce crabwood oil.	Cultural	Locals	Low	Moderate	Low
Mangroves River Defense – Erosion Protection	Regulating Services	The rivers are covered by extensive mangroves protecting the banks from the impacts of the motor boats and water current. The mangroves are quick to reclaim any lands not maintained by the community.	Coastal wetlands, river ecosystems	Transportation **ES Linkages:** Fishing, transport	Essential	Low	Critical
Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture, and socioeconomic	Essential	Low	Critical
0109 Mabaruma Town Council – Population estimate 8,000 people							
Socio/Economic: Transportation - Wharf facilities	Provisioning	The Kumaka waterfront is used for transportation, commerce, and administrative services by over 200 people daily. There were over 20 large vessels in the area docked. Main transportation hub for the Region	River	Local communities **ES Linkages:** Tourism, commerce	Essential	High	High
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	There are over 20 fishing boats visiting the Kumaka market to sell their catch on a daily basis. Catch includes queriman bangamary, butterfish, curass, gillbacker, cufum, basha, and others. There are more than 100 fisherfolk within the Town living in the outlying district making at least weekly fishing trips lasting 3-5 days at sea. The smaller boats can do daily fishing trips to Waini Point. Shrimp is caught in a limited manner in the shrimp season (April – August) by less than 10 people. Fishing has increased due to the additional migrant fisherfolk now residents in the area.	Marine environment; Mangroves; river ecosystem	Local people **ES Linkages:** Economic shrimping & Crabbing	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crab catching is done daily for sale at Kumaka and to hucksters working on the ferry to Georgetown. Blue crabs are found year round but red crabs are seasonal. Crab meat project initiated in some areas. Migrants also hunt for crabs for their sustenance.	Marine environment; Mangroves;	Local people, traders	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Agriculture, Cultivated Crops	Provisioning Services	Cassava and ground provision are the main crops used as the local staple along with fish for a daily meal. Cash crop includes bananas, coconuts, fruits, vegetables, and vine crops. About 60% of the people have farms particularly those living out of the urban center.	Bush Islands, Forests	Local farmers, residents	Essential	Moderate	Critical
Freshwater - Household Use	Provisioning Services	The outlying community depends on freshwater from the rivers, creeks, and natural springs. Some people harvest rainwater for domestic purposes and others use the groundwater from water wells provided by the government. Freshwater in the creeks and rivers is used for bathing, washing, cooking, and drinking.	Coastal wetlands, river ecosystems	Local Communities **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
Traditional Resource Use	Provisioning Services	Villagers in Smiths Creek, Wicabri, and Aruka Mouth cut cabbage sticks for sale. Traditional medicine is used by the locals in a limited manner. Morocut is caught in the freshwater rivers for sale at Mabaruma at $ 300 per lb. Medicinal plants are harvested from the beach area. Mangroves are utilized be people living in swampy areas as post for construction and for building foundation. Mangrove barks are also harvested to be used in tanning.	Biodiversity, Cultural Heritage	Local people **ES Linkages:** Fishing, Tourism, Commerce	Essential	High	High
Biodiversity	Supporting Services	The town covers six villages and has a high diversity of flora and fauna. The rubber trees that line the main road are imported from Asia. Numerous species of birds, fishes, mammals are found in the rivers and inland environment. Many birds are in the area but not caught for food or trade. Many Iguanas are in the town and caught and sold. Parrots and macaws can be seen in the evening sky with a bird roosting area close to the town. Numerous monkeys are living in the town and are considered a pest by the farmers.	Coastal wetlands, Forested areas, Rivers	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Wildlife Trapping & Hunting	Provisioning Services	Trapping and hunting are conducted mainly in the riverine areas. Iguanas, labba, agouti, and wild ducks are the main animals hunted. Many bird species are trapped including toucan, macaws, parrots, etc. Anteaters, small rodents, etc. are trapped. It is estimated that there are 100 trappers within the area and 3 traders based at Kumaka.	Mangroves, shoreline, Savannas, Forest	Local people **ES Linkages:** Tourism, Commerce	High	Moderate	High
Agriculture, Livestock Farming	Provisioning Services	Grazing occurs throughout the Town with many heads of cattle seen roaming the roadways and in pastures. Pigs are also kept in pens by farmers who do not allow them to roam. Sheep and goats are more rare but present in small numbers in the town. The animals have no interaction with the coastland.	Mangroves, Sea Dam, Pastures	Local communities, private cattle farmers	Moderate	High	Low
Shoreline Protection, River defense	Regulating Services	Extensive area of Mangrove forest covering the banks of the main rivers and the coastline offering valuable protection and stability. Honey bees are found within the mangroves but seldom interfered with by the locals.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Erosion regulation, Beekeeping	Moderate	Moderate	Medium
Socioeconomic, Sawmill. Lumberyard, and Boat Building/Repairs	Provisioning Services	Sawmill and lumberyard located in Mabaruma. Boat building at Mabaruma, with repairs done to vessels and engines, is also done within the sawmill and lumberyard area.	Coastal	Local fisherfolk, boat owners	Essential	High	High

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Tourism and Recreation - Ecotourism	Provisioning	The town has a few hotels to house tourists who can visit historic sites, experience the Amerindian culture, and see the town. Sport fishing is optional in the many fishing sites close to the Town. Green Park was built for recreation and relaxing that can be utilized by tourists as well. Locals visit Waini Point and Shell Beach on Easter and on special occasions. There is a Shell Mound within the Town. Daily flights have increased to the town and so has tourism activities.	Forests, River, Savannas	Local communities **ES Linkages:** Commerce, Agriculture, Guides	Essential	High	High
0110 Aruka Mouth – Population estimate 300 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	Approximately 80% of the households or about 60 men catch fish in the sea at Waini Point making weekly trips per month to catch snook, basha, bangamary, gillbacker, curass, queriman etc. at Waini Point. Some people catch shrimp in the shrimp season that is April – August.	Marine habitat and Mangrove Forests	Commercial fishing along the coast	Essential	Moderate	Critical
Biodiversity	Supporting Services	Numerous species of birds and fishes along with monkeys can be seen in the area. There are no wildlife traders in the village but any animal caught can be sold to the traders at Mabaruma. There were river dolphins and otters in the area that have migrated because of the pollution in the water (primarily from oil and gasoline from boats). Significant roosting areas for birds along river.	Coastal wetlands, Forested areas, Mangroves	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught in the season in the village by all households. There are 15 persons that catch crabs for the markets on Tuesdays and Saturdays. Crabs are caught at Waini Point and in the riverine areas. Crabs are purchased by traders and taken to Georgetown	Marine environment; Mangroves;	Three Brothers, Imbotero, Smiths Creek, Mabaruma villagers	Essential	Moderate	Critical
Agriculture, Cultivated Crops	Provisioning Services	A total of 20 families have farms that are impoldered and provide food for the household. Cassava, plantains, and ground provisions are the main crops. The water seems to be getting higher and flowing over the dams. The crabs can be a pest destroying the dams and serves to discourage villagers from farming. The farm produce is sold at Kumaka on Tuesdays and Saturdays.	Cultivated lands	Local communities (general population) **ES Linkages:** Transportation, Commerce	Essential	High	High
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	All villagers can be found fishing in the rivers and creeks for different fishes on almost a daily basis. Freshwater fishes are found nearby in the rainy season when the waters are fresh. The Morocut will be found in the fresh river water during the rainy season at this location.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Traditional Resource Use	Provisioning Services	2-5 households in the village cuts cabbage palm for sale to the company. The crab catchers utilize forest products for the crab quakes. Mangrove is used for building and in the farms and also for firewood.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Freshwater - Household Use	Provisioning Services	The village has a problem with access to safe drinking water. The entire community depends on freshwater from the rivers and creeks for bathing, washing, cooking, and drinking. There are no groundwater wells in the area and people depend on a spring that is located some distance from the river. The waterways are also used for transportation of people and food.	Coastal wetlands, river ecosystems	Local Communities **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Mangroves, River Defense, and Erosion Protection	Regulating Services	The river banks are protected by extensive mangroves. The mangroves protect the river from the impacts of the motor boats and water current. The mangroves are quick to reclaim any lands not maintained by the community.	Coastal wetlands, river ecosystems	Transportation **ES Linkages:** Fishing, transport	Essential	Moderate	Critical
Food: Wild Meat	Provisioning Services	There are about ten persons from the community that hunt meat for sale at the Kumaka market. Wild birds are also caught in the season when they are plentiful.	Mangroves, shoreline, savannas, forest	Local people **ES Linkages:** Tourism, Commerce	High	High	Medium
Aquatic Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture, and socioeconomic	Essential	Low	Critical
0111 Morawhanna – Population estimate 100 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	Approximately 30-40 men from Morawhanna catch fish in the sea making three trips per month to catch snapper, snook, basha, banga, gillbacker, curass, quereman, etc. at Waini Point to Iron Punt. Most of the fresh catch is sold to vessels from Venezuela.	Marine habitat and Mangrove Forests	Commercial fishing along the coast	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught in the season in the village by all households. There are 13-15 people who catch crabs for the markets on Tuesdays and Saturdays. Crabs are caught at Waini Point and in the riverine areas including Morawhanna.	Marine environment; Mangroves;	Three Brothers, Imbotero, Smiths Creek, Mabaruma villagers	Moderate	Moderate	Medium
Biodiversity	Supporting Services	The area has a roosting spot with scarlet ibises and egrets roosting for the night. Numerous species of other birds, fishes, mammals, and crabs are found in the rivers and mangrove forests. Hunting is not practiced by the villagers buys whistle birds from Venezuela.	Coastal wetlands, Forested areas, Mangroves	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Agriculture, Cultivated Crops	Provisioning Services	No farming currently done since all farmlands are flooded as the dams have been destroyed and people are discouraged to invest to empolder their lands. The crabs can be a pest destroying the dams in addition to the high tides affecting the area in the past three years.	Cultivated lands	Local communities (general population) **ES Linkages:** Transportation, Commerce	Essential	High	Critical
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	Freshwater fishes are caught in the river in the rainy season when the water is fresh. Fishes are also found in the wetlands and creeks that are more available in the dry season.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Traditional Resource Use	Provisioning Services	No one from the village cuts cabbage palm for sale to the company. The village is of mainly mixed ethnic origin and people rarely make traditional furniture or craft. Mangrove is used for construction of houses and few people cook with firewood. Some people use noni and fegosa for medical purposes.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	High	Medium
Social/Economic - Commercial	Provisioning Services	The village has a few fuel suppliers selling to villagers and other people in the region. Many people have shops and carry numerous products for sale on the riverfront. About 40 boats from Venezuela are selling fuel in the area. The ice plant is now operational supplying ice to the fisherfolk. Food and other supplies are provided to the crew of the numerous ships on a daily basis.	Commercial, Administrative	Local people **ES Linkages:** Hunting, fishing, tourism	High	High	Medium

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Freshwater - Household Use	Provisioning Services	The entire community depends on freshwater from the rivers and creeks for bathing, washing, cooking, and drinking. There are no groundwater wells in the area and people depend on rain as a safe source of drinking water. Bottled drinking water is purchased from Mabaruma. A new well in the village had reduced the dependence on river water.	Coastal wetlands, river ecosystems	Local Communities **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture, and socioeconomic	Essential	Low	Critical
0112 Smiths Creek – Population estimate 248 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	All males are fisherfolk with more than 100 men fishing in the Waini River and at Waini Point. The village has three large boats that make 2 trips per month each lasting 8-10 days at sea. Catch includes curass, snapper, gillbacker, highwater, cufum, and bangamary mainly at Waini Point to Iron Punt. The village also has 15-20 small boats that can make daily trips to Waini Point.	Marine environment; Mangroves; river ecosystem	Local people	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Everyone catches crabs for the markets on Tuesdays and Saturdays with a minimum 100 quakes supplied per market day valued at $1000 each. Crabs are also sold to hucksters on the ferry to Georgetown. Both blue and red crabs are sold (7-8 blue per quake and 10 red per quake). A crab processing facility is being established within the community with the support of the government.	Marine environment; Mangroves;	Waramuri villagers	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	The villagers fish in the Barima River and Smiths Creek throughout the year. In the rainy season freshwater fished including the morocut is caught in the area.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Biodiversity	Supporting Services	There are many species of birds, fishes, and mammals including jaguars, tapir, deer, and labba are found in the rivers and forests. Many ducks and egrets are seen in the area but not hunted. One hunter traps birds at Macaw Point for sale to the traders (GYD$500 per pound).	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Agriculture, Cultivated Crops	Provisioning Services	Three people have farms in the area that is constantly flooded. Cassava and ground provisions are the staple crop for the households. Fresh vegetables and fruits are grown for home use and for sale in the village, to the school and at Mabaruma.	Cultivated lands	Local communities (general population)	Essential	High	High
Traditional Resource Use	Provisioning Services	Everyone is involved in the harvesting of manicole at different times with an average of 40 persons cutting per month. A family or crew can harvest 2500 sticks of manicole palms per trip, making a trip per month. Other traditional resources are harvested in a limited manner except materials related to crabbing. Most people cook with cooking gas using firewood in a limited manner. Noni, guava and mangroves is used for many medicinal remedies by villagers. Mangroves are utilized by people for construction and for building foundation and for firewood, fishing poles and medicinal uses.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	Moderate	Moderate	Medium

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Social/Economic	Provisioning Services	The village has a few fuel suppliers selling to villagers and other people in the region. Many people have shops and carry numerous products for sale on the riverfront.	Commercial, Administrative	Local people **ES Linkages:** Hunting, fishing, tourism	High	High	Medium
Freshwater - Household Use	Provisioning Services	The community depends on freshwater from the rivers and creeks. The river network is critical for fishing and transportation. Freshwater in the creeks and rivers is also used for bathing, washing, cooking, and drinking.	Coastal wetlands, river ecosystems	Local Communities ES Linkages: Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
River Defense, Erosion Protection	Regulating Services	The rivers are covered by mangroves protecting the banks from the impacts of the motor boats and water current. The mangroves also act as roosting habitats for many birds. There are a lot of mangrove being cut to construct new houses for the migrants and being cleared for their dwelling places along the Barima River.	Coastal wetlands, river ecosystems	Transportation **ES Linkages:** Fishing, transport	High	Low	Critical
Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture, and socioeconomic	Essential	Low	Critical
Wildlife Trapping and Hunting	Provisioning Services	A few men hunt meat for food and trap animals for sale. Land turtles are hunted for meat and for sale to the trader at Kumaka.	Mangroves, shoreline, savannas, forest	Local people **ES Linkages:** Tourism, Commerce	High	High	Medium
0113 Imbotero – Population estimate 353 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	There are more than 100 men who fish. All men in the village are fisherfolk and some women also fish. Catch includes queriman bangamary, butterfish, curass, gillbacker, cufum, basha, and others. Each household has a boat that they can use with either with outboard engine or by paddling to the fishing ground.	Marine environment; Mangroves; river ecosystem	Local people **ES Linkages:** Economic shrimping, Crabbing, commerce	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught in the crab season in the village by all households. There are also crabs in the village area caught on a daily basis. People from outside the area are seen catching crabs at Waini Point on a weekly basis for the market. The women of the village are reputed to be the better crab catchers catching 5–12 quakes per catching day.	Marine environment; Mangroves;	Three Brothers, Imbotero, Smiths Creek, Mabaruma villagers	Moderate	Moderate	Medium
Agriculture, Cultivated Crops	Provisioning Services	20 households have farms located in the savannas or forests that sometimes floods in the rainy season. Cassava is the main crop grown along with vegetables and fruits. Some of the food is sold locally to the school and in the village.	Forests, Bush Islands	Local farmers, residents **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical
Shoreline Protection	Regulating Services	Mangroves cover Waini Point and shell beach protecting the coast from the ravages of the sea. These areas are used by the fisherfolk in different seasons with some fishing camps onshore.	Mangrove Forests	Local communities **ES Linkages:** Fishing, hunting, Erosion regulation	High	Moderate	Medium

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Commercial, Social/Economic	Provisioning Services	The village has a school and that employs four teachers who contribute to the cash economy along with the pensioners. The trade in petroleum and some products from Venezuela boosts the local economy. The community now has a significant migrant population from Venezuela that has settled along the Barima River banks (Warraus settlement). The migrants have been given temporary status to live and utilize the village resources. As such, these have been an increased use of the same resources utilized by the community.	Human settlement, governance	Local people **ES Linkages:** Recreation, Administration	Essential	Low	Critical
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	The villagers fish throughout the year in the rivers, creeks, and lakes mainly for saltwater fishes. Fishing trips to Baramanni Lake and Luri Creek are made a few times per year. Freshwater fishes are caught more frequently from Lion Creek.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Biodiversity	Supporting Services	There are numerous species of birds, fishes, and mammals including tapir, deer, acouri, and labba found in the rivers and forest. Many birds are seen but not hunted. The entire environment has rich biodiversity with numerous species. Many jaguars and black caimans are prowling the area with jaguars eating 30 hunting dogs from the village. The Warraus from Venezuela have cleared patches of mangrove and built houses along the river.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Moderate	High
Wildlife Trapping & Hunting	Provisioning Services	Iguanas and birds are plentiful but the ducks are difficult to catch. The iguanas are caught and eaten regularly. Some birds including parrots, macaws, black headed parrots, rainbow parrots are caught at Macaw Point and these can be sold to the wildlife trader visiting the area or at Kumaka.	Mangroves, shoreline, Savannas, Forest	Local people **ES Linkages:** Tourism, Commerce	High	High	Medium
Tourism & Recreation	Provisioning Services	The village has no plans for ecotourism. They are confident that people visiting the area will wish to see the border with Venezuela and visit shell beach. This can be part of a package offered to tourists.	Forests, River, Savannas	Local communities ES Linkages: Commerce, Agriculture, Guides	Essential	High	High
Traditional Resource Use	Provisioning Services	Resources including noni, sweet broom, pear leaf, Indian tobacco, and others are used for medical purposes. The fisherfolk cut manicole palm in the dry season while on their fishing trips. Mangroves are utilized by people for construction and for building foundation and for firewood, fishing poles and medicinal uses.	Biodiversity, Cultural Heritage	Local people **ES Linkages:** Fishing, Tourism, commerce	Moderate	High	Medium
Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture, and socioeconomic	Essential	Low	Critical
0114 Almond Beach – Population estimate 51 people							
Agriculture, Cultivated Crops	Provisioning Services	All households have farms located on the beach and at risk of erosion. Cassava is the main food crop grown along with vegetables and fruits. Coconut is the main crop on the beach. Copra and both dried and water coconuts are sold at Kumaka. Erosion is still taking away mature and young trees as it washes the shell away every high tide. In general, farming has reduced due to a prolonged dry spell.	Forests, Bush Islands	Local farmers, residents **ES Linkages:** Fishing, Tourism, Transportation, Commerce	Essential	Moderate	Critical

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Shoreline Protection	Regulating Services	Mangroves cover most of the beach with a wide buffer of shells. The shells are the first wall of protection for most of the beach protecting the coast from the ravages of the sea. These areas are used by the fisherfolk in different seasons with some fishing camps onshore.	Mangrove Forests	Local communities **ES Linkages:** Fishing, hunting, Erosion regulation	High	Moderate	High
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning Services	There are three families who fish making two trips per month using from Waini Mouth to Tiger Beach in the sea. Catch includes queriman bangamary, butterfish, curass, gillbacker, cufum, basha, and others. Each household has a boat that they can use reach the fishing ground. Nobody catches shrimp and considers the shrimp seine to be inappropriate for the area. Fishing in the Atlantic Ocean depends on the catch, price, and cost of fuel. High gasoline prices have reduced fishing activities.	Marine environment; Mangroves; river ecosystem	Local people **ES Linkages:** Economic shrimping, Crabbing, commerce	Essential	Moderate	Critical
Food: aquaculture and wild-caught fish & shellfish: Crabs	Provisioning Services	Crabs are caught all year around by people from other areas. The villagers will catch some crabs when they are heading to Mabaruma on a market day. Crabs are caught in the crab season in the village by all households in their farms.	Marine environment; Mangroves;	Three Brothers, Imbotero, Smiths Creek, Mabaruma villagers	Moderate	Moderate	Medium
Tourism & Recreation - Ecotourism	Provisioning	The village has plans for ecotourism as they seek to collaborate with the PAC. Tourists were restricted in 2017 following the washing away of the beach with the tourism building. The rebuilding of the accommodations will see the return of tourists in the near future.	Forests, River, Savannas	Local communities **ES Linkages:** Commerce, Agriculture, Guides	Essential	High	High
Traditional Resource Use	Provisioning Services	Villagers use noni, pear leaf, wild mangrove, buttercup, and others for medical purposes. Villagers collect driftwood on the beach as their ancestors did for millennia. Turtle meat or eggs are no longer eaten by the villagers who are now strict turtle conservationists.	Biodiversity, Cultural Heritage	Local people **ES Linkages:** Fishing, Tourism, commerce	Essential	High	High
Food: aquaculture and wild-caught fish & shellfish: Freshwater	Provisioning Services	Freshwater fishes are caught in the wetlands beyond the beach throughout the year. Fishing trips to Baramanni Lake and Luri Creek are made a few times per year as the villagers make trips to Santa Rosa. Saltwater has intruded in much of this area and depleted fish like hassar that were once plentiful.	Inland freshwater ecosystems	Commercial and subsistence fishing along the rivers, creeks and savannas	Essential	Moderate	Critical
Biodiversity	Supporting Services	There are numerous species of birds, fishes, and mammals including agouti, tapir, deer, acouri, and labba found in the areas close to the beach. Many birds are seen but not hunted. Numerous iguanas are found on the beach and some are eaten by the villagers. Many jaguars are prowling the area with one killing a leatherback turtle two weeks prior to the visit to the beach. Several species of sea turtle nest on the beach. Harpy Eagle and armadillos are sometimes sighted.	Coastal wetlands, Forested areas, Bush Islands	Local people **ES Linkages:** Hunting, fishing, tourism	High	Low	Critical
Food: Wild Meat	Provisioning Services	Iguanas and some mammals are hunted and eaten regularly, along with crabs. Ducks, on the other hand, are difficult to catch, so only the duck eggs are typically consumed. There is no one catching birds or any animals for trade in the village.	Mangroves, shoreline, Savannas, Forest	Local people **ES Linkages:** Tourism, Commerce	High	Moderate	High

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Transportation	Provisioning Services	Access to the community is mainly via boats through the river network.	Rivers	Local People **ES Linkages:** Settlements, agriculture, and socioeconomic	Essential	Low	Critical
Social/Economic Settlements	Provisioning Services	An entire community resides along the beach. The PAC is also based within this community.	Coastland	Almond's Beach, PAC	High	Moderate	High

Identified Ecosystem Services and Priority Ratings: Region 2 Coastal

-Page Intentionally Left Blank-

TABLE C-1: IDENTIFIED ECOSYSTEM SERVICES AND PRIORITY RATINGS: REGION 2 COASTAL

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
NDC 1 - Charity/ Urasara – Population estimate 7,800 people							
Marine aquaculture and wild-caught fish & shellfish, including crab (food)	Provisioning	• Crabbing is practiced by hundreds of persons in the NDC over the July, August, and September crabbing season. Approximately ten families in the NDC are engaged in crabbing as an everyday activity for their livelihoods. Some of these persons travel to the Pomeroon Mouth for crabbing. • Crabbing in the Pomeroon River at Providence.	Marine habitat and Mangrove Forests	a) Commercial and subsistence crabbing at mouth of river and along the coast b) Subsistence crabbing in Pomeroon River	a) Essential b) Moderate	a) Moderate b) Low	**a) Critical** **b) High**
	Provisioning	• 5-6 commercial fisherfolk in area and their supply chain (buyers, sellers etc.) of the Pomeroon River. • All fisherfolk come to mouth of river. A few times per week. Catfish catch is approximately 100 pounds over 3 days catch valued at USD 500. • Fishing site for pin seine and pole seine in Essequibo Coast, Pomeroon River, and Moruca. • Waste and pollution of river and coastal areas has been the biggest challenge for fisherfolk over the years.	Marine habitat and Mangrove Forests	a) Commercial fishing along the coast and in mangroves b) Commercial fisherfolk fishing in the mouth of the Pomeroon River c) Commercial and subsistence fishing	a) Essential b) Essential c) High	a) High b) Low c) High	**a) High** **b) Critical** **c) Medium**
	Provisioning	• The Big Bird Fish Complex at Charity is a major processing facility that processes large amounts of catch for export.	Marine habitat and Mangrove Forests	Commercial landing site and fish processing facility	Essential	Low	**Critical**
	Provisioning	• Most families in the area depend on fishing for sustenance.	Marine habitat and Mangrove Forests	a) Subsistence fishing along the coast and in mangroves b) Subsistence fishing along the river banks	a) High b) Moderate	a) High b) Moderate	**a) Medium** **b) Medium**
Cultivated Crops	Provisioning	• Crop cultivation is present in many communities along the coast, and ranges in scale from subsistence farming of staple grains, to export-oriented growing of coconuts and watermelons. • Staple grains, including rice, are also farmed for both commercial and subsistence use. • There are close to 50 families who farm along the Pomeroon River.	Cultivated lands	Local communities (general population)	Essential	High	**High**
Livestock Farming	Provisioning	• Grazing on the sea dam and the sea defenses throughout the NDC.	Pasturelands	Local communities	Moderate	Moderate	**Medium**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Food: wild meat	Provisioning	• Within certain mangrove areas, there are a few men who hunt birds and iguana to sell on the open market near Charity. This activity is on the decline in the NDC.	Mangrove Forests	Local communities (general population) near Charity **ES Linkages:** Fishing	Low	Moderate	**Low**
Tourism and Recreation	Cultural	• Biodiversity: Important Bird Area for Scarlet Ibis	Mangrove Forests	Local communities (general population) of Region 2 and visitors to the Pomeroon River **ES Linkages:** Mangroves, fishing, tourism	Moderate	Moderate	**Medium**
Habitat provision, coastal protection	Supporting	• Extensive mangrove forests have provided habitats for birds, crabs, and other wildlife. The mangroves also protected the shoreline of the NDC. • However, there has been significant erosion of the sea dam, mudflats and mangroves along the shoreline of the NDC with the result that habitats for wildlife, birds, and crabs are reduced. This is especially prevalent at along the coast of the NDC and in the Pomeroon River.	Marine habitat and Mangrove Forests	Local communities **ES Linkages:** Fishing, crabbing mangroves	Essential	Low	**Critical**
NDC 2 - Evergreen/Paradise – Population estimate 7,500 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Crabbing is common during the July to September crab season, and crabbers from other parts of Region 2 utilize the area. • More than ten persons from the NDC catch crabs in the Summerset & Berks mangroves on a weekly basis for sale.	Mangroves	Commercial and subsistence crabbing in mangroves	Low	High	**Low**
	Provisioning	• Approximately 10 boat owners from the local area with an average of 2-3 fisherfolk working each boat every 2-3 days; more than 30 people in the Andrews Koker area rely on fishing for livelihoods. • Two other primary dock areas in Paradise with less than 10 fishing boats per day. • Fishing landing area at Dartmouth and Westbury with three boats. • Fish landing site in Evergreen with five boats. • Fishing landing site in Perth with six boats	Marine environment; beach; Kokers	a) Commercial fishing at Andrews Koker, including crabbers b) Commercial and subsistence fishing in Paradise c) Commercial and subsistence fishing at Dartmouth and Westbury d) Commercial fishing at Evergreen e) Commercial fishing at Perth	a) High b) Moderate c) Moderate d) Moderate e) Moderate	a) Moderate b) Moderate c) Moderate d) High e) High	**a) High** **b) Medium** **c) Medium** **d) Low** **e) Low**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Cultivated Crops	Provisioning	• In Paradise, approximately 10 families utilize land along the coastal wall for crops and subsistence farming. There are very few other places/lands where they could cultivate crops.	Cultivated lands	Local communities (general population)	High	Low	**Critical**
Livestock farming	Provisioning	• Along the sea defense walls, approximately seven households utilize the land for grazing, primarily cows, for livelihoods in St. Andrews and Perth to Dartmouth. • Cows, sheep, and goats are grated in the Evergreen to La Resource area	Pasturelands	a) Local communities (general population) in St. Andrews and Perth to Dartmouth b) Local communities in Evergreen to La Resource	a) Low b) High	a) High b) Moderate	**a) Low** **b) High**
Tourism and recreation	Cultural	• Locals utilize Paradise Beach and Andrews area (approximately 10-15 people a day at each location) for recreation, kite flying, etc. • Approximately 50 users per day are at the seawall along the southern portion of the NDC. • Unity Park is also used for recreation although few people utilize this over the seawalls. • Recreation at the Dartmouth Seawall especially on Sundays when dominoes are played.	Coastal and Marine	a) Local communities in northern portion of coastal NDC; Unity Park users b) Local communities in southern portion of NDC **ES Linkages:** Sea Defense	a) Low b) Moderate	a) Moderate b) Moderate	**a) Low** **b) Medium**
Cultural, spiritual or religious value	Cultural	• The seashore areas at Paradise, Jib, Andrews, and Bounty Hall are used for religious activities. • Residents of Westbury and Perth use the seashore in Dartmouth. • Burial ground at Jib.	Coastal	a) Local Hindu communities along coastal areas from Bounty Hall to Dartmouth b) Local communities for burial at Jib c) Local Hindu communities at Paradise	a) High b) Low c) High	a) High b) Low c) High	**a) Medium** **b) Low** **c) Medium**
Food: wild meat	Provisioning	• Residents of the NDC hunt iguanas in the La Resource area for sustenance or but sometimes for sale. The iguanas are sold in the NDC or at popular restaurants in the region. Shore birds are also caught for both sustenance and sale. Some persons hunt large lizards (salipenters) for meat. • Anacondas are also caught for sale to traders.	Mangroves	Local communities	Low	Moderate	**Low**
NDC 3 - Aberdeen/Zorg-en-Vlygt – Population estimate 6,000 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are approximately 15 boats and 40 families engaged in fishing in the NDC. These boats use landing sites at La Union, Three Friends and Capoey Koker depending on the accessibility of these sites. • An average of 2-3 fisherfolk work on each boat every 2-3 days.	a) Marine environment; beach; Kokers b) Coastal areas	a) Commercial fishing at Capoey Koker, including crabbers b) Fishing landing site in La Union c) Fishing landing site in Three Friends	a) High b) Low c) Low	a) Moderate b) Moderate c) Moderate	**a) High** **b) Low** **c) Low**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
	Provisioning	• Crabs are caught daily throughout the NDC for subsistence and commercial use. They are sold to persons both within and outside the NDC.	Mangroves	Crabbing for subsistence and commercial use	High	High	**Medium**
Livestock farming	Provisioning	• Along the sea defense walls, approximately 15-20 households utilize the land for grazing, primarily goats and cows, for livelihoods; • There is a cattle rearing camp at the seashore at Hoff-Van-Aurich and La Union.	Pasturelands	a) Local communities (general population) from Aberdeen to Affiance b) Local communities in/around Hoff-Van-Aurich and La Union	a) Moderate b) High	a) Moderate b) Moderate	**a) Medium** **b) High**
Shoreline protection / Mangroves / River defense	Regulating	• Mangroves have been growing in the NDC naturally with the buildup of mud and silt over the last 1.5 years. Mangroves are also growing near Bacchus Park. The new growth has resulted in iguanas, crabs, and new species of birds in the area. However, mangroves are also being degraded in some areas.	Ocean, mud flat	a) Coastal Communities (general population) of the NDC b) Coastal communities near Bacchus Park	a) High b) Moderate	a) Moderate b) Low	**a) High** **b) High**
Shoreline protection / Mangroves / River defense	Regulating	• Government has installed bamboo groynes at Columbia, Aberdeen, and Affiance which are helping to protect the shoreline and reduce erosion along the coast of these areas.	Ocean, mud flat	Coastal communities	High	Moderate	**High**
Religious/ Ritual	Cultural	• Hindus conduct religious activities along the coastal areas but typically mudflats prevent significant usage in the area • Cremation site at La Union is the only sanctioned site in the Region	Coastal areas; ocean	a) Local Hindu population b) Hindu population throughout Region 2 use the Cremation Site	a) Low b) Critical	a) High b) Critical	**a) Low** **b) Critical**
Recreation	Cultural	• Bacchus Park and the seawall both provide recreation on a daily basis for over 100 people; more active on weekends and holidays. • Many persons use the sea walls in Queenstown for recreation purposes.	Seawall	a) Local communities utilizing the seawall at Bacchus Park b) Local communities using the seawalls in Queenstown	a) Moderate b) Moderate	a) Low b) Moderate	**a) High** **b) Medium**
Food (wild meat)	Provisioning	• Iguanas are hunted in the fish pond areas by a small group of men who sell the meat on the market • Approximately 60–70 persons hunt iguanas daily for sale at prices ranging from GYD$3,000–5,000. Currently, there is no hunting of wild birds.	Biodiversity Mangroves	a) Local community in Zorg-en-Vlygt b) Local communities through the NDC	a) Low b) High	a) Low b) Moderate	**a) Medium** **b) High**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
NDC 4 - Anna Regina Town Council – Population estimate 19,000 people							
Mangroves & Carbon Sequestration	Regulating	• The mangroves grow naturally on the newly deposited mudflats, regulating man natural factors; they contribute to pollination of crops and add to carbon sequestration; they also cause nuisance such as bird singing at night, mosquitoes and sand flies (for first time in 20 years); • NAREI program in Reliance started a few years ago has been welcome and in some areas (near Lima Port) the importance to stakeholders is expected to grow over time.	Mangroves	a) Local community b) Local communities near new plantings **ES Linkages:** Fishing, Crabbing, biodiversity	a) High b) Low	a) High a) High	**a) Medium** **b) Low**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are several fishing landing sites in the municipality, including Anna Regina (15 boats); Windsor Castle (3 owners); Lima (6 owners); Walton Hall (10–12 boats); Lima (10–12 boats); Hampton Court (20 boats); Sparta (15 boats). • There is subsistence fishing at other locations, but on a small scale.	Marine environment; beach; mooring locations	Commercial fishing at coastal areas	High	Moderate	**High**
Religious/ Ritual	Cultural	• Hindus conduct religious activities along the coastal areas where they can get access	Coastal areas; ocean	Hindu population mainly	Low	High	**Low**
Tourism and recreation	Cultural	• Approximately 10 to 20 users per day are at the seawall for recreation • More than 50 persons visit the Henrietta Hotel on a daily basis for recreation. Softball cricket matches are also played on the beach behind the hotel.	Coastal	Local communities **ES Linkages:** Sea Defense	High	Moderate	**High**
Agriculture Cultivated Crops	Provisioning	• Farmers utilize land along the river defense wall for subsistence farming at Lima, Walton Hall, Anna Regina, and Devonshire Castle. Crops include coconuts, bananas, plantains, and cash crops are planted. • Areas near Lima Port are popular for rice paddies.	Cultivated lands	a) Local communities (general population) b) Local community near Lima Port	a) High b) Low	a) Low b) High	**a) Critical** **b) Low**
Livestock Farming	Provisioning	• Areas near Lima Port are popular for grazing.		Local community near Lima Port	Low	High	**Low**
NDC 5 - Annandale/Riverstown – Population estimate 9,400 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are fishing landing sites at: Golden Fleece (2 boats), Zorg (5 boats), Adventure (2 boats), Riverstown (1 boat), and Abrams Zuil with 20 boats including 2 new anchor seine boats.	Marine environment; beach; mooring locations	a) Commercial fishing at Adventure b) Commercial fishing at Golden Fleece c) Commercial fishing at Zorg d) Commercial fishing at Riverstown e) Commercial fishing and anchor seine fishing at Abraham Zuil	a) Low b) Low c) Moderate d) Low e) Essential	a) High b) High c) High d) High e) Moderate	**a) Low** **b) Low** **c) Low** **d) Low** **e) Critical**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Livestock farming	Provisioning	• Along the sea defense walls at Golden Fleece, some households utilize the land for grazing, cows goats and sheep	Pasturelands	Local communities (general population)	High	Moderate	**Medium**
Cultural, religious, or spiritual value	Cultural	• Hindus conduct religious activities along beach primarily at Golden Fleece where there is also a temple nearby; • Cullen Beach also very popular	Coastal areas; ocean	a) Hindu population throughout the NDC b) Hindu population at Cullen Beach	a) High b) Moderate	a) Moderate b) Moderate	**a) High** **b) Medium**
Tourism and Recreation	Cultural	• More than 50 persons used seawalls for recreation purposes at Perseverance, Golden Fleece, Cullen Beach, and Suddie where there are cricket matches, football matches, and bar-be-ques on weekends.	Coastal areas	General population	High	Moderate	**High**
Aquatic transportation/ports	Provisioning	• Main port is essential for access to other areas, including the islands; the ferry used to dock here but it is now used for businesses and trade. • Big Pier, located in Abrams Zuil, is another commercial port where fuel, goods, cattle, etc., are transported.	Commercial areas at Port	a) Residents, local businessmen and islanders, farmers, fisherfolk, tourists who utilize the main port b) Residents, local businessmen, farmers, fisherfolk who utilize the Big Pier area	a) Essential b) High	a) Moderate b) Low	**a) Critical** **b) Critical**
NDC 6 - Good Hope/Pomona – Population estimate 1,500 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are fishing landing sites at: Pomona with 10–12 boats, Riverside Creek with 10–12 boats, Riverstown with 6 boats, and Vilvoordeen with 15 boats. Fishing boats also occasionally land at the Supenaam port. • Families who live close to the seashore often engage in near shore fishing and have their own small boats to conduct fishing activities. There are two boats at Good Hope which are used for this type of fishing. • Fishing is popular along the coasts at Tiger Island and in the Essequibo River using hooks, seines, and gillnets for catching high water; catfish; shrimp. Riverside fishing is also popular due to wharves.	Marine environment; wharf; mooring locations	a) Commercial fishing at Riverside b) Commercial fishing at Vilvoordeen c) Commercial fishing at Pomona and Riverstown d) Fishing at Tiger Island and Essequibo River	a) Moderate b) High c) Essential d) Moderate	a) Moderate b) Moderate c) Moderate d) Moderate	**a) Medium** **b) High** **c) High** **d) Medium**
		• Crabbing is popular during the July to September crabbing season.	Marine habitats and Mangrove Forests	Crabbing along the coasts of the NDC	Low	High	**Low**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Aquatic transportation/ports	Provisioning	• There are several wharfs in the NDC: three wharfs in Fairfield, one wharf in Good Hope, one wharf in Spring Garden, one wharf in Vilvoordeen and one wharf in Riverstown. These are essential to commercial business and livelihoods; cargo unloading area for fertilizer; gas plant equipment; quarry material; rice; cattle • Supenaam port is a major area for passenger transport and shipment with over 100 boats	Commercial areas on wharf	Residents, local businessmen and islanders, farmers, fisherfolk, tourists at: a) Fairfield b) Vilvoordeen c) Supenaam	a) Essential b) Essential c) Essential	a) Moderate b) Moderate c) Low	**a) Critical** **b) Critical** **c) Critical**
Social/Economic Commercial activity	Provisioning	• Sawmills utilize river defense area to transport logs to the mill	Commercial areas	Residents, local businessmen	Moderate	Moderate	**Medium**
Erosion Regulation	Regulating	• Tiger Island is a critical sea defense from the NDC to erosion and flooding since there is no manmade or natural mangroves protecting the coast	Coastal vegetation	Local businesses at Sawmill and Aurora	Essential	Low	**Critical**
Historical landmark	Cultural	• Dutch Chimney is an important landmark in Supenaam	Tourism	Tourists, Residents	Low	Low	**Medium**
Livestock farming	Provisioning	• There is grazing of animals along the seashore from Riverstown Creek throughout the NDC in vacant areas.	Pasturelands	Local communities (general population)	Moderate	High	**Low**
Cultivated Crops	Provisioning	• Large scale cash crop farming on Tiger Island.	Cultivated lands	Local communities	Essential	Low	**Critical**
Food (wild meat)	Provisioning	• Iguanas are hunted on Tiger Island as well as on the southern coast of the NDC within and outside the NDC area.	Biodiversity	Local community	Low	Low	**Medium**
Tourism and Recreation	Cultural	• Beaches are used for recreation purposes at Vilvoordeen, Aurora, Spring Garden, Good Hope, and Tiger Island.	Beaches	a) Local communities on Essequibo Coast b) Visitors to Tiger Island	a) Moderate b) High	a) Moderate b) Moderate	**a) Medium** **b) High**
Cultural, Religious of Spiritual Value	Cultural	• There are religious activities on the seashore through the NDC. • The Spring Garden temple is located close to the shoreline.	Beaches, shoreline	Local communities who utilize the seashore and temple	Moderate	Moderate	**Medium**

-Page Intentionally Left Blank-

APPENDIX D

Identified Ecosystem Services and Priority Ratings: Region 3 Coastal

-Page Intentionally Left Blank-

TABLE D-1: IDENTIFIED ECOSYSTEM SERVICES AND PRIORITY RATINGS: REGION 3 COASTAL

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
NDC 07 – Wakenaam - Population 3,200 – on the decrease due to migration							
Food - aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Fishing is done on both sides of the Island. Some boats are owned by persons from the Island while others come from the West Coast of Demerara. The fishing area is also shared with residents of Leguan. Approximately 20-30 boats and 40-60 commercial fisherfolk operate on the island fishing a few days per week. Many families on the island depend on fishing for sustenance and livelihoods. • Shrimp is dried on the sea defense by fisherfolk in the shrimp season occurring during the months of April to September. Shrimp mainly caught between Leguan and Wakenaam • Crabs are caught during the July to September period by many residents and by approximately 5 persons all year round in the mangroves abundant on the island.	Marine habitat, river habitat, mangrove forests and sea defense	a) Commercial fishing at mouth of Essequibo River b) Commercial and subsistence fishing along the coast and in mangroves c) Commercial fishing in the Essequibo River d) Crabbing in mangroves e) Drying of shrimp on sea defenses	a) Essential b) High c) High d) Moderate e) Moderate	a) Moderate b) Moderate c) Low d) High e) High	**a) Critical** **b) High** **c) Critical** **d) Low** **e) Low**
Agriculture - Cultivated Crops	Provisioning	• There is some planting on the sea defense reserves mainly by persons who have done their own empoldering and consider the lands their responsibility to maintain and farm. Islanders also farm on the other islands in the Essequibo River including Tiger Island, Hogg Island, Truli Island, and Karia. • The dominant crop on Wakenaam is plantains. • Rice is also farmed for both commercial and subsistence use. • There are more than 100 families who farm along the river dam bordering their land.	Cultivated lands	Local communities (general population)	Essential	Moderate	**Critical**
Livestock Grazing	Provisioning	• Along the river defense, households utilize the land for grazing of cows, goats, and sheep for livelihood. Animals are tied in the farming areas or graze freely in Palmyra, Zeelandia, or New Friendship.	River defense and mangroves	Local communities (general population)	Medium	Medium	**Medium**
Transportation - Ports, Wharf, Ferry Stelling	Provisioning	• Ports, wharfs, and shipyards, inclusive of boat building, on the river dam. Over 22 ships seen in dock at the wharfs. Farmers have their own boats to carry supplies and produce. • Wharf essential for access to the island. • Sawmill utilize river defense area to transport logs to the mill.	Commercial areas on river dam	Residents, local businessmen and islanders, farmers, fisherfolk, tourists	Essential	Medium	**Critical**
Religious/Ritual	Cultural	• Areas with good access to the river used by the Hindu population for daily and seasonal worship. There are many locations for use with a few more established sites, including a temple.	River, river defense	Hindu population	Moderate	Low	**High**
Food: wild meat and Materials	Provisioning	• Within certain mangrove areas, there are a few men who hunt birds and iguanas, “labba” and crabs to sell on the island or over at Parika. • In the July to September period while it is dry, iguanas are out and are caught for fun or meat. • Bamboo growing along the river defense is harvested for a variety of uses such as religious, construction material for sheds, fishing poles and in farming.	Mangroves coconuts and bamboo	Local communities (general population) near Charity	Low	High	**Low**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Freshwater – Household use	Provisioning	• Households use the freshwater for many household purposes including animal husbandry and gardening.	Freshwater	Local communities on the island	High	Moderate	**High**
Freshwater – Crop irrigation and other agricultural uses	Provisioning	• The entire island depends on freshwater from the Essequibo River for its irrigation of rice paddies and other crops during the dry season. • Animals also drink the water that flows in the irrigation channels. • Freshwater intake contributes to inland fishery whereby tilapia and hassar are caught in the wild for sale and subsistence use.	Freshwater	Island farming community	Essential	Moderate	**Critical**
Recreational	Cultural	• Beaches to the north of the island are utilized for recreational purpose by residents and visitors	Beaches and mangroves	a) Beach at Maria's Pleasure b) Beach at Wakenaam Point	a) Medium b) Moderate	a) Medium b) High	**a) Medium** **b) Low**
Mangroves & Carbon Sequestration	Regulating	• The mangroves grow naturally on the island, regulating many natural factors, contributing to pollination of crops and adding to carbon sequestration.	Mangroves	Local community **ES Linkages**: Fishing, Crabbing, Biodiversity	Moderate	High	**Low**
Aquatic transportation/ports	Provisioning	• Commercial wharf at San Sousi for transport of fuels, rice, and other products that are shipped or imported to the island. Ferry also lands at San Sousi. • Speedboat landing site at Maria's Pleasure. Speed boats to Parika and Leguan operate from this location. Six boats operate this route charging 1000 for a trip per passenger.	Sea shore, shoreline	a) Wharf at San Sousi b) Speedboat landing at Maria's Pleasure	a) Essential b) High	a)Low b) Moderate	**a)Critical** **b) High**
NDC 08 – Leguan - Population 2,500 – decreasing due to migration to Region 3 and North America.							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Approximately 25 fishing boats catch fish and shrimp using areas such as Waterloo, Success, Canefield, and other areas where they can dock their boats. • Shrimp mainly caught between Leguan and Wakenaam. • Crab fishing is common during the summer crab season with 2-3 people making a daily catch for sale.	Marine environment; beaches; kokers and mangroves	a) Commercial fishing at Waterloo, Success and Canefield b) Commercial and subsistence fishing in Essequibo River c) Commercial and subsistence crabbing in mangroves	a) High b) High c) Low	a) Moderate b) Moderate c) High	**a) High** **b) High** **c) Low**
Transportation and Commercial Services	Provisioning	• Approximately 20 boats offer transportation services to Parika and other areas. Most islanders have their own boat. The ferry at Enterprise offers three services daily to Parika. • Commercial wharfs and loading sites are used for shipping fuel and produce. • A new wharf was constructed at Belfield which facilitates shipping of construction materials.	River & river defense dam	a) Transportation Services b) Commercial wharfs on the island	a) Essential b) High	a) Moderate b) Low	**a) Critical** **b) Critical**
Religious/ Ritual	Cultural	• Hindus conduct religious activities along the river and on the river defense. Areas with good access to the river are preferred. There are many locations for use, with a few more established sites. • Cremation at Uniform is conducted on one of the beaches on the island.	River & river dam	a) Hindu population using the cremation site at Uniform b) Hindu religious activities along the river and river defense at Blenheim	a) Essential b) Essential	a) Moderate b) Moderate	**a) Critical** **b) Critical**
Cultivated Crops	Provisioning	• Farmers utilize land along the river defense wall for crops and subsistence farming. Coconuts, bananas, plantains, and cash crops are planted.	Cultivated lands	Local communities (general population) cultivating crops at: a) Richmond Hill b) Success	a) Moderate b) Moderate	a) Moderate b) Moderate	**a) Medium** **b) Medium**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Irrigation Water	Provisioning	• The entire island depends on freshwater from the Essequibo River for its irrigation of rice paddies and other crops during the dry season. • Animals also drink the water that flows in the irrigation channels.	Essequibo River	Crops and livestock farmers	Essential	High	**High**
Livestock Grazing	Provisioning	• Households utilize the land Better Hope to La Resource for grazing of cows, goats, and sheep for livelihood • Grazing has been constrained by the river defense works at Maryville, Success, and Thieres.	River defense and Mangroves	Local communities (general population)	Medium	Medium	**Medium**
Tourism and Recreation	Cultural	• Locals utilize Canefield Beach, Success Beach (approximately 10-15 people a day at each location) for recreation, swimming, etc. • Organized tours are done to Leguan to tour its historic sites including St. Peters Church	River, Coastal and Marine	Local communities in northern portion of NDC and tourists: a) Beach at Uniform b) Heritage Site at St. Peter's Church c) Beach at Canefield	a) Moderate b) Essential c) Moderate	a) Moderate b) Low c) Moderate	**a) Medium** **b) Critical** **c) Medium**
Habitat provision, coastal protection	Supporting	• The island has a large area covered by mangroves with rich biodiversity of birds and crabs.	Coastal Mangroves	Local communities	Low	High	**Low**
Food (wild meat)	Provisioning	• Iguanas, capybara, labba, and wild hogs are hunted in the cultivated areas. Wild ducks will visit this area in the planting season to feed on the rice paddies.	Biodiversity	Local residents, Region 3, wild meat tourism	Low	Moderate	**Low**
Cultural Practices	Cultural	• Hunting, harvesting and fishing continue to be practiced in some traditional fashion including the local craft made to hunt or fish.	Cultural Heritage	Local communities **ES Linkages:** Possibility for sport tourism	Low	Moderate	**Low**
Erosion Regulation	Regulating	• The island is at risk to erosion and much of the shore is not protected by manmade concrete defense. The mangroves and other vegetation help to defend the island against erosion.	Coastal vegetation	Local communities **ES Linkages:** Biodiversity, Fishing, hunting, socioeconomic	Essential	Low	**Critical**
NDC 09 - Mora/Parika - Population 10,000, growing due to migration to the NDC							
Transportation and Commercial Services	Provisioning	• Parika stelling has transportation services by ferry to Supenaam, Leguan, Bartica, and Wakenaam. Hundreds of people travel daily. • Over 100 passenger boats leave for various destinations daily to other parts of the country. • Ten private wharves facilitate transportation services daily. • There are seven boat houses in the NDC with two parking lots for vehicles. • Ship terminal serving as a hub for timber, stone, fuel and river transportation at the Parika koker. • This NDC is significantly reliant on marine transport services and related economic activities.	River	a) Parika Stelling users by ferry and boats from Regions 2, 3 and Essequibo Islands b) Local users of private wharfs c) Private docking and landing sites for passenger travel d) Parika Koker **ES Linkages:** Tourism, recreation and socioeconomic	a) Essential b) Essential c) Essential d) Essential	a) Low b) Moderate c) Moderate d) Low	**a) Critical** **b) Critical** **c) Critical** **d) Critical**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Fisheries wharf, where more than 20 boats load, refuel, and discharge catch. • Outfall area, where more than 10 boats operate • Big Kiss wharf, where more than 10 deep water vessels operate	River	Fisherfolk using landing sites at: a) Parika Stelling b) Parika Outfall c) Big Kiss Wharf	a) Essential b) Essential c) High	a) Moderate b) Moderate c) Moderate	**a) Critical** **b) Critical** **c) High**
Religious/ Ritual	Cultural	• Big Kiss has a temple on the river dam for worship activities for the general public.	River dam	a) Local Hindu Community using Big Kiss	a) Essential b) Moderate	a) High b) Moderate	**a) High** **b) Medium**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• Religious activities along the river defense. • The religious activities are about the same with the Hanuman Murti being a new feature at the riverside of the NDC		b) Local Hindu community using other sites			
Cultivated Crops	Provisioning	• Crops cultivated along the sea dam including, bananas, coconuts and fruits	River dam, mangroves and bamboos	Local Community	Low	High	**Low**
Livestock Farming	Provisioning	• Grazing of goats and cows in the Namryk – Hyde Park area of > 100 animals	River dam, mangroves and bamboos	Local communities	Medium	Medium	**Medium**
Social/Economics	Provisioning	• 10 saw mills in the NDC with access to the river dam where logs are discharged and processed • Boat building, boat docking and landing area	River dam	a) Local sawmillers and forest sector stakeholders using the river dam b) Local boat builders	a) Essential b) Essential	a) Moderate b) High	**a) Critical** **b) High**
Biodiversity Reserve	Supporting	• Locals protect two small islands that are roosting areas for hundreds of birds including scarlet ibis and wild ducks in the Essequibo River. The birds are not hunted due to the actions of the community.	Biodiversity, Culture	Biodiversity, local community **ES Linkages:** Tourism	Essential	Moderate	**Critical**
Freshwater – Household use	Provisioning	• Hundreds of residents squat in more than 200 buildings on the shore and along the sea defense reserves. They use the fresh water from the river for household purposes.	Freshwater	Local communities	Essential	High	**High**
Social/Housing	Provisioning	• Approximately 50 houses are squeezed into the sea defense and shore area.	Shoreline, beach, river defense reserves	Local communities **ES Linkages:** Freshwater, fishing	High	Moderate	**High**
Tourism and Recreation	Cultural	• Recreation for residents of the NDC and the region. Private developer charges a user fee for entrance to the area.	Shoreline	Local communities	Moderate	Moderate	**Medium**
NDC 10 - Hydronie/Good Hope - Population 4,000 and increasing.							
Food: Fishing, shrimp, crabs	Provisioning	• Fishing at Ruby Koker with 10-15 boats daily with 2/3 mainly focusing on fish. • A few fishing boats also operate from the Orangestein Shore • Fishing along the shore line by nets, seine, lines	River, Ocean	a) Local communities and fisherfolk at Ruby Koker b) Fisherfolk along Orangestein Shore and other fisherfolk fishing along the shoreline	a) Essential b) Moderate	a) High b) Moderate	**a) High** **b) Medium**
Recreation	Cultural	• The Bushy Park Beach is a popular tourist attraction for locals and people from other parts of the country, with approximately 50 people visiting daily and hundreds on weekends and special occasions. • Orangestein Beach where people living in close proximity frequent.	River, Beach	Local communities, Regions 3 and 4 at Bushy Park and Orangestein beach	Essential	Low	**Critical**
Agriculture: Grazing and Crops	Provisioning	• Cattle and goats graze in the Ledestein–Good Hope area. • People in Orangestein graze cows on the sea dam.	Sea Dam, Vegetation	a) Local communities at Ledesteine-Good Hope b) Local communities at Orangestein	a) High b) Moderate	a) Moderate b) Moderate	**a) High** **b) Medium**
Religious	Cultural	• Religious activities at Ruby Koker and Bushy Park. Mosque at Ruby Koker. • People living along the river dam use the beach for Hindu religious activities • Burial Ground at Farm	Sea dam, beach	a) Local communities at Ruby Koker and Bushy Park and Hindu communities using the sea dam b) Burial Ground	a) Essential b) High	a) High b) Low	**a) High** **b) Critical**
Social/Economic Commercial activity	Provisioning	• Industrial activity at Bushy Park by KARES Engineering	Sea Dam, beach	Commercial activity for Region 3 and 4 and local businesses at:	a) High b) Essential	a) High b) Low	**a) High** **b) Critical**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• Two new wharves were established at Orangestein. Wharf supporting sea going vessels at Bushy Park, including ship repairs • Boat building and repairs on the seadam		a) Kares Engineering b) Wharf users c) Boat builders	c) Moderate	c) High	**c) Low**
Food (Wild Meat)	Provisioning	• A few people catch iguanas on a regular basis for sale in the area.	Sea dam vegetation	Local communities	Low	Moderate	**Low**
Biomass for Livestock	Provisioning	• Animals grazing on the sea dam, mangrove blossoms, bamboo shoots, grass, etc.	Sea dam vegetation	Local residents in proximity to vegetation	Moderate	Moderate	**Medium**
NDC 11 – Greenwich Park/Vergenoegen – Population – 2,500 people							
Food: Fishing, shrimp, crabs	Provisioning	• Vergenoegen Outfall and Philadelphia Koker, with more than 20 boats • Greenwich Park, with seven boats • Shrimp drying along concreted sea defense • 10–15 persons in the NDC dry fish for sale on a large scale of whom four have permission from the NDC • Some fisherfolk use the fishing grounds at Barnwell	Seashore, river, ocean, mangroves River defense	Local communities, Region 3 using: a) Vergenoegen Outfall and Philadelphia Koker b) Greenwich Park c) Shrimp and fish drying on the seawall d) Fishing grounds in Barnwell	a) Essential b) High c) High d) Low	a) Low b) Moderate c) High d) Moderate	**a) Critical** **b) High** **c) Medium** **d) Low**
Recreation	Provisioning	• Vergenoegen Seawall, which 10-20 people use daily to exercise, relax or socialize • Philadelphia Seawall, which 10-20 people use daily for recreation • Low tide beach at Philadelphia utilized for games such as cricket.	River defense	Local Communities using Vergenoegen and Philadelphia Seawalls	a) High	a) Moderate	**a) High**
Religious	Cultural	• Barnwell with access to the river. • Philadelphia with access and temple next to the river. • Religious activities also conducted at Greenwich Park	River bank	Mainly local Hindu community using Barnwell access, and Philadelphia access and temple	High	Moderate	**High**
Cultivated Crops	Provisioning	• Cash crops and fruits planted along the river defense reserves. Some gardens are fenced off.	River defense reserves	Local communities	Essential	High	**High**
Squatting	Provisioning	• Informal housing at Barnwell with over a dozen houses with 30-50 people in total.	Sea defense	Local communities	High	High	**High**
Biomass for livestock	Provisioning	• Grazing occurs on the natural vegetation by a reported >200 animals in the NDC. At Greenwich Park and Barnwell the dam is completely blocked off by the residents.	Natural vegetation	Local residents in proximity to grazing	Moderate	Moderate	**Medium**
Aesthetic Value of Natural Landscapes	Cultural	• Views of natural landscapes and landscape features, including the river and its bank, are highly valued by local communities and visitors.	River, ocean, beach	Local communities **ES Linkages:** Tourism	Moderate	High	**Low**
NDC 12 – Tuschen/Uitvlugt - Population in excess of 30,000 due to the growing Tuschen Housing Scheme							
Food: Fishing, shrimp, crabs	Provisioning	• Zeeburg Seawall, with 30-50 fish/shrimp boats • Boeraserie Koker, with 20 boats • Uitvlugt Seawall, with 15-20 boats • Zeelugt Seawall, 25 boats • In addition, large scale shrimp processing occurs at Zeeburg with large scale fish processing occurring in Zeelugt, all on the sea walls or sea defense reserves.	Seashore, river & ocean	Fisherfolk, Region 3 using: a) Zeeburg seawall b) Boeraserie Koker c) Uitvlugt Seawall d) Zeelugt Seawall	a) Essential b) Essential c) Essential d) Essential	a) Moderate b) Moderate c) High d) Moderate	**a) Critical** **b) Critical** **c) High** **d) Critical**
Tourism and Recreation	Cultural	• Cinderella Park at Zeelugt is used by 10-20 people daily and >100 on weekends • Ocean View, Uitvlugt has approximately 20 people daily	Seawall, sea defense reserves	Local communities, Region 3 using: a) Cinderella Park b) Ocean View	a) High b) Moderate c) Low	a) Moderate b) Moderate c) High	**a) High** **b) Medium** **c) Low**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• Kastev has about 10 people visiting daily		c) Kastev			
Religious/Ritual	Cultural	• Temple on the sea defense reserves at Uitvlugt. In addition, religious activities are held at the sea throughout the NDC	Seawall reserves, shore, beach	Local Communities, Region 3, 4 using the Uitvlugt Temple and coastal areas	Essential	High	**High**
Crop Cultivation	Provisioning	• Crops and fruits planted in Zeelugt and in Uitvlugt	Seawall reserves	Local Communities planting	Moderate	High	**Low**
Livestock Farming	Provisioning	• Grazing occurs throughout the NDC. The open areas are limited due to cash crop farming on the sea defense reserves in Zeelugt, Meten-meer-zorg, and De Willem. It is also affected by the shrimp and fish processers.	Seashore	Local communities grazing animals	High	Moderate	**High**
Social/Economic	Provisioning	• Fish Processing at Zeelugt and Uitvlugt • Shrimp Processing at Zeeburg and Uitvlugt, with 1kg selling for GYD$1,600	Seawall & reserves	a) Fish processors b) Shrimp processors	a) Moderate b) Essential	a) High b) Moderate	**a) Low** **b) Critical**
Coastal Protection	Supporting	• The concrete sea defense is supported by natural vegetation including mangroves, coconuts, fruits, and some cash crop plots.	Sea defense & reserves	Coastal region	High	Low	**Critical**
Social/ Housing	Provisioning	• Informal housing of about on the sea dam and beyond on the sea defense reserves. The persons use the sea water and also dump their refuse in the sea.	Sea defense & reserves	Coastal region	High	High	**Medium**
Aesthetic Value of Natural Landscapes	Cultural	• Views of natural landscapes and landscape features, including the ocean and its shore, are highly valued by local communities and visitors.	River, ocean, beach	Local communities **ES Linkages:** Tourism	Moderate	High	**Low**
NDC 13 - Stewartville/Cornelia Ida – Population – 30,000 people							
Food: Fishing, shrimp, crabs	Provisioning	• Fishing boat landing area at Leonora used by 15 boats that catch fish and shrimp. • Fishing area at Anna Catherina used by 8 boats. • Landing site at Corneila Ida with 3 boats.	Seashore and ocean	Fisherfolk using landing sites at: a) Leonara b) Anna Catherina c) Cornelia Ida	a) Essential b) High c) Moderate	a) Low b) Moderate c) High	**a) Critical** **b) High** **c) Low**
Recreation	Cultural	• Stewartville seawalls are used by almost 20 people daily. • Leonora seawall is used by 10-20 people daily. • Anna Catherina seawall is used by more than 20 people daily, with >100 on weekends.	Seawall, beach	Local communities using seawalls: a) Stewartville and Leonora; b) Anna Catherina c) Groenveldt	a) Moderate b) High c) Moderate	a) High b) Moderate c) Moderate	**a) Low** **b) High** **c) Medium**
Religious	Cultural	• Stewartville seawalls are used by < 10 people daily. • Leonora seawall is used by < 10 people daily. • Anna Catherina seawall is used by more than 10 people daily. • Cornelia Ida Seawall and reserves are used by >20 people daily. A temple is located at this site.	Seawall, beach, reserves	Local Communities, Region 3 using seawalls for religious practices at: a) Stewartville, Leonora, Anna Catherina; b) Cornelia Ida	a) Moderate b) High	a) High b) Moderate	**a) Low** **b) High**
Livestock Farming	Provisioning	• Grazing occurs throughout the NDC with cows, goats, and sheep numbering 200-300. • Some people keep ducks and pigs on the sea defense reserves using the fish for food.	Sea defense reserves	Local communities: a) Stewartville b) Anna Catherina b) Leonora	a) Moderate b) Moderate c) High	a) High b) Moderate c) High	**a) Low** **b) Medium** **c) Medium**
Crop Cultivation	Provisioning	• A few people plant on the sea defense reserves at Leonora. Squatters plant fruits and crops at Anna Catherina.	Sea defense reserves	Local communities	Low	High	**Low**
Social/Housing	Provisioning	• Squatting at Anna Catherina sea defense reserves by 15-20 families.	Sea defense and reserves	Local Communities	High	High	**High**
Social/Economic (Shrimp Processing)	Provisioning	• Large scale fish and shrimp processing occurs at Leonora with large scale shrimp processing occurring in Anna	Sea wall	Local communities	Essential	Moderate	**Critical**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		Catherina, all on the sea walls or sea defense reserves. Some persons have built their own drying floors and storage facility on the sea defense reserves.					
Coastal Protection	Supporting	• The concrete seawall/defense is supported by natural vegetation including mangroves, coconuts, fruits, and some cash crop plots.	Sea defense and reserves	Coastal region	High	Low	**Critical**
Biodiversity	Regulating	• A small area on the shore with mangroves is occupied by birds for roosting. Fishes and crabs are found in the water below where people fish.	Sea defense and reserves	Local communities **ES Linkages:** Tourism	Low	Moderate	**Low**
NDC 14 - Hague/Blankenburg - Population - 4,200 people							
Food: Fishing, shrimp, crabs	Provisioning	• Fishing boat landing area at Hague seawall used by 10-12 boats. There is a reduction in the number of boats due to the ban on catfish in the USA and also fears of piracy. • About 10-20 persons use hooks, lines, seines, cast nets, or use fishing rods to catch fish and shrimp on a daily basis at Den Amstel and Blankenburg.	Seawall, seashore	a) Local communities, Region 3 b) Landing site at Hague and fishing by hooks, lines, seines and caste nets at Den Amstel and Blankenburg	a) High b) Moderate	a)Low b) Moderate	**a) Critical** **b) Medium**
Recreation	Cultural	• Den Amstel seawall with > 20 people using the area on a daily basis to swim, relax, exercise, and socialize and about 200 persons on weekends. • Hague seawall is used by <10 people daily. • A small beach which is utilized for sports such as cricke.t	Seawall, beach, shore	Local communities using the seawall at: a) Den Amstel b) Blankenburg **ES Linkages:** Tourism	a) High b) Moderate	a) Moderate b) Moderate	**a) High** **b) Medium**
Religious	Cultural	• Religious activities at Hague seashore. • Religious activities at Blankenburg sea dam. • Cemetery at Blankenburg with historical significance.	Beach, sea shore	Local communities	a) Moderate b) Essential Moderate	b)High b) Moderate c) Moderate	**a) Low** **b) Critical** **c) Medium**
Agriculture/Grazing	Provisioning	• Grazing at Hague of cows, horses, and goats. • Grazing of > 100 goats at Blankenburg. • Grazing of cows and goats at Den Amstel.	Sea dam, reserves, mangroves	Local communities: a) Grazing at Hague and Den Amstel; b) Grazing at Blankenburg	a) Moderate b) High	a) Moderate b) Moderate	**a) Medium** **b) High**
NDC 15 - La Jalousie/Nouvelle Flanders - Population - 4,480 people							
Food: Fishing, shrimp, crabs	Provisioning	• Twenty boats use the Windsor Forest Koker to dock and some fisherfolk sell their fish in that area. • There are three fish mongers selling the prized catfish (gillbacker) by the Windsor Forest koker on a daily basis.	Seashore, ocean and rivers	Local Communities	Essential	Moderate	**Critical**
Recreation	Cultural	• Windsor Forest seawall frequented by approximately 30 people daily and 100 on weekends. The previously existing beach is now completely eroded. • Recreation area and bar on the sea dam in La Jalousie has more than 20 visitors daily	Seawall, beach	Local Communities using: a) The Windsor Forest Seawall b) Recreation area and bar at La Jalousie sea dam	a) High b) Moderate	a) Moderate b) Moderate	**a) High** **b) Medium**
Religious	Cultural	• Religious activity at La Jalousie with tent in place for worshipers. • Religious activities at Windsor Forest • Cremation site at Ruimzeigt utilized daily	Sea shore, sea dam, reserves	Local Communities, Region 3, 4 using religious sites at: a) La Jalouise b) Windsor Forest c) Ruimzeigt	a) High b) Low c) Essential	a) Moderate b) High c) Moderate	**a) High** **b) Low** **c) Critical**
Agriculture/Grazing	Provisioning	• Grazing occurs along the sea defense reserve from La Jalousie – Waller's Delight and Crane. However, it is not a significant activity.	Sea defense reserves	Local Communities in: a) La Jalousie to Waller's Delight b) Crane	a) Moderate b) Moderate	a) High b) Moderate	**a) Low** **b) Medium**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Tourism and Recreation/ Religious	Cultural	• New beach forming at Harlem	Sea shore	Local community	Low	Moderate	**Low**
NDC 16 - Best Klien/Pouderoyen – Population - 20,300 people							
Social/Economic: Transportation, Wharfs	Provisioning	• Transport Wharf, GPL Wharf, Sawmill • Speedboat stelling, with 75 speed boats registered to work at the crossing between Georgetown and Vreed en Hoop with fifty three (53) working on a daily basis.	River, river dam, reserves	Local Communities, Regions 3,4	Essential	Moderate	**Critical**
Food: Fishing, shrimp, crabs	Provisioning	• There are 11 fishing boats working in the NDC docking at Vreed en Hoop, Phoenix Park and the Jetty. • Mainly near shore fishing done in both the Demerara River and Atlantic Ocean. • Approximately five people catch crabs on a weekly basis for sale in the community. More persons join in the crab season.	Seashore, river and ocean	Fisherfolk operating from: a) Vreed-en-Hoop b) Phoenix Park c) Nearshore	a) Moderate b) High b) Low	a) High b) High b) Moderate	**a) Low** **b) Medium** **b) Low**
Mangroves	Provisioning	• Mangrove growth at Crane, Best Village, Vreed-en-Hoop, and Pouderoyen. Mangrove spread is increasing. • Lots of wildlife within mangroves including several species of birds, monkeys, raccoons, wild ducks, etc.	Mangroves	Local Communities: a) Plastic City b) Pouderoyen	a) Essential b) Low	a) Low b) Moderate	**a) Critical** **b) Low**
Grazing	Provisioning	• Grazing at Crane, Pouderoyen, and Best Villages by locals and squatters. Cows are tied and goats and sheep allowed to roam freely on the sea dam.	Sea dam, mangroves	Local Communities: a) Phoenix Park; Pouderoyen b) Best Village, Vreed-en-Hoop	a) Moderate b) High	a) Moderate b) High	**a) Medium** **b) Medium**
Social/Housing	Provisioning	• Squatting at Phoenix Park and Best Village. • Squatting in the mangroves at Plastic City.	Sea defense, mangroves	Squatters at: a) Phoenix Park b) Mangroves in Plastic City c) Best Village	a) Essential b) Essential c) High	a) High b) High c) High	**a) High** **b) High** **c) Medium**
Religious	Cultural	• Crane jetty and Cogland Dam Koker permits religious activities.	Sea, river, beach, reserve	Local Communities	Moderate	Moderate	**Medium**
Food: wild meat	Provisioning	• A small number of people catch iguana for sale. • Shore birds such as “plawads” and “curry” are hunted. River turtles are caught but this is on a decline.	Mangroves forests	Local communities (general population)	Low	Moderate	**Low**
Aquatic transport	Provisioning	• Waterway is used by boat builders for access to launch boats built on the riverbank.	Drainage channel	Local communities	High	Moderate	**High**
Tourism	Cultural	• Bird watching is sometimes done in the mangrove area. • Historical sites along river bank including a monument and 1700’s Dutch koker serve as attractions	Coastal mangroves and shoreline	Local communities and tourists	Medium	Medium	**Medium**
Erosion Regulation	Regulating	• Mangrove vegetation assists in regulating erosion of the riverbanks. River bank is being built up naturally.	Mangrove Forest	Local communities **ES Linkages:** River defense	High	High	**Medium**
Pollination	Regulating	• Pollinators are abundant in the mangroves and increase crop productivity on the coastland farms.	Mangrove forests, biodiversity	Local communities, famers, national economy	High	High	**Medium**
Timber and wood products/ Non-wood fibers and resins	Provisioning	• A small percentage of households harvest mangroves, primarily for construction of fences and other structures in the squatting area.	Forests	Local communities (general population)	Low	High	**Low**

APPENDIX E

Identified Ecosystem Services and Priority Ratings: Region 4 Coastal

-Page Intentionally Left Blank-

TABLE E-1: IDENTIFIED ECOSYSTEM SERVICES AND PRIORITY RATINGS: REGION 4 COASTAL

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Georgetown City, Population 132,000, with increases in suburban housing areas							
Social/Commercial – Port & Wharfs	Provisioning	• The Port Georgetown is used by >30 ocean-going vessels daily, with others anchored in the river. • The wharfs are used by > 50 fishing vessels including trawlers for deep sea fishing • Thousands of passengers use the ferry stelling on a daily basis.	River & Sea	a) Regions 3, 4 and other communities using Port of Georgetown and ferry stelling b) fisherfolk at wharfs **ES Linkages:** Food, Tourism, Employment	a) Essential b) Essential	a) Low/ Moderate b) High	**a) Critical** **b) High**
Tourism/Hotels	Cultural	• Two of the main hotels in Guyana are located on the seashore, with hundreds of guests per week and >200 employees.	Seashore	Guyana	High	Moderate	**High**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• >20 fishing vessels use the seashore to fish or to access their fishing grounds in deeper waters. • Individuals use the area to fish with lines.	Ocean/ River	a) Commercial fisherfolk b) Recreational or subsistence fishing	a) Essential b) Low	a) Moderate b) Moderate	**a) Critical** **b) Low**
Recreation	Cultural	• >100 individuals use the stretch of Seawall from Kingstown – UG road daily. >1000 frequent the bandstand area on weekends and holidays.	Sea/river defense, beach	Georgetown, Guyana **ES Linkage:** Tourism	Essential	Low	**Critical**
Biodiversity	Provisioning	• Thousands of birds roost in the mangroves close to the Demerara Harbour Bridge. Birds feed on the mudflats of the river.	Sea/ River, Mangroves	Georgetown, Region 3, Guyana, International **ES Linkage:** Tourism	High	Moderate	**High**
Religious/Ritual	Cultural	• Religious activities at the Kingston shore/beach, with > 20 people daily • Religious activities at the UG Road seawall, with > 10 people daily	Seawall, shore, beach	Local communities using religious areas at: a) Kingston shore b) UG Road	a) High b) Moderate	a) Moderate b) High	**a) High** **b) Low**
Mangroves	Provisioning	• Mangroves grow on the banks of the Demerara River and on the Georgetown seashore	Sea/ River, Mangroves	Georgetown, Guyana	High	Moderate	**High**
Erosion Regulation	Regulating	• The coastland is at risk to erosion, although protected by concrete defense. The mangroves and other vegetation help to defend the coast against erosion. Beaches forming along the seawall are contributing to this effort.	Coastal vegetation	Local communities **ES Linkages:** Biodiversity, Fishing, hunting, socioeconomic	Essential	Low	**Critical**
NDC 17 – Industry/Plaisance - Population – 25,000 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Fishing, including shrimp, caught by >20 boats for commercial purposes. • Pin seine fishing by a few people on the shore. Hand line and cast net fishing by a few people for sustenance. Most boats dock at the Ogle Koker.	Marine habitat, river habitat and mangrove forests	a) Commercial fishing in the ocean b) Pin seine fishing at Industry and Plaisance	a) Essential b) Moderate	a) Moderate b) High	**a) Critical** **b) Low**
Recreation	Cultural	• 40-50 people visit the Cummings Lodge–Ogle Road area for daily exercise. Some people walk/jog from Kingston to this area as part of their exercise routine. • 20-40 persons can visit the Turkeyen to Cummings Lodge seawall daily to relax, exercise and socialize	Sea wall, reserves	Local communities using seawalls in: a) Cummings Lodge to Ogle b) Turkeyen to Cummings Lodge c) Plaisance to Betterhope	a) High b) High c) Moderate	a) Moderate b) High c) Moderate	**a) High** **b) Medium** **b) Medium**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Religious/Ritual	Cultural	• Cummings Lodge shore and sea defense is used for religious activities by >10 people daily. • Plaisance Koker is used for religious activities. • The Ogle Koker is used by Jordanites to conduct baptism and twice per year there are African Libation Ceremonies.	Sea defense, reserves	Local communities: a) Cummings Lodge to Ogle b) Plaisance	a) Essential b) Moderate	a) Moderate b) Moderate	**a) Critical** **b) Medium**
Food: Wild Meat	Provisioning	• Wild ducks and birds caught in summer season as they feed in the area. Birds hunted including the Scarlet Ibises in the summer months when the birds are plentiful in the area.	Seashore, mangroves	Local communities (especially boys)	Moderate	High	**Low**
Agriculture - Cultivated Crops	Provisioning	• A few people planted trees and cash crops (squatters) along the sea defense reserves. The dominant crop is coconuts.	Cultivated lands	Local communities (general population)	Low	High	**Low**
Mangroves & Carbon Sequestration	Regulating	• The mangroves grow naturally on the newly deposited mudflats, regulating many natural factors, contributing to pollination of crops and adding to carbon sequestration. New mangrove growth has covered shoreline between Ogle and Plaisance.	Mangroves	Local community. **ES Linkages:** Fishing, Crabbing, biodiversity	High	High	**Medium**
Shoreline Protection	Regulating	• Mangroves and coastal vegetation play a critical role in maintaining coastal stability and protecting inland areas from waves, wind, and flooding from storms in Plaisance. Mangroves also offer shoreline protection helping the shells and mud to accumulate and build and further buffer the sea defense,	Mangroves Beaches	Coastal Communities **ES Linkages:** Tourism, biodiversity	High	High	**Medium**
Social/Cultural	Squatting	• Squatting occurring in close proximity to the sea defense at Plaisance	Shoreline, sea defense	Coastal Communities	Moderate	High	**Low**
NDC 18 – Better Hope/La Bonne Intention - Population - 50,000 – is increasing due to natural population growth							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Approximately 35 fishing boats catch fish and shrimp from Montrose, Success, and Better Hope. New mangrove growth are blocking of access to the sea which is affecting the fisherfolk. • Crab fishing is common during the summer crab season with about 12 people making a regular catch for sale. • There is salt fish drying along the seashore at Montrose.	a,b) Marine environment; beach; mangroves	a) Commercial fisherfolk at LBI and Chateau Margot b) Commercial fisherfolk at Montrose c) Salt Fish Drying at Montrose d) Crabbers	a) High b) High c) Essential d) Low	a) Moderate b) Moderate c) High d) Moderate	**a) High** **b) High** **c) Critical** **d) Low**
Shoreline protection / Mangroves / River defense	Regulating	• The coastland is at risk of erosion and much of the shore is protected by concrete defense. The mangroves and other vegetation helps to defend the coast against erosion. Mangrove is growing naturally at the seashore due to the increases in mud/silt deposits. • The NDC monitors the growth of the mangroves within the area and has observed that mangroves growth along the shoreline continues to increase.	Coastal vegetation	Local communities. **ES Linkages:** Biodiversity, Fishing, hunting , socioeconomic, tourism	Low	Moderate	**Low**
Religious/ Ritual	Cultural	• Hindus conduct religious activities along the sea and on the sea defense reserves at Ogle or Mon Repos	Sea & sea defense reserves	Local communities	Moderate	Moderate	**Medium**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Livestock Farming	Provisioning	• Locals utilize land along the sea wall for grazing of goats at Better Hope to Montrose. • Along the sea defense in the NDC, households utilize the land for grazing of cows and goats for livelihood. The animal pens are built on the reserves and also includes ducks and chickens.	Sea defense reserves, mangroves	Local communities (general population) in: a) Better Hope to Montrose b) LBI	a) High b) Moderate	a) Moderate b) Moderate	**a) High** **b) Medium**
Primary production, biodiversity	Supporting	• The NDC has a large area covered by new growth mangroves with rich biodiversity of birds and crabs. People use this area for crabbing in season and out of season.	Coastal Mangroves	Local communities	Low	Moderate	**Low**
Food: wild meat	Provisioning	• Lulu, egrets, plover birds are caught by a few people in the NDC on the seashore.	Biodiversity	Local communities, NDC **ES Linkages:** Wild meat tourism	Low	Moderate	**Low**
Tourism and Recreation	Cultural	• 10–20 persons relax and exercise on the seawalls at Le Ressouvenir, LBI, and Chateau Margot. • More than 20 persons use the Montrose seawall daily for recreation including playing dominoes and exercise.		Local communities using the seawalls in: a) Le Ressouvenir, LBI and Chateau Margot b) Montrose	a) Moderate b) High	a) Moderate b) High	**a) Medium** **b) Medium**
NDC 19 – Beterverwagting/Triumph - Population - 7,000 people							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Fisheries landing area in Triumph where 15-20 boats load, refuel and discharge catch. • Mudflat where 10-15 catamarans operate using pin seine to fish.	Ocean, Mudflats, mangroves	a) Local Fisherfolk b) Local Communities	a) Essential b) High	a) Moderate b) High	**a) Critical** **b) Medium**
Recreation	Cultural	• >20 people use the Triumph end of the NDC to exercise, recreate, or socialize. Many people used to frequent the area before the mangroves began to increase. On weekends and holidays, there are a few families recreating in the area.	Sea wall, reserves	Local communities	Moderate	Moderate	**Medium**
Religious/ Ritual	Cultural	• Religious activities along the sea defense and at the koker at Triumph > 10 people daily.	Sea defense reserves, shore	Local Communities	Moderate	High	**Low**
Agriculture/Grazing	Provisioning	• Grazing of goats and cows in the NDC is limited as there is not much unoccupied or reserve land. • There has been a reduction of grazing along the shoreline. The NDC places high fines for stray cattle and many farmers have moved their animals to the backlands which is being developed by the Rural Agricultural Infrastructural Development Project for agriculture purposes.	Sea dam, Mangroves, reserves	Local communities	Low	Moderate	**Low**
Shoreline Protection	Regulating	• Mangroves and coastal vegetation at Beterverwagting play a critical role to maintain coastal stability and protect inland areas from waves, wind, and flooding from storms.	Mangroves Beaches	Coastal Communities **ES Linkages:** Tourism, biodiversity	Low	Moderate	**Low**
Coastal Protection	Supporting	• Mudflats are being built on the coast in the NDC that protect the sea defense structures. Mangroves has been growing in the NDC naturally with the buildup of mud and silt	Ocean, sea defense	Coastal communities	High	High	**Medium**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Food: Wild Meat	Provisioning	• Wild ducks and shore birds are caught and eaten by few families in the summer when birds are plentiful in the area.	Seashore, mangroves	Local communities	Low	Moderate	**Low**
Social/Housing	Provisioning	• A housing scheme of 22 lots for residents is being developed Triumph North.		Residents in Triumph North	High	Low	**Critical**
NDC 20 – Mon Repos/La Reconnaissance - Population - 40,000 and increasing							
Food: Fishing, shrimp, crabs	Provisioning	• There are more than 100 fishing boats landing at Mon Repos Koker, Lusignan Koker and Annandale. Approximately 400–500 persons mainly from the villages of Mon Repos and Annandale. Mangroves have made it difficult for fisherfolk to access their landing areas. • < 10 people catch crab on a weekly basis for sale in the area.	Ocean & River ecosystems	a) Local fisherfolk at Mon Repos Koker and Lusignan Koker b) Annandale c) Local crabbers **ES Linkages:** Mangroves	a) Essential b) Essential b) Low	a) Low b) Low b) Moderate	**a) Critical** **b) Critical** **c) Low**
Recreation	Cultural	• Recreation at Lusignan and Annandale where people living in close proximity and others frequent. • The NDC has an abandoned play park in Annandale for recreational activities that is overgrown by vegetation. The NDC plans to refurbish the park for recreation and tourism purposes.	Sea wall, Beach	Local Communities using: a) Lusignan and Annandale b) community playground at Annandale	a) Moderate b) Low	a) High b) High	**a) Low** **b) Low**
Livestock Farming	Provisioning	• Cattle, sheep, and goats graze on the shoreline in the Lusignan area. Grazing is reduced due to stealing of animals.	Sea Dam, Vegetation	Local Communities	Moderate	Moderate	**Medium**
Religious	Cultural	• Religious activities with shrine built on the sea dam at Mon Repos • People living along the sea defense use the areas; accessible for religious activities at Annandale and Lusignan	Sea dam, beach	Local community using accessible areas at: a) Mon Repos b) Lusignan and Annandale	a) High b) Low	a) Moderate b) Moderate	**a) High** **b) Low**
Social/Economic Boat Building	Provisioning	• Boat building & repairs	Sea dam, beach	Local Community, Region 4	Essential	Moderate	**Critical**
Social/Economic - Tannery	Provisioning	• Mangrove barks are being utilized by three tanneries to color leather	Mangroves	Local leather tanner	High	High	**Medium**
Food: Wild Meat	Provisioning	• Wild ducks and shore birds are caught and eaten by few families in the summer when birds are plentiful in the area.	Sea shore, Mangroves	Local communities	Low	Moderate	**Low**
Social/Economic	Provisioning	• A heliport and a hotel are proposed for sea defense area at Lusignan, with the site already cleared for the construction to commence.	Sea Defenses	Private developers	Moderate	Moderate	**Medium**
Social/Economic	Provisioning	• A coconut processing center will be developed in close proximity to the shoreline at Annandale.	Sea shore	Private developers, Local communities	Moderate	High	**Low**
Social/Housing	Provisioning	• A new private housing scheme consisting of seventeen houses is being constructed close to the sea defense at Good Hope.	Sea dam	Private developers; Local communities	Moderate	Moderate	**Medium**
Shoreline protection / Mangroves / River defense	Regulating	• Mangroves cover the sea shore in Mon Repos and Annandale. In Mon Repos mangrove cover is increasing.	Mangroves	Local communities	High	Moderate	**High**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
NDC 21 – Buxton/Foulis – Population – 7,000 people							
Food: Fishing, shrimp, crabs	Provisioning	• Fishing with six boats landing at Non Pariel as mud accumulation along the shoreline at Stratsphey made the landing site inaccessible • Fishing boats at Melanie and Paradise with pin seine • Some also catch shrimp	River, Ocean, mangroves	Local fisherfolk at: a) Non Pariel b) Melanie and Paradise	a) High b) Moderate	a) Moderate b) Moderate	**a) High** **b) Medium**
Recreation	Provisioning	• Buxton/Friendship Seawall, which 10-20 people use daily to exercise, relax or socialize • Melanie/Non Pariel Seawall, which 10-20 people use daily for recreation	Sea defense, shore,	Local Communities at: a) Buxton / Friendship Seawall b) Melanie/Non Pariel Seawall	a) Moderate b) High	a) Moderate b) Moderate	**a) Medium** **b) High**
Religious	Cultural	• Religious activity at Melanie with access to the sea. On Sundays, 20-30 families visit the area for religious activities.	Sea shore, sea dam	Local communities	Essential	Moderate	**Critical**
Livestock Farming	Provisioning	• Grazing of goats, sheep and cattle occurs on the natural vegetation by a reported few animals in the NDC	Natural vegetation	Local residents in proximity to grazing	Low	Moderate	**Low**
Habitat provision, coastal protection	Supporting	• Birds, insects, and some small mammals pollinate certain flora species, including some agricultural crops grown along the coast. The area has some tracts of mangrove and mixed vegetation that allows for such services.	Cultivated lands	Local communities **ES Linkages:** Crop cultivation	Low	Low	**Medium**
Aesthetic Value of Natural Landscapes	Cultural	• Views of natural landscapes and landscape features, including the ocean and its shore, are highly valued by local communities and visitors.	River, ocean, beach	Local communities **ES Linkages:** Tourism	Moderate	High	**Low**
Food: Wild Meat	Provisioning	• Wild ducks and shore birds are caught and eaten by few families in the summer when birds are plentiful in the area.	Sea shore, Mangroves	Local communities	Low	High	**Low**
Shoreline protection / Mangroves / River defense	Regulating	• NAREI plots at Mon Repos and Vigilance for mangroves. The growth of mangroves has created security issues for recreational users who are now avoiding these areas.	Sea shore, Mangroves	Local communities	High	Moderate	**High**
NDC 22 – Unity/Vereeniging - Population in excess of 9,000							
Food: Fishing, shrimp, crabs	Provisioning	• Unity shoreline has fewer than 20 fish/shrimp boats. • Riverview landing site at Unity at the Mahaica River mouth has approximately 50 boats. • Helena Koker, with approximately 25 boats. • There are over 150 fishing boats in the NDC of different types employing over 500 persons directly in fishing and an additional 500 persons in supporting services. • Crab catching done a lot, but seasonal.	River &sea	Local fisherfolk Region 4 a) Riverview landing site b) Unity Shoreline c) Landing sites at Beehive and Lowland d) Crabbing	a) Essential b) Moderate c) High d) Low	a) Low b) Moderate c) Moderate d) Moderate	**a) Critical** **b) Medium** **c) High** **d) Low**
Agriculture/Grazing	Provisioning	• Grazing at Unity shore for cows, horses, and goats. >200 animals graze in the pasture. Over 15 persons graze animals in the area.	Beach mangroves, vegetation; fishing	Local communities	Essential	Moderate	**Critical**
Recreation	Cultural	• Unity beach is frequented for swimming, exercise, recreation and socializing by 20-30 people daily.	Seawall, sea defense reserves	Local communities, Region 4	High	Moderate	**High**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Religious/Ritual	Cultural	• Religious activities held at the sea with access from the road throughout the NDC. • Unity Beach is the main area in the NDC for religious activity. 10-20 persons use this area daily for religious activities. Over 300 persons can be found on Sundays and thousands on Hindu religious days. • Crematorium at Unity Foreshore utilized regularly.	Seawall reserves, shore, beach	Local Communities, Region 4 using: a) Along coastal access areas b) Unity Beach and Crematorium	a) Essential b) Moderate	a) Moderate b) Moderate	**a) Critical** **b) Medium**
Ecotourism: Bird Tours	Cultural	• Daily bird tours in the Mahaica River to spot numerous bird species including the Canjie Pheasant	River ecosystem , Biodiversity	Local Guides, Tourists	High	Low	**Critical**
Cultivate Crops	Provisioning	• Crops and fruits planted on the sea and river defense reserves. • Coconut estates encroach on the reserves along with some cash crops.	Seawall reserves	a) Local Communities planting crops and fruits b) Coconut estate owners and workers	a) Moderate b) High	a) High b) Moderate	**a) Low** **b) High**
Food: Wild Meat	Provisioning	• Iguanas and some birds are increasingly caught in the shore and among the mangroves on a weekly basis for sale to wild meat enthusiasts.	Mangroves, Biodiversity	Local Boys	Moderate	Moderate	**Medium**
Social/Economic	Provisioning	• Wharfs in the Mahaica River supporting trade and the local economy. Numerous boats carry farm produce, goods, and passengers in the river.	Seawall & reserves	Local Communities	Moderate	Low	**High**
Coastal Protection	Supporting	• The concrete sea defense is supported by natural vegetation including mangroves, coconuts, fruits, and some cash crop plots.	Sea defense & reserves	Coastal region	High	Low	**Critical**
Aesthetic Value of Natural Landscapes	Cultural	• Views of natural landscapes and landscape features, including the ocean and its shore, are highly valued by local communities and visitors. The Canjie Pheasant is highly valued and attracts daily tours to the area.	River, ocean, beach	Local communities **ES Linkages:** Tourism	Moderate	Low	**High**
Habitat provision, coastal protection	Supporting	• Birds, insects, and some small mammals pollinate certain flora species, including some agricultural crops grown along the coast. The area has some tracts of mangrove and mixed vegetation that allow for such services.	Cultivated lands	Local communities **ES Linkages:** Crop cultivation	High	High	**Medium**
Mangrove Materials	Provisioning	• Some harvesting of mangroves for firewood and poles, but this is limited.	Mangrove	Few local individuals	Moderate	High	**Low**
NDC 23 Haslington/Grove - Population - 22,000 people							
Food: Fishing, shrimp, crabs	Provisioning	• Fishing boat landing area at Greenfield >15 boats, mainly for fishing • Fishing boats landing area at Hope, with 10 boats. Fish are sold in the area. • Fishing boat landing area at Haslington, with 5 boats, and Victoria, with 3 boats • Fishing boat landing area with approximately 5 boats at Cove and John • Fishing done along the shoreline using seines and at kokers using cast net and lines. Catamarans used to access seine and lines via the mudflats.	Ocean, Mudflats, shore	Local fisherfolk , Region 4 at: a) Greenfield, b) Hope c) Cove and John d) Haslington e) Along other kokers; catamaran operators and users of cast nets and lines	a) Essential b) Essential c) High d) Moderate) e) Moderate	a) Moderate b) Moderate c) Moderate d) Moderate e) Moderate	**a) Critical** **b) Critical** **c) High** **d) Medium** **e) Medium**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• The locals catch much fishes in the swamps beyond the sea dam that is offered for sale in and out of the NDC.					
Primary production, biodiversity	Supporting	• This NDC has a Mangrove Reserve that facilitates mangrove conservation, apiculture, bird watching tours, and mangrove tours.	Mangrove Forest	a) Local Beekeeper, b) Coastal Communities c) Tourists	Essential	Moderate	**Critical**
Ecotourism	Cultural	• The mangrove reserve has over 70 species of birds that attract three tours daily in the school tour season and monthly tours from other markets including internationals.	Biodiversity, Mangroves	a) Local communities, b) Tour operators **ES Linkages:** Biodiversity	Essential	Moderate	**Critical**
Coastal Protection	Supporting	• Mudflats are naturally being built on the coast in the NDC that protects the sea defense structures and promotes the growth of mangroves. • Mangroves are monitored by 3 rangers; as such, there is no hunting of wildlife or harvesting on mangroves. • Mangroves on the increase due to planting and natural growth. • Previously Hope Beach was popular but now overgrown with mangrove. • Lots of awareness to protect mangroves	Ocean, sea defense	Coastal communities	Low	Moderate	**Low**
Recreation	Cultural	• Cove & John – Victoria seawalls is frequented by 20-40 people daily. • Haslington –Nootenzuil is used by 50 people daily to exercise, relax, or socialize. • Recreational area being constructed at Bel Field Seawall. • The NDC is in process of developing the beach at Victoria/Haslington for recreation and tourism purposes. There is a Regional Tourism Committee which is spearheading tourism development within the Region. • Weekend activities such as parties have increased along the seawall area.	Seawall, beach, shore	Local communities using: a) Cove and John Seawall b) Haslington –Nootenzuil **ES Linkages:** Tourism	a) Moderate b) Essential	a) Moderate b) Moderate	**a) Medium** **b) Critical**
Religious	Cultural	• Religious activities at Cove & John attracts thousands for the special religious days • Religious activities at Hope and Greenfield <10 people.	Beach, seashore	Local communities Guyana using: a) Cove & John b) Hope and Greenfield	a) Essential b) Moderate	a) Moderate b) High	**a) Critical** **b) Low**
Apiculture	Provisioning	• Beekeeping is done in the mangrove area, with about 4 liters of honey sold daily. Two persons are involved in Golden Grove.	Mangrove	Local beekeepers	High	Medium	**Medium**
Livestock Farming	Provisioning	• Grazing of cows at Hope sea dam and shore. • Grazing of cows at Hope – Golden Grove.	Sea dam, reserves, mangroves	Local communities	Moderate	Moderate	**Medium**
Food: Wild meat	Provisioning	• Iguanas are caught by a few people for own use. Tilapia is caught in the mangroves that grow in the flood basin.	Mangroves	Local communities **ES Linkages:** Biodiversity	Moderate	Moderate	**Medium**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Squatting	Provisioning	• Informal housing at Golden Grove and Nabaclis.	Sea defense, mangroves	Local communities	High	High	**Medium**
Cultivated Crops	Provisioning	• Crops and fruits planted on the sea and river defense reserves at Golden Grove and Nabaclis. • Coconut estate in Greenfield.	Sea defense reserves	a) Local farmers planting on sea and river defense reserves b) Coconut estate	a) Moderate b) Moderate	a) Moderate b) Moderate	**a) Medium** **b) Medium**
Habitat provision, coastal protection	Supporting	• Birds, insects, and some small mammals pollinate certain flora species, including some agricultural crops grown along the coast. The area has some tracts of mangrove and mixed vegetation that allow for such services.	Cultivated lands	Local communities **ES Linkages:** Crop cultivation	High	High	**Medium**
Aesthetic Value of Natural Landscapes	Cultural	• Views of natural landscapes and landscape features, including the ocean and its shore is highly valued by local communities and visitors.	Mangrove area	Local communities **ES Linkages:** Tourism	Moderate	High	**Low**
NDC 24 Enmore/Hope – Population – 2,000 people							
Food: Fishing, shrimp, crabs	Provisioning	• Twenty boats use the Enmore Koker to dock. People fish with line and nets in the area. • Pin seine fishing is also practices by 2 to 3 persons using catamaran to access to fishing grounds. • Shrimp is caught by persons dragging seine along the shoreline. • Tilapia is caught in the flood reservoir within mangroves • The area is under much economic depression due to the closure of the sugar estates. There is more demand on the fishing resources offshore and in the canals and wetlands within mangroves. • The fisherfolk have good access to their landing area as the access was upgraded by the National Drainage and Irrigation Authority. The improved access is also used by the pin seine fisherfolk.	Ocean, reservoir	a) Local commercial fisherfolk b) Pin seine fishing and shrimping along the shoreline c) Fishing in mangroves	a) Essential b) Moderate c) Moderate	a) Moderate b) Moderate c) Moderate	**a) Critical** **b) Medium** **c) Medium**
Recreation	Cultural	• Enmore seawall was a popular spot but now is only frequented by >10 people daily. Most people use the community center.	Seawall, beach	Local Communities	Moderate	High	**Low**
Religious	Cultural	• Enmore shoreline is a popular place for worshipers.	Seashore, sea dam, reserves	Local Communities	High	Moderate	**High**
Livestock Farming	Provisioning	• Grazing occurs along the sea defense reserve from Enmore – Hope. The amount is decreasing due to stealing of animals.	Sea defense reserves	Local Communities	Moderate	Moderate	**Medium**
Cultivate Crops	Provisioning	• Crops and fruits planted on the sea and river defense reserves at Haslington by one person.	Sea defense reserves	Local farmers	Low	Moderate	**Low**
Ecosystem, Mangroves	Provisioning	• The NDC has an area covered by mangroves with rich biodiversity of birds, fishes, and crabs. New mangrove growth on the shore is increasing and contributing to carbon sequestration. Mangroves are increasing within the NDC shoreline, which has resulted in less persons exercising due to security fears.	Coastal Mangroves	Local communities **ES Linkages:** Carbon Sequestration	High	High	**Medium**

Service	Type of Service	Description and Examples in the Study Area based on stakeholder input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Coastal Protection	Supporting	• Mudflats are being built on the coast in the NDC that protect the sea defense structures and promote the growth of mangroves	Ocean, sea defense	Coastal communities	High	High	**Medium**
Food: wild meat	Provisioning	• Some birds such as the plover birds are caught using wire along the shoreline.	Mangroves	Local communities	Low	High	**Low**

APPENDIX F

Meeting Schedule

-Page Intentionally Left Blank-

REGION 1 VCs/CDCs/TCs

Name of VC/CDC/TC	Date and Time (2018)		Date and Time (2019)	
Father's Beach	Wed, April 4	9:30 AM	Mon, June 10	8:30 AM
Manawarin	Thur, April 5	9:00 AM	Mon, June 10	1:00 PM
Haimakabra	Thur, April 5	2:00 PM	Tues, June 11	8:30 AM
Waramuri	Fri, April 6	9:00 AM	Tues, June 11	8:30 AM
Santa Rosa	Fri, April 6	2:00 PM	Tue, June 11	2:00 PM
Assakata	Sat, April 7	9:00 AM	Wed, June 12	1:00 PM
Warapoka	Sat, April 7	2:00 PM	Thu, June 13	8:30 AM
Three Brothers	Mon, April 9	11:00 AM	Thu, June 13*	1:00 PM
Mabaruma Town Council	Tue, April 10	9:00 AM	Fri, June 14	8:30 AM
Aruka Mouth	Tue, April 10	2:00 PM	Fri, June 14	11:00 AM
Morawhanna	Wed, April 11	9:00 AM	Fri, June 14	1:00 PM
Smith's Creek	Wed, April 11	11:00 AM	Fri, June 14	3:00 PM
Imbotero	Wed, April 11	2:30 PM	Sat, June 15	9:00 AM
Almond Beach	Thur, April 12	9:00 AM	Sat, June 15	2:00 PM

* Meeting not held due to unavailability of village.

REGION 2 NDCs

Name of NDC	Date and Time (2017)		Date and Time (2019)	
Charity/Urasara	Wed, Nov. 15	10:00 AM	Tue, May 28	8:30 AM
Evergreen/Paradise	Thu, Nov. 16	9:00 AM	Tue, May 28	11:00 AM
Aberdeen/Zorg-en-Vlygt	Thu, Nov. 16	1:00 PM	Wed, May 29	8:30 AM
Anna Regina Town Council	Fri, Nov. 17	8:00 AM	Tue, May 28	2:00 PM
Annandale/Riverstown	Fri, Nov. 17	10:00 AM	Wed, May 29	11:00 AM
Good Hope/Pomona	Fri, Nov. 17	1:00 PM	Wed, May 29	2:00 PM

REGION 3 NDCs

Name of NDC (Coastal)	Date and Time (2017)		Date and Time (2019)	
Wakenaam (island)	Mon, Nov. 20	9:00 AM	Tues, July 9	9:00 AM
Leguan	Tue, Nov.21	9:00 AM	Tues, July 9	2:00 PM
Mora/Parika	Wed, Nov.22	9:00 AM	Wed, July 10	8:30 AM
Hydronie/Good Hope	Wed, Nov.22	1:00 PM	Wed, July 10	11:00 AM
Greenwich Park/ Vergenoegen	Thu, Nov. 23	9:00 AM	Wed, July 10	2:00 PM
Tuschen/Uitvlugt	Thu, Nov.23	1:00 PM	Thur, July 11	8:30 AM
Stewartville/Cornelia Ida	Fri, Nov. 24	9:00 AM	Thur, July 11	11:00 AM
Hague/Blankenburg	Fri, Nov. 24	1:00 PM	Thur, July 11	2:00 PM
La Jalousie/Nouvelle Flanders	Mon, Nov. 27	9:00 AM	Fri, July 12	8:30 AM

Name of NDC (Coastal)	Date and Time (2017)		Date and Time (2019)	
Best/Klien/ Pouderoyen	Mon, Nov. 27	1:00 PM	Fri, July 12	11:00 AM

REGION 4 NDCs

Name of NDC (Coastal)	Date and Time (2017)		Date and Time (2019)	
Georgetown City	Tue, Dec. 5	9:00 AM	---	---
Industry/Plaisance	Tue, Nov. 28	9:00 AM	Wed, May 8	8:30 AM
Better Hope/ LBI	Tue, Nov. 28	1:00 PM	Wed, May 8	11:00 AM
Beterverwagting/Triumph	Wed, Nov. 29	9:00 AM	Wed, May 8	2:00 PM
Mon Repos/ La Reconnaissance	Wed, Nov. 29	1:00 PM	Thu, May 9	8:30 AM
Buxton/Foulis	Thu, Nov. 30	9:00 AM	Thu, May 9	11:00 AM
Enmore/Hope	Mon, Dec. 4	1:00 PM	Thu, May 9	2:00 PM
Unity/Vereeniging	Thu, Nov. 30	1:00 PM	Fri, May 10	11:00 AM
Haslington/Grove	Mon, Dec. 4	9:00 AM	Fri, May 10	8:30 AM

--- Location not revisited during validation exercise.

TC	Town Council
VC	Village Council

1. INTRODUCTION

As detailed in Section 1.2, after documenting the findings and analysis, the final phase in the process was to validate the compiled data and verify that the associated detailed mapping was accurate. An ecosystem services validation exercise commenced in May 2019 and concluded in July 2019. As described in Section 2.4, in addition to validating previously recorded information, the validation exercise allows for the collection of any new data relating to ecosystem services functions and values since the previous engagements, while also providing the opportunity to collect updated socioeconomic data at the community level.

The information presented in this Validation Data Summary appendix is limited to the feedback obtained from stakeholders during the validation stage whereby the socioeconomic and biodiversity experts presented the findings of the ecosystem services study and the coastal sensitivity maps on which the results of the ecosystem services study were displayed. These were presented to 62 of the original 64 Neighbourhood Democratic Councils (NDCs), Town Councils (TCs), Village Councils (VCs), and Community Development Councils (CDCs) in the coastal area of Regions 1, 2, 3, 4, 5, and 6.

The responses received during the validation exercise are detailed below, presented by region and stakeholder group. Feedback regarding additional or changed ecosystem services data is reflected under the “Ecosystem Services Survey” heading. Issues not directly related to ecosystem services functions or values, but related generally to socioeconomic status, are also noted under “Other data collected” headings for the purpose of documentation. References within the data to changes over time (e.g., increase in population, decrease in fishing) refer to the time which has lapsed since the 2017/2018 original data were collected and the 2019 validation exercise. In some cases, there are specific notes regarding changes that will be made within the Liza Project Geographic Information System (GIS) database. These are captured within the responses in order to maintain accuracy in the reporting and subsequent mapping efforts. The findings outlined in this appendix are provided in detail within the Detailed Findings Sections of the report.

Some minor changes and updates were recommended as indicated by individual focus groups. These minor updates relate mainly to adjustments in the quantitative data for some ecosystem services presented, as well as location of some activities. In a few instances, additional uses/services in some areas were recommended to be included. The spatial adjustments of locations and inclusion of new uses have been updated in the Liza GIS Database.

Additional socioeconomic data at the NDC, CDC, VC, and TC level were also collected, including updated population figures.

The NDCs, CDCs, VCs, and TCs generally expressed gratitude for the information shared and the opportunity to participate in the original screening and scoping process, and subsequent validation exercise. At their request, finalized maps of their area depicting the ecosystems services within their area as well as the summarized analysis was provided to each of the participating NDCs, CDCs, VCs, and TCs and Regional Councils in December 2019.

1.1. Region 1

This section presents the feedback from the ecosystem services validation exercise within Region 1. Engagements with the following CDCs, VCs, and TC within Region 1 were conducted during the period June 10 to June 15, 2019:

- Father's Beach
- Manawarin
- Waramuri
- Santa Rosa
- Assakata
- Warapoka
- Three Brothers
- Mabaruma Town Council
- Aruka Mouth
- Smith's Creek
- Morawhanna
- Almond Beach
- Imbotero

As noted above, Haimokabra and Waramuri in Region 1, which were visited separately in 2017/2018, were visited simultaneously during the validation exercise since Haimokabra is considered a satellite village of and shares leadership with Waramuri. A representative from the National Toshaos Council (NTC) participated in the entire Region 1 exercise. The NTC participation was to ensure all the engagements were fair and impartial and the concerns of the Indigenous communities were raised and addressed. The participation of the NTC was beneficial to the exercise, since communities were more comfortable during the engagements as a result of the presence of the representative of the NTC and, as such, had more confidence in the process and participated freely in the discussions. A representative from the non-governmental organization (NGO) Guyana Marine Conservation Society, who is also affiliated with the University of Guyana, attended the meetings in Region 1 to verify that engagement with Indigenous communities was performed in a matter that meets community expectations. Two of Esso Exploration and Production Guyana Limited's (EEPGL's) community and socioeconomic experts also attended the engagements at Father's Beach, Manwarin, and Waramuri.

1.1.1. Father's Beach Village Council

Ecosystem Services Survey

- Coconut palms on the shore, which are protected by the mangroves and earthen barriers, also function as dams. Cassava, fruits, vegetables, and other crops are planted on the farms with some of the produce sold in Pomeroon or at Charity. Coconut cockles are currently affecting the coconut grove. Coconut cockles attack the heart of the coconut palm, which eventually leads to the death of the tree. This is not isolated to Region 1 and is a known pest to coconut plantations in other parts of the coast of Guyana.

- Plants with medicinal and spiritual values are abundant on the beach and almost all plants found in the area are used for medicinal and other purposes.
- Mangroves, in addition to offering protection from erosion, also serve as a buffer between crops and the ocean, preventing the salt water spray from reaching the crops. In some areas there are mature mangroves and in others there is mangrove regrowth.
- There has been significant beach erosion over the years. Shells are being used for construction in place of stone and also used for landfill and to provide nutrients for plants (e.g., fruit trees).
- Fuel and boat repair services are provided onshore and offshore. Persons in need of fuel or repairs offshore can call and service is provided by residents. (Note: This service was added as 50_130 to the GIS dataset.)
- Hunting of wild animals or birds is limited in the area, and hunting by outsiders is banned. Some persons do catch iguanas but not on a regular basis. There are small animals caught for meat that can be found in the swamp beyond the farms.
- Crab meat is an important source of food for the households. Persons from other areas also catch crabs at Father's Beach. Crabs damage the dams and cassava crops.

Other Data Collected

- The village population is declining and currently stands at 23 persons. When there were significant activities on the beach, the population was in excess of 300 persons. Some have signaled their intention to return but have not done so.
- Father's Beach was well occupied with large cultivated farms some 60 years ago. From that time onwards, the beach has been slowly eroding with many of the farms washed away and the people migrating inland or to the Pomeroon River. On long stretches of the beach, the mangroves have completely eroded.
- The school was closed and most children now attend school at Waramuri. The medical center no longer functions and medical services are sought at Charity.
- The local people are prohibited by law from using turtle shells, which is important in one of their traditional religious practices. They claim that the village did not agree to these restrictions during the Shell Beach Protected Area (SBPA) consultation process. The community is awaiting the revision of the rules of the SBPA by the Government of Guyana to better reflect Indigenous people's culture.
- The community is not willing to discuss its spiritual practices with outsiders.
- Savannah burning is still a concern since it burns the dams that protect the community.

1.1.2. Manawarin Village Council

Ecosystem Services Survey

- Fishing along the sea coast has decreased because residents do not have the necessary boats and engines.

- Crabbing is an important cultural activity that the entire community participates in at some level.
- The Manawarin River is not the only form of access to the village. There are numerous tracks and dirt roads that provide access to the community from various points.
- Many species of animals are trapped for trading at Charity, including the emerald boa, rainbow boa, anaconda, and parrots. Seabirds are rarely caught, as people do not frequent the shore apart from during the crab season.
- The community cuts wood for internal construction and for sale commercially. The current dispute with the village of Wakapoa (an adjacent Amerindian village in Region 2 but not located within the coastal area) over the ownership of the resources has reduced the level of this activity.
- People have increasingly planted small-scale, cash-crop farms (e.g., vegetables, cassava) but the market for the produce is lacking and the costs for transport to Charity or Kumaka are prohibitive.
- A giant river otter feeding area was observed during the exercise. (Note: This service was added as 50_131 to the map dataset.)

Other Data Collected

- The population is in excess of 2,000 and is increasing.
- The area referred to as Rockstone is disputed but it is a spiritual site and has the potential to be a tourist attraction. It belongs to Manawarin since they previously occupied it. Trees planted by residents exist there today.

1.1.3. Waramuri Village Council

Ecosystem Services Survey

- According to the village Toshao, Waramuri houses the world's 27th shell mound to be discovered (although this has yet to be internationally verified). The expectation is for this site to be developed into a leading tourist attraction in the future as part of the village's plan to enhance ecotourism activities.
- The number of people involved in fishing is the same with most living in Haimokabra. Iron Punt area is used for fishing camps. Fish are caught and dried along the beach since ice is not available.
- Shorebirds are not hunted by the fisherfolk visiting the shore, but are sometimes used as bait for fishing.
- Wildlife is hunted on the shore with the assistance of dogs. Ducks, iguanas, deer, labba, agouti, and alligator are caught onshore. Snakes are caught and sold to trappers visiting the village or sold in Charity. Duck eggs are also collected.
- The shoreline area is preferred for farming since it is more fertile. However, large cultivated areas were washed away, as well as the fisherfolks' camp. Significant stands of mangroves and other lands are also eroded from Shell Beach.

- The village has deposits of stone that are used in construction. Stone is mined and sold locally and to contractors in Santa Rosa.
- Coconut cultivation is increasing within the community. Coconuts are sold at Pomeroon. Copra is also made and sold at Pomeroon.
- Lumbering is performed mainly for domestic construction. This activity is managed by the VC. However, no inventory of the forest within the community has been completed. SBPA management has indicated that it will assist the village in completing its forest resources inventory. Once completed, the village will use this information when developing its own management plan.
- The ite palm (an indigenous type of palm) is recognized by the village as the tree of life. The palm provides tibisiri[8], food, roof material, fruit for drink making, other construction material, and the tacoma worm[9].
- In addition to the river network, there is land access to the village from different onshore areas.

Other Data Collected

- The population is approximately 2,500 and is increasing.
- Economic activities within the community are also on the rise.
- Boats from Charity selling various commodities visit the community on a regular basis.
- The community plans to pursue tourism development. Some of the possible attractions/activities include crab catching, nature trails, historical remnants (such as Dutch bottles), the Shell Mound, and a nature creek. There are also plans to construct a guest house.
- Mangroves along the river banks sometimes fall into the river, which affects navigation. The village, given its location, often receives requests to remove the fallen trees.
- There has been a notable decrease in fishing within the Moruca River in recent years.
- The village has changed its construction methods and materials with the new designs being more modern and better for the households.

1.1.4. Santa Rosa Village Council

Ecosystem Services Survey

- Ite palms are found throughout the community, and residents can easily access and gather forest materials for multiple purpose use. People have chosen to build with modern materials but tibisiri is still used for many crafts.

[8] Tibisiri is made from the fiber from the leaves of the palm and is used to make hammocks, thatch roof, furniture, baskets, and carpets.
[9] Tacoma worm, also known as the beetle larvae (Rhynchophorus palmarum), feeds on old ite trees that have fallen to the ground. These beetles are full of fat and are considered a delicacy and a good source of nutrients by the indigenous communities that consume them.

- The Moruca River and its numerous waterways are used for swimming, cultural acts, fishing, recreation, sports, and some spiritual practices. (Note: This service was added as point 50_132 to the GIS dataset in order to identify cultural uses of the rivers.)
- Turtle shells are used by persons in their homes for spiritual practices.
- Some hunting/trapping of wildlife still occurs even though there is zero tolerance of this activity within the community. Deer are scarce in the savannas due to overhunting but iguanas are plentiful. Recently, many saki monkeys were trapped by a wildlife trader.
- The mangroves at the mouth of the Moruca River are part of the cultural heritage of Santa Rosa and should be carefully preserved while cleared to accommodate the safe movement of boats. The Moruca River mouth is part of the ancestral lands of the Amerindian people of Santa Rosa.
- The village has more than 100 fisherfolk who fish in both freshwater rivers and in the ocean. Fishing areas include Manawarin River, Moruca River, Baramanni River, Biara River, Dog Creek, Luri Creek, Baramanni Lake, Waini River, Waini Point, Iron Punt, and Father's Beach.
- Plants are gathered from the beach and throughout the community for medicinal and other purposes.

Other Data Collected

- The population is approximately 10,500 and is increasing. There are many returning Guyanese from Venezuela who have ties to the community.
- Economic activities are increasing. There is a new shopping mall under construction near the community that will be opened in the near future.

1.1.5. Assakata Village Council

Ecosystem Services Survey

- Lumbering is performed for domestic use and community projects.
- The village has no boats that fish in the ocean. The popular fishing areas include Baramanni Lake, Luri Creek, and Dog Creek.
- Crabs are caught in season, as the fisherfolk do not venture into the crab breeding area on a regular basis.
- The community plans to develop the Village Lake into a tourist attraction and combine it with the shell mound also found in their village. The community will develop an ecotourism plan and seek funding from the government as well as private sources.
- Members of the community are not involved in the trapping of animals for trade. Wild dogs are hunted. Occasionally, iguanas are also hunted for their meat. Conservation efforts have paid off with a reduction in wildlife trapping and trade within the community.
- About 30 persons are involved in the cutting of cabbage sticks for sale.

Other Data Collected

- The village population is 473 and increasing.
- Most persons from the community engage in farming.

1.1.6. Warapoka Village Council

Ecosystem Services Survey

- Warapoka is making strategic investments to become a major ecotourism destination, with visitor counts on the rise over the past several years due in part to government-sponsored ecotourism programs. The guest house has been renovated and plans to bridge the wetland leading to harpy eagle nests are being considered for the dry season. The community is also developing its sport fishing product at Luri Creek with help from Rewa village (North Rupununi). About 20 people are employed in tourism activities, an increase from 10 in 2018. Visitors, primarily consisting of local tourists, have increased over the past year as well. Attractions and activities include village tours, bird watching, cave visits, visits to harpy eagle nesting sites, cultural presentations and sport fishing. [Note: Two points were added to the GIS dataset: 50_133 identifying the Shell mound at Warapoka, and 50_134 for the sports fishing at Luri Creek.]
- The community does not fish in the Atlantic Ocean at this time, but sometimes fishing occurs along the beach, which is accessed through Luri Creek and Baramanni River. The fisherfolk currently fish in the rivers as far as Waini Point.
- Crabs are caught at Waini Point and Moruca River Mouth during the crabbing season.
- The community rarely traps animals for trade, but some community members hunt meat for food. The community gathers eggs from the tiger birds seasonally. Ducks and cranes that lay eggs by the thousands are found in the ite palm forest.
- Approximately 80 men cut cabbage (heart of palm) for sale commercially on a weekly basis during the dry periods of the year.
- Some persons within the community are engaged in craft making.

Other Data Collected

- The population is 650 and is increasing. Guyanese persons from Venezuela with ties to the community are returning. Forty such people have returned to date. However, there are also about 40 other Venezuelan migrants without any ties to the community who have also moved into the community.

1.1.7. Three Brothers Village Council

Ecosystem Services Survey

- Fishing remains the main sustenance and economic activity.
- Some villagers are still involved in the cutting of cabbage palm.

- There are a few commercial-scale farms in the area, but farming is generally in decline despite successes with ginger and other root crops.
- The village dogs continue to be attacked by jaguars, which is affecting hunting activities.

Other Data Collected

- The village population is 120 and is in decline as people continue to migrate to more populated areas like Mabaruma.
- The economic situation is declining more rapidly due to the fuel crisis, which has driven up the price of fuel that villagers depend on to travel in the Waini River and to Mabaruma.
- The villagers expressed discontent with the SBPA management and regulations.

1.1.8. Mabaruma Town Council

Ecosystem Services Survey

- The resource use in the township generally remains the same from the last year. There is a small increase in fishing from the migrant community, but the quantity remains unknown. The migrants also hunt for crabs for their sustenance, mainly in the areas close to their temporary homes.
- There is a small growth in the tourism sector, although there was significant growth in the number of people flying to Mabaruma.
- The township has three sawmills that provide dressed lumber for the town and other communities. The owners have timber concessions and also purchase timber from the Amerindian communities. There is a current boost in the building sector that sustains the three sawmills. These are not affected by the shortage of gasoline. [Note: A new point 50_134 was added to the GIS dataset to show the sawmill and lumber yard that supplies dressed lumber to the town and other communities.]
- The township has embraced the Green State Development Strategy and has built a “Green Park” at Hosororo and planted more than a thousand trees in the town. It also has a solar farm that generates power for the electric grid. There are plans to install a wind farm as well.

Other Data Collected

- The current population is estimated at 8,000.
- There has been in excess of 4,000 migrants (the vast majority Venezuelan and the rest Guyanese people with links to these communities) passing through the community recently, with more than 1,000 remaining. Most of these are residing in an area referred to as Khan’s Hill.
- The local people of the town are not responding in a positive manner to the presence of the migrants who are suspected of taking jobs, spreading diseases, conducting unsanitary practices, and occupying open spaces. There are also numerous cases of migrants being taken advantage

of by local people, which are not reported or given legal consideration due to lack of enforcement.

- There is a small increase in economic activities due to the presence of the migrants.
- The town needs a dedicated site for the disposal of garbage. The current site is not adequate and the migrants at Khan's Hill are seen rummaging through the garbage.

1.1.9. Aruka Mouth Community Development Council

Ecosystem Services Survey

- The community has about 60 men who fish on a regular basis, mainly in the Waini River Mouth.
- In addition to the fisherfolk who also have farms, there are approximately 20 farmers who rely mainly on farming as a means of sustenance. Produce is sold at Kumaka market on Tuesdays and Saturdays.
- Approximately 15 persons catch crabs and sell them on Tuesdays and Saturdays at the Kumaka market. Crabs are purchased by traders and taken to Georgetown.
- The community has about ten persons who hunt. The meat is used domestically and sold at the market. A few people hunt seabirds when they are plentiful.

Other Data Collected

- The population is approximately 300 and is increasing.
- The Warraus from Venezuela visit the community on the way to the Kumaka market and trade with a few willing people. Hammocks, craft, and dried fish are the main items that are in demand in Aruka Mouth.

1.1.10. Smith's Creek Community Development Council

Ecosystem Services Survey

- More than 100 people fish in the Waini River and at Waini Point heading further west along the Venezuelan Coast.
- Approximately 40 people cut cabbage palm during the dry season. A crew of ten men average 1,500 sticks, which occurs twice a month.
- Some men hunt for food but few trap any animals for sale. Land turtles are a favorite.
- There are many mangroves being cut and cleared to construct new houses for the migrants along the Barima River.
- Crab catching remains a significant activity. A crab processing facility is being established within the community with the support of the government.

Other Data Collected

- The population is 248 and increasing.
- There are migrants present within the community, mainly comprising of the same Warrau tribe of the community. At one time there were as many as 80 migrants present. Currently there are ten migrant families who have established dwellings within the community.
- Commercial activities relating to the fuel trade have increased at nearby Morawhanna on the opposite bank of the river. Fuel spills and leaks in the waterways are affecting the community as fuel washes up on the shore. Also, there has been a decline in fish caught within the river.
- The community needs an alternative source of water since the river is often contaminated by fuel, and during the dry season the creek that provides water is usually dry.

1.1.11. Morawhanna Community Development Council

Ecosystem Services Survey

- There has been an increase in economic activity due to the fuel trade. Boats from Venezuela bring fuel to sell to local vessels. There can be as many as 40 vessels docking in the Barima River in proximity to Morawhanna.
- The ice plant is now operational and numerous fishing boats come to purchase fuel.
- The area is mainly a commercial hub with the community taking advantage of its wharf and the increased trading. Food and other supplies are provided daily to the crews of the numerous ships.
- The community floods regularly so people have given up on planting crops.
- There are no hunters in the area who trap animals for trade or meat.
- Everyone fishes in the river for fresh fish on nearly a daily basis. The presence of numerous fish affirms for the villagers that their waters are not polluted due to fuel spills.
- There is now a water well within the community, which has significantly reduced the use of the river as a water source.

Other Data Collected

- The current population is approximately 100 persons.
- The community houses the Coast Guard, the Guyana Revenue Authority, and Immigration authorities.

1.1.12. Almond Beach Community Development Council

Ecosystem Services Survey

- Coconut is the main crop on the beach. Copra, dried coconuts, and water coconuts are sold at Kumaka market. Erosion is still taking away mature and young trees as it washes the shells away during high tide.
- Farming has been reduced due to the prolonged dry spell.
- Salt water has taken over the swamp, driving the freshwater fish away, including the hassar that was recently caught by the thousands.
- Fishing in the Atlantic Ocean is the same with small variations, positive and negative, depending on the catch, price, and cost of fuel. Current gasoline prices have reduced fishing activities.
- Ecotourism is nonexistent, as the community has had no recent visitors due to the lengthy and burdensome process prescribed by the SBPA authority. The SBPA authority also forbids visitors to walk on the beach in order to observe turtles. There have been fewer turtles observed on the beach since 2016, but the reduction in sightings may be as a result of reduced monitoring.
- Rain water is harvested for drinking and shell ponds are constructed to provide water for bathing and domestic chores.
- [Note: A new point 50_135 was added to the GIS dataset to show the SBPA Field Station on Almond Beach.]

Other Data Collected

- The village population is 51 persons.
- There are seven students currently attending the school on the beach.
- Erosion continues to affect the beach and livelihood activities. A comprehensive approach from the community, the Regional Democratic Council, and the Protected Area Commission is needed to address this issue.
- The community may need to be relocated further inland. This was previously proposed for an area inland but there has been no feedback on this plan.
- The community would like to re-introduce ecotourism but the SBPA authority restrictions are affecting this and other activities. There were previous awareness activities being conducted in relation to the sea turtle program, targeting schools, etc., but these are no longer being done.

1.1.13. Imbotero Community Development Council

Ecosystem Services Survey

- Almost everyone fishes in the Imbotero Creek and Barima River for daily catch. The community fisherfolk are not currently venturing out to Waini Point to fish, as they are afraid of having their outboard engine stolen by pirates.

- All hunting and fishing is done in proximity to the community, which has abundant resources. Building materials are also abundant in close proximity including mangroves for house building.
- Some villagers trap birds, reptiles, and small animals for sale to the wildlife traders or at Kumaka market. Some animals are caught for their meat especially in the dry season.
- The community now has a significant migrant population from Venezuela that has settled along the Barima River banks. [Note: Point 50_136 was added to the GIS dataset to show the Warraus settlement.] The migrants have been given temporary status to live and use the village resources. As such, there has been an increased use of the community's resources.

Other Data Collected

- The community currently has a population of 353 persons.
- The community currently has 153 Warraus migrants from Venezuela and is trying to cope with the influx of the migrants who are arriving with very little resources and materials.
- The government is currently providing some assistance to the migrants but this is not properly coordinated with the community. Also, this is causing tensions within the community since no assistance is being provided to the residents.
- The Warraus bring fish, hammocks, crafts, and household items for sale in the village and at Kumaka market.

1.2. Region 2

This section presents the feedback from the ecosystem services validation exercise within Region 2. Engagements with the following NDCs and TC within Region 2 were conducted during the period 28 May to 29 May 2019:

- Charity/Usara
- Evergreen/Paradise
- Aberdeen/Zorg-en-Vlygt
- Anna Regina Town Council
- Annandale/Riverstown
- Good Hope/Pomona

1.2.1. Charity/Usara NDC

Ecosystem Services Survey

- Approximately ten families in the NDC area are engaged in daily crabbing for their livelihoods. Some of these people travel to the Pomeroon River Mouth for crabbing. Crabs are in-season from July through September. During this time, there is an increase in the number of people crabbing.

- There has never been much hunting of wild animals in the area. However, hunting of wild birds has declined. In addition, some people catch iguanas, but not on a regular basis.
- The Big Bird Fish Complex at Charity is a major processing facility that processes large amounts of catch for export.
- There is significant erosion of the sea dam, mudflats, and mangroves along the shoreline of the NDC, which reduces the habitats for wildlife, birds, and crabs. This is especially prevalent along the coast of the NDC and in the Pomeroon River. Additional manmade sea defense structures like groins can be constructed to assist in capturing sediments by reducing the power of the washing waves.
- There is cash-crop farming and grazing on the sea dam and the sea defenses. There is more grazing when the rice lands are under cultivation. The cultivated areas are not adequately irrigated and need urgent investment in order for the land to reach its full potential for agricultural production.

Other Data Collected

- The population within the NDC area is 7,800 and has been stable.
- There is large-scale rice cultivation, which is water intensive in the NDC area. However, the Tapacuma Reservoir was not designed to provide irrigation for rice cultivation but for farming cash crops only. Incomes are higher in rice cultivation and this incentivizes farmers to cultivate rice in the NDC area. As a consequence, farmers have a shortage of fresh water for all crops particularly during the dry seasons.

1.2.2. Evergreen/Paradise NDC

Ecosystem Services Survey

- More than ten people from the NDC hunt crabs in the Summerset and Berks mangroves on a weekly basis for commercial purposes.
- Residents of the NDC hunt iguanas in the La Resource area for sustenance, and occasionally for commercial purposes. The iguanas are sold in the NDC for popular restaurants in the region. Shorebirds are also caught for both sustenance and sale. Some people hunt large lizards (salipenters) for meat and anacondas to sell to traders.
- There is an increase in fishing activity in the NDC mainly due to decreased rice cultivation. There are more fisherfolk at the Andrews Koker than previously reported. In addition, there are five boats in Evergreen and six at Perth. Castle is not located in the NDC area.
- Many cows graze in the Perth, Dartmouth, and Andrews areas. In addition, cows, sheep, and goats are grazed in the Better Hope to La Resource areas.
- The seashore areas at Paradise, Jib, Andrews, and Bounty Hall are used for religious activities. Residents of Westbury and Perth use the seashore in Dartmouth.

- Recreation activities are found at the Dartmouth Seawall, especially on Sundays when dominoes are played.
- Trees along the sea dam from Evergreen to Better Hope are being cut down, which is contributing to erosion.

Other Data Collected

- The population in the NDC area is 7,500.
- There has been a decline in rice cultivation in the NDC area due to lower rainfall and saline intrusion into the drainage and irrigation system. This has led to more mixed farming with multiple crops being grown, including an increase in red peas in Dartmouth.
- Grazing of animals in the NDC area has increased.

1.2.3. Aberdeen/ Zorg-en-Vlygt NDC

Ecosystem Services Survey

- There are approximately 15 boats and 40 families engaged in fishing in the NDC. These boats use landing sites at La Union, Three Friends, and Capoey Koker depending on the accessibility of these sites.
- There is a new growth of mangroves in the NDC, which has resulted in iguanas, crabs, and new species of birds in the area. Crabs are caught and sold daily from persons both within and outside the NDC. In addition, approximately 60 to 70 persons hunt iguanas daily for sale at prices ranging from $3,000 to $5,000 GYD (approximately $14.35 to $23.92 USD). Currently, there is no hunting of wild birds.
- Mangroves are washing away at Columbia. At this locale, the government has installed bamboo groins at Columbia, Aberdeen, and Affiance, which help to protect the shoreline and reduce erosion along the coast of the NDC.
- There is a rearing camp for cattle at the seashore at Hoff-Van-Aurich and La Union.
- Many persons graze their animals on the sea dam and over the seashore. There has been a small increase in the amount of cattle present in the NDC.
- There is a cremation site at La Union that is used by the entire Essequibo coast.
- Many persons use the sea wall in Queenstown for recreation purposes.

Other Data Collected

- There are significantly more mosquitoes in the NDC area due to the regrowth of mangroves.
- Coconuts have been growing wildly along the seashore beyond the rip raps, particularly in Queenstown. This is aided by the accretion of mud in the NDC area. However, there is no large-scale cultivation of coconuts in the NDC.

1.2.4. Anna Regina Town Council

Ecosystem Services Survey

- There has been significant regrowth of mangroves in the municipality and mangrove growth continues to increase. This has resulted in negative impacts for residents including:
  - Increasing mosquitoes that deter people from visiting the seawall. There are also more mosquitoes in residential areas within the municipality.
  - The accumulation of mud and sediments on the seashore that blocks the channel. In some instances, grazing animals become stuck in the mud and die. In addition, sometimes fishing boats become stuck in the mud and dead fish are dumped into the mud. These create odors and also act as breeding grounds for mosquitoes.
  - The beach at Anna Regina has been lost due to the accretion of mud. At Easter, which is the biggest day for recreation activities at the seawall and beach, there was a lower turnout than in previous years and those that visited left early. In addition, people can no longer access the seashore to conduct religious activities.
- There are landing sites at Sparta with 15 boats, Hampton Court with 20 boats, Anna Regina with 15 boats, Walton Hall with 10 to 12 boats, and Lima with 10 to 12 boats. Overall, fishing activities have declined in the municipality; this is partly attributed to the ban on exports of the gillbacker.
- More than 50 people visit the Henrietta seawall on a daily basis, particularly to access the open Wi-Fi hotspot supplied by the government. Softball cricket matches are also played on the beach.
- There is crop cultivation on the government reserves at Lima, Walton Hall, Anna Regina, and Devonshire Castle.

Other Data Collected

- There are approximately 22,000 persons in the municipality. In addition, the boundaries of the township were expanded since the last visit to include Lima Sands.
- There are approximately 5,000 persons from Venezuela scattered throughout the township comprising both returning Guyanese and native Venezuelans.
- Rice cultivation has declined in the municipality due to declining rainfall and a paddy bug infestation.
- There are two excavators on pontoons in the channel leading to the koker in Anna Regina that keep the channel clear due to the accretion of drift mud.

1.2.5. Annandale/Riverstown NDC

Ecosystem Services Survey

- There are fishing landing sites at: Golden Fleece with 2 boats, Zorg with 5 boats, Adventure with 2 boats, Riverstown with 1 boat, and Abraham Zuil with 20 boats, including 2 new anchor seine boats.
- Fishing activities have increased in the NDC area because other employment options are limited.
- Grazing of cows has increased on the seawall and sea dams.
- Religious activities are conducted throughout the NDC but mostly at Golden Fleece.
- There are recreational activities at the seawalls at Perseverance, Golden Fleece, and Suddie, where there are cricket matches, football matches, and barbecues on weekends.
- The beach at Cullen is popular but needs upgrading to facilitate tourism activities. The NDC is seeking to build stands and washroom facilities that will improve the services offered at the beach. Dumping of garbage on the seashore should also be reduced.

Other Data Collected

- There are 10,840 persons in the NDC. This count was completed in 2018 and includes Venezuelan migrants.
- The Venezuela migrants include returning Guyanese and native Venezuelans. It is alleged that many of the migrant women engage in prostitution, which causes significant, negative impacts to the local population.

1.2.6. Good Hope/Pomona NDC

Ecosystem Services Survey

- There are fishing landing sites at: Pomona with 10 to 12 boats, Riverside Creek with 10 to 12 boats, Riverstown with 6 boats, and Vilvoordeen with 15 boats. Fishing boats also occasionally land at Supenaam. There has been an increase in fishing in the NDC area due to declines in other economic sectors, such as rice and livestock.
- Families who live close to the seashore often engage in nearshore fishing and have their own small boats to conduct fishing activities. There are two boats at Good Hope which are used for this type of fishing.
- There are wharves to facilitate shipping of raw materials for construction, commercial products, and exports. There are three wharfs in Fairfield, one in Good Hope, one in Spring Garden, one in Vilvoordeen, and one in Riverstown.
- There is grazing of animals along the seashore starting from Riverstown Creek.
- Hunting of iguanas has increased and is done by persons from both within and outside the NDC area.

- There are beaches for recreation purposes at Vilvoordeen, Aurora, Spring Garden, and Good Hope.
- There are religious activities on the seashore throughout the NDC. The Spring Garden temple is located close to the shoreline.
- There is significant erosion along the coastline of the NDC. Tiger Island is helping to slow the rate of erosion. Currently, revetments are being installed at Aurora. Similar sea defense measures are needed at other locations in the NDC.
- The landing area at Supenaam is being enhanced.
- [Note: The GIS datasets should include the label "Itribisi Lake" at the point 6_15 as a portion of this lake falls within the NDC; remove "West Demerara" from the points at 6_10 and 6_11; clarify the Tiger Island is under management of Region 2.]

Other Data Collected

- There are approximately 10,000 persons in the NDC and the population is increasing. This includes previous residents returning to the NDC area, migrants from Venezuela, and Amerindians moving from inland areas of Region 2.
- There are several new houses in the NDC.

1.3. Region 3

This section presents the feedback from the ESS Validation Exercise within Region 3. Engagements with the following NDCs within Region 3 were conducted during the period of 9 to 12 July 2019:

- Wakenaam
- Leguan
- Mora/ Parika
- Hydronie/ Good Hope
- Greenwich Park/Vergenoegen
- Tuschen/ Uitvlugt
- Stewartville/Cornelia Ida
- Hague/ Blankenburg
- La Jalousie/Nouvelle Flanders
- Best/ Klien/Pouderoyen

1.3.1. Wakenaam NDC

Ecosystem Services Survey

- Fishing is done on both sides of the island. Some boats are owned by persons from the island, while other boats come from the West Coast of Demerara. The fishing area is shared with residents of Leguan and approximately 20 to 30 boats operate in the area.
- Many residents catch crabs from July to September, but a few residents catch crabs all year in the mangroves on the island.

- During April to September, fisherfolk catch shrimp during the shrimp season and dry it on the sea defense wall.
- During the dry season in July to September, residents catch iguanas for recreation and sustenance.
- By empoldering, some people plant/farm on the sea defense reserves and consider upkeep of farms along the Essequibo and on Tiger Island, Hogg Island, Truli Island, and Karia Karia their responsibility.
- Animal grazing is not a challenge—animals are either tied in the farming areas to graze or graze freely in Palmaria, Zeelandia, or New Friendship.
- The beach at Zeelandia has significantly eroded over the years.
- There are 46 kokers around the island, which provide drainage and irrigation.
- There is a pending proposal to construct and operate a solar farm on the island.

Other Data Collected

- At its peak, the population of the island was 18,000 but is now 3,300. This is likely due to the fact that there are not many jobs on the island and islanders seek employment elsewhere and the majority of current residents are self-employed.
- There is an increase in the presence of Amerindians from various areas of the country and many of these Amerindians are seeking employment.
- The plantain chip factory that was constructed in 2014 is not yet operational, but is expected to bring about 30 jobs to the island.
- Plantain production has been increasing recently. It is estimated that the island exports five boats, each with approximately 15,000 pounds of plantains, every day.
- The island does not have a landfill site or garbage collection system, which results in dumping in waterways.

1.3.2. Leguan NDC

Ecosystem Services Survey

- Residents hunt iguanas (which are plentiful on the island) for recreation, sustenance, and sale.
- Several residents from the island catch and sell crabs from the mangroves on a weekly basis.
- Fishing has increased in the NDC mainly due to the decreased rice cultivation. There are around 25 fish and shrimp boats on the island.
- There is significant grazing in the NDC, which is concentrated between Better Hope and La Resource. Grazing has been constrained by the river defense works at Maryville, Success, and Thieres.

- Shorebirds are rarely caught for their meat and only in the summer months. Grassland birds are caught and kept in cages to become pets, with some sold at Parika.
- Recreation activities often occur at Canefield and Success beaches, especially on weekends when many games are played.
- Guyana Energy Agency is looking to set up a wind farm at Dauntless Point on the island.
- The island is considered by residents to be rich in natural gas, with pockets reportedly visibly flowing out of the ground in Belfield and Richmond. One resident traps the gas and uses it for cooking.
- A new wharf was recently constructed at Belfield. It facilitates shipping of construction materials.
- Farming has declined along the shoreline as a result of construction of the sea defense.

Other Data Collected

- The population on the island was 10,000 at its peak, but is currently 2,700.
- There are not many jobs on the island and the majority of the residents are self-employed.
- Economic activities on the island fluctuate, depending on rice cultivation and price.
- There are about 20 speed boats providing transportation to Parika.
- The island is challenged by the absence of a landfill site or garbage collection system, which results in dumping along the shoreline and in trenches.

1.3.3. Mora/ Parika NDC

Ecosystem Services Survey

- Within the Essequibo River, Parika remains the hub of river transportation with speed boat services, shipping, ferry, etc.
- There are a few fishing boats operating in the NDC at Kent and Hyde Park. The boats move around the NDC tracking the catch. In general, the deep sea trawlers are found at Big Kiss and Shairaz wharfs.
- Grazing has significantly declined as a result of the sea defense works and theft.
- There are seven house boats in the NDC and two associated parking lots.
- There are five dockyards for ship repairs in the NDC.
- There are 10 wharves within the NDC—two being recently constructed.
- Squatting along the shoreline remains a big challenge for the NDC, with more persons migrating to the NDC and seeking low-cost housing.
- The religious activities are about the same, with the Hanuman Murti being a new feature at the riverside of the NDC.
- Residents of Bird Island are protecting the island as a safe haven for birds.

- Mangroves are sparse within the NDC, with mainly boulders as the sea defense. The sea defense is currently being rebuilt between Grove and Hyde Park.

Other Data Collected

- The population within the NDC is currently 12,000 and is increasing due to an influx of people from other areas of the country seeking employment.
- There is some squatting inland by Guyanese nationals who have recently returned from Venezuela.
- There has been an increase in economic activities related to small business and service providers.
- The NDC is a major hub for commercial activities within Region 3.

1.3.4. Good Hope/Hydronie NDC

Ecosystem Services Survey

- The sawmill at Bushy Park is now closed; however, there are other economic activities in place such as the pre-casting concrete plant.
- Crops are still being planted along the shoreline.
- In addition to Ruby Koker, there are a few fishing boats operating from the Orangestein Shore.
- The Orangestein beach is used a landing site for large vessels.
- Two new wharves were built at Orangestein.
- There are two burial grounds along the sea dam in the NDC at Good Hope and Ruby.

Other Data Collected

- The population within the NDC is currently 4,200.

1.3.5. Greenwich Park/ Vergenoegen

Ecosystem Services Survey

- There are seven fishing boats, although they are also used to catch shrimp, at Greenwich Park along the sea dam, while there are approximately 25 more fishing boats at the Vergenoegen Outfall.
- Approximately 10 to 15 NDC residents dry fish for sale on a large scale, only four of whom have permits to do so.
- There is an increase in recreational use of the seawall and, aligned with this, the government is interested in building up the seawall area at Vergenoegen for recreational use.
- There is grazing along the sea dam at Greenwich Park and Barnwell. This area is completely blocked off by the residents.

- Religious activities are also conducted mainly in Barnwell, Philadelphia, and Greenwich Park in the NDC.
- Residents continue to use the sea defense reserve for farming.
- There are some squatters on the sea defense reserve.
- Most of the mangroves from are now gone.

Other Data Collected

- The population within the NDC is currently 2,600.
- There are about 75 Venezuelan migrants within the NDC.
- There has been an increase in small businesses such as supermarkets and wash bays.
- Illegally dumping waste in public spaces is a common issue in the NDC.

1.3.6. Tuschen/ Uitvlugt NDC

Ecosystem Services Survey

- There are 25 fishing boats at each of the sites Zeelugt, Zeeburg, and Uitylugt, respectively.
- Large scale shrimp processing occurs at Zeeburg, while large scale fish processing occurs at Zeelugt. All of this occurs on the sea walls or sea defense reserves.
- Grazing occurs in open areas in Zeelugt, Uitvlugt, and Tuchen; however, these areas are limited because of cash crop farming on the sea defense reserves and the shrimp and fish processers.
- Residents utilize the seawall for exercise and recreation, although some residents are deterred from using this space because there is significant garbage along the shore that distracts from quality time along the seawall.
- The NDC has a number of schools and parks in close proximity to the sea defense.
- Squatting along the shoreline area has increased since the previous engagement. This is occurring at several areas in the NDC.

Other Data Collected

- The population within the NDC is currently 35,500. There are new housing accommodations at Zeelugt, Tuschen, De Williem, Zeeburg, and Uitvlugt. It is expected that the population will continue to increase as a result of these accommodations.
- There is a significant migrant population within the NDC, which includes Guyanese nationals returning from Venezuela.

1.3.7. Stewartville/ Cornelia Ida NDC

Ecosystem Services Survey

- There are 15 fishing boats at Leonora, 8 boats at Anna Catherina, and 3 boats at Cornelia Ida.
- Large scale fish and shrimp processing occurs at Leonora; large scale shrimp processing occurs in Anna Catherina. All of this processing occurs, on the seawalls or sea defense reserves. Some residents have built their own drying floors and storage facilities on the sea defense reserves.
- Ducks and pigs are reared on the sea defense reserves, being drawn by the fish disposed by the fisherfolk.
- Grazing occurs in open areas throughout the NDC; however, this area is limited by squatters in Anna Catherina and Stewartville.
- The sea walls at Stewartville, Leonora, and Anna Catherina are used for recreation and religious practices on a daily basis.

Other Data Collected

- The population within the NDC is currently 30,000.
- It is estimated that there are 200 to 300 Venezuelan migrants within the NDC, consisting primarily of returning Guyanese nationals.
- There has been an increase in small businesses within the NDC.

1.3.8. Hague/ Blankenburg NDC

Ecosystem Services Survey

- There are approximately 10 fishing boats operating at Hague in the NDC, which is less than previous counts. This is likely due to the US embargo on catfish and heightened fears of piracy.
- Grazing has increased on the sea defense and shore, as the owners avoid the public road where thieves monitor.
- Recreation activities have been reduced with the rehabilitation of the sea defense and the erosion of the beach; however, many residents—upwards of 200 on weekends—continue to visit the Den Amstel sea walls for recreation and exercise. Recreation activities have also likely been reduced as a result of the significant amount of garbage that washes up along the shoreline.
- Approximately 20 residents use hooks, lines, seines, cast nets, or fishing rods to catch fish and shrimp on a daily basis at Den Amstel and Blankenburg.
- There are mangroves beyond the sea defense where birds roost.
- The religious activities are about the same within the NDC as they were in 2017.
- Shrimp drying no longer occurs, as the seawall—which was historically used—has been updated as part of sea defense works.

Other Data Collected

- The NDC population remains 4,200.
- There has been an increase in small businesses within the NDC such as wash bays, taxi services, and supermarkets.

1.3.9. La Jalousie/ Nouvelle Flanders NDC

Ecosystem Services Survey

- The mangroves in the NDC have been completely eroded. The wildlife has migrated east to the mangroves in the neighboring NDC.
- There are approximately 20 fishing boats in the NDC. There are three fish mongers who sell prized catfish (gillbacker) daily by the Windsor Forest koker.
- The main areas for religious activities are at Blankenburg, Windsor Forest, and the Cremation Site.
- The Cremation Site continues to be one on the most used site in the country, with as many as three cremations per day.
- Grazing is not a significant activity on the reserves anymore. Some animal graze on the sea defense reserves or graze freely; however, more animals graze in the burial grounds inland, south of the shore.
- There is almost no hunting of shorebirds. There is no other biodiversity inhabiting the shoreline within the NDC.
- During the weekdays, approximately 30 residents exercise or recreationally use the Windsor Forest sea wall daily, while during the weekends more than 100 residents exercise or recreational use this area. The previously existing beach is now completely eroded.

Other Data Collected

- The population within the NDC is approximately 5,500 and is increasing due to three new housing accommodations. Guyanese nationals returning from Venezuela are also contributing to an increase in the NDC's population.
- There has been a small increase in small businesses within the NDC such as supermarkets.

1.3.10. Best/ Klien/ Pouderoyen NDC

Ecosystem Services Survey

- There are 75 speed boats registered to work at the crossing between Georgetown and Vreed en Hoop, with 53 working on a daily basis.
- There are 11 fishing boats docking at Vreed en Hoop, Phoenix Park, and the Jetty.

- Grazing mostly occurs in the Best Village and Pouderoyen area. Cows are tied and goats and sheep are allowed to roam freely.
- The NDC's mangroves are increasing, but are under threat from squatters who are clearing them and using the trees and shrubs for building materials.
- A few residents catch crabs on a daily basis as their livelihood, and more residents participate in the industry during crab season.
- Little hunting—mainly iguanas—occurs in the area.
- Tourists, primarily bird watchers, visit the NDC as part of tours organized by operators located in Georgetown.
- The shoreline is being actively considered for the development of shore-based facilities.

Other Data Collected

- The population within the NDC is approximately 25,000 and is increasing due to migration. Guyanese from the hinterlands and other rural areas move to the area, as well as Venezuelan migrants.
- There has been an increase in small businesses within the NDC.

1.4. Region 4

This section presents the feedback from the ecosystem services validation exercise within Region 4. Engagements with the following NDCs within Region 4 were conducted during the period 8 May to 10 May 2019:

- Industry/Plaisance
- Better Hope/La Bonne Intention
- Beterverwagting/Triumph
- Mon Repos/La Reconnaissance
- Buxton/ Foulis
- Enmore/Hope
- Haslington/Golden Grove
- Unity/Vereegining

1.4.1. Industry/Plaisance NDC

Ecosystem Services Survey

- The mangroves are now more prevalent along the shoreline within the NDC and are taking over parts of the shore completely, especially between Ogle and Plaisance. The mangroves offer shoreline protection by helping the shells and mud to accumulate and build, which further buffers the sea defense.

- The locals hunt sea birds, including the Scarlet Ibis on occasion, mainly in the summer months when the birds are plentiful in the area. The birds avoid the areas near the shore, feeding in shallow mud a few hundred meters from the seawall, thus making it additionally challenging for hunters to get close enough to catch them.
- In addition to worshipping at the seashore by Hindus, the Jordanites (a religious group within Guyana) conduct baptisms at the Ogle Koker and there are African Libation Ceremonies twice per year.
- There is squatting occurring in close proximity to the sea defense at Plaisance.
- [Note: Recreation areas should be changed in the GIS dataset from Cummings Lodge–UG Road to Cummings Lodge – Ogle.]

Other Data Collected

- The population within the NDC area is approximately 25,000 and should be increasing given that there are new housing schemes within the area.
- The NDC has seen the growth of small businesses in recent times, including an influx of migrants who work mainly in the bars.
- The major challenge in the NDC is the illegal dumping of garbage along the shore that ends up in the mangroves. A youth group in Plaisance is actively cleaning up the shoreline on a regular basis, but its efforts are not enough to address the garbage problem.
- The increasing use of the Ogle Koker by fisherfolk has decreased its aesthetics with the build-up of shacks and the odor of decaying fish.

1.4.2. Betterhope/LBI NDC

Ecosystem Services Survey

- The NDC monitors the growth of the mangroves within the area and has observed that mangrove growth along the shoreline continues to increase. This has resulted in:
  - An increase in mosquitos that has limited the use of the shoreline for recreation and religious practices. Religious activities have moved to Ogle or Mon Repos, where there is better access and less sand flies and mosquitoes.
  - An increase in garbage dumping within the mangrove area, which is challenging to clean.
  - Blocking access to the sea which affects the fisherfolk.
- There has been a reduction in grazing of animals on the shoreline and adjacent areas.
- There is salt fish drying along the seashore at Montrose.
- There was no new activity within the NDC along the seashore.

Other Data Collected

- The estimated population is 30,000; the population is increasing.
- There was a report of mangrove destruction at Pigeon Island.

1.4.3. Beterverwagting/Triumph NDC

Ecosystem Services Survey

- A new housing area is changing the land use. The NDC is building a housing scheme of 22 lots for residents at Triumph North. The project has reduced the area available for grazing animals.
- There has been a reduction of grazing along the shoreline. The NDC places high fines for stray cattle and many farmers have moved their animals to the back lands which are being developed by the Rural Agricultural Infrastructural Development Project for agriculture purposes.
- There is not much change in the mangrove cover despite the rapid growth in other NDCs.
- There are new businesses in the NDC over the last year, including Chinese supermarkets.

Other Data Collected

- The population is approximately 7,000.

1.4.4. Mon Repos/La Reconnaissance NDC

Ecosystem Services Survey

- A heliport and a hotel are proposed for the sea defense area at Lusignan, with the site already cleared for the construction to commence.
- An application for a coconut processing center in close proximity to the shoreline at Annandale is currently being reviewed by the NDC.
- A new private housing scheme consisting of 17 houses is being constructed close to the sea defense at Good Hope. Eight of the houses are already constructed.
- In Mon Repos, mangrove growth has increased. This has resulted in:
  - The fisherfolk experiencing difficulties in accessing the landing area along the shore.
  - An increase in mosquitoes. The NDC has a fogging machine to help with the mosquitoes, but has not used it due to the lack of knowledge in mixing the chemicals and operating the machine.
  - An increase in garbage within the mangroves.
- There are more than 100 fishing boats within the NDC employing approximately 400 to 500 people, mainly from the villages of Mon Repos and Annandale.
- The NDC has a mangrove plot with an abandoned play park for recreational activities that is overgrown by vegetation. The NDC plans to refurbish the park for recreation and tourism purposes.

Other Data Collected

- The population is approximately 40,000.
- The NDC has an influx of migrants (Guyanese returning from Venezuela as well as Venezuelan citizens), but they are mainly employed in various businesses and are not squatting on the NDC reserves.

1.4.5. Buxton/Foulis NDC

Ecosystem Services Survey

- There is no new mangrove growth within the NDC except for the National Agricultural Research and Extension Institute (NAREI) plots at Mon Repos and Vigilance. However, the growth of mangroves has created security issues for recreational users who are now avoiding these areas.
- There are some changes to the fish landing sites within the NDC as a result of mud accumulating along the shoreline. Boats are now landing at Non Pariel.
- There is less grazing in the NDC as more animals were lost to thieves preying on the animals in the bushes.
- The local squatters vacated the area at the Buxton sea dam on their own accord.
- There is seasonal hunting of the birds on the shore by a few individuals.

Other Data Collected

- The population is approximately 7,000.
- There are new businesses in the NDC, including three Chinese supermarkets.
- More people are involved in fishing as a means of supplementing their incomes since the closure of the Enmore Sugar Estate.
- A group of Venezuelan migrants with Guyanese family members is now squatting at Non Pariel.

1.4.6. Enmore/Hope NDC

Ecosystem Services Survey

- The area is under economic depression due to the closure of the sugar estates. There is more demand on the fishing resources offshore, in the canals and wetlands, and within the mangroves. The wetland is an important source of tilapia that is caught for sale by many residents of the NDC.
- The fisherfolk have good access to their landing area as the access was upgraded by the National Drainage and Irrigation Authority. The improved access is also used by the pin seine fisherfolk.
- There are two to three persons who conduct pin seine fishing using catamarans to access to fishing ground.

- Shrimp is caught by persons dragging seines along the shoreline.
- The mangroves are increasing within the NDC shoreline, which has reduced recreation in the area.
- Some birds, such as the plovers, are caught using wire along the shoreline.

Other Data Collected

- The population is approximately 8,000.

1.4.7. Haslington–Golden Grove NDC

Ecosystem Services Survey

- The NDC is developing the beach at Victoria/Haslington for recreation and tourism purposes. There is a Regional Tourism Committee that is spearheading tourism development within the Region.
- There is an increase in the number of fishing boats within the NDC, which is directly employing more local people. The number of catamaran fisherfolk has decreased as the mud flats have moved beyond the boundary of the NDC.
- The level of grazing within the NDC has decreased with many of the animals moved to the back lands where there are more grazing grounds.
- Two persons in the NDC engage in bee keeping at Golden Grove.
- The locals catch fish in the swamps beyond the sea dam. The catch is offered for sale in and out of the NDC.
- There is a minor increase in squatting near the sea defense.
- Weekend activities such as parties have increased along the seawall area.

Other Data Collected

- The population is approximately 27,000 and is increasing due to new housing schemes within the NDC.
- An old coconut estate is being cleared and prepared for rice cultivation.

1.4.8. Unity/Vereeniging NDC

Ecosystem Services Survey

- More boats are now docking on the Mahaica River due to security concerns arising from the previous docking areas, especially the Helena Landing Site, which now has about 25 boats. There are more than 150 fishing boats in the NDC of different types employing more than 500 people directly in fishing and an additional 500 people in supporting services.
- The fish landing site at the old Mahaica River Bridge falls within the Woodlands–Farm NDC and not within this NDC. This site has about 15 to 20 boats.

- The two landing sites at Unity should be separated, with the Riverview site at the Mahaica River mouth having about 50 boats, while the landing site at the Unity shoreline has fewer boats (less than 20 boats).
- Grazing within the NDC remains the same; however, the changing land use is detrimental to grazing animals.
- Mangrove growth remains the same and the wood is used by farmers and fisherfolk.
- There is an increasing number of people who hunt iguanas and wild birds on a weekly basis for sale to wild meat enthusiasts.
- The wharf facilities remain the same but there are plans to expand the wharf to facilitate additional development in the area.

Other Data Collected

- The population is approximately 13,000.

1. INTRODUCTION

1.1. Overview

This report provides an introduction to the concept and treatment of ecosystem services along the coastal communities in Regions 5 and 6 of Guyana. Ecosystem services are typically defined as the benefits that people obtain from the natural environment as further defined and described in Section 1.2. The report was prepared by Environmental Resources Management (ERM) and Environmental Management Consultants (EMC). The work described herein is supplemental to the Liza Phase 1 Post-Permit Studies for Regions 1-4 requested by the Guyana Environmental Protection Agency (EPA) in the Environmental Permit issued to Esso Exploration and Production Guyana Ltd. (EEPGL) for its Liza Phase 1 Development Project[1].

Along with the Enhanced Coastal Sensitivity Mapping – Biodiversity report and related geospatial mapping (submitted under separate cover), this report is a summary of field studies conducted to verify (i.e., ground truth) selected shoreline and coastal habitat classifications in Regions 5 and 6. The information presented in this report specifically provides for the screening and scoping of ecosystem services utilizing an internationally recognized ecosystem services methodology combined with geospatial analysis, as described in Section 2. The purpose is to provide specific details on coastal communities and their use of coastal resources to better inform EEPGL's oil spill response planning, as well as to provide information for use in future project Environmental Impact Assessments (EIAs).

The information presented in this report is limited to Regions 5 and 6. A similar report for Regions 1-4 has been prepared under separate cover for submission to the EPA as a regulatory requirement. This report covering Regions 5 and 6 is for EEPGL's internal use only.

1.2. Scope Development

ERM and EMC held a coordination and planning workshop in October 2017 in Georgetown, with key stakeholders including Government, non-governmental organizations (NGOs), academics, indigenous community representatives, and other expert entities to discuss the purpose of the Region 1-4 ecosystem services study, its applicability and the proposed methodology. It was determined that a Community Based Participatory Research (CBPR) approach with local communities would be utilized in order to conduct a screening and scoping of ecosystem services. The objective of the study was to provide data to establish a baseline of the relationship between coastal communities and the natural environment. The results of the study are captured in this report, as well as in the Liza Project Geographic Information System (GIS) database, and Liza Project Stakeholder Engagement Plan. The Study Area was defined as the immediate coastal area, up to a distance of 500 meters from the shoreline.

The first phase of the exercise was conducted in November and December 2017 in Regions 2, 3, and 4. The second phase of the exercise for Region 5 and 6 was conducted in January and

[1] Environmental Permit No. 20160705-EEDPF, dated June 1, 2017

February 2018. Local specialists from EMC accompanied by an ERM socioeconomic expert conducted stakeholder meetings with 24 coastal Neighborhood Democratic Councils (NDCs) in Regions 5 and 6 to learn first-hand about their activities related to ecosystem services. Over 168 local community members participated in the meetings, and many from each NDC accompanied the team into the field after each meeting to help visually observe and map the activities.

The team entered data at each meeting directly into handheld tablets linked to the Liza Project GIS database, and also took notes on general comments and observations. The results of these Region 5 and 6 meetings and field observations are described in this report, along with Ecosystem Service-specific maps for each NDC. Map books have been created from the GIS information contained in the database, and are appended to this report. Additionally, integrated map books (including both ecosystem service and biodiversity information) will be included in EEPGL's Oil Spill Response Plan, where necessary.

During May to July 2019, following the screening, scoping, and assessment exercise, the same team of socioeconomic experts conducted a validation effort of the ecosystem services baseline data collected during the previous assessment phase. The team visited the same coastal NDCs, CDCs, VCs, and TCs (the Black Bush Polder NDC in Region 6 was not revisited due to its distance from the coastal zone). This additional validation step enhances the accuracy of the original effort by allowing stakeholders to review and comment on the results of the screening, scoping, and assessment exercise. Any changes or additions to individual ecosystem services from the exercise were documented and larger trends that could have occurred over time as a result of specific ecosystem management interventions (e.g., mangrove programs) or extrinsic factors (e.g., population changes) were identified.

1.3. Collaboration with NAREI

The participation of four officers from the Mangrove Restoration and Management Department of the National Agriculture Research & Extension Institute (NAREI) Mangrove Department ("the Department") for a total of nine days in the ESS work was beneficial to both the ESS Team and the Department, as well as the Local Authorities (NDCs and Town Councils). The ESS Team was able to access information on activities occurring within the mangroves areas of these regions, as well as the concerns of the Department in relation to these activities. Information was also obtained on areas where the Department is/was involved in activities, including monitoring and restoration. The ESS engagement also provided an opportunity for the Local Authorities to identify and discuss issues and concerns relating to the mangroves within their districts. Other benefits included the following:

- The ESS engagements with the Local Authorities provided a forum for NAREI to discuss issues relating to mangroves within districts. For many of the NDCs/Town Councils this was their first direct engagement with NAREI.
- NAREI was able to collect information on mangroves within each district, including mangrove distribution, uses of the mangrove forest, activities being conducted within the mangrove forest, and issues and concerns regarding mangroves.

- The verification exercise provided the opportunity for NAREI to interact with some users of mangrove areas, especially persons involved in fishing and construction and operation of fish ponds within mangrove areas.
- NAREI was able to share information with the Local Authorities relating to mangrove management, including the importance of mangroves, the status of mangroves as protected species, activities which are allowed within mangrove forests, activities which are prohibited and are detrimental to mangroves, and potential economic activities which can be conducted within mangroves forest. Importantly, recommendations on addressing some of the current issues and concerns such as grazing within mangrove forest and clearing of mangrove vegetation were shared. There was good dialogue and sharing of ideas between the Department and the Local Authorities on these areas.
- NAREI was able to share its plans for improvement in mangrove management along coastal areas, especially through more public awareness and information sharing now that there is a dedicated Community Development Officer.
- The communities recognized the importance of mangroves and their legal status as a protected species. There was a call for a balance between enforcement and sustainable use issues for the rural people who have been historically utilizing its many ecosystem services.
- The shrimp farmers of Region 6 agreed to organize themselves into a formal group that could be better engaged by NAREI for the mangrove management and sustainable use of the coastal resources.

1.4. Definition of Ecosystem Services

Ecosystem services are typically defined as the benefits that people obtain from the natural environment, including natural resources that underpin basic human health and survival needs, support economic activities and provide cultural fulfilment.

There are four standard categories of ecosystem services: *provisioning, regulating, cultural and supporting* services, defined as follows.[2]

- **Provisioning services:** The goods or products obtained from ecosystems such as food, freshwater, timber, fiber and other goods.
- **Regulating services:** The benefits obtained from an ecosystem's control of natural processes such as climate, water flow, disease regulation, pollination, and protection from natural hazards.
- **Cultural services:** The non-material benefits obtained from ecosystems such as recreation, spiritual values, and aesthetic enjoyment.
- **Supporting services:** The natural processes such as erosion control, soil formation, nutrient cycling, and primary productivity that maintain other services.

Additional details about the types of services under each category are provided in Appendix A.

[2] Millennium Ecosystem Assessment (MA). 2005. Synthesis Report. Island Press, Washington DC.

2. METHODOLOGY

2.1. Ecosystem Services Screening

A screening exercise was undertaken with the NDCs prior to field observations in order to identify a comprehensive list of the ecosystem services that are potentially present along coastal communities in Regions 5 and 6. This step does not attempt to consider the importance of the services to beneficiaries or the likelihood of the Project impacting them in the event of an unplanned oil spill; it simply asks whether a service is likely to be present or not in each costal area.

For a service to be considered present, it must meet two criteria:

1. Habitats present in the Study Area are believed to provide this service or are similar to habitats elsewhere that provide this service; and
2. People are believed to benefit from the service, either at the local, national, or global level, and/or the Project is expected to benefit from this service.

Appendix A provides the screening checklist that was used by the team when interviewing the NDCs. The table uses a standard list of ecosystem services adapted from internationally accredited sources.[3] All services identified as present or potentially present were then "screened in" to be considered when going into the field for observation, data collection, and mapping of the exact locations where such services exist.

PHOTO 1: INTERVIEWS WITH NDC MEMBERS AND LOCAL COMMUNITY

[3] World Resources Institute (WRI). 2013. Weaving Ecosystem Services into Impact Assessment: A Step-by-Step Method. WRI, Washington, DC.

2.2. Ecosystem Services Scoping

Following completion of the screening exercise, the team and members of the local community used the ecosystem services that were identified as present or potentially present as a guide for the field observations. This step aimed to:

- Establish a complete list of ecosystem service beneficiaries;
- Establish the value of ecosystem services to beneficiaries;
- Identify the habitats and resources that provide ecosystem services in the Study Area; and
- Identify the existing condition and trends of natural resources providing ecosystem services.

The descriptions and examples of "scoped-in" services for the Study Area, based on stakeholder input and field verification information, are provided in the scoping tables and broken down by NDC. During the engagements, the team, where appropriate, also asked for baseline data at the NDC level, including population statistics, numbers of beneficiaries utilizing each service or partaking in various livelihoods, incomes generated from livelihoods, and other socioeconomic baseline data. These data, when available, are captured in the overview of each Region, as well as in the detailed scoping tables. This information can also be found in the Liza Project GIS Database.

PHOTO 2: FIELD OBSERVATIONS WITH NDC MEMBERS, NAREI TEAM, AND LOCAL COMMUNITY

2.3. Ecosystem Services Prioritization

The ecosystem services prioritization has been designed to be consistent with international best practice, using the 2012 International Finance Corporation (IFC) Performance Standards (PS) as guidance. The prioritization process focuses on identifying services which are important to local stakeholders and difficult to replace, where loss or degradation of the service could adversely affect local communities. The prioritization process considered the following criteria:

a) **Importance of ecosystem services** to beneficiaries was assessed according to the following criteria and assigned a rating from low to essential based on:
   - Intensity of use – e.g., daily, weekly or seasonal use; quantitative data were used if available and relevant;
   - Scope of use – e.g., household versus community level, commercial use only, subsistence only or both;
   - Degree of dependence – e.g., contribution of fish to total protein in the diet; contribution of fishing to employment in the community; and
   - The importance expressed by stakeholders and beneficiaries, including cultural and historical importance.

The weight given to each of these components varied slightly depending upon the service, but the importance to stakeholders and beneficiaries take precedence over other criteria where the rating is not clear. Where a service was of greater or lesser importance to different stakeholder groups, two (or more) ratings were assigned so that impacts on these groups can be assessed individually.

b) **Availability of alternatives (replaceability):** Understanding the availability of spatial alternatives is critical to assessing the extent to which a community will be adversely impacted if that service declines due to Project activities. The 'replaceability' of a service was assessed according to the following criteria and assigned a rating from high (many alternatives) to low (few or no alternatives):
   - The existence of spatial alternatives, including both natural replacements (e.g., the replacement of one type of wild food with another) and man-made substitutes (e.g., availability of man-made items as an alternative to handicrafts);
   - The accessibility, cost and sustainability of potential alternatives, including a consideration of other users and the existing status and threats to the resource(s) providing natural alternatives to the service; and
   - Preference / appetite for and cultural appropriateness of alternative services.

After compiling information on the importance and replaceability of each service, these ratings were combined to assign a priority rating to the service (see Figure 2-1 below). **Ecosystem services *with high* or *critical* priority ratings are considered to be 'priority' ecosystem services.** As noted above, some services may have different importance ratings for different

beneficiary groups, and therefore may be rated 'priority' services for some beneficiaries but not for others.

FIGURE 2-1: ASSIGNING A PRIORITY RATING TO ECOSYSTEM SERVICES

		Replaceability of Service		
		High *(many spatial alternatives)*	**Moderate** *(some spatial alternatives)*	**Low or Not Replaceable** *(few to no spatial alternatives)*
Importance of Service to Beneficiaries	**Essential**	*High*	*Critical*	*Critical*
	High	*Medium*	*High*	*Critical*
	Moderate	*Low*	*Medium*	*High*
	Low	*Low*	*Low*	*Medium*

2.4. Ecosystem Services Validation

Following completion of the above described steps, it was decided to revisit each of the NDCs, VCs, CDCs, and TCs to:

- Validate that the information compiled was correct;
- Verify that the Coastal Resources Maps were accurate;
- Collect any new data relating to ecosystems benefits since the previous engagements; and
- Collect updated socioeconomic data.

During the validation exercises, the team presented the findings and maps and asked the stakeholders a series of questions, as detailed below:

- Is the information presented for your district (NDC/TC/CDC/VC) correct?
- If not, what do we need to change/adjust?
- Are the locations for the various services presented on the map correct?
- Are the main economic activities/livelihoods in the area the same as one year ago? If not, what has changed?
- Has there been any notable growth or decline in any particular sector? What sector? What has changed?
- Has there been any increase in coastal resources over the past year? What purpose and where?
- Has there been any new use of coastal resources within the area over the past year? What purpose and where?
- Has there been any change to previous mapped points?

- What is the general description of the change?
- What is the current population estimate or trend (increased or decreased over past year)? What is contributing to the trend?
- Are there any other notable socioeconomic data that you wish to have documented?

The responses received during the validation exercise are incorporated below, presented by region. Raw data as it was recorded can be found in Appendix E: Validation Data Summary. References within the data to changes over time (e.g., increase in population, decrease in fishing) refer to the time elapsed between the 2017/2018 original data collection and the 2019 validation exercise.

3. ECOSYSTEM SERVICES FINDINGS AND PRELIMINARY CONCLUSIONS

3.1. Overview of Findings

Based on the findings of the assessment, provisioning services were the primary service provided by the coastal ecosystem in Regions 5 and 6, accounting for 63.6 percent of the location-specific services identified in the two regions. The most common provisioning services identified include:

- Fish, shrimp, and crabs caught for subsistence or commercial sale;
- Annual and permanent cultivated crops grown for subsistence use and commercial sale;
- Agricultural and grazing, including livestock farming supported by coastal grassland and plants; and
- Animals hunted primarily for food (recreational hunting is covered separately under cultural services).

Cultural services were the second most prevalent ecosystem service, representing approximately 23.3 percent of the location-specific services identified in the three regions. The most common cultural services identified include:

- Cultural value placed on traditional practices such as use of a location for prayer services; and
- Use of natural spaces and resources for local tourism or local recreation, such as use of coastal walls for walking, coastal parks for relaxing, and beaches for recreational fishing;

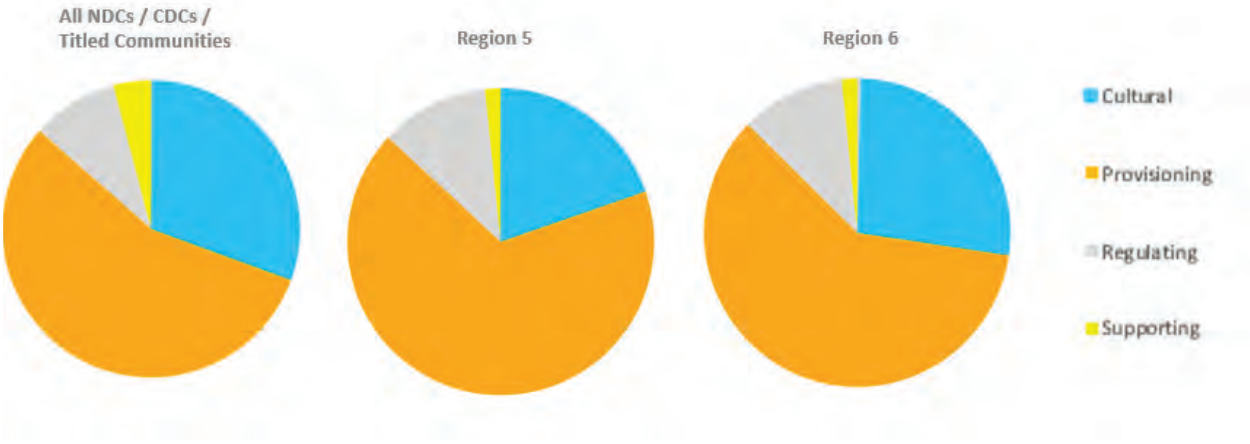
Regulating services were the least prevalent ecosystem services, representing approximately 11.3 percent of the location-specific services identified in the three regions. The most common regulating services identified include:

- Shoreline protection and the role of mangroves in protecting crops, buildings, recreation areas from waves, wind and flooding; and
- Shoreline protection along rivers.

Supporting services, which represented less than 2 percent, are intermediate ecological outcomes that are not directly used, but rather support other ecosystem services. The service “Habitat Provision” is typically an exception, which is sometimes valued as an “end-use” service by stakeholders in addition to its supporting role. Therefore, lack of identified supporting services is not atypical.

Figure 3-1 summarizes the distribution of identified ecosystem services across the four ecosystem service categories for Regions 5 and 6, as well as for all NDCs (including Regions 2 through 6).

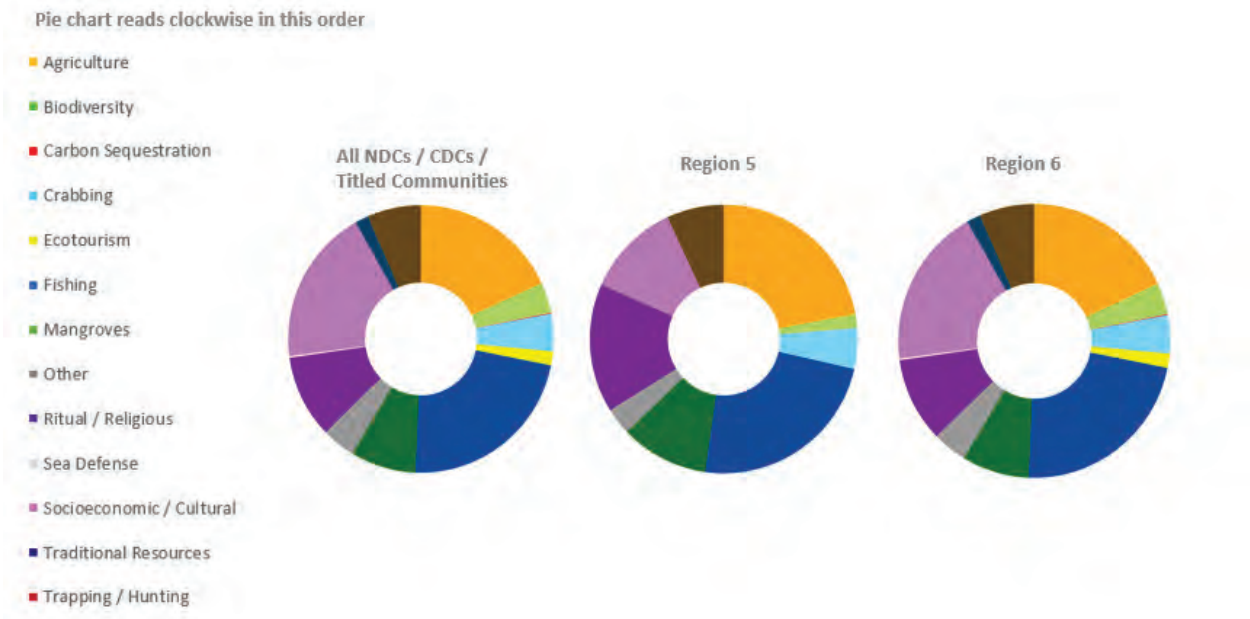
FIGURE 3-1: DISTRIBUTION OF ECOSYSTEM SERVICE CATEGORIES



NOTE: "All NDCs" pie chart includes Regions 1 through 6, which, when combined, indicates provisioning at 55.5 percent, cultural at 31 percent, regulating at 9.5 percent, and supporting at 4 percent.

Figure 3-2 summarizes the distribution of specific ecosystem service types across the categories. The service types match those used in the map books described herein.

FIGURE 3-2: DISTRIBUTION OF ECOSYSTEM SERVICE TYPES



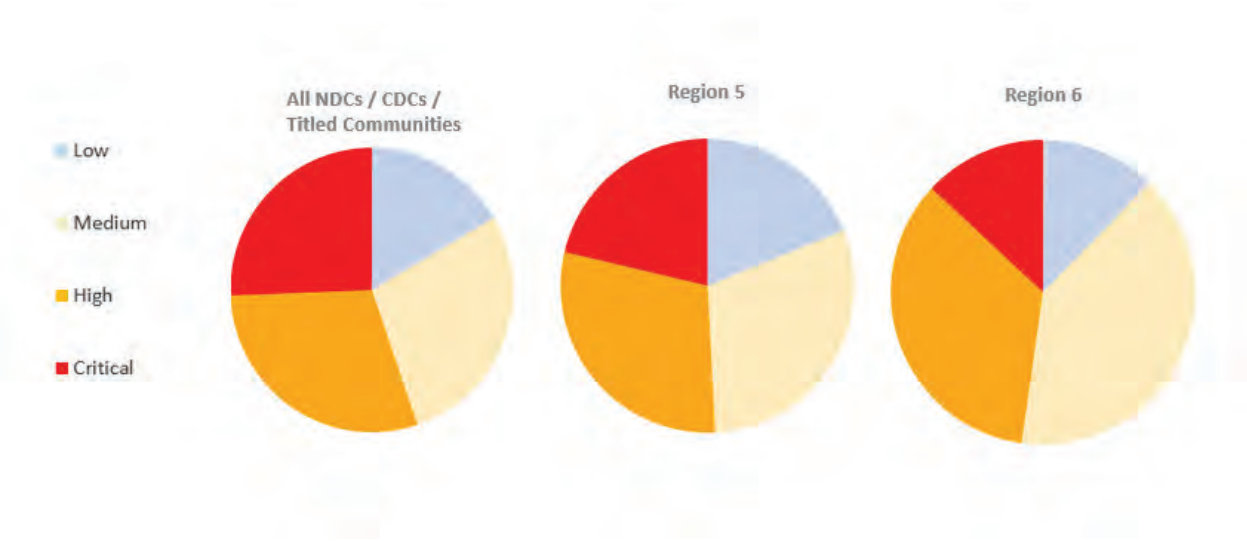
NOTE: "All NDCs" includes Regions 1 through 6, which, when combined, indicates fishing at 23 percent, socioeconomic/cultural at 19 percent, agriculture at 18 percent, ritual/religious at 10 percent, mangroves at 8 percent, trapping/hunting at 7 percent, crabbing at 5 percent, other at 4 percent, ecotourism and traditional resources each at 2 percent, and sea defense and carbon sequestration each at under 1 percent.

3.2. Summary of Findings by Region

Detailed findings for each identified ecosystem service, as well as priority ratings, are provided in Appendices B and C, and are summarized in Sections 4 and 5. As one of the primary goals of this study was to understand the relationship between coastal communities and the natural environment along the entire coast in Regions 5 and 6, the ratings vary widely depending upon the responses from each NDC. For example, in one NDC in Region 6, livestock farming along the coastal wall was reported to be medium priority, whereas in the same NDC at another location, the same service was considered a critical priority. Furthermore, some services may have different importance ratings for different beneficiary groups, and therefore may be rated as high priority services for some beneficiaries but not for others.

Figure 3-3 summarizes the distribution of priority ratings for the location-specific ecosystem services identified.

FIGURE 3-3: DISTRIBUTION OF ECOSYSTEM SERVICE PRIORITY RANKINGS



NOTE: "All NDCs" includes Regions 2 through 6, which, when combined, indicates critical at 26 percent, high at 28 percent, medium at 28 percent, and low at 18 percent.

For overview and general comparison purposes only, the **highest priority rating for each service in each region is included in the table below.** As described in the methodology, services with *high* or *critical* priority ratings are considered to be 'priority' ecosystem services and would be a primary focus in the event of oil spill response. The overview table also helps to visualize which services did not feature as having importance to beneficiaries across the regions.

Table 3-1 summarizes the highest priority rating assigned in each region for each ecosystem service and Figure 3-4 shows a map of where all of the 'priority' (i.e., critical or high rating) ecosystem services are located, regardless of type or region.

TABLE 3-1: HIGHEST ECOSYSTEM SERVICE PRIORITY RATINGS FOR EACH REGION

Ecosystem Service Type	Region 5	Region 6
Provisioning Services		
Marine aquaculture and wild-caught fish & shellfish (food)	Critical	Critical
Cultivated crops	High	High
Livestock farming	Critical	Critical
Food: wild plants and honey	Medium	Low
Food: wild meat	Medium	High
Biomass fuel	N/A	N/A
Timber and wood products	N/A	N/A
Non-wood fibers and resins	N/A	N/A
Traditional medicine	N/A	N/A
Freshwater for household use	N/A	N/A
Freshwater for irrigation use	N/A	Medium
Aquatic transportation/ports	Critical	Critical
Social/Economic Commercial activity	Critical	Critical
Social/Housing	Low	High
Regulating Services		
Global climate regulation	N/A	N/A
Regulation of water timing and flows	N/A	N/A
Flood regulation	Critical	High
Erosion regulation	N/A	N/A
Shoreline protection / Mangrove	Critical	High
Pest regulation	N/A	N/A
Pollination	N/A	N/A
Disease regulation	N/A	N/A
Cultural Services		
Cultural, religious, or spiritual value	Critical	Critical
Aesthetic value of natural landscapes, historical landmarks	N/A	N/A
Tourism and recreation	Critical	Critical
Non-use value of biodiversity	N/A	N/A
Supporting Services		
Habitat provision, coastal protection	N/A	High
Primary production, biodiversity	N/A	N/A
Nutrient cycling	N/A	N/A
Water cycling	N/A	N/A
Soil formation	N/A	N/A

N/A – Not applicable; service not identified in the region

FIGURE 3-4: IDENTIFIED LOCATIONS OF CRITICAL AND HIGH PRIORITY ECOSYSTEM SERVICES – REGIONS 5-6

3.3. Use of Findings

The services rated as "critical" or "high" priority (which constitute Priority Services) priority services within the NDCs are summarized below:

TABLE 3-2: SERVICES RATED AS "CRITICAL" OR "HIGH" PRIORITY WITHIN THE NDCs—REGION 5

NDC Name	Type of Service	Brief Description
Woodlands/Farm	Provisioning	Commercial and subsistence fishing along the coast and in mangroves
	Provisioning	Grazing of livestock Fairfield to Bath, and High Dam to Drill
	Cultural	New beach at Taymouth Manor used for recreational purposes
Hamlet/Chance	Provisioning	Fishing and fisheries landing at the Mahaicony River (Old Bridge); shrimping and crabbing in the mangroves and swamps
	Provisioning	Cultivation of cash crops and fruits throughout the NDC
	Regulating	Shoreline protection with mangrove forest protecting from the impacts of the Mahaicony River
Mahaicony/Abary	Cultural	There is a large beach at Good Faith that is frequented by persons from throughout Region 5 for recreational and religious purposes.
	Provisioning	Commercial and subsistence fishing, shrimping, and crabbing along the coast and in mangroves with fishery landing site at Abary River Mouth
	Provisioning	Grazing of cows, goats, and sheep and pigs on the shore in the mangroves and on adjacent lands.
	Regulating	Extensive area of mangrove forest on the shoreline
Profit/Rising Sun	Cultural	Locals from throughout the West Berbice area utilize the Belladrum Beach to relax, swim, exercise, and socialize daily. More persons visit on weekends including Hindus for religious purposes.
	Cultural	A crematorium at Weldaad is used by the residents of the NDC and Region.
	Provisioning	Boat landings at Belladrum, Profit, and Foulis are used by many fisherfolk.
	Provisioning	Grazing of cows, goats, and sheep and pigs on the shore in the mangroves and on adjacent lands
	Regulating	Existing and new growth of mangroves protecting the shoreline from the impacts of the sea
Seafield/Tempie	Provisioning	Fisherfolk use the fishing landing sites at Jacoba and Seafield and local communities fishing and shrimping in mangroves and swamps
	Provisioning	Grazing of cows, goats, and sheep and pigs on the shore in the mangroves and on adjacent lands
Union/Naarstigheid	Cultural	Locals utilize Onverwagt, Bush Lot and Hopetown for recreational and religious purposes. Bush Lot has a horse racing track close to the shore that is

NDC Name	Type of Service	Brief Description
		used by thousands of persons at least each quarter.
	Provisioning	Commercial and subsistence fishing along the coast and in mangroves with fishery landing site at Bush Lot
	Regulating	Existing and new growth of mangroves protecting the shoreline from the impacts of the sea and drainage pump at Trafalgar aids in flood prevention
Bath/Woodley Park	Provisioning	Fishing and fisheries landing at the No. 12 Village outfall; fishing, shrimping, and crabbing in mangroves and swamps
	Provisioning	Cash crop cultivation in close proximity to the sea dam and on the façade throughout the NDC; animals are also grazed along the shoreline and in mangroves throughout the NDC
	Cultural	Local Hindu religious activities are practiced at Bath, Experiment, and No. 11 & 12
Woodlands/Bel Air	Provisioning	Cash crop cultivation in close proximity to the sea dam and on the façade throughout the NDC
	Provisioning	Cows, goats, and sheep on the shore in the mangroves and on adjacent lands
Zeelugt/Rosignol	Cultural	Religious activities held at three temples located at the shore at Rosignol and No. 2 Village
	Provisioning	Processing facility at Rosignol that processes Manicole Palm for export
	Provisioning	Commercial and subsistence fishing along the coast and in mangroves with fishery landing sites at Rosignol, De Edward, Victory Dam, and Bennet Dam
	Provisioning	Processing facility at Rosignol that processes much of the landed fish catch for export
	Provisioning	Boat building at Victory Dam and De Edward
	Provisioning	Cows, goats, donkeys, and sheep are grazed along the shoreline and in the mangroves
	Provisioning	River transportation wharf used by more than 1,000 persons daily and Berbice River Bridge used by thousands of Guyanese daily

3.3.1. Provisioning Services

The primary ecosystem service along the coastal zones in Region 5 is fishing in the sea and in the mangroves along the coast. The main commercial products from the sea include many types of catfish, snapper, bangamary, butterfish, mullet, snook, and trout. Some shrimping also occurs in selected areas, sometimes close to the shore. Mangroves provide an important nursery function and provide habitat for a number of commercial fish and shellfish species. The natural ponds and drainage channels receive ocean water during the spring tide, which contains young shrimp and fish species that are looking to migrate into less salty water until they mature into adulthood. These are harvested by persons for both commercial and subsistence purposes.

Crab catching is also done in the mangrove areas. Crabs are caught in the period July to August during their spawning season in areas where they are available. Some persons catch crabs throughout the year by hunting them in the mangroves. The sea crabs are found in small puddles left on the mudflat when the water recedes. The system of rivers is also critical to the growth of the rich biodiversity of the sea. The Mahaica, Mahaicony, Abary, and Berbice rivers provide spawning grounds, shelter, and nutrients for aquatic life.

Housing is the main activity on the coastland, followed by agriculture. Communities along the coast engage in subsistence farming of vegetables and fruits. Commercial farms grow sugarcane, staple grains (including rice), coconuts, and cash crops. Some of the cash crop farming occurs along the sea defense area.

The scale of livestock farming ranges considerably across communities in Region 5, depending on the level of crop cultivation - since this restricts grazing grounds. Some households keep a few chickens, pigs, sheep, goats, and cattle for household consumption and sale of any excess product. Larger operations can have dozens of heads of cattle and may be either dual purpose or specialize in dairy or beef. There is also large-scale rearing of sheep and goats, which primarily graze at the shoreline areas.

A limited number of residents in Region 5 are engaged in honey production. While mangroves provide the habitat for honey production, it is not common in Region 5 despite the fact that many people interviewed understood how honey production could be a major source of income. The bees provide a critical service of pollination for the cash crop farmers whose produce is highly valued in the economy. However, there is only one large producer and a few smaller ones who are making use of this service.

A small number of households utilize various types of meat (including iguana, etc.) for subsistence, whether they hunt it themselves or purchase it. Persons are engaged in hunting of wild animals which are sold throughout the region. Bird hunting is common by wire, shotgun, or nets and is a major source of food or income in the area, with birds sold openly in local markets.

Some wood and non-wood fibers, including mangrove trees and coconut husks, are used in handicrafts and household items in some of the coastal communities, although this is not extensive. Mangrove bark is used in a limited amount for tanning. The buttonwood tree of the mangrove forests is used by the cash crop farmers as a prop for vines and fence posts. Fisherfolk use the white mangrove for fish poles, which they refer to as “cedar.”

Potable water is available for communities from groundwater and many residents harvest rainwater. A few persons rely on the canals for household purposes. Transportation is mainly land-based along the coast, except for a few instances when the sea coast is used.

3.3.2. Regulating Services

The majority of the shoreline of Region 5 is a mixture of mud or sand/shells. This shoreline has a first line defense of mangroves to buffer the wave action of the sea. Mangroves play a critical role in maintaining coastal stability and protecting inland areas from waves, wind, and flooding from storms. Short tracks of riprap sea defense exist in a few of the NDCs.

The NAREI mangrove re-growth program has resulted in significant mangrove population in the Bel Air – Mon Choisi area. However, these have increased concerns over the nuisance of sand flies and mosquitoes. Residents are aware of the importance of mangrove in coastal protection and report that they have reduced activities that can negatively affect growth.

Natural shoreline protection services can be replaced by man-made engineering solutions, if needed. However, these are generally expensive to build and maintain over time.

3.3.3. Cultural Services

The Hindu population visits the shoreline for their traditional daily or weekly early morning prayers. More recently, daily visits have been reduced for the majority, with most persons conducting prayers on Fridays or Sundays at the places with beaches or access to the shoreline. The Hindu tradition of planting prayer flags at various points along the shoreline, typically associated with shore access, is a significant practice. On occasions, the beaches will be used by Christians for baptism services. These natural spaces with cultural, spiritual or religious importance are considered “living heritage,” particularly for Hindus.

There are a few areas along the shoreline which locals utilize for recreation, including walking, running, kite flying, and general recreation. Some persons will venture out of the NDC or will have visits from other NDCs, depending on the shoreline or beach in the area. Views of natural landscapes and landscape features, including river and ocean views, are highly valued by local communities and visitors.

3.3.4. Supporting Services

The natural processes such as soil formation, nutrient cycling, erosion control, and primary productivity are likely in the region. This is evidenced by the excessive expanse of natural sea defense supported by mangroves. The processes of soil formation and nutrition cycling are constant in the region, as areas are constantly being eroded or built up by sediments. The mangrove growth rapidly follows the buildup of sediments giving further protection to the natural shore. However, it should be noted that during the engagement, the existence of these supporting services was not reported.

3.4. Use of Findings

The findings of the ecosystem services assessment provide an improved understanding of the specific locations where priority ecosystem services are present along the coast, and this information can be used to support the update of EEPGL’s OSRP (i.e., with respect to prioritizing response activities in the event of an oil spill) to include Regions 5 and 6, if necessary. In addition, the data can be leveraged for future EIAs and for ethnographic analysis, where understanding how stakeholders view their relationship with the natural environmental may be required.

4. REGION 5 COASTAL ECOSYSTEM SERVICES FINDINGS

4.1. Population

Population estimates are based upon data provided by NDC leadership during the ecosystem services-related engagements.

TABLE 4-1: POPULATION ESTIMATES - REGION 5

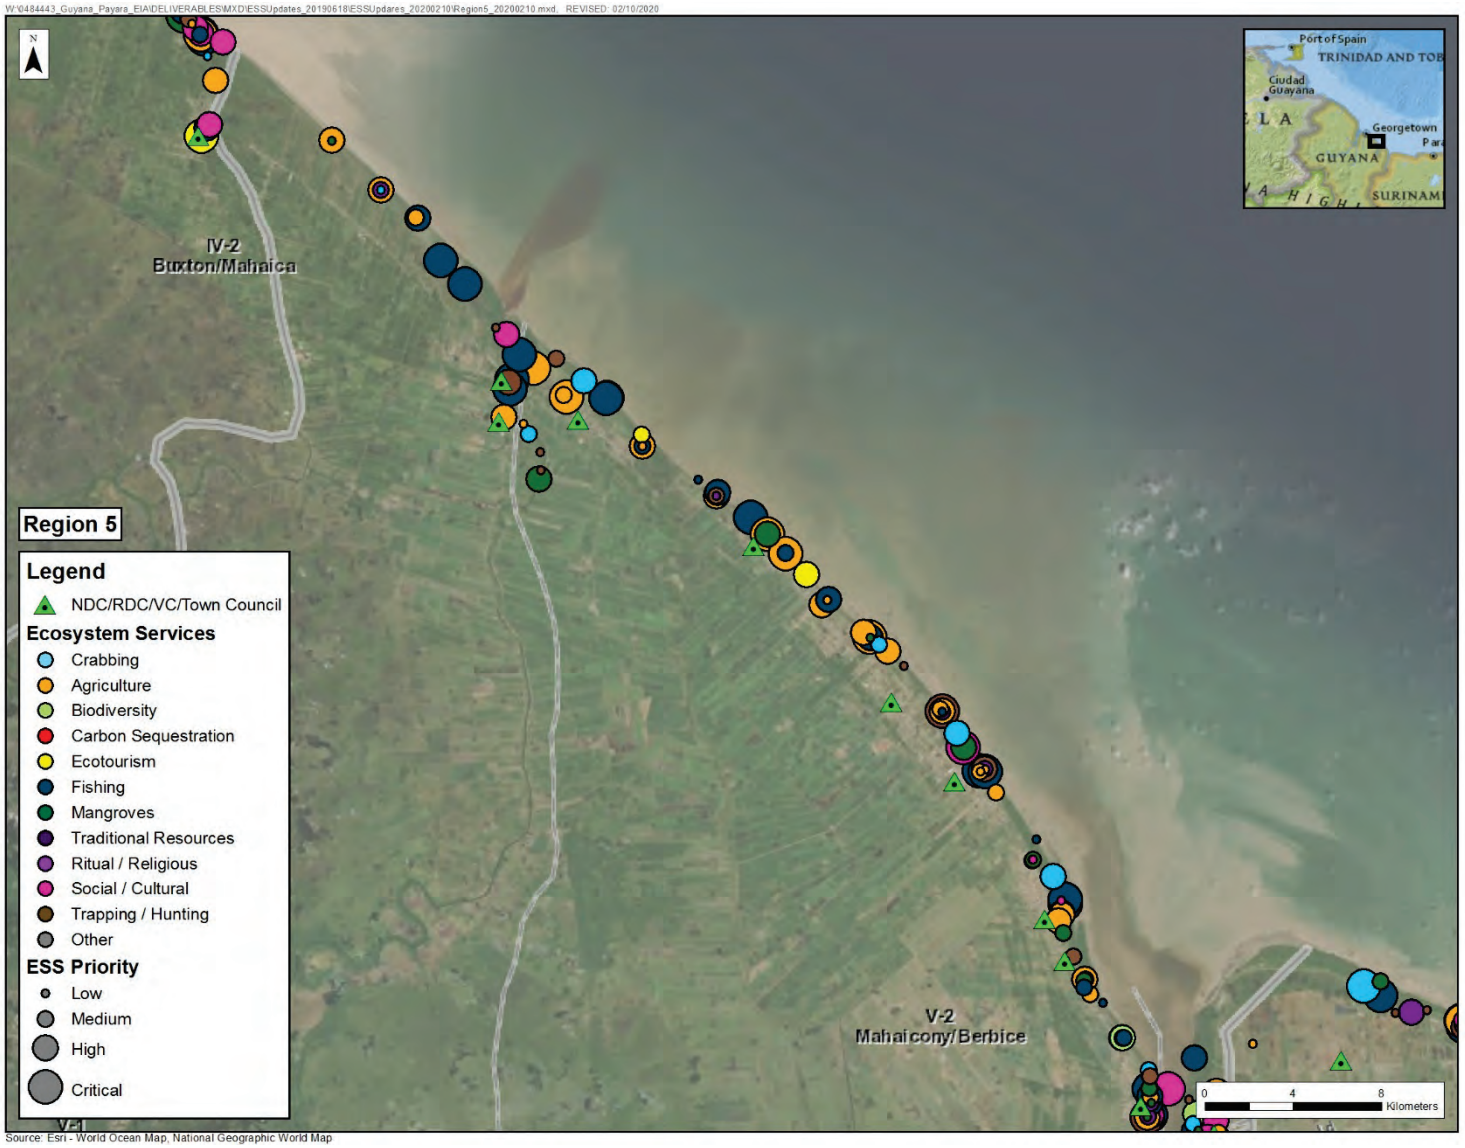
NDC Name	Population Estimate
Woodlands/Farm	20,000
Hamlet/Chance	1,500
Profit/Rising Sun	7,500
Mahaicony/Abary	8,000
Union/Naarstigheid	15,000
Seafield/Tempie	5,000
Bath/Woodley Park	18,000
Woodlands/Bel Air	1,200
Zeelugt/Rosignol	2,000

4.2. Detailed Findings

Detailed information on all ecosystem services scoped in for the Study Area are listed by NDC and provided in the scoping tables located in Appendix B.

Figure 4-1 shows the shows the ecosystem service locations identified by the Region 5 NDC members and local communities during the engagement process and which were mapped during the field observations. They are displayed by ecosystem service (color of symbol) and priority (size of symbol)—critical, high, medium, or low—utilizing the methodology outlined in Figure 2-1. Detailed maps by NDC are provided in the ecosystem services map book (appended to this report).

FIGURE 4-1: IDENTIFIED LOCATIONS OF ECOSYSTEM SERVICES – REGION 5



5. REGION 6 COASTAL ECOSYSTEM SERVICES FINDINGS

5.1. Population

Population estimates are based upon data provided by NDC leadership during the ecosystem services-related engagements.

TABLE 5-1: POPULATION ESTIMATES—REGION 6

NDC Name	Population Estimate
Ordinance/Fort Lands	8,500
Kintyre/No.37	1,000
Gibraltar/Fyrish	5,600
Kilcoy/Hampshire	25,000
Rose Hall Town Council	15,000
Port Mourant/John	16,000
Bloomfield/Whim	4,000
Lancaster/Hogstye	2,500
Black Bush Polder	4,500
Good Hope/No.51	2,354
Macedonia/Joppa	3,535
Bushlot/Adventure	6,000
Maida/Tarlogie	3,500
No. 52/No. 74	20,000
Corriverton Town Council	18,000

5.2. Summary of Findings

The services rated as “critical” or “high” priority (which constitute Priority Services) within the NDCs are summarized below:

TABLE 5-2: SERVICES RATED AS “CRITICAL” OR “HIGH” PRIORITY WITHIN THE NDCs—REGION 6

NDC Name	Type of Service	Brief Description
Ordinance/Fort Lands	Provisioning	Wharf at Canje Bridge facilitating transport of building supplies (stone, steel and sand) and boat repairs, sawmill at Sheet Anchor
	Provisioning	Fishing and fisheries landing at Sheet Anchor, Cumberland and Seawell
	Provisioning	Significant livestock population grazing along the shore area
	Provisioning	Informal housing at Sheet Anchor and Cumberland

NDC Name	Type of Service	Brief Description
	Supporting	Mangroves provide habitats for wild bees, birds, crabs, fish, and shrimp
Kintyre/No.37	Provisioning	Numerous ponds both natural and man-made being used for shrimp and fish including tilapia and mullet
	Provisioning	Significant crab catching throughout the year
	Provisioning	Significant grazing of livestock along the shore area
	Provisioning	CXG Shorebase in Seawall and Wharf on Crab Island
	Provisioning	Clay along shore area harvested for clay brick making
	Regulating	Extensive area of mangrove forest used as shoreline and coastal protection; drainage pumps are installed at Borlam Dam
	Cultural	Cemetery located in close proximity to the seashore
Gibraltar/Fyrish	Provisioning	Natural and man-made shrimp/fish ponds on the shore area throughout the NDC
	Regulating	Extensive area of Mangrove forest used as shoreline and coastal protection
	Provisioning	Animal grazing pastures in mangroves and in pasturelands in the NDC
Kilcoy/Hampshire	Provisioning	Significant crab catching throughout the year
	Provisioning	Natural and man-made shrimp/fish ponds on the shore area throughout the NDC
	Provisioning	Large landing site at Albion for commercial artisanal fishing boats
	Provisioning	Large-scale poultry farms along the sea shore at Kilcoy and Chesney; cattle also grazed along the seashore and in mangroves
	Provisioning	Cultivation of cash crops and fruits along the shoreline
	Regulating	Extensive area of Mangrove forest used as shoreline and coastal protection
Rose Hall Town Council	Cultural	The Rose Hall beach is utilized for recreational and religious purposes by hundreds of persons on a daily basis
	Cultural	The religious activities of the Hindus are held at the beach, which provides space and privacy
	Provisioning	Beach used as landing site for fishing boats
	Provisioning	Pin seine fishing conducted along shoreline area by locals
Port Mourant/John	Provisioning	Significant livestock population grazing along the shore area
	Provisioning	A large poultry farm exists at John with over 5,000 chickens
	Provisioning	Natural and man-made shrimp/fish ponds on the shore area throughout the NDC with

NDC Name	Type of Service	Brief Description
		a fishing landing site at the Port Mourant Outfall
	Cultural	Babu John Crematorium at Tain has national significance
Bloomfield/Whim	Provisioning	Natural and man-made shrimp/fish ponds on the shore area throughout the NDC and boats dock along coast
	Provisioning	Cash crop cultivation in close proximity to the sea dam at Whim & Letter Kenny
	Provisioning	A Guyana Water Incorporated (GWI) water well and pump system is located in Letter Kenny in close proximity to the seashore
	Regulating	Mangrove forest covers most of the shore with new growth in some areas
	Cultural	Religious activities are held at Whim to Letter Kenny, including a cemetery
Lancaster/ Hogstye	Provisioning	Natural and man-made shrimp/fish ponds on the shore area throughout the NDC and fishing boats use Hogstye/Adventure outfall
	Provisioning	Cash crop cultivation in close proximity to the sea dam throughout the NDC
Black Bush Polder	Regulating	Two drainage outlets at No. 43 and at Adventure
Good Hope/No.51	Provisioning	Natural and man-made shrimp/fish ponds on the shore area throughout the NDC
	Provisioning	Catching of crabs, fish and shrimp in the mangrove forest on a weekly basis
	Provisioning	Hunting of iguanas in mangroves for meat and for sale by persons from the NDC and wider Region 6
	Regulating	Mangrove coverage is increasing throughout and is important to protecting the shoreline
Macedonia/Joppa	Provisioning	Significant boat building at No. 43
	Provisioning	Livestock grazing along the shore area throughout the NDC
	Provisioning	Fishing and fisheries landing at No. 43 and Eversham, and fishing and crabbing in mangroves and fish ponds
	Regulating	Extensive area of Mangrove forest used as shoreline and coastal protection
Bushlot/Adventure	Regulating	Two drainage outlets at No. 43 and at Adventure
	Provisioning	Cash crop cultivation in close proximity to the sea dam on private lands and on reserves at Bushlot–Friendship
	Provisioning	Fishing and crabbing in mangroves, swamps, and communal fish ponds; privately owned shrimp ponds and landing sites for commercial artisanal fishing boats at Adventure and Bushlot/Kildonan

NDC Name	Type of Service	Brief Description
	Cultural	Recreation and religious activities at the Bushlot beach by hundreds of persons on a weekly basis
Maida/Tarlogie	Provisioning	Natural and man-made shrimp/fish ponds on the shore area throughout the NDC; crabbing in the mangroves for sustenance and recreation
	Regulating	Extensive area of Mangrove forest used as shoreline and coastal protection
	Provisioning	Grazing of more than 1,000 animals on the dam and in the mangroves at Ellington Park, Philippi and Kilmarnock; there are also small farms adjacent to the sea dam where cash crops and fruits are planted
	Provisioning	Boats landing at Tarlogie, Maida and Kilmarnock
No. 52/No. 74	Provisioning	Significant commercial fishing and fisheries landing at No. 66 and No. 65 and catching fish, shrimp, and crabs in mangroves and along the shoreline
	Provisioning	Construction of a fish processing plant approximately 10 meters from the No. 65 Outfall
	Provisioning	Cash crop cultivation along most areas of the shore and on sea dam on private lands with coconuts and other crops
	Provisioning	Significant boat building activities at No. 66
	Cultural	Significant recreational activities at the No. 63 beach—the most popular and widely used beach in the country—as well as at No. 69 and No. 70 beaches
	Cultural	Religious activities along the shoreline of the NDC, especially at No. 63 and No. 73 villages
Corriverton Town Council	Provisioning	Wharves facilitate the movement of people and cargo between Guyana and Suriname daily, as well as between the Region and other parts of Guyana
	Provisioning	Significant livestock population grazing along the shore area
	Provisioning	The shoreline at the central area of the Township (No. 78 Village) is utilized for recreational purposes.
	Provisioning	Significant fishing and fisheries landing, and boat building, at No. 79 and other areas
	Provisioning	Informal housing (squatting) along the shoreline of Line Path, Dukestown, Scottsburg, and No. 78 and No. 79 villages
	Cultural	Religious activities held in the area at Line Path, Scottsburg, and Spring Garden

NDC Name	Type of Service	Brief Description
	Cultural	Tour operators who provide trips along the Corentyne River with fishing options

5.2.1. Provisioning Services

The primary ecosystem service along the coastal zones in Region 6 is fishing in the sea and along the shore in close proximity to the coastal mangroves. The main commercial products from the sea include many types of catfish, snapper, bangamary, butterfish, mullet, snook, trout, and 'sardines'[4]. There are almost 1,000 fishing boats in the region, making the fishing occupation a critical one for the economy. The sardines are caught in the Corentyne River in seasons. The fisherfolk utilized the Chinese seine for shrimping in the Ocean. Coastal shrimping is done by the use of small seines pulled by two persons on the near shore where sandy beaches occur.

The abundant mangrove forest provides an important nursery function and habitat for a number of commercial fish and shellfish species including tilapia, mullet, shrimp, and the sherriga. A widespread practice is allowing seawater to flow into ponds, where it is kept for the growth of black belly shrimp and some fish species. Ponds are both natural and man-made and the species harvested are in much demand by the local people. This practice is dominant throughout the region.

Crab catching is also done in the mangrove areas. Crabs are caught in the period July to August during their spawning season in areas where they are available. Some persons catch crabs throughout the year by hunting them in the mangroves. The sea crabs are found in small puddles left on the mudflat when the water recedes. The system of rivers is also critical to the growth of the rich biodiversity of the sea. The Mahaica, Mahaicony, Abary, and Berbice Rivers provide spawning grounds, shelter, and nutrients for aquatic life.

Region 6 is a major agricultural production hub, with its farmlands extending to the shoreline with cultivation of cash crops, fruits, and coconuts. Agriculture plays a dominant role in the economy, with much of the produce taken to Georgetown. Many farmers also keep livestock including pigs, sheep, goats, chickens, and ducks. Some households keep a few of these animals in their yards for household consumption and sale of any excess product. Larger operations can have dozens of heads of cattle and may be either dual purpose or specialize in dairy or beef. A lot of grazing occurs along the shoreline area, especially by sheep and goats. Some farmers graze their animals in the backlands during the out of crop period for rice, but once cultivation recommences, these are returned to the shore.

In this region, only a small group of people take advantage of the numerous benefits of the mangroves. Many persons are afraid of the bees and keep away from them. The bees provide a critical service of pollination for the cash crop farmers, whose produce is highly valued in the economy but undervalued in the community.

[4] The species is referred to as sardine by the locals but may not be the sardine species.

Many persons in the various NDCs hunt iguanas and other form of wildlife. In Corriverton, rabbits are hunted for their meat, along with other small mammals that move to the shoreline from the sugar cultivation areas. The hunting of shorebirds with nets, wire, and shotgun is a significant activity for locals. The bird meat is normally sold in the market and is in high demand, especially from overseas-based Guyanese returning home. However, this activity is treated as illegal in the No. 63 Beach area and hunters can be arrested. Bird hunting is more prevalent on remote mudflats where birds gather to feed. Some birds are also captured at the fish ponds, where they feed on the fish and shrimp.

5.2.2. Regulating Services

For most of the region, there is a naturally-built sea defense consisting of a mixture of clay or sand/shells. Most of this shoreline has as a first line of defense in the form of the mangroves - to buffer wave action. The large expanse of mangroves plays a critical role in maintaining coastal stability and protecting inland areas from waves, wind, and flooding from storms. The shoreline is being eroded in some areas while accretion is evident in others, bolstered by new mangrove growth. Short tracks of concrete and riprap sea defense exist in a few NDCs, where the wave action would have broken down the natural sea defense.

The NAREI mangrove re-growth programs are active in a few of the NDCS of Region 6, in areas such as Wellington Park. Some re-growth areas are being affected by erosion within this region. There are plans for extending mangrove restoration activities within the region and the mangrove restoration project has been well received by the NDCs and accepted by many locals; as such, activities which could be detrimental to mangroves have been drastically reduced.

5.2.3. Cultural Services

The region has the most popular beach in the country, the No. 63 Beach, which is utilized daily and especially on weekend for recreational purposes. It is frequented by thousands of persons from throughout the country on Easter and other holidays. It is also utilized by Hindus and Christians for various spiritual and recreational purposes. There are many other locations that are frequented by the Hindu population for their traditional daily early morning prayers and religious functions. Most persons frequent the sea or areas close to the sea on Fridays or Sundays. In a few of the NDCs, there are temples in close proximity to the sea that are frequented on a regular basis. These natural spaces with cultural, spiritual or religious importance are considered “living heritage,” particularly for Hindus. The most prominent of these is the Hindu tradition of planting prayer flags at various points along the shoreline – most typically associated with shore access.

The community recognizes the value of their beaches and shoreline areas within their NDCs which are used for recreation, including walking, running, kite flying, and general socialization. Many persons will visit areas outside of their NDC to locations that provide better access to the shoreline with beaches for their own purposes. Views of natural landscapes and landscape features, including river and ocean views, are highly valued by local communities and visitors. The Town Council of Rose Hall Town has plans to invest in its beach that is a popular spot for

recreational activities. The Town Council of Corriverton has plans to erect a boardwalk along a portion of its sea defense to promote tourism in the town. Further improvements to facilitate tourism are planned for the No. 63 Beach.

5.2.4. Supporting Services

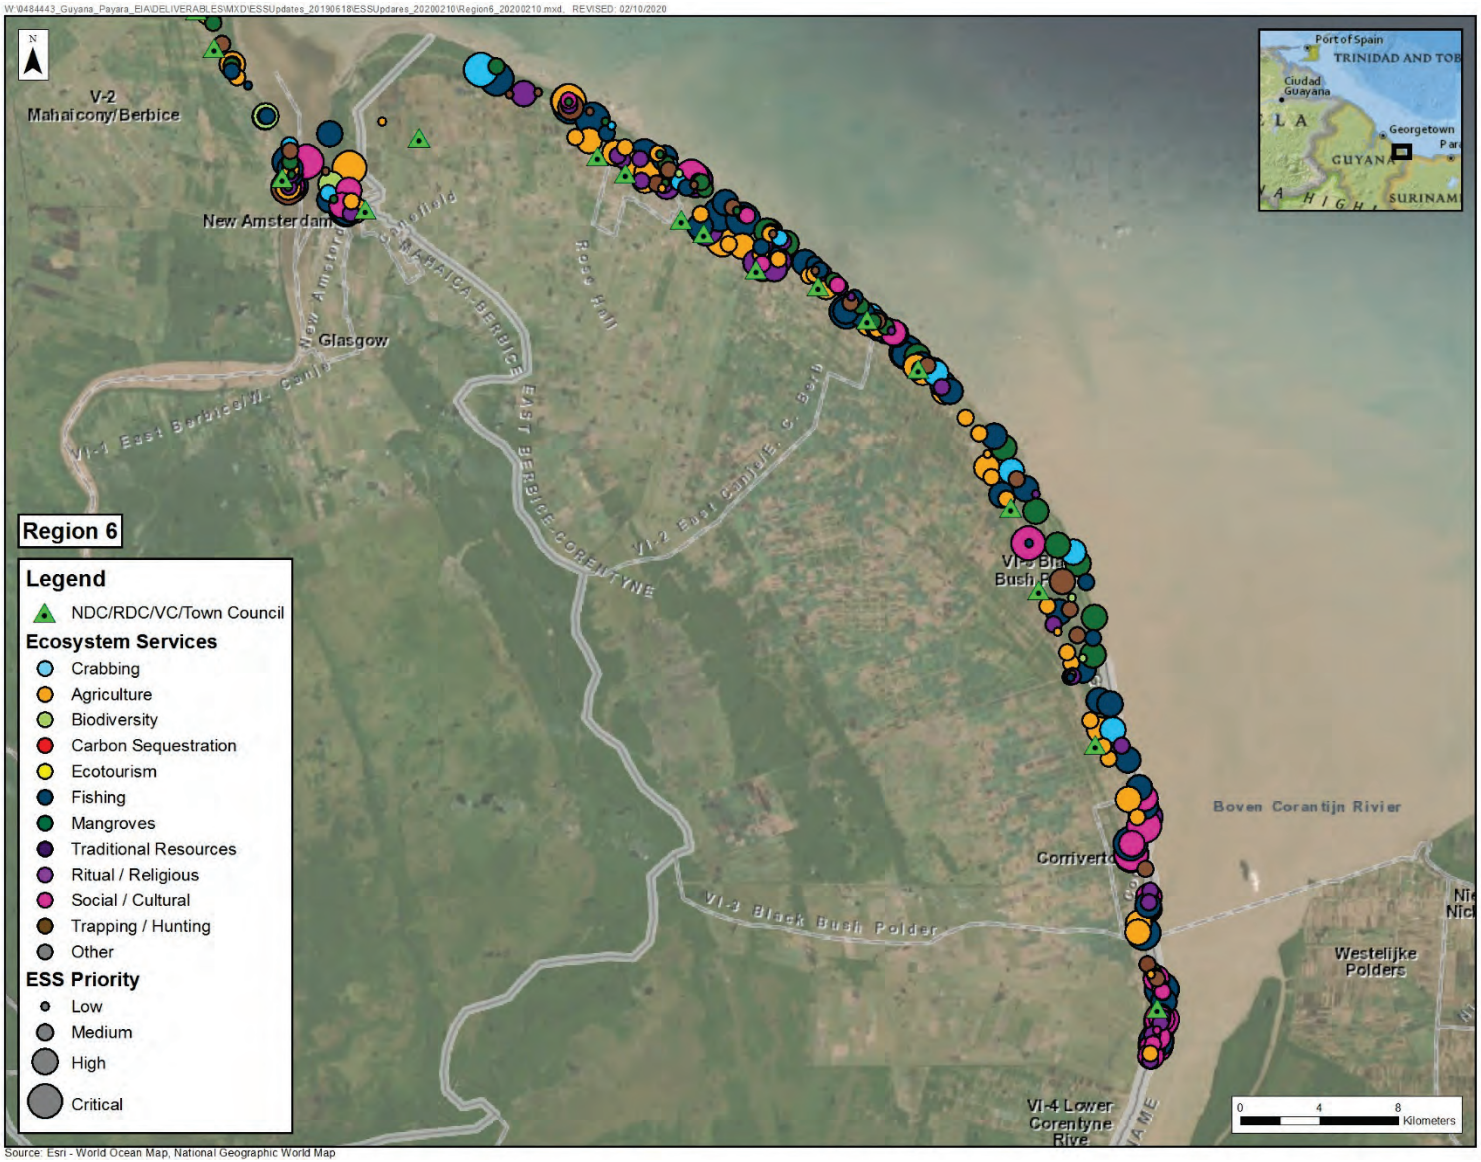
The natural processes such as soil formation, nutrient cycling, erosion control, and primary productivity are likely in the region. This is evident by the excessive expanse of natural sea defense supported by mangroves. The processes of soil formation and nutrition cycling are constant in the region, as areas are constantly being eroded or built up by sediments. The mangrove growth rapidly follows the buildup of sediments, giving further protection to the natural shore. However, it should be noted that during the engagement, the existence of these supporting services was not reported.

5.3. Detailed Findings

Detailed information on all ecosystem services scoped in for the Study Area are listed by NDC and provided in the scoping tables located in Appendix C.

Figure 5-1 shows the ecosystem service locations identified by the Region 6 NDC members and local communities during the engagement process and which were mapped during the field observations. They are displayed by ecosystem service (color of symbol) and priority (size of symbol) – critical, high, medium, or low – utilizing the methodology outlined in Figure 2-1. Detailed maps by NDC are provided in the ecosystem services map book (appended to this report).

FIGURE 5-1: IDENTIFIED LOCATIONS OF ECOSYSTEM SERVICES – REGION 6



-Page Intentionally Left Blank-

APPENDIX A

Screening Checklist

-Page Intentionally Left Blank-

Ecosystem Service	Description, Examples
Provisioning Services	
Food: wild-caught fish and shellfish & aquaculture	Fish caught for subsistence or commercial sale; Fish, shellfish, and/or plants that are bred and reared in ponds, enclosures, and other forms of freshwater or saltwater confinement for harvesting
Food: wild plants, nuts, mushrooms, fruit, honey	Fruit, nuts, wild plants, etc. collected in natural areas for consumption or sale
Food: wild meat	Animals hunted primarily for food (recreational hunting is covered separately under cultural services)
Food: cultivated crops	Annual and permanent crops grown for subsistence use and commercial sale
Biomass for livestock production	Sedentary and nomadic livestock farming supported by native forage plants
Biomass fuel	Wood, dung and plant matter collected for charcoal or fuel
Timber and wood products	Wood collected for local use or for sale as timber, wood pulp, paper – wood is used in house construction (importance varies by community)
Non-wood fibres and resins	For example, cane, palm, straw, cotton, hemp, twine and rope, natural rubber
Freshwater - household use	Freshwater for bathing, drinking, laundry, household use
Freshwater - irrigation & industry	Freshwater for irrigation or industrial use
Natural medicines, pharmaceuticals	Natural medicines, biocides, food additives, pharmaceuticals and other biological material for commercial or domestic use
Ornamental resources	For example, pelts, carved or decorative animal products, live animal trade
Genetic resources	Genes and genetic information used for animal breeding, plant improvement, and biotechnology
Regulating Services	
Regulation of air quality	The influence ecosystems have on air quality by extracting chemicals from the atmosphere (i.e., serving as a “sink”) or emitting chemicals to the atmosphere (i.e., serving as a “source”)
Climate regulation: global	Vegetated areas sequester CO_2, with implications for global climate change
Climate regulation: local	Regulation of temperature, shade air, and quality by vegetated areas
Regulation of water timing and flows (including flood regulation)	Influence ecosystems have on the timing and magnitude of water runoff, flooding, and aquifer recharge
Water purification and waste treatment	Role played by vegetation in the filtration and decomposition of organic wastes and pollutants and the assimilation and detoxification of compounds
Shoreline protection	Role of natural habitats (e.g., wetlands, beaches, reefs) in protecting crops, buildings, recreation areas from waves, wind and flooding from coastal storms
Fire regulation	Regulation of fire frequency and intensity (e.g., dense forest can provide firebreaks)

Ecosystem Service	Description, Examples
Pest regulation	Predators from forests, grassland areas, etc. may control pests attacking crops or livestock
Disease regulation	Influence ecosystems have on the incidence and abundance of human pathogens
Erosion regulation	Role of vegetation in regulating erosion on slopes and riparian areas
Pollination	Birds, insects and some small mammals pollinate certain flora species, including some agricultural crops
Cultural Services	
Spiritual or religious value	Natural spaces or species with spiritual or religious importance
Traditional practices	Cultural value placed on traditional practices such as hunting, fishing, crafts and use of natural resources
Tourism and recreation	Use of natural spaces and resources for tourism or local recreation (e.g., swimming, boating, fishing)
Aesthetic value	Cultural value placed on the aesthetic value provided by landscapes, natural landmarks
Educational and inspirational values	Information derived from ecosystems used for intellectual development, culture, art, design, and innovation
Non-use value of biodiversity (e.g. existence, bequest value)	Species and areas valued globally as of high conservation value
Supporting Services[5]	
Habitat provision	Natural spaces that maintain species populations and protect the capacity of ecological communities to recover from disturbances
Primary production	Formation of biological material by plants through photosynthesis and nutrient assimilation
Nutrient cycling	Flow of nutrients (e.g., nitrogen, sulphur, phosphorus, carbon) through ecosystems
Water cycling	Flow of water through ecosystems in its solid, liquid, or gaseous forms.
Soil formation	Natural soil-forming processes throughout vegetated areas

[5] Supporting Services are intermediate ecological outcomes that are not directly used but rather support other ecosystem services. An exception is made for Habitat Provision, which is sometimes valued as an "end-use" service by stakeholders in addition to its supporting role.

APPENDIX B

Identified Ecosystem Services and Priority Ratings: Region 5 Coastal

-Page Intentionally Left Blank-

TABLE B-1: IDENTIFIED ECOSYSTEM SERVICES AND PRIORITY RATINGS: REGION 5 COASTAL

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low- Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
NDC 26 – Woodlands/Farm							
Shoreline Protection	Regulating	• Extensive area of mangrove forest on the shore line protecting the sea shore from the impacts of the sea. There are lots of birds, crabs, fish and shrimp in the mangroves with crabs and shrimp caught for commercial purposes at De Kindren to Drill area. Mangroves also protect the river defense in the Mahaica River. The sea defense is under threat, with erosion taking place in some sections, particularly Fairfield seashore. • There is beekeeping within the NDC, but not at the shoreline. However, the bees might be feeding within the mangroves at the shoreline.	Mangrove Forests	Commercial and subsistence fishing along the coast and in mangroves **ES Linkages:** Agriculture, sea defense	Moderate	Moderate	**Medium**
Livestock Farming	Provisioning	• Less than 10 persons with over 200 heads of cattle in the area on lands beyond the sea dam and approximately 20 sheep at Fairfield/Bath. • Over 300 heads of cattle grazing at High Dam to Drill with a private farm at Drill.	Sea Dam, Pastures	Local communities, private cattle farmers Agriculture	High	Moderate	**High**
Cultivated Crops	Provisioning	• Rice cultivation close to the sea dam in a few areas. Other crop cultivation in close proximity to the sea dam on private lands and on reserves. Grazing is done on the lands in this area not under cultivation.	Sea dam, cultivated areas	Local farmers, residents Private developers	High	High	**Medium**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Swamp shrimp caught for commercial purposes between De Kindren to Drill area in the drainage canals and sold locally @ 10,000 per bucket. Tilapia, mullet, and other species caught in this area as well with approximately 50 persons weekly visiting the area to harvest. • There is much fishing within the Bellamy Canal that is behind the sea dam. More than 10 persons visit this canal daily during the dry season to catch fish and shrimp. • Fish Landing Site at Mahaica River at Old Bridge, with 10-15 boats. • Some persons also catch crabs in the mangroves.	Marine Habitat and Mangrove Forests	Fisherfolk engaged in: a) Commercial and subsistence fishing along the coast, canal, and in mangroves b) Fishing at the Mahaica River Old Bridge c) Crabbing	a) Essential b) High c) Low	a) Moderate b) Low c) High	**a) Critical** **b) Critical** **c) Low**
Cultural, Religious	Cultural	• Religious activity along the dams leading to the sea shore and on the sea shore where access is provided and the area is clear or with a beach.	Seashore; Sea Dam	Local Hindus	Moderate	Moderate	**Medium**
Food: wild meat	Provisioning	• Many persons hunt along the shoreline for iguanas, labba, and wild birds for subsistence use and sale.	Mangroves, seashore	Local communities	Moderate	High	**Low**
Tourism and Recreation	Cultural	• A new beach at Taymouth Manor is being used for recreational activities. Access to the area is currently a challenge but the NDC is hoping to put the necessary infrastructure in place.	Seashore	Local communities	Moderate	Low	**High**
NDC 27 – Hamlet/Chance							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are 30 boats which dock at the Mahaicony River that do commercial fishing at sea. The area also has a few small boats that fish in the river. • Tilapia and mullet are caught in the mangroves by a few persons for sale in the community. • Crabs are caught in the July-August season.	Marine environment; Mangroves; River ecosystem	Local communities and fisherfolk who: a) Utilize the landing site and fishing in the Mahaicony River b) Fish in the mangroves	a) Essential b) Essential c) Moderate	a) Moderate b) Moderate c) Moderate	**a) Critical** **b) Critical** **c) Medium**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low- Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• Fish is caught by lines and nets in the Mahaicony River by more than ten persons daily for subsistence.		c) Crab in the mangroves			
Wildlife: wild meat and song birds	Provisioning	• Iguanas are caught on the seashore and along the banks of the Mahaicony River for sale with each adult going for GYD$3,000–5,000. • Sea birds including curi curi and storks are caught for meat. • Song birds are caught for trade. Birds caught along the shore and river banks include Twa Twa, Grasie, Canary, Red, and Love birds.	Mangroves	a) Local communities who hunt iguanas and sea birds for meat and for sale b) Local communities who catch song birds for trade	a) Low b) Low	a) Moderate b) Moderate	**a) Low** **b) Low**
Cultural, Religious	Cultural	• Religious activity mainly done outside of NDC or along the river with good access.	Seashore; sea dam	Local communities	Low	Moderate	**Low**
Shoreline Protection	Regulating	• Extensive area of mangrove forest protects the local communities from the impacts of the Mahaicony River.	Mangrove Forests	Local communities **ES Linkages:** River Defense	High	Moderate	**High**
Livestock Farming	Provisioning	• A few head of cattle are grazed within the NDC but the main stocks are kept at the backlands where there are pastures.	Pastureland	Local communities	Low	High	**Low**
Cultivated Crops	Provisioning	• Farming of household crops for consumption; banana trees, bora, etc., throughout the NDC	Cultivated Lands	Local communities	Moderate	Low	**High**
NDC 28 – Mahaicony/Abary							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are 60 boats in the Abary River that commercially fish in the sea employing over 200 persons. Catch includes bangamary, butterfish, trout, and some shrimp. The number of boats fluctuates with the fish season with more persons putting their boats to work in the summer when the catch is plentiful. The sargassum is a constant bother to the fisherfolk, affecting their nets and their ability to catch fish. There are also numerous wrecks in the area that affect the fisherfolk when the nets get tangled in the wrecks. Drift mud also affects fishing activities • Pin seine fishing done by almost 50 persons on a daily basis along the shore in the NDC. • Hundreds of persons from Regions 4 & 5 catch shrimp and crabs in the mangroves and swamps when in season.	Marine environment; Mangroves; River Ecosystem	Local communities and fisherfolk who: a) Utilize the Abary landing site b) Fish using pin seines c) Shrimping and crabbing in the mangroves **ES Linkages:** Economic shrimping & Crabbing	a) Essential b) High c) High	a) Moderate b) High c) Moderate	**a) Critical** **b) Medium** **c) High**
Agriculture: Apiculture	Provisioning	• Beekeeping in the mangroves with three sets of active hives of about 20 in total observed in Huntley and Airy Hall.	Mangrove Forest	Local communities	High	High	**Medium**
Shoreline Protection	Regulating	• Extensive area of mangrove forest on the shoreline protecting the seashore from the impacts of the sea. Mangroves also protect the river defense along the Abary River. Mangroves are in the increase in the NDC due to natural growth.	Mangrove Forests	Commercial and subsistence fishing along the coast and in mangroves **ES Linkages:** Agriculture, Apiculture, Grazing Fishing Sea & River defense	Essential	Moderate	**Critical**
Tourism and Recreation	Cultural	• There is a large beach within the NDC at Good Faith that is frequented by persons from throughout Region 5 and is used by approximately 50-100 persons per	Coastal and Marine	Local communities in NDC and Region 5 using the beaches in:	a) Essential b) Moderate	a) Moderate b) Moderate	**a) Critical** **b) Medium**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low- Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		day and more than 50 families on holidays and weekends. This beach is used increasingly as beaches in other NDCs are being covered by mud and taken over by mangroves. • There is a small beach at Abary that is used by several persons in the area.		a) Good Faith b) Abary **ES Linkages:** Religious activity, Fishing			
Religious Activities	Cultural	• More than 10 persons daily and 100 on weekends and religious days used the Good Faith Beach for worshipping. There is also a cremation site at the beach.	Coastal	Local Hindu communities	High	Low	**Critical**
Livestock Farming	Provisioning	• Approximately fifty people graze over 1,000 heads of cows, goats, and sheep and pigs on the shore in the mangroves and on adjacent lands.	Coastal, Pasturelands	Local communities grazing cattle in: a) Abary b) Huntley c) Good Faith	a) High b) Essential c) Essential	a) Moderate b) Moderate c) Moderate	**a) High** **b) Critical** **c) Critical**
Cultivated Crops	Provisioning	• There are a few persons who farm on the sea m and on adjacent lands with mainly cash crops and fruits in Abary.	Coastal, Pasturelands	Local communities	Low	Moderate	**Low**
Wildlife: wild meat and song birds	Provisioning	• Sea birds including curi curi, plover and egrets are caught for meat • Songbirds are caught during the summer months when they are plentiful on the shore and river banks.	Mangroves	Local people	Moderate	Moderate	**Medium**
NDC 29 - Profit/Rising Sun							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are 12 boats landing at Belladrum, Profit, and Foulis employing approximately almost 40 persons. Catch includes catfish, bangamary, butterfish, trout, mullet, and some shrimp. The fishing boats move according to the migration of the fish to different fishing grounds. • Fishing and shrimping with 3-5 boats at Weldaad. • Pin seine fishing done by 6 persons on a daily basis along the shore in the NDC.	Marine environment; Mangroves; river ecosystem	Fisherfolk who: a) Utilize the fishing landing site in the Belladrum, b) Utilize the landing site in Profit Foulis c) Utilize the landing site in Weldaad d) Practice pin seine fishing along the shoreline	a) Essential b) High c) High d) Moderate	a) Moderate b) Moderate c) High d) High	**a) Critical** **b) High** **c) Medium** **d) Low**
Food: wild meat	Provisioning	• Iguanas are caught on the seashore along with sea birds including curi curi and wild ducks for meat on a limited basis by a few persons.	Mangroves, shoreline	Local people	High	High	**Medium**
Cultural: Religious	Cultural	• The NDC has a few sites throughout used for religious purposes. A crematorium at Weldaad is used by the residents of the NDC and Region.	Coastal	Hindu rituals at: a) Sea dam in Profit/Foulis b) Sea dam in Weldaad	a) Low b) Moderate	a) Moderate b) Moderate	**a) Low** **b) Medium**
Livestock Farming	Provisioning	• There are more than 100 persons who graze more than 2,000 animals on the shore, in the mangroves, and on adjacent lands with a growing population due to natural increase. • However, there is a reported high rate of thievery of livestock.	Coastal, Pasturelands	Local Communities grazing animals in: a) Profit/Foulis b) Belladrum c) Weldaad	a) High b) Essential c) Essential	a) Moderate b) Moderate c) Moderate	**a) High** **b) Critical** **c) Critical**
Tourism and Recreation	Cultural	• Locals utilize Belladrum Beach with approximately 50 persons per day to relax, swim, exercise, and socialize. More persons visit on weekends including Hindus for religious purposes. The beach is used by many persons and expected to be used by more as a bridge and a new road will be built to access the beach.	Coastal and Marine	a) Local communities using the sea front at Belladrum b) Birdwatching by locals and tourists	a) High b) Moderate	a) Moderate b) Low	**a) High** **b) High**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low- Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• There is an increase in bird watching in the area by tourists promoted by the Georgetown-based bird watching groups. Species include curi curi, pellew, and duckla. There are thousands of duckla in the area in the afternoons when the tide is low.					
Shoreline Protection	Regulating	• Extensive area of Mangrove forest at Weldaad shore protecting the sea shore from the impacts of the sea. New mangrove growth is noted in the area. Grazing of animals occurs in the mangroves and may affect the new plants.	Mangrove Forests	Local communities **ES Linkages:** Agriculture, fishing, grazing	High	Moderate	**High**
NDC 30 – Seafield/Tempie							
Food: wild meat	Provisioning	• A few mammals and iguanas are caught on the seashore. Many plover birds are caught using wire along with curi curi and wild ducks for meat.	Mangroves, shoreline	Local people	Low	Moderate	**Low**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are landing sites for fishing boats at Jacoba and Seafield. Catch includes catfish, bangamary, butterfish, trout, mullet, and some shrimp. The mangroves have reduced at Jacoba and more fishing boats are now in the area as the mud is washing away. • In addition, approximately 10 persons catch shrimp, tilapia, coo coo belly, and cufum in the swamp ponds or drainage canals. • Crabs are caught in the season by a numerous persons locally.	Marine environment; Mangroves ecosystem	Local people using the: a) Fishing landing site at Jacoba b) Fishing and shrimping in swamp ponds, mangroves and drainage canals c) Fishing landing site in Seafield d) Mangroves and shoreline area for crabbing	a) High b) Moderate c) High d) High	a) Moderate b) Low c) Moderate d) High	**a) High** **b) High** **c) High** **d) Moderate**
Cultivated Crops	Provisioning	• There are approximately 20 persons in Seafield-Litchfield with cash crop farms on the sea dam and on adjacent lands with mainly cash crops and fruits. Cash crop cultivation is increasing along the sea defense. • Coconut plantations are found beyond the sea dam.	Coastal lands	Local communities	Moderate	High	**Low**
Shoreline Protection	Regulating	• Erosion has significantly reduced the shoreline within the NDC over the years. The area has old sluices that are in the sea approximately 1 km from the present shoreline. • The farmers are fearful of the salt water intruding onto their farms as some persons are cutting the mangroves for their own purposes in No. 42 and No. 37 villages.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation	Moderate	High	**Low**
Livestock Farming	Provisioning	• There are many persons who graze more than 1,500 animals on the shore, in the mangroves, and on adjacent lands. Mainly sheep and goats graze along the shoreline area and the number of animals in the NDC is increasing. Grazing has increased at Ross, Seafield, and Tempie.	Coastal Pasturelands	Local communities grazing animals in: a) No. 37 Village b) Lichfield c) Kingelly d) Seafield	a) Essential b) High c) High d) High	a) Moderate b) Moderate c) Moderate d) Moderate	**a) Critical** **b) High** **c) High** **d) High**
NDC 31 – Union/Naarstigheid							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There is a fishing landing site at Bushlot. Fishing has increased within the NDC with more boats at Bushlot. Catch includes various catfishes, bangamary, butterfish, trout, and mullet. A number of smaller boats catch shrimp. • More than thirty persons are involved in the on land fishing of tilapia and shrimp for commercial purposes.	Marine environment; Mangroves; Drainage canals; Natural ponds	Local people within the NDC who: a) Utilize the landing site at Bush Lot b) Utilize the landing site at No. 29 Village	a) Essential b) Moderate c) High d) High	a) Moderate b) High c) Low d) Moderate	**a) Critical** **b) Low** **c) Critical** **d) High**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low- Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		Approximately 10 persons catch shrimp, tilapia, coo coo belly, and cufum daily in the natural swamps, ponds, or drainage canals at Bush Lot, Hopetown, and Lovely Lass. • Crabs are caught in the season and on a regular basis by locals.		c) Fish in the swamps and drainage canals d) Engage in crabbing			
Shoreline Protection	Regulating	• Extensive area of Mangrove forest at Bushlot, Hopetown, and Naarstigheid and new growth at Onverwagt. There is an increase in mangroves, especially at Onverwagt. The extensive coverage of mangroves deters the residents of the NDC from making full use of the sea shore.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination	Essential	High	**High**
Agriculture: Apiculture	Provisioning	• Beekeeping in the mangroves at Bush Lot, Naarstigheid, Hopetown, and No. 29 Village. • Beekeeping is done Union, Lovely Lass, Onderneeming, Hopetown and No. 29.	**Mangrove Forest**	Local communities engaged in apiculture in: a) Bush Lot b) Hopetown **ES Linkages:** Pollination, Pest control, Mangroves	a) Moderate b) Moderate	a) High b) Moderate	**a) Low** **b) Medium**
Agriculture, Grazing	Provisioning	• Grazing occurs in many places in the NDC but is more predominant at No. 29 Village and Hopetown with grazing of cattle and other animals. • There are more animals grazing now in the NDC than in 2018. The animals compete with the cash crop farmers for space on the sea dam and reserves.	Mangroves, Sea Dam, Pastures	Local communities, Private cattle farmers who graze animals in: a) No. 29 Village b) Hopetown c) Bushlot **ES Linkages:** Cultivated crops	a) High b) High c) Moderate	a) Moderate b) Moderate c) High	**a) Medium** **b) Medium** **c) Low**
Agriculture, Farming	Provisioning	• Cash crop cultivation in close proximity to the sea dam at Bush Lot, No. 29 & No. 30 villages. Crops include bananas, coconuts, fruits, vegetables, and vine crops.	Sea dam, cultivated areas	Local farmers, Residents	Moderate	Moderate	**Medium**
Religious activities	Cultural	• The religious activities of the Hindus are held at Onverwagt and Bush Lot. A crematorium at Bush Lot is used by the residents of the NDC.	Coastal	Local Hindu communities in: a) Bushlot b) Onverwagt	a) Moderate b) Moderate	a) Moderate b) Moderate	**a) Medium** **b) Medium**
Tourism and recreation	Cultural	• Locals utilize Bush Lot, Union, Bel Air, Lovely Lass, and Hope Town Community Centre for recreational purposes. The areas are used by approximately 10-50 persons per day and more on holidays and weekends. Bush Lot has a horse racing track that is used by thousands of persons at least each quarter.	Coastal and Marine, Sand Reef	Local communities in NDC and Region 5 **ES Linkages:** Religious activity, Horse Racing	Essential	Moderate	**Critical**
Wildlife Trapping & Hunting	Provisioning	• Iguanas are caught on the seashore in the August season. Many plover birds are caught using wire in addition to curi curi, stork, egrets, and wild ducks for meat to sell in the market.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Essential	Moderate	**High**
Flood Regulation	Regulating	• Drainage pump installed at Trafalgar/No. 29 Village			Essential	Low	**Critical**
NDC 32 – Bath/Woodley Park							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There is a landing site at the No. 12 Village outfall for boats that engage in commercial fishing in the sea employing over 20 persons. Catch includes queriman, bangamary, butterfish, and some shrimp.	Marine environment; Mangroves ecosystem	Fisherfolk who: a) Utilize the landing site at the No. 12 outfall	a) High b) Essential c) Essential d) Low	a) Low b) Moderate c) High d) High	**a) Critical** **b) Critical** **c) High** **d) Low**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low- Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• Many persons are fishing in the swamps and the near shore during the out-of-crop season of the sugar estates. It is estimated that 10 persons conduct this activity regularly while during out-of-crop periods it can range from 30-50 persons. Catch shrimp and tilapia daily. • In the summer crabbing seasons, hundreds of persons catch crabs. • One fisherfolk used pin seine along the mudflats for his daily catch.		b) Fish and shrimping in the ponds and swamps c) Crab d) Use pin seines for fishing **ES Linkages:** Economic shrimping & Crabbing			
Religious activities	Cultural	• The religious activities of the Hindus are held at Bath, Experiment, No. 11 & 12 villages along the shore and along the main canal in other areas.	Coastal	Local Hindu communities in: a) No. 12 Village b) Experiment	a) High b) Moderate	a) Moderate b) High	**a) High** **b) Low**
Agriculture: Grazing	Provisioning	• Grazing occurs throughout the NDC and across the shoreline and mangroves with many residents owning animals.	Mangroves, Sea Dam, Pastures	Local communities, private farmers	Moderate	Low	**High**
Cultivated Crops	Provisioning	• Cash crop cultivation in close proximity to the sea dam and on the façade throughout the NDC. Crops include plantains, bananas, coconuts, fruits, vegetables, and vine crops. Some farmers have chickens and ducks.	Sea dam, cultivated areas	Local farmers, residents at: a) No. 12 Village b) Hope	a) High b) Moderate	a) Moderate b) Moderate	**a) High** **b) Medium**
Shoreline Protection	Regulating	• Extensive area of mangrove forest throughout the NDC. The mangrove protects the mud dams erected for sea defense. Mangroves have been reduced by erosion in some areas in the NDC.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Pollination	Moderate	Moderate	**Medium**
Socioeconomic: Squatting	Provisioning	• Persons squatting along the reserves bordering the sea dam from Bath, Experiment, and Hope mainly due to economic reasons taking advantage of the opportunity to plant crops and keep animals. • There is a lot of squatting along the façade canal throughout the NDC, with the persons engaged in crop farming.	Coastal Habitat	Local persons	Moderate	High	**Low**
Tourism and Recreation	Cultural	• Possible site for picnics in the No. 12 Village.	Shoreline	Local communities	Low	Moderate	**Low**
NDC 33 Woodlands/Bel Air							
Religious Activities	Cultural	• The religious activities of the Hindus are held at No. 6 and 7 and other villages along the main canal bordering the shore.	Coastal	Local Hindu communities	Moderate	Moderate	**Medium**
Agriculture: Farming	Provisioning	• Cash crop cultivation in close proximity to the sea dam and reserves throughout the NDC, except in No. 10 Village, by persons living in close proximity. Crops include peppers, bananas, coconuts, fruits, tomatoes, and carilla. Some farmers have chickens and ducks for home use and sale.	Sea dam; Cultivated areas	Local farmers; Residents	High	Moderate	**High**
Shoreline Protection, Mangroves	Regulating	• Extensive area of mangrove forest throughout the NDC that protects the mud dams erected for sea defense. Grazing occurs in the mangroves and sea dam despite actions taken by NAREI to protect the mangroves. Mangroves were replanted in the area at No. 6 & 7 villages. Some beekeeping is done within	Mangrove Forests	Local communities; Farmers; Beekeepers **ES Linkages:** Fishing, Grazing, Pollination, Beekeeping	High	High	**Medium**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low- Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		mangrove at No. 10 Village. Crabs are caught seasonally within mangroves. • There is now mangrove growth throughout the NDC shoreline which has reduced religious and recreational activities along the shoreline. The No. 6 beach is taken over by mangroves and the local people have to travel further to find a beach for recreation.					
Food: wild meat	Provisioning	• Birds are hunted with shotguns by a few hunters on an irregular basis including curi curi, egrets, and wild ducks for meat. Plover birds are caught using wire.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
Livestock Farming	Provisioning	• There are more than 100 persons who graze over 1,000 heads of cows, goats, and sheep on the shore in the mangroves and on adjacent lands. The number of grazing animals in the NDC has reduced due to actions by NAREI.	Coastal, Pasturelands	Local communities in: a) No. 6 Village b) No. 7 Village	a) Moderate b) Moderate	a) Moderate b) High	**a) Medium** **b) Low**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Two fishing boats dock at No. 9. • Numerous persons catch fish and shrimp in the swamps and drainage canals using nets or long seines.	Shoreline, mangroves	a) Fishing boats at No. 9 Village b) Fishing and shrimping in swamps and canals	a) Low b) High	a) High b) High	**a) Low** **b) Medium**
NDC 34 Zeelugt/Rosignol							
Cultural: Religious	Cultural	• Religious activities held at three temples at Rosignol, Victory Dam, and No. 2 Village. • There are 6 Hindu temples at De Edward, Cotton Tree, No. 3, Bennett Dam, Victory Dam and along the main canal	Coastal	Local Hindu communities in: a) Rosignol b) No. 2 Village c) Victory Dam d) Bennet Dam	a) Moderate b) High c) Moderate d) Moderate	a) Moderate b) Moderate c) Moderate d) Moderate	**a) Medium** **b) High** **c) Medium** **d) Medium**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are 90 boats using the Rosignol wharf for commercial fishing. Catch includes queriman, bangamary, butterfish, and some shrimp. • 75 boats using the De Edward port for fishing with a few shrimp boats. • 25 fishing boats use other landing areas along the river daily. • Shrimp is abundant in the swamps. • Crabs are practiced during the summer crabbing season.	Marine environment; Mangroves; River ecosystem	Fisherfolk using the landing sites at: a) Rosignol b) De Edward c) Victory Dam d) Bennet Dam e) Local communities shrimping in the swamp f) Local communities crabbing in the mangroves and swamps **ES Linkages:** Economic shrimping & Crabbing, Fish/Shrimp Processing	a) Essential b) Essential c) High d) High e) Moderate f) Moderate	a) Moderate b) Moderate c) Moderate d) Moderate e) Moderate f) Moderate	**a) Critical** **b) Critical** **c) High** **d) High** **e) Medium** **f) Medium**
Socioeconomic: Wharf Facilities	Provisioning	• River transportation wharf used by over 1,000 persons daily for river launch crossing.	River	Local communities **ES Linkages:** Tourism	Essential	High	**High**
Socioeconomic: Fish/Shrimp Processing	Provisioning	• Processing facility at Rosignol that processes much of the landed fish catch for export.	Coastal	Local fisherfolk, Export market	Essential	Moderate	**Critical**
Livestock Farming	Provisioning	• Grazing occurs throughout shore of the NDC with many residents owning animals. There are more than 400 pigs grazing in Rosignol. A few persons graze	Mangroves; Sea Dam; Pastures	Local communities, private cattle farmers in: a) Victory Dam	a) Moderate b) Moderate c) Essential	a) Moderate b) Moderate c) High	**a) Medium** **b) Medium** **c) High**

Service	Type of Service	Description and Examples in the Study Area Based on Stakeholder Input	Relevant Land Use / Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low- Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		over 100 cows, goats, donkeys, and sheep in Rosignol on the sea dam. Much grazing occurs at Bel Air, Zeelust, and Cotton Tree with over 300 goats, sheep, and cows on the dams and in the mangroves.		b) No. 2 Village c) Zeelugt/Rosignol			
Socioeconomic: Palm Processing Facility	Provisioning	• Processing Facility at Rosignol for processing of Manicole Palm for export.	Coastal	Local harvesters from riverine communities including Amerindians, Export market	Essential	Moderate	**Critical**
Shoreline Protection	Regulating	• Extensive area of Mangrove forest from Zee Zeight to De Edward with ponds in the forest. Mangroves covering the banks of the Berbice River at most locations. Grazing occurs in the mangroves and sea dam at each location. Honey bees are kept at No. 3 Village by one family.	Mangrove Forests	Mangrove in: a) De Edward b) No. 2 Village c) Zeelugt/Rosignol d) Bennet Dam **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination, Beekeeping	a) Moderate c) Moderate d) Moderate	a) Moderate b) High c) High	**a) Medium** **b) Low** **c) Low**
Food: Mangrove Forest	Provisioning	• Crabs, fish, and shrimp caught in ponds in the mangrove forest. Pin seine is used for fishing beside the mangroves in the river.	Mangrove Forests, River Ecosystem	Local communities	High	Moderate	**High**
Food: wild meat	Provisioning	• Iguanas are caught daily in the mangroves by fewer than 50 hunters. • Many plover birds are caught using wire for a trap. Curi curi is not hunted regularly. • Cage birds are caught along the shore.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
Socioeconomic: Boat Building	Provisioning	• Boat building at Victory Dam and De Edward with an average of two boats per month with the 35-foot boat selling for GYD$780,000.	Coastal	Local fisherfolk	Moderate	Moderate	**Medium**
Socioeconomic	Provisioning	• The Berbice River Bridge is used by thousands of persons daily and the Berbice River launch transports almost 1000 school children and Government workers on weekdays between Rosignol and New Amsterdam.	Coastal	Local communities (general population)	Essential	Low	**Critical**
Cultivated Crops	Provisioning	• Planting of fruits and cash crops in De Edward and No. 2 Village	Cultivated lands	Local communities	Moderate	Moderate	**Medium**

APPENDIX C

Identified Ecosystem Services and Priority Ratings: Region 6 Coastal

-Page Intentionally Left Blank-

TABLE C-1: IDENTIFIED ECOSYSTEM SERVICES AND PRIORITY RATINGS: REGION 6 COASTAL

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
NDC 35 – Ordinance/Fort Lands							
Socioeconomic: Sawmilling	Provisioning	• Sawmill at Sheet Anchor employing 10-50 persons on a part time basis. Use Canje River to transport logs to mill.	Coastal	Local community	High	Moderate	**High**
Socioeconomic, Wharf, Building Materials Depot	Provisioning	• Wharves at Canje Bridge facilitating transport of building supplies (stone, steel, and sand) and boat repairs used by approximately 100 persons daily.	Coastal	Local community, Hardware suppliers, Construction sector, Boat owners	Essential	Moderate	**Critical**
Socioeconomic	Provisioning	• Two crab meat processing plants are located within the NDC.	Sea shore	Local community; crabbers	High	High	**Medium**
Shoreline Protection, River defense	Regulating	• Extensive area of mangrove forest on the riverbanks protecting the land from the Berbice and Canje Rivers.	Mangrove Forests	**ES Linkages:** Agriculture, fishing river defense	Moderate	High	**Low**
Habitat provision, coastal protection	Supporting	• Mangroves provide habitats for wild bees, birds, crabs, fish and shrimp in the mangroves.	Mangrove Forests	Local community	High	Moderate	**High**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• Approximately 50 boats docking at Sheet Anchor, Cumberland, and Seawell. The boats catch both fish and shrimp. • Approximately 100 persons catch shrimp and fish in the mangroves and canals using nets and seine for daily use and sale. The downturn of the sugar industry has resulted in approximately 50–60 persons seeking employment in fishing, especially within the swamps along the shoreline areas. Catch is sold within and outside of the NDC. • Crab catching done throughout the year supplying two crab meat processing operations.	Marine habitat and Mangrove Forests	a) Fishing boats landing at Sheet Anchor b) Fishing boats landing at Sheet Anchor Wharf c) Commercial and subsistence fishing in the mangroves d) Crabbing	a) Essential b) Essential c) High d) High	a) Moderate b) Moderate c) Moderate d) High	**a) Critical** **b) Critical** **c) High** **d) Medium**
Livestock Farming	Provisioning	• More than 2,000 head of cattle graze in the Cumberland, Fort Ordinance, Palmyra, and No. 2 area. • Grazing at Sheet Anchor of more than 100 head of cow, goats, and sheep.	Sea Dam, Pastures	Local communities, private cattle farmers that graze animals in: a) Fort Ordinance b) Sheet Anchor c) Cane Field	a) Essential b) High c) Moderate	a) Moderate b) Moderate c) Moderate	**a) Critical** **b) High** **c) Medium**
Cultivated Crops	Provisioning	• Cash crop cultivation in close proximity to the sea dam on private lands and on reserves. Grazing is also done on the lands in this area not under cultivation.	Sea dam; Cultivated areas	Local farmers; Residents	Moderate	Moderate	**Medium**
Cultural: Religious	Cultural	• Religious activity along the dams leading to the Canje River at Sheet Anchor and Cane Field used by less than 10 persons daily and more on religious days.	Seashore, sea dam,	Local Hindus	Moderate	Moderate	**Medium**
Socioeconomic: Informal Housing	Provisioning	• Squatting at Sheet Anchor and Cumberland by 10-20 households. Squatting has increased by 1 or 2 households.	Coastal	Local community, Fisherfolk	High	Moderate	**High**
Food: wild meat	Provisioning	• Sea birds including curi curi, plover, and wisi wisi ducks are caught for meat by a few locals.	Coastal Mangroves	Local people	Moderate	High	**Low**
NDC 36 – Kintyre/No. 37							
Food: aquaculture and wild-caught fish & shellfish: Marine & Coastal	Provisioning	• There are numerous ponds in the area used for shrimp and fish including tilapia and mullet. Persons from throughout the Corentyne Coast benefit from these resources. • Over 1,000 crabs are caught daily by different crews of 4-6 persons. 20 crabs sell for GYD$1,000 locally and in Georgetown. Catches are more significant during the crab marching season. More persons are involved in crabbing.	Coastal environment; Mangroves; River ecosystems	a) Fish and shrimp ponds b) Crabbing, fishing and shrimping at Borlam Dam **ES Linkages:** Tourism, Trapping	a) Essential b) Essential	a) Moderate b) Moderate	**a) Critical** **b) Critical**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Food: wild meat	Provisioning	• Approximately 10 persons are involved in the daily capture of sea birds including curi curi, plover and wisi wisi ducks are caught for meat at the shoreline and by the ponds.	Mangroves	Local people **ES Linkages:** Tourism	Low	Moderate	**Low**
Cultural: Religious	Cultural	• Religious activity at Seawell and Borlam Dam, with daily and weekly use by the Hindu religious community. • There is a cemetery located in close proximity to the seashore in Bohemia.	Seashore; Sea dam	a) Hindu religious activities b) Cemetery in Bohemia	a) Moderate b) High	a) Moderate b) Moderate	**a) Medium** **b) High**
Shoreline Protection	Regulating	• Extensive area of mangrove forest protects the local communities from the impacts of the sea. Crabs, fish, shrimp, and birds are abundant.	Mangrove Forests	Mangroves in: a) Borlam Dam b) Bohemia and Warren **ES Linkages:** Fishing, crabbing	a) Moderate b) Moderate	a) High b) Moderate	**a) Low** **b) Medium**
Flood Regulation	Regulating	• Extensive area of the coast covered by housing and other economic activities are drained by drainage pumps installed at Borlam.	Mangrove Forests	Local communities **ES Linkages:** Fishing, crabbing	High	Moderate	**High**
Livestock Cultivation	Provisioning	• Grazing of more than 1,000 heads of cattle, goats, and sheep.	Coastal, Pasturelands	Local communities in: a) Bohemia/Warren b) Seawell	a) Essential b) Moderate	a) Moderate b) High	**b) Critical** **b) Low**
Tourism and Recreation	Cultural	• Locals utilize Crab Island and Borlam Beach for recreational purposes.	Coastal and Marine	Tourism and recreation	Moderate	Moderate	**Medium**
Socioeconomic	Provisioning	• There is brick making from the burning of clay in lands adjacent to the shoreline. It was reported that the operation has been disrupting the cemetery which is in proximity and reports have been made to the Regional Health Officer. Concerns were raised that brick making increases erosion risk due to the extraction of soil and excavation is moving in the direction of the shoreline.	Coastal	Cemetery; Mangroves; Grazing	Low	Moderate	**Low**
Socioeconomic	Provisioning	Presence of CGX shore base in Seawell and wharf on Crab Island.	Coastal, Mangroves	Businesses; Local communities	Moderate	Low	**High**
NDC 37 – Gibraltar/Fyrish							
Food: aquaculture and wild-caught fish & shellfish: Coastal Mangroves	Provisioning	• There are about 12 shrimp ponds in the NDC with the majority on the seashore. Each pond can earn GYD$200,000 per crop/month in shrimp. • There are a few persons who catch crabs for sale in the NDC at GYD$50 for each adult crab. • Catching crabs, fish, and shrimp for subsistence use has increased.	Marine environment; Mangroves; Crab grass	a) Fishing and shrimping in the ponds for subsistence use and sale b) Crabbing for sale and subsistence use	a) Essential b) Moderate	a) Low b) High	**a) Critical** **b) Low**
Shoreline Protection	Regulating	• Extensive area of mangrove forest on the shore line protecting the coast from the impacts of the sea. Mangroves are in the increase in the NDC due to natural growth but there is some erosion at No.1 Village. The seas defense is being breached to allow for sea water into the shrimp ponds.	Mangrove Forests	a) Local communities protected by mangroves throughout the NDC b) Business persons who breach mangrove for shrimp pond in No. 1 Village/Courtland **ES Linkages:** Agriculture, fishing Sea & River defense	a) Moderate b) Moderate	a) High b) Moderate	**a) Low** **b) Medium**
Livestock Farming	Provisioning	• There are grazing pastures at Gibraltar and Portland with cows, goats, and sheep and pigs in pasturelands and in the mangroves on the coast.	Coastal Pasturelands	Local communities that graze animals in: a) No. 1/ Courtland b) Fyrish c) Gibraltar	a) Moderate b) High c) High	a) Moderate b) Moderate c) Moderate	**a) Medium** **b) High** **c) High**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Religious Activities; Burial Ground	Cultural	• Hindu religious activities are practiced along the shoreline in areas where there is access such as the eastern section of Fyrish and the No. 1 Village. • There is a cemetery in Fyrish that is used for burials by all religions.	Coastal	Local communities using: a) The Fyrish and No. 1 shoreline b) The cemetery in Fyrish	a) Moderate b) Moderate	a) Moderate b) Moderate	**a) Medium** **b) Medium**
Food: wild meat	Provisioning	• Sea birds including curi curi, plover, and wisi wisi ducks are caught for meat by a few locals. The number of persons involved in this activity has increased.	Coastal Mangroves	Local people	Low	Moderate	**Low**
NDC 38 - Kilcoy/Hampshire							
Food: aquaculture and wild-caught fish & shellfish: Marine and Coastal	Provisioning	• There is a large landing site for commercial artisanal fishing vessels Albion. Approximately 450–475 persons from the NDC are employed in fishing. Catch includes catfish, bangamary, butterfish, trout, mullet, and white belly and fat shrimp. • There are about 40 ponds in the NDC used for shrimp farming with each pond reaping an average of 20 buckets of shrimp per month that can sell for GYD$160,000–200,000. • In addition, there are several persons involved in cast net and drag net fishing along the seashore for subsistence purposes. During the out-of-crop sugar seasons, more persons are involved in these types of subsistence fishing. • There are 10-50 persons from the NDC and the Region who catch crabs weekly for sale at GYD $50 for each adult crab. Crab catching is also considered a recreational activity and the crabs caught in this way are for subsistence use.	Marine environment; Mangroves;	a) Local fisherfolk using the landing site at Albion b) Persons using shrimp ponds c) Local communities engaged in crabbing d) Subsistence fishing along the sea shore	a) Essential b) Essential c) Moderate d) High	a) Moderate b) Moderate c) Moderate d) Moderate	**a) Critical** **b) Critical** **c) Medium** **d) High**
Food: wild meat	Provisioning	• Iguanas are caught on the seashore along with sea birds including plovers, egret, curi curi, stork, and wild ducks for meat by a few persons and sold in the local market at 10-40 for GYD$1,000.	Mangroves; shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
Primary production, biodiversity	Supporting	• Wild bees are found in the mangroves with hives at Hampshire.	Mangrove Forest	Local communities **ES Linkages:** Pollination, Pest control	Low	Moderate	**Low**
Livestock Farming	Provisioning	• The poultry farm located in Kilcoy and Chesney comprises five large multi-storey chicken pens with each pen containing approximately 20,000 chickens.	Coastal	Local communities Local Businesses	High	Moderate	**High**
Cultural: Religious	Cultural	• Hindu temples are in close proximity to the seashore at Chesney, Hampshire, Nigg, No. 4 Village, and two temples are located in Belvedere. • Hindu religious activities are also conducted on the sea dam in No. 4 Village. • The NDC has a burial ground at the foreshore of No. 4 Village where burial is done for all religions.	Coastal	Local Hindu Community using: a) temples at Chesney and No. 4 b) temples at Belvedere and Hampshire c) temple at Nigg d) Burial Ground in No. 4 Village	a) Moderate b) Moderate c) Moderate d) Moderate	a) High b) Moderate c) Moderate c) Low	**a) Low** **b) Medium** **c) Medium** **d) High**
Cultivated Crops	Provisioning	• A few persons farm on the sea dam and on adjacent lands with mainly cash crops and fruits for subsistence and sale in the community. Mainly done at Nigg, Kilcoy, and Chesney.	Cultivated lands	Local communities	Moderate	Low	**High**
Livestock Farming	Provisioning	• Grazing of cattle in Nigg and Hampshire	Pasturelands	Local communities grazing animals at: a) Hampshire b) Nigg	a) Moderate b) High	a) Moderate b) Moderate	**a) Medium** **b) High**
Shoreline Protection	Regulating	• Extensive area of Mangrove forest on the shore line protecting the coast from the impacts of the sea. Mangroves are in the increase in the NDC	Mangrove Forests	Mangroves offering shoreline protection at:	a) Moderate b) Low	a) High b) High	**a) Low** **b) Low**

		due to natural growth but there is some erosion at No.1 Village. The seas defense is being breached to allow for sea water into the shrimp ponds. Mangrove cover has increased.		a) Hampshire b) Albion c) Nigg **ES Linkages:** Agriculture, fishing Sea & River defense	c) Moderate	c) Moderate	**c) Medium**
Socio-Economic	Provisioning	• Land in Hampshire close to the seashore has been earmarked for the establishment of a new industrial site	Sea shore; shoreline	Local business communities	Low	Low	**Medium**
NDC 39 – Rose Hall Town							
Tourism and Recreation	Cultural	• There is a long stretch of beach within the Town Council that is used by the wider community and is frequented by over hundreds persons daily and approximately 500 on weekends. In 2019, there were a comparable number of persons on the beaches at Rose Hall and No. 63 beach during the Easter holidays.	Coastal and Marine	Local communities in NDC and Region 6 **ES Linkages:** Fishing, Grazing	Essential	Low	**Critical**
Shoreline Protection	Regulating	• Extensive area of mangrove forest at the shore protecting the town from the impacts of the sea. Animals graze within mangrove area and the extent of mangrove coverage in the municipality has declined. However, mangroves are still harvested for use as firewood, in construction and to be used as fishing rods. Mangroves are being monitored.	Mangrove Forests	Local communities **ES Linkages:** Fishing, grazing	Moderate	Moderate	**Medium**
Food: wild meat	Provisioning	• Many plover birds are caught using wire for sale at the local market.	Mangroves, shoreline	Local communities	Low	High	**Low**
Cultural: Religious	Cultural	• The Hindu religious activities are held at the Rose Hall beach, which provides space and privacy. Religious activities by Hindus on the Rose Hall beach has increased and approximately 200 persons use the area on a weekly basis, with more on Sundays and Tuesdays. Thousands of persons use the area on special days of worship for Hindus.	Coastal	Local Hindu communities	Essential	Low	**Critical**
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There is a landing site for fishing boats at Rose Hall. Pin seine fisherfolk also use this site for catching fish for subsistence and for sale. Fishes include bangamary, butterfish, trout, and mullet. • Fish pond for locals to catch fish, shrimp and crabs in Williamsburg	Marine environment; Mangroves;	a) Local fisherfolk using the Rose Hall site b) Local communities using the fish pond	a) Moderate b) High	a) Moderate b) High	**a) Medium** **b) Medium**
Livestock Farming	Provisioning	• There are approximately 100 animals grazing on the shore and near shore areas.	Coastal; Pasturelands	Local communities	High	High	**Medium**
Cultivated Crops	Provisioning	• There are small farms on the sea dam and on adjacent lands used by persons living in proximity planting fruits and cash crops. Farming on the sea dam and on adjacent lands has decreased due to saline intrusion.	Coastal, Pasturelands	Local communities	Moderate	High	**Low**
NDC 40 – Port Mourant/John							
Food: aquaculture and wild-caught fish & shellfish: Marine and Coastal	Provisioning	• There are 9 boats using the Port Mourant outfall employing 33–40 persons, as a landing area for fish and shrimp. Fishing is considered a second job for sugar workers during out-of-crop seasons on the sugar estates. • Approximately 20–25 persons catch shrimp, tilapia, coo coo belly, and cufum in the swamp or drainage canals along the sea dam on a daily basis. During out-of-crop seasons, up to 100 persons catch fish and shrimp in swamps and drainage canals for subsistence use and for sale. • There are approximately 100 shrimp and fish ponds in the NDC owned by 40 persons in the NDC. Ponds have been expanded and there are different sections for species. In addition, areas formerly used for rice cultivation have been converted to shrimp and fish ponds. The ponds in Babu John have been rehabilitated and are currently in use. All ponds in the NDC are privately owned.	Marine environment; Mangroves; river ecosystem	a) Fisherfolk using the Port Mourant outfall b) Owners of private fish and shrimp ponds c) Local people fishing in swamps and drainage canals	a) High b) Essential c) High	a) Moderate b) Moderate c) Moderate	**a) High** **b) Critical** **c) High**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Livestock Farming	Provisioning	• A farm at John has five large multi-story pens with approximately 5,000 chickens per pen; it employs more than 20 persons full time. • More than 8,000 animals graze on the shore, in the mangroves, and on adjacent pastures. More than 1,000 animals graze in Tain. The number of animals in the NDC is increasing. • There is a ranch at Babu John with 400-500 animals. The NDC has no established pasture.	Coastal	Local communities, Local Businesses: a) Operating poultry farms b) Grazing animals in Tain c) Grazing animals in Port Mourant	a) High b) Essential c) High	a) Moderate b) Moderate c) High	**a) High** **b) Critical** **c) Medium**
Shoreline Protection	Regulating	• Mangrove forest at the shore aids in capturing the sediments as the shore is built. There is no monitoring of mangrove cover and mangroves are reported by the NDC to be cut by shrimp farmers to access the water for ponds and to create ponds. Some persons collect dried mangrove roots for use in their kitchen gardens and as firewood.	Mangrove Forests, Coastal	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation	Moderate	High	**Low**
Food: wild meat	Provisioning	• Shore birds including plover and spika are caught using wire for sale at the local market at GYD$1,500–2,000 per string of about 20 birds. Curi curi and carrow are sold at 2 for GYD$1,000–1,500. Although a few persons routinely catch these birds, there are peak numbers of persons involved on a seasonal basis.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
Cultural: Religious	Cultural	• The religious activities of the Hindus are held at Port Mourant and Tain. Prayers and daily worship are held at the Port Mourant beach extending from Rose Hall. • Religious activities are held at Port Mourant. In addition, the main cremation site at Babu John is dedicated to late President Cheddi Jagan. There is also a cemetery at Babu John.	Coastal	a) Local Hindu communities at Port Mourant b) Babu John Crematorium in Tain	a) Moderate b) High	a) Moderate b) Low	**a) Medium** **b) Critical**
Tourism and recreation	Cultural	• Locals utilize the Port Mourant beach from the Rose Hall entrance for recreational purposes.	Coastal and Marine	Local communities in NDC and Region 6	Moderate	Moderate	**Medium**
NDC 41 – Bloomfield/Whim							
Food: aquaculture and wild-caught fish & shellfish: Marine and Coastal	Provisioning	• The outfalls at Letter Kenny and Whim are used as landing sites for fishing boats. They are not frequently used, as the channels are heavily silted making access to the landing sites difficult. However, approximately 28 fishing boats are owned by persons from the NDC who use landing sites at Adventure and Complex 66. In addition, more than 100 persons in the NDC are employed as fisherfolk on boats at different landing sites throughout the Corentyne Coast. Catch various catfishes, bangamary, butterfish, trout, and mullet. • Approximately 15 persons catch crabs on a regular basis for sale. The number of persons engaged in crabbing increases during the summer crab season. • Approximately 30 ponds in the area for shrimp farming which are owned by 10–15 people. One bucket valued at GYD$10,000. • Approximately 15 persons fish along the shoreline using pin seines and cast nets.	Marine environment; Mangroves; Drainage canals; Natural ponds	a) Fisherfolk using the landing site at Letter Kenny b) Fisherfolk using the landing site at Whim c) Owners of shrimp ponds in the NDC d) Persons engaged in crabbing **ES Linkages:** Fishing, Grazing, Erosion regulation, Tourism	a) High b) High c) High d) Moderate	a) High b) High c) Moderate d) Moderate	**a) Medium** **b) Medium** **c) High** **d) Medium**
Shoreline Protection	Regulating	• Mangrove forest covers most of the shore with new growth in some areas as the silt washes ashore and is trapped. Cows and goats are found grazing in the mangroves.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination	High	Moderate	**High**
Livestock Farming	Provisioning	• Grazing occurs throughout the NDC but is more predominant at Whim to Letter Kenny, with hundreds of heads of cattle, goats, and sheep. Grazing along the sea dams and shoreline has increased; this is attributed to former sugar workers seeking alternative employment.	Mangroves; Sea Dam; Pastures	Local communities; Private cattle farmers	High	High	**Medium**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Cultivated crops	Provisioning	• Cash crop cultivation in close proximity to the sea dam at Whim and Letter Kenny. Crops include watermelon, muskmelon, cucumbers, bora, tomatoes, and eggplant. Cultivation of cash crops and fruit in close proximity to the sea dams increases during the wet seasons when freshwater is easily available.	Sea dam; Cultivated areas	Local farmers; Residents; Businessmen in: a) Letter Kenny and Whim	a) Moderate	a) Moderate	**a) Medium**
Cultural: Religious	Cultural	• The religious activities of the Hindus are held from Bloomfield to Letter Kenny. Persons from within and outside of the NDC come to these areas for worship. • There are three Hindu temples located in close proximity to the shoreline at Letter Kenny and Whim. • There are cemeteries at Letter Kenny and Whim which are used by all religions.	Coastal	a) Local Hindu communities using shoreline between Bloomfield and Letter Kenny b) Local Hindu communities using the temples c) Cemeteries at Letter Kenny and Whim	a) High b) High c) Moderate	a) High b) Moderate c) Low	**a) Medium** **b) High** **c) High**
Food: wild meat	Provisioning	• Shore birds including egret, curi curi, dukla, plover, wisi wisi, and spika are caught for meat or sale in the market.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	High	**Low**
Social	Provisioning	• There is a nursery school located in close proximity to the seashore in Letter Kenny.	Mangroves; Shoreline	Local children; local communities	High	High	**Medium**
Socio-economic	Provisioning	• A water well and pump system was installed by Guyana Water Incorporated (GWI) Letter Kenny and provides water to Whim, Bloomfield, Letter Kenny and Auchlyne.	Mangroves; Shoreline	Local communities	Essential	Moderate	**Critical**
NDC 42 – Lancaster/Hogstye							
Food: aquaculture and wild-caught fish & shellfish: Marine and Coastal	Provisioning	• There are 12 boats that use the Hogstye/Adventure outfall for fishing. The number of large fishing boats landing at the Hogstye/Adventure outfall has increased as there is easy access and the landing site at Complex 66 is crowded. None of the boats at the outfall are owned by persons from the NDC. However, persons from the NDC, mostly from Lancaster, work on fishing boats that land at various sites along the Corentyne Coast. • Persons throughout the NDC utilize pin seines and cast nets for fishing along the shoreline. • There is one shrimp pond and one tilapia pond in Lancaster occupying 198 acres of land close to the seashore. Two persons own these ponds.	Marine environment; Mangroves;	a) Fisherfolk using the landing site at Hogstye/Adventure b) Local fisherfolk fishing with pin seines and cast nets along the shoreline c) Local persons who own the shrimp and fish ponds	a) High b) High c) High	a) Moderate b) High c) Moderate	**a) High** **b) Medium** **c) High**
Food: wild meat	Provisioning	• Iguanas are hunted daily for meat and for sale by young persons in the NDC who are unemployed. There is limited hunting of birds in the NDC.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	High	**Low**
Cultural: Religious	Cultural	• The religious activities of the Hindus are held mainly at Manchester and Alness where sand beaches facilitate these activities. These activities are increasing because access to the beaches has improved.	Coastal	Local Hindu communities	Moderate	Moderate	**Medium**
Livestock Farming	Provisioning	• Grazing occurs throughout the NDC and across the shore with many residents owning more than 5000 cows, goats, sheep, pigs, and horses.	Mangroves, Sea Dam, Pastures	Local communities, private cattle farmers	Moderate	Moderate	**Medium**
Shoreline Protection	Regulating	• Mangrove forest exists throughout the NDC on the shore and is reported to be destroyed by the shrimp farmers. Grazing occurs in the mangroves and on the sea dam. Natural regrowth of mangroves is continuing.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Pollination, Bird hunting	High	Moderate	**Medium**
Cultivated Crops	Provisioning	• Cultivation of cash crops and fruits along the shoreline throughout the NDC. These activities are increasing and more crops are planted during the wet seasons. Crops include watermelon, bora, tomatoes, muskmelon, etc.	Sea dam, cultivated areas	Local farmers, residents	High	Moderate	**High**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• In Lancaster there are conflicts for land between the farmers and the owners of the fish and shrimp ponds. In addition, there are complaints from some residents of the NDC that spraying pesticides on the crops cultivated on the seashore adversely impacts their lives.					
Tourism and Recreation	Cultural Services	• Locals utilize the Manchester and Alness beaches for recreational purposes with over 100 persons on weekends. These activities are increasing because access to the beaches has improved.	Coastal and Marine	Local communities in NDC and Region 6	High	Moderate	**Medium**
NDC 43 Black Bush Polder							
Drainage	Regulating	• The agricultural settlement has two drainage outlets at No. 43 and at Adventure, with drainage pumps to drain the excess water.	Coastal; cultivated areas	Local farmers, residents	Essential	High	**High**
Religious Activities	Cultural	• The religious activities some residents are held at Adventure beach for special ceremonies.	Coastal	Local Hindus	Moderate	Moderate	**Medium**
Wildlife Trapping & Hunting	Provisioning	• Birds are hunted with shotguns by a few persons on an irregular basis including curi curi, egrets, and wild ducks for meat. Other persons buy the birds at the market.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Low	Moderate	**Low**
Food: aquaculture and wild-caught fish & shellfish: Coastal & mangroves	Provisioning	• A small group of persons visit the mangroves on the coast at No. 43–47 villages to catch crabs in season and on occasion out of season. • Black belly shrimp from the shrimp ponds are sold in the NDC on a daily basis by vendors from the coast.	Marine environment; Mangroves	Local people **ES Linkages:** Economic shrimping & Crabbing	a) Low b) High	a) High b) High	**a) Low** **b) Medium**
NDC 44 Good Hope/No. 51							
Shoreline Protection	Regulating	• Extensive area of mangrove forest from No. 47–49 villages. Mangrove coverage throughout the NDC is increasing throughout the NDC and the Council is actively trying to stop the harvesting of mangroves because of its importance to protecting the shoreline of the NDC.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination	High	Moderate	**High**
Primary production; biodiversity	Supporting	• Wild bees are present in the mangroves in No. 45, No. 47, No. 48, No. 50, and No. 51. Honey is harvested from these hives for subsistence use. However, the numbers of bees are increasing and there have been complaints of bees swarming residences in these areas. • Birds and crabs are abundant. Grazing also occurs in the mangroves and on the sea dam.	Mangrove Forests	Local communities	Low	Moderate	**Low**
Livestock Farming	Provisioning	• One person grazes goats on the sea dam and in the mangroves at No. 49 Village. • In addition, several other persons graze cows, goats and sheep at No. 45, No. 47, No. 48, No. 50, and No. 51 villages.	Mangroves, Sea Dam, Pastures	Local communities; Private cattle farmers who graze animals in: a) No. 49 Village b) Other villages in the NDC	a) Moderate b) High	a) High b) High	**a) Low** **b) Medium**
Cultural: Religious	Cultural	• Religious activities are held in No. 49 and No. 51 villages with the most persons on Fridays and Sundays. There is easy access to the shoreline at No. 49 Village.	Coastal	Local Hindu communities	Moderate	Moderate	**Medium**
Food: wild meat	Provisioning	• Hunting of iguanas has increased significantly in the mangroves throughout the NDC. Persons from throughout the Corentyne Coast including New Amsterdam visit the NDC to catch iguanas for sale. • Hunting of shore birds has increased and is done daily at No. 45, No. 48, No. 50, and No. 51 villages. • In addition, cage birds/finches are caught for sale and training in the NDC at No. 45, No. 48, No. 50 and No. 51 villages.	Mangroves, shoreline	People who hunt: a) Iguanas b) Shore birds for meat and sale, and cage birds for sale **ES Linkages:** Tourism	a) High b) Moderate	a) Moderate b) Moderate	**a) High** **b) Medium**
Food: aquaculture and wild-caught fish &	Provisioning	• A few boats use the landing site at No. 51 Village. The boats mainly fish including bangamary, butterfish, trout, and mullet.	Marine environment; Mangroves	Local fisherfolk Local people who:	a) Moderate b) Moderate	a) High b) Moderate	**a) Low** **b) Medium**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
shellfish: Marine and Coastal		• Persons fish along the shoreline using pin seines and cast nets daily throughout the NDC. • There are four large shrimp ponds in the No. 49 Village which are all privately owned. • In the No. 51 Village, there is a swamp area where persons through the NDC catch fish and shrimp for subsistence use. This area is also used by persons from the No. 52 Village, located outside of the NDC. • Approximately 30–40 persons from within and outside of the NDC catch crabs in the mangrove forests in the NDC. In addition, catch is sold both within and outside the NDC.		a) Use the landing site at located in No. 51 Village b) Fish along the shoreline c) Own private shrimp ponds d) Fish in the communal ponds e) Catch crabs	c) High d) High e) High	c) Moderate d) Moderate e) Moderate	**c) High** **d) High** **e) High**
Socioeconomic: Brick burning	Provisioning	• Brick burning by 4-8 persons on the sea dams using dried mangrove and lumber as fuel.	Coastal	Local communities	Moderate	Moderate	**Medium**
Cultivated Crops	Provisioning	• Cultivation of cash crops and fruits including coconuts on the sea dam and adjacent lands in No. 47 Village has stopped due to significant saltwater intrusion where the dam was eroded and there were breaches in the mangroves. • Farming is continuing on the sea dams on No. 50 and No. 51 villages.	Coastal; Pasturelands	a) Local communities farming on the sea dams b) Local communities planting coconuts on the sea dams	a) Moderate b) Moderate	a) High b) Moderate	**a) Low** **b) Medium**
NDC 45 Macedonia/Joppa							
Shoreline Protection	Regulating	• Extensive forest of mangroves in the NDC. Grazing occurs in the mangroves and on sea dam. Shrimp and fish ponds in the mangroves used by locals. Mangroves are reduced due to erosion of the shore. • There is extensive mangrove cover in the NDC and the mangrove stand has been increasing.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination	Moderate	Moderate	**High**
Livestock Farming	Provisioning	• Cows, goats, and sheep graze throughout the NDC in Bengal, Joppa, Brighton, Eversham, Kiltaira, and No. 35 Village. The least amount of grazing occurs in Eversham. • In between the rice crops, some animals are taken to the rice fields to graze.	Coastal, Mangroves, Sea Dam, Pastures	Local communities, Cattle farmers who graze animals in: a) No. 35 Village b) Brighton c) Kiltaira d) Eversham	a) Moderate b) High c) Moderate d) Moderate	a) Moderate b) Moderate c) Moderate d) High	**a) Medium** **b) High** **c) Medium** **d) Low**
Food: aquaculture and wild-caught fish & shellfish: Marine and Coastal	Provisioning	• Fishing boats that use the outfall in No. 43 Village has declined and larger boats use the landing at Complex 66. 5 boats use the Eversham outfall. Catch of bangamary, mullet, catfish, etc. • Persons fish along the shoreline using pin seines and cast nets. • There are 5 privately owned shrimp ponds on the sea dams of Bengal, Kiltyre, and No. 36 Village. • Approximately 100 persons catch shrimp, tilapia, and hassar in the mangroves, canals, and along the shoreline using pin seines and cast nets daily for subsistence use. If there is excess catch, then it is sold within the NDC. Turtles are sometimes caught in the mangroves for meat. • Crabbing is a significant activity in the NDC and during the crab season persons from Canje visit the NDC to catch crabs for sale.	Marine environment; Mangroves;	Local fisherfolk and local people: a) Fishing boats at the No. 43 Village b) Fishing boats at Eversham c) Privately owned shrimp ponds d) Fishing along the shoreline; and in mangroves, swamps and canals e) Crabbing	a) Low b) High c) High d) High e) High	a) High b) Moderate c) Moderate d) Moderate e) Moderate	**a) Low** **b) High** **c) High** **d) High** **e) High**
Cultivated Crops	Provisioning	• Cultivation of cash crops, fruits, and coconuts is continuing on the government reserves in the Brighton Canal, Kiltyre, and Eversham. However, there are challenges with saltwater intrusion and high water levels close to the mangroves. Cultivation of cash crops and fruits increases during the wet seasons which fresh water is available.	Sea dam, cultivated areas	Local farmers, residents	Moderate	Moderate	**Medium**
Cultural: Religious	Cultural	• Hindu religious activities occur at the shoreline in No. 43 Village. Most persons use the No. 63 beach.	Seashore, sea dam	Local Hindus	Low	High	**Low**
Socioeconomic: Boat Building	Provisioning	• Boat building at No. 43 outfall. There is also boat maintenance and seine mending at the No. 43 outfall.	Coastal	Local fisherfolk, Boat builders, Lumber dealers	Essential	Moderate	**Critical**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Food: wild meat	Provisioning	• A few persons catch plover using wire or seine. Curi curi and wild ducks are shot for meat.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
NDC 46 Bushlot/Adventure							
Food: aquaculture and wild-caught fish & shellfish: Marine	Provisioning	• There are 6 boats using Bushlot/Kildonan outfall for docking. • 12 boats use the Adventure outfall for docking. A total of 20-25 persons work these boats. • Persons fish along the shoreline using pin seines and cast nets. Shrimp caught on the shore with seine by locals daily. The number of persons who fish along the shoreline using pin seines and cast nets is increasing. These persons are generally seeking alternative sources of employment following the closure of sugar estates. • A small group of persons visit the mangroves on the coast regularly to catch crabs and more persons in season. • There are three shrimp ponds in the NDC. Two are in Bushlot Farm and are privately owned by two persons. A communal pond is in Bushlot.	Marine environment; Mangroves; Drainage canals;	Fisherfolk and local people who: a) Bushlot/Kildonan landing site b) Adventure landing site c) Fish along the shoreline d) Private Shrimp ponds e) Communal pond and fishing in mangroves and swamps f) Catch crabs **ES Linkages:** Fishing, erosion regulation, Tourism	a) High b) Essential c) High d) High e) High f) High	a) Moderate b) Moderate c) High d) Moderate e) Moderate f) Moderate	**a) High** **b) Critical** **c) Medium** **d) High** **e) High** **f) High**
Food: wild meat	Provisioning	• Shore is highly populated by thousands of birds. A few persons, mainly in Bushlot, catch plover using wire or seine. Curi curi and wild ducks are shot for meat for sale. A few persons also catch iguanas. This is mostly done by young people who have completed secondary school and are unemployed.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
Cultural: Religious	Cultural	• Hindu religious activities are mainly conducted on the Bushlot beach for Hindu religious activities from other areas as far east as Hampshire use the beach for religious purposes.	Seashore, sea dam,	Local Hindus using: a) Bushlot beach b) other areas in the NDC	a) Moderate b) Moderate	a) Low b) High	**a) High** **b) Low**
Tourism and Recreation	Cultural	• Approximately 100 persons use the Bushlot Beach on a weekly basis for recreation purposes. There are several hundred persons on special holidays like Easter weekend.	Coastal and Marine	Local communities in NDC and Region 6	High	Moderate	**High**
Cultivated Crops	Provisioning	• Cultivation of cash crops and fruits in continuing near the sea dam from Bushlot–Adventure. Cultivation has increased and this is also linked to higher levels of unemployment resulting from the closure of the sugar estates. There is no farming on private lands.	Sea dam; Cultivated areas	Local farmers, residents	High	Moderate	**High**
Shoreline Protection	Regulating	• Extensive area of Mangrove forest in the NDC protecting the mud or sand sea defense. Birds and crabs are abundant and used by locals. Grazing in the mangroves and sea dam particularly by residents living in proximity. • Mangrove cover at Kildonan has been increasing. Persons from the NDC use dried mangroves in their kitchen gardens and sometimes as firewood.	Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination	Moderate	Moderate	**Medium**
Livestock Farming	Provisioning	• Grazing of goats and sheep along the seashore in Kildonan.	Mangroves	Local communities	Moderate	Moderate	**Medium**
NDC 47 Maida/Tarlogie							
Shoreline Protection	Regulating	• Mangrove forest covers the entire shore protecting the fragile mud sea defense. In 2018, NAREI established a mangrove restoration plot in Wellington Park. These mangrove seedlings have died. However, there are mangroves on other areas in the NDC and new natural growth is continuing in Kilmarnock.	Coastal, Mangrove Forests	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination	Essential	High	**High**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
Agriculture: Grazing	Provisioning	• More than 1,000 cows and sheep graze along the shoreline throughout the NDC. The owners of these animals reside in Wellington Park, Philippi, and Kilmarnock.	Mangroves; Sea Dam; Pastures	Local communities; Private cattle farmers	High	Moderate	**High**
Religious Activities	Cultural	• Religious activities held in areas with access to the sea at Wellington Park, Kilmarnock, Maida, and Tarlogie.	Coastal	Local Hindu communities	Moderate	Moderate	**Medium**
Food: wild meat	Provisioning	• Curi curi, flamingo, duckla, wisi wisi, and plover birds are hunted regularly for meat or sale. • Hunting of iguanas and sea birds for meat and sale in the mangroves is increasing and approximately 20–25 persons do this daily.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
Food: aquaculture and wild-caught fish & shellfish: Marine and coastal	Provisioning	• 14 boats landing at Maida, Kilmarnock, and Wellington Park depending on the ease of traversing the channels to access the sites. Approximately 60 persons are employed in these boats. Catch includes catfish, bangamary, butterfish, trout, mullet, snook, basha, etc. • Persons fish along the shoreline using pin seines and cast nets. • Crabbing is also an important source of livelihoods throughout the year in the NDC. Crab catching is also done by several persons for recreation. • There are canals and swamp basins in Tarlogie that are open for communal catch of fish and shrimp. • Large area in the NDC with shrimp ponds harvesting approximately 125 buckets of shrimp monthly valued at GYD$1,000,000. Additional privately owned shrimp ponds have been created on Wellington Park, Maida, and Kilmarnock. Approximately 8–10 persons own the ponds in the NDC.	Marine environment; Mangroves;	Local fisherfolk Local people who: a) Utilize the landing sites at Maida, Kilmarnock, and Wellington Park. b) Catch fish and shrimps in swamps and fish along the shoreline c) Own private shrimp ponds d) Catch crabs	a) High b) High c) Essential d) High	a) Moderate b) Moderate c) Moderate d) Moderate	**a) High** **b) High** **c) Critical** **d) High**
Cultivated Crops	Provisioning	• There are small farms on the sea dam and on adjacent lands at Maida, Tarlogie, and Wellington Park planting fruits and cash crops.	Coastal, Pasturelands	Local communities	High	Moderate	**High**
NDC 48 No. 52/74 Villages							
Food: aquaculture and wild-caught fish & shellfish: Marine and Coastal	Provisioning	• There are more than 400 boats at No. 66 Village outfall for nearshore and deep sea fishing. Fishing boats from Regions 4 and 5 and along the Corentyne Coast use this landing site. • 100 boats use the No. 65 Village outfall for fishing activities with shrimp. • At No. 63 Village, there are approximately 20 small boats that use pin seines to fish along the shoreline. In total, there are approximately 60–75 small boats in the NDC that practice pin seine fishing along the shoreline for sale. • 10-30 persons daily catch shrimp and fish on the shore by the beach using hand seine. Shrimp, mullet, and sardines are caught for sale. • Erosion of mangroves has significantly reduced crabbing activities and crabs are only caught during crab marching seasons. In crab season more than 50 persons daily catch crabs. • Approximately 4,000 persons are directly indirectly employed in the fishing sector in this NDC.	Marine environment; Mangroves; Drainage canals;	Fisherfolk who: a) Use the landing site at No. 66 Village b) Use the outfall at No. 65 Village c) Conduct pin seine fishing and fish along the shoreline d) Catch crabs **ES Linkages:** Fishing, Fish mongering, Boat Building; Mangroves	a) Essential b) Essential c) Essential d) High	a) Low b) Moderate c) High c) Moderate	**a) Critical** **b) Critical** **c) High** **d) High**
Socio/economic	Provisioning	• Approximately 10 meters from the No. 65 outfall, construction of a fish processing plant has commenced. The owner of this processing plant is has also purchased 45 new fishing boats, which may eventually land at the processing plan. Approximately 500 persons are expected to be employed at the fishing processing plant.	Mangroves, outfall, shoreline	Local business persons, fisherfolk, local communities	High	Moderate	**High**
Food: wild meat	Provisioning	• Many iguanas are caught and sold for GYD$4,000-5,000 each. Few birds are caught using nets or wire though the practice is illegal at the No. 63 beach.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
Shoreline Protection	Regulating	• Mangrove forest covers most of the NDC offering protection and aids in capturing the sediments as the shore is built. There is significant to complete erosion of mangroves in No. 52–No. 63, No. 67, No. 69,	Mangrove Forests, Coastal	Local communities	High	Moderate	**Medium**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		No. 70, No. 73, and No. 74 villages. There is no cutting of mangroves and it is likely that these are natural deaths due to the age of the stand.		**ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination			
Livestock Farming	Provisioning	• Previously, thousands of animals grazed throughout shoreline areas of the NDC. Grazing of animals along the shoreline has decreased significantly. Due to the erosion of the mangrove forests, grazing lands have been lost to the sea and available lands are not private property. As a result, grazing has shifted largely to the back-dam areas. At present, more persons are involved in cattle rearing but there are fewer livestock overall in the NDC.	Mangroves, Sea Dam, Pastures	Local communities, Private cattle farmers who graze animals at No. 61 and No. 63 villages	High	Moderate	**Medium**
Cultural: Religious	Cultural	• Religious activities held in the area at No. 63 beach with 20-50 persons daily and hundreds on weekends. • Religious activities at No. 73 beach with 20 persons daily and more than 200 on weekends. • In general, religious activities are held throughout the NDC where there is easy access to the shoreline including No. 69, No. 70, and No. 71 villages.	Coastal	Local Hindu communities Christians (baptisms/ outings) Muslims (Outings) with: a) Religious activities at No. 63 beach b) Religious activities at No. 73 beach c) Other locations in the NDC	a) Essential b) High c) Moderate	a) Low b) Moderate c) Moderate	**a) Critical** **b) High** **c) Moderate**
Socioeconomic: Boat Building	Provisioning	• Boat building occurs on both sides of the dam at Complex 66. Surinamese fisherfolk also order fishing boats at the boat building sites at Complex 66 due to the quality of wood used in Guyana and the skills of the boat builders. • A boat construction facility has also been opened adjacent to the new fish process plant at No. 65 Village.	Coastal	Local fisherfolk, boat builders, lumber dealers	Essential	Moderate	**Critical**
Tourism and Recreation	Cultural	• 50-100 persons use the No. 63 beach daily for recreational purposes with hundreds of persons on weekends and thousands on Easter and August weekends. • No. 69–No. 70 beach is used by 20-50 persons daily and over 100 on weekends and holidays.	Coastal and Marine	Local communities in NDC, Region 6 and other areas of the Country using: a) No. 63 beach b) No. 69 to 70 beach and other beaches, recreational sites in the NDC	a) Essential b) High	a) Low b) Moderate	**a) Critical** **b) High**
Cultivated Crops	Provisioning	• Cash crop cultivation along most areas of the shore and on sea dam on private lands with coconuts and other crops. Peeled dried coconuts sells at GYD$4,000–6,000 per hundred. Cash crop cultivation along the shoreline has also decreased due loss of lands as a result of mangrove erosion.	Sea dam, cultivated areas	Local farmers, residents	High	Moderate	**High**
NDC 49 Corriverton Town Council							
Socioeconomic: Renewal Energy	Provisioning	• Private company has installed a wind turbine of 275 KVA capacity on the riverbank, but it is not yet operational. The business is awaiting permission from the Government of Guyana before it can be used.	Coastal	Local businessmen Township	Moderate	High	**Low**
Socioeconomic: Wharf for Passengers & Cargo	Provisioning	• The wharf located at Line Path is used by farmers and loggers for transport of their produce from Orealla and Siparuta to Corriverton. • Passengers use the 'backtrack route' at No. 78 Village to access the speedboat service to Suriname. When in operation, the ferry to Suriname lands at Moleson Creek, which is not located in the municipality.	Coastal; River	Local boatmen, Businessmen; locals; Guyanese, Surinamese using: a) Wharf in Line Path b) Speedboat service to Suriname	a) Essential b) Essential	a) Moderate b) Moderate	**a) Critical** **b) Critical**
Food: aquaculture and wild-caught fish & shellfish: Marine and Coastal	Provisioning	• There are more than 40 boats at No. 79 Village seawall for fishing in the Corentyne River and catch fish and shrimp. • Nine fishing boats docked for fishing activities in the river and the sea including sardines.	Marine environment; Mangroves; Drainage canals;	Fisherfolk and locals who: a) Utilize the landing site at No. 79 Village b) Fish along the shoreline	a) High b) Essential	a) Low b) Moderate	**a) Critical** **b) Critical**

Service	Type of Service	Description and Examples in the Study Area based on Stakeholder Input	Relevant Land Use/ Habitat Categories	Beneficiaries and ES Linkages	Importance to Beneficiaries (Low-Essential)	Replaceability (Low-High)	Priority Rating (Importance x Replaceability)
		• Approximately 10–50 persons are engaged in daily use of seines and cast nets for catching mullet and shrimp. • Catching sardines is seasonal and more than 100 persons are engaged in using seines to catch sardines when in season. When in season, catching sardines is also considered a recreational activity.		**ES Linkages:** Fishing, Fish mongering, Boat Building, Shrimping			
Socioeconomic: Boat Building	Provisioning	• Boat building at No. 84 Village outfall with 2 boats under construction by a crew of 4 persons. • Boat building at Line Path Skeldon by a crew of 6 persons. • Speed boat construction is done at the No. 78 Village.	Coastal	Local fisherfolk, boat builders, lumber dealers involved in boat building at: a) Line Path b No. 84 outfall c) No. 78 Village	a) Moderate b) High c) High	a) Moderate b) Moderate c) Moderate	**a) Medium** **b) High** **c) High**
Shoreline Protection: River Dam Protection	Regulating	• There has been significant erosion of mangrove cover from No. 75 Village to Scottsburg. The municipality requested support from NAREI to replant mangroves in the area. However, rip rap sea defense structures have been installed in Scottsburg. Mangroves are not harvested but some persons collect dried mangroves to use as firewood. • Erosion of the sand bank in No. 79 Village has decreased use of the area for recreational purposes.	Mangrove Forests, Coastal	Local communities **ES Linkages:** Fishing, Grazing, Erosion regulation, Pollination	Moderate	Moderate	**Medium**
Cultural: Religious	Cultural	• Religious activities held in the area at Line Path, Scottsburg, Springlands, and Spring Garden by 20-50 persons daily and hundreds on weekends. • Some Christian groups also perform baptisms in these areas.	Coastal	Local Hindu and Christian communities, using shoreline areas for worship Burial site	a) Moderate b) Moderate	a) Moderate b) Moderate	**a) Medium** **b) Medium**
Food: wild meat	Provisioning	• More than 10 persons are engaged in hunting of iguanas on a weekly basis along the shoreline in Scottsburg. Each week about 50 iguanas are caught and sold forGYD$4,000-5,000 each by 5-7 persons. A few rabbits are also caught for meat.	Mangroves, shoreline	Local people **ES Linkages:** Tourism	Moderate	Moderate	**Medium**
Livestock Farming	Provisioning	• There are fewer than 30 cows grazing along the shoreline in the NDC. According to the bylaws of the TC, there should be no livestock farming in the town.	Mangroves, Sea Dam, Pastures	Local communities, private cattle farmers	Low	High	**Low**
Tourism and Recreation	Cultural	• There are approximately five tour operators who provide trips down the Corentyne River. Sometimes regattas and other events like pageants are held in communities in the river such as Orealla. • Locals use beaches and shoreline areas in the municipality for relaxation and recreation in No. 79 Village, Springlands, and Scottsburg.	Coastal and River	a) Local communities in Town and Region 6 and Suriname involved in tourism in the Corentyne River b) Locals using beaches and shoreline areas for recreation	a) Moderate b) Moderate	a) Low b) Moderate	**a) High** **b) Medium**
Socioeconomic: Informal Housing	Provisioning	• Squatting occurs at Line Path, Dukestown, Scottsburg, and No. 78 & No. 79 villages by approximately 30 households.	Coastal	Local fisherfolk, local people squatting in the municipality	High	Moderate	**High**
Cultivated Crops	Provisioning	• Approximately 35 persons are engaged in cash crop and fruits cultivation most areas of the shore and sea dam at Line Path, Scottsburg, Dukestown, and No. 75 Village. • Irrigation pump located at the koker in No. 74 Village	Sea dam; cultivated areas	a) Local farmers, residents cultivating crops on sea dams b) Local farmers benefiting from irrigation pump	a) Moderate b) Moderate	a) Moderate b) Moderate	**a) Medium** **b) Medium**

1. INTRODUCTION

As detailed in Section 1.2, after documenting the findings and analysis, the final phase in the process was to validate the compiled data and verify that the associated detailed mapping was accurate. An ecosystem services validation exercise commenced in May 2019 and concluded in July 2019. As described in Section 2.4, in addition to validating previously recorded information, the validation exercise allows for the collection of any new data relating to ecosystem services functions and values since the previous engagements, while also providing the opportunity to collect updated socioeconomic data at the community level.

The information presented in this Validation Data Summary appendix is limited to the feedback obtained from stakeholders during the validation stage whereby the socioeconomic and biodiversity experts presented the findings of the ecosystem services study and the coastal sensitivity maps on which the results of the ecosystem services study were displayed. These were presented to 62 of the original 64 Neighbourhood Democratic Councils (NDCs), Town Councils (TCs), Village Councils (VCs), and Community Development Councils (CDCs) in the coastal area of Regions 1, 2, 3, 4, 5, and 6.

The responses received during the validation exercise are detailed below, presented by region and stakeholder group. Feedback regarding additional or changed ecosystem services data is reflected under the “Ecosystem Services Survey” heading. Issues not directly related to ecosystem services functions or values, but related generally to socioeconomic status, are also noted under “Other data collected” headings for the purpose of documentation. References within the data to changes over time (e.g., increase in population, decrease in fishing) refer to the time which has lapsed since the 2017/2018 original data were collected and the 2019 validation exercise. In some cases, there are specific notes regarding changes that will be made within the Liza Project Geographic Information System (GIS) database. These are captured within the responses in order to maintain accuracy in the reporting and subsequent mapping efforts. The findings outlined in this appendix are provided in detail within the Detailed Findings Sections of the report.

Some minor changes and updates were recommended as indicated by individual focus groups. These minor updates relate mainly to adjustments in the quantitative data for some ecosystem services presented, as well as location of some activities. In a few instances, additional uses/services in some areas were recommended to be included. The spatial adjustments of locations and inclusion of new uses have been updated in the Liza GIS Database.

Additional socioeconomic data at the NDC, CDC, VC, and TC level were also collected, including updated population figures.

The NDCs, CDCs, VCs, and TCs generally expressed gratitude for the information shared and the opportunity to participate in the original screening and scoping process, and subsequent validation exercise. At their request, finalized maps of their area depicting the ecosystems services within their area as well as the summarized analysis was provided to each of the participating NDCs, CDCs, VCs, TCs, and Regional Councils in December 2019.

The NDCs, CDCs, VCs, and TCs generally expressed gratitude for the information shared and the opportunity to participate in the original screening and scoping process, and subsequent validation exercise. At their request, finalized maps of their area depicting the ecosystems services within their area as well as the summarized analysis was provided to each of the participating NDCs, CDCs, VCs, and TCs and Regional Councils in December 2019.

1.1 Region 5

This section presents the feedback from the ecosystem services validation exercise within Region 5. Engagements with the following NDCs within Region 5 were conducted during the period 20 May to 22 May 2019:

- Woodlands/Farm
- Hamlet/Chance
- Mahaicon/Abary
- Profit/Rising Sun
- Seafield/Tempie
- Union/Naarstigheid
- Bath/Woodley Park
- Woodlands/Bel Air
- Zeelugt/Rosignol

1.1.1 Woodlands/Farm NDC

Ecosystem Services Survey

- There is significant hunting along the NDC shoreline for iguanas, labba, and wild birds for domestic and commercial purposes.
- There is significant fishing within the Bellamy Canal behind the sea dam. More than ten people visit this canal daily during the dry season to catch fish and shrimp.
- A new beach is being built up at Taymouth Manor that has potential for recreation activities. Current access to the area is a challenge, but the NDC is hoping to build the necessary infrastructure.
- The sea defense is under threat, with erosion taking place in some sections, particularly the Fairfield seashore.
- There is beekeeping within the NDC but not at the shoreline. However, the bees might be feeding within the mangroves at the shoreline.
- [Note: The Fish Landing Site that was included under the Unity/Vereegining NDC (Region 4) is actually within this NDC area and should be labeled as such in the GIS database.]

Other Data Collected

- The population is approximately 20,000.

- Small businesses within the NDC are increasing.
- There has been an increase in coconut cultivation recently.

1.1.2 Hamlet/Chance NDC

Ecosystem Services Survey

- There is significant hunting of iguanas on the seashore and along the banks of the Mahaicony River. Songbirds are caught for trade. Birds caught along the shore and river banks include Twa Twa, Grasie, Canary, Red, and Love birds.
- More than ten people catch fish by lines and nets daily in the Mahaicony River for subsistence.
- Few cattle graze within the NDC, but the main stocks are kept at the backlands where there are pastures.

Other Data Collected

- The population is approximately 1,500.

1.1.3 Mahaicony/Abary NDC

Ecosystem Services Survey

- The number of boats fluctuates with the fish season. In summer, the number increases when the catch is plentiful. The sargassum is a constant burden to the fisherfolk, affecting their nets and ability to catch fish. There are numerous wrecks in the area that affect the fisherfolk as their nets become tangled. Drift mud also affects fishing activities.
- People from other regions come to the mangroves and swamps to catch shrimp and crabs during the summer months.
- Songbirds are caught during the summer months when they are plentiful on the shore and river banks.
- There is an increased use of the beach at Good Faith as beaches in other areas are being covered by mud and taken over by mangroves. There is a small beach at Abary that is frequented by a number of people.

Other Data Collected

- The population is approximately 8,000.
- There has been an increase in agriculture, consisting of both crops and livestock.

1.1.4 Profit/Rising Sun NDC

Ecosystem Services Survey

- The fishing boats move according to the migration of the fish to different fishing grounds. Six people set pin seines in low tide on the mud flats.

- There is an increase in birdwatching in the area by tourists, which is promoted by the Georgetown birdwatching groups. Species of note include curri curri, pellew, and duckla. There are thousands of duckla in the area in the afternoons when the tide is low.
- More than 2,000 sheep, goats, and cattle graze in the NDC, but the activity is plagued by thieves.
- The beach is used by many people and expected to be used by more as a bridge and a new road are built to access the beach.

Other Data Collected

- The population is approximately 7,500.
- There is an increase in small-scale agricultural activity, including both livestock and crop farming.

1.1.5 Seafield/Tempie NDC

Ecosystem Services Survey

- The mangroves have reduced at Jacoba and more fishing boats are now in the area as the mud is washing away.
- Erosion has significantly reduced the shoreline within the NDC over the years. The area has old sluices that are in the sea approximately 1 kilometer (.62 mile) from the present shoreline.
- The farmers are fearful of the salt water intruding onto their farms as some people are cutting the mangroves for their own purposes in # 42 and # 37 Villages.
- Grazing has increased at Ross, Seafield, and Tempie.
- Cash crop cultivation is increasing along the sea defense.

Other Data Collected

- The population is approximately 5,000.
- There is an increase in small scale agricultural activity, including both livestock and crop farming.

1.1.6 Union/Naarstigheid NDC

Ecosystem Services Survey

- Fishing has increased within the NDC with more boats at Bushlot.
- More than 30 people are involved in the on-land fishing of tilapia and shrimp for commercial purposes.
- There is an increase in mangroves, especially at Onverwagt. The extensive coverage of mangroves deters the residents of the NDC from making full use of the seashore.
- Recreation activities are facilitated by the Hope Town Community Center. Other locals use Bushlot, Union, Bel Air, and Lovely Lass for recreation purposes.

- There are more animals grazing now in the NDC than in 2018. The animals compete with the cash-crop farmers for space on the sea dam and reserves.
- There are no religious activities at Lovely Lass. [Note: Remove this point from the map.] These activities are conducted at Onverwagt and Bush Lot.
- Many sea birds are hunted for meat and sale in the local markets. Iguanas are hunted mainly during the summer months when they are more plentiful in the area.
- Beekeeping is conducted at Union, Lovely Lass, Onderneeming, Hopetown, and # 29.

Other Data Collected

- The population is approximately 15,000 and is increasing due to new housing areas.

1.1.7 Bath/Woodley Park NDC

Ecosystem Services Survey

- Many people are fishing in the swamps and nearshore during the period when sugar estates are out of season. It is estimated that 10 people conduct this activity regularly, with a peak of 30 to 35 people when crops are out of season. Locals can be seen dragging long seines within the various swamps to catch shrimp.
- In July and August, hundreds of people catch crabs by the thousands in the region, including the NDC. [Note: The priority rating in the GIS database for this activity should be changed to medium.]
- One fisherfolk used pin seine along the mudflats for his daily catch.
- Experiment, Bath, # 11, and # 12 villagers use the façade canal for religious purposes, as the shore is almost inaccessible.
- Grazing is about the same in the NDC from 1 year ago and is plagued by thieves.
- There is significant squatting along the façade canal throughout the NDC. The squatters engage in crop farming.
- Mangroves have been reduced by erosion in some areas in the NDC.

Other Data Collected

- The population is approximately 18,000.
- There has been an increase in economic activities within the NDC, including cash crop cultivation, taxi services, wash bays, and supermarkets.

1.1.8 Woodlands/Bel Air NDC

Ecosystem Services Survey

- There is mangrove growth throughout the NDC shoreline, which has reduced religious and recreational activities along the shoreline. The # 6 beach has been taken over by mangroves and the local people are forced to travel further to find a beach for recreation.
- There is no bee keeping at # 10, as was indicated on the map. [Note: Remove this from the map.] However, there are wild bees and bee hives in the NDC.
- Two fishing boats now dock at # 9 Village.
- There is cash crop cultivation throughout the NDC except in the # 10 Village.
- There is grazing of animals throughout the NDC. The National Agricultural Research and Extension Institute (NAREI) Ranger monitors for grazing within the mangroves.
- Many people catch fish and shrimp in the swamps and drainage canals using nets or long seines.

Other Data Collected

- The population is approximately 1,200.
- There has been a slight increase in agricultural activities.

1.1.9 Zeelugt/Rosignol NDC

Ecosystem Services Survey

- The cremation site at # 2 is no longer used by the people of the NDC.
- There are approximately seven Hindu temples at De Edward, Cotton Tree, # 3, Bennett Dam, Victory Dam, and along the main canal.
- The Berbice River Bridge is used by thousands of people daily and the Berbice River launch transports approximately 1,000 school children and government workers on weekdays between Rosignol and New Amsterdam.
- There are now 90 boats at Rosignol and 75 boats at De Edward. More fishing boats are ordered from Crabwood Creek, where there is better wood available for construction.
- Many cows, goats, sheep, donkeys, and pigs are found grazing the NDC.
- Cage birds are caught along the shore.
- Shrimp is abundant in the swamp and crabs are caught during the season.
- Iguanas are hunted almost daily by approximately 50 people in the NDC.

Other Data Collected

- The population is approximately 2,000.

- There has been an increase in economic activities within the area, especially at Rosignol and De Edward.

1.2 Region 6

This section presents the feedback from the ESS Validation Exercise within Region 6. Engagements with the NDCs and TCs within Region 6 were conducted during the period of 24 to 28 June 2019:

- Ordinance/ Fort Lands
- Kintyre/ No. 37
- Gibraltar/ Fyrish
- Kilcoy/ Hampshire
- Rose Hall Town Council
- Port Mourant/ John
- Bloomfield/ Whim
- Lancaster/ Hogstye
- Bushlot/ Adventure
- Maida/ Tarlogie
- Macedonia/ Joppa
- Good Hope/ No. 51
- No. 52/ No. 74
- Corriverton Town Council

1.2.1 Ordinance/ Fort Lands NDC

Ecosystem Services Survey

- The sawmill located at Sheet Anchor continues to operate and employs between 10 and 50 workers on a part-time basis. Logs are transported to the sawmill using the Canje River.
- The wharves located at the Canje Bridge are used to dock vessels either transporting building supplies or waiting for boat repairs. Approximately four vessels dock at the wharves daily. Boat repairs are also continuing.
- Fishing boats dock at Sheet Anchor, Cumberland, and Seawell; however, the majority of these boats dock at Sheet Anchor because of the wharf.
- The closure of the sugar estates has caused former employees to seek new employment opportunities; and many of them have ended up in the agriculture sector raising livestock. This has increased the number of livestock to more than 2,000 head of cattle grazing at Cumberland, Fort Ordinance, Palmyra, and No. 2, and more than 100 head of cattle, goats, and sheep grazing in Sheet Anchor.
- Similarly, the downturn of the sugar industry has resulted in approximately 50 to 60 people seeking employment in fishing, especially within the swamps along the shoreline areas. Catch is sold within and outside of the NDC.

- Cash crop cultivation is occurring in close proximity to the seawall, including in Seawell. It was prevalent in the past, but slowed in recent years; however, with the downturn of the sugar industry, it appears to be increasing.
- There has been no change in the extent of mangrove coverage in the NDC. Mangroves are a habitat for wild bees, birds, crabs, fish, and shrimp.
- Fish and shrimp are caught daily in the mangroves and canals using cast nets and seines and are sold on the market.
- Locals hunt seabirds such as curi curi, plower, and wisi wisi ducks for meat.
- Crabbing occurs throughout the year and there are two crab meat processing operations located in the NDC.
- Squatting on the seawall at Sheet Anchor and Cumberland has increased by a few households.
- Religious activities are conducted by Hindu communities at Sheet Anchor and on the dams leading to the Canje River. People from the NDC also use dams in Canefield, a neighboring community, for religious purposes.

Other Data Collected

- The population within the NDC area is 8,500 and is relatively stable. A new residential area has opened in Fort Ordinance where approximately 2,500 to 3,000 people reside. Although it has not yet been handed over to the NDC by the Government of Guyana, the NDC has already provided some services to the area.
- Cash crop cultivation in areas close to the seawall in Seawell was prevalent in the past but had declined in recent years. However, cultivation has recommenced in this area by former sugar workers.

1.2.2 Kintyre/ No.37 NDC

Ecosystem Services Survey

- More residents are involved in crabbing and raising livestock due to high levels of unemployment from the closure of the sugar estates.
- The downturn in sugar has also led to an increase in grazing of animals in the NDC.
- Approximately 10 residents are involved in daily hunting of seabirds such as curi curi, plower, and wisi wisi ducks for meat and for sale. More residents participate in hunting during peak seasons (for example, curi curi during the dry season).
- There is a cemetery located in close proximity to the seashore in Bohemia.
- There is brick making in lands adjacent to the shoreline. Soil from the NDC is extracted to burn for the creation of bricks. However, complaints have been lodged to the Regional Health Officer because it is disrupting the nearby cemetery. In addition, concerns were raised that brick making

increases erosion risk due to the extraction of soil and excavation in the direction of the shoreline.

- There has been no change to the extent of mangrove cover in the NDC. Mangroves protect the NDC from the impacts of the sea. In addition, crabs, shrimp, fish, and seabirds are abundant.
- Shrimp and fish are still caught in the communal fish ponds located in the NDC. Residents throughout the Corentyne Coast benefit from the use of these ponds.
- Hindu religious activities are practiced in Borlam daily, particularly on Sundays.
- Drainage pumps located at Borlam are still operational.
- Crab Island and Borlam Beach are used for recreational purposes.
- There is no farming of cash crops and fruits on the sea dam and adjacent areas.

Other Data Collected

- The population within the NDC area is 1,000 and is relatively stable.
- It was reported that mosquitoes are more prevalent when culverts are opened, which the NDC does to allow shrimp to swim from the ocean into shrimp ponds.
- At present, two species of crab are being caught; however, the “sheriga” crabs, which were previously abundant, are now scarce.

1.2.3 Gibraltar/ Fyrish NDC

Ecosystem Services Survey

- The main source of livelihoods in the NDC comes from livestock farming. There is pig farming in the back dam of No. 1 Village and two large poultry farms in the Fyrish back dam.
- There has been no change to the 12 shrimp ponds located along the seashore.
- Many residents of the NDC were employed by the sugar industry and were retrenched when the estates closed. Many people pursued alternative livelihoods such as crabbing, fishing, shrimping, and raising livestock farming.
- Cattle, goats, sheep, and pigs graze on lands adjacent to the mangroves.
- There is a cemetery in Fyrish that is used for burials by all religions.
- Sea birds such as curi curi, plower, and wisi wisi ducks are hunted for meat and sale. The number of residents involved in these activities has increased, also likely due to the downturn in the sugar industry.
- Hindu religious activities are practiced along the shoreline in areas where there is access to the shoreline such as the eastern section of Fyrish and the No. 1 Village.
- The No. 4 Village is not located within the NDC. However, people from the NDC use the dam in the No. 4 Village for Hindu religious activities.

Other Data Collected

- The NDC population is approximately 5,600 and remains stable.
- There are grazing pastures (cattle, goats, sheep, and pigs) in each of the four villages located in the NDC. The NDC is receiving support from the Government of Guyana for the construction of pastures. There is a new pasture in the No. 1 Village.
- The Government of Guyana provided an excavator to clear the channels around the sea dam to facilitate easier refilling and emptying of the shrimp ponds. Currently, the NDC is engaged with the Sea Defence Board to ensure that the sea dams are sufficient to protect lands from the impacts of the sea.
- In the past, there was a breach of the sea dam as a result of shrimping activities (to refill the shrimp ponds in the NDC), resulting in saline intrusion into residential areas, and the destruction of more than 1,000 mango trees in the back dams of Fyrish and Gibraltar.
- There is no landfill in the NDC and consequently residents and businesspeople (as they are required to pay) illegally dump garbage on the access dam. A significant quantity of garbage ends up in the channels. The NDC is allowed to dispose of garbage free of cost at the landfill located in the Rose Hall Municipality. However, businesspeople are required to pay to dispose of their garbage at the Rose Hall landfill and most are unwilling to do so.

1.2.4 Kilcoy/Hampshire NDC

Ecosystem Services Survey

- The number of fishing boats associated with the Albion landing site has increased to 160 boats during off-season and to175 boats during peak season. Approximately 450 to 475 residents are employed in fishing[6].
- More residents than in years past are involved fishing, crabbing, and hunting for subsistence and sale as a result of the downturn in the sugarcane industry. This includes:
    - Fishing with cast and drag nets;
    - Crabbing; and
    - Hunting iguanas and sea birds in the mangroves.
- There are 40 privately owned shrimp ponds in the NDC in close proximity to the sea dam.
- Iguanas and seabirds are caught for meat and sale in the mangroves. These activities are mostly done by young people who have completed secondary school but are unemployed. Young people from within and outside of the NDC are engaged in this activity.

[6] Based on data collected from fisherfolk at the Albion landing site as part of the Participatory Fishing Study (PFS), approximately 50 boats routinely use the Albion landing site. It is unlikely that the landing site has capacity for 175 boats. Based on the PFS findings, boats that previously landed at Albion are docking at the Adventure landing site due to ease of access and clearance of the channel. As a consequence, while more people in the NDC are involved in fishing, they are using alternative landing sites located on the Corentyne Coast.

- The number of people from the NDC who catch crabs on a weekly basis for sale has increased. In addition, crab catching is also considered a recreational activity and the crabs caught are for subsistence use.
- The poultry farm located in Kilcoy and Chesney has five large multi-story chicken pens, which house approximately 100,000 chickens.
- A few residents engage in farming of cash crops and fruits for subsistence and sale on the sea dam and adjacent lands.
- Hindu temples are in close proximity to the seashore at Chesney, Hampshire, and Nigg, and two temples are located in Belvedere. Hindu religious activities are also conducted on the sea dam in No. 4 Village.
- Wild bees are found in hives in the mangroves at Hampshire.
- The extent of mangrove cover in the NDC has increased, extending further offshore. In previous years, there was significant harvesting of mangroves resulting in almost 1 kilometer of erosion inland. However, mangrove harvesting has been reduced.

Other Data Collected

- The population of the NDC is 25,000 and is increasing as new housing accommodations have been built in Kilcoy/Chesney and Block X of Belvedere/Nigg/Hampshire.
- Land has been earmarked by the Government of Guyana in Hampshire North for the establishment of a new industrial site.
- There is cattle rearing in Hampshire but it is not located in proximity to the seashore.
- Region 6 is heavily dependent on GUYSUCO and negative effects of the closure of the estates are being experienced throughout the region.
- In previous years, there was significant harvesting of mangroves resulting in almost 1 kilometer of erosion inland. However, mangrove harvesting has been reduced although a few people still cut mangroves to use in their kitchen gardens.

1.2.5 Rose Hall Town Council

Ecosystem Services Survey

- The beach in Rose Hall and No. 63 remain popular, with comparable users during the Easter holidays in 2019. Rose Hall has increased in popularity; hundreds of people visit it daily—upwards of 500 people on weekends.
- Religious activities by Hindus on the Rose Hall beach has increased and approximately 200 people use the area on a weekly basis, with more on Sundays and Tuesdays. Thousands of people use the area on special days of worship for Hindus.

- There has been no change in the number of people engaged in fishing in the NDC[7].
- The extent of mangrove coverage in the municipality has declined, as trees and cover are harvested for firewood, building materials, and fishing rods.
- Approximately 100 cattle, sheep, and goats are grazed on the shore and nearshore areas.
- Seabirds are caught for subsistence and sale, and include spika, cranes, and wisi wisi ducks. Some residents from the municipality visit fish ponds located in other areas of the Corentyne Coast to catch large birds for sale.
- Farming on the sea dam and on adjacent lands has decreased due to saline intrusion.

Other Data Collected

- There are approximately 15,000 people in the municipality.
- The access road to the Rose Hall beach is in poor condition. The Ministry of Social Cohesion visited the municipality to assess opportunities for improving infrastructure, including construction of an access road and providing electricity. However, this project is on hold.
- Region 6 was very dependent on the sugar industry. Many businesses in the municipality depended on "crop seasons" of the sugar estates. In addition, the closure of the estate in Rose Hall has negatively affected the revenues in the municipality as fewer people purchase from vendors in the markets and vendors are unable to pay their rates to the TC. Similarly, residents from the municipality who lost their jobs are employed in alternative activities such as farming for subsistence use and fishing in canals in the back dams.

1.2.6 Port Mourant/ John NDC

Ecosystem Services Survey

- There are nine boats employing between 33 to 40 people that use the Port Mourant outfall for fishing and shrimping. Fishing is considered a second job for sugar workers during out-of-crop seasons.
- Approximately 20 to 25 residents catch fish and shrimp in the swamp areas and drainage canals on a daily basis, while up to 100 residents catch fish and shrimp in these same areas during out-of-crop seasons.
- There are approximately 100 shrimp and fish ponds owned by 40 people in the Rose Hall to Babu John area. Ponds have been expanded, converted, or restored, and there are different sections for diverse species. In addition, areas formerly used for rice cultivation have been converted to shrimp and fish ponds. The ponds in Babu John have been rehabilitated and are currently in use. All ponds in the NDC are privately owned.
- The poultry farm at Johns has five large multi-story pens with approximately 25,000 chickens.

[7] Note: Based on findings of the PFS, the number of vessels operating at the Rose Hall landing site has declined over the last six months due to the difficulty accessing the channel and personal challenges encountered by the fisherfolk.

- Sea- and shore birds are hunted for subsistence and for sale. Although a few people routinely catch these birds, there are peak numbers of people involved on a seasonal basis.
- There has been no change in mangrove cover in the NDC but there is no monitoring. Some people collect dried mangrove roots for use in their kitchen gardens and as firewood.
- Religious activities are held at Port Mourant. In addition, the main cremation site at Babu John is dedicated to the late President Cheddi Jagan. There is also a cemetery at Babu John.

Other Data Collected

- There are approximately 16,000 people in the NDC. The population may be increasing as several people from New Amsterdam, Mara, Canje, and Black Bush Polder have relocated to the NDC.
- The closure of the sugar estates in Region 6 has significantly affected the quality of life in the NDC. Former sugar workers have been struggling to find alternative livelihoods such as fishing and subsistence farming. The overall reduction in disposable income in the NDC has adversely affected businesses and vendors in the Port Mourant market. In addition, sports like cricket have been severely affected following the closure of the estates.

1.2.7 Bloomfield/ Whim NDC

Ecosystem Services Survey

- The outfalls at Letter Kenny and Whim are used as landing sites for fishing boats; however, they are infrequently used because the channels are heavily silted making passage difficult.
- Approximately 28 fishing boats are owned by people from the NDC who use landing sites at Adventure and Complex 66. In addition, more than 100 people in the NDC are employed as fisherfolk on boats at different landing sites throughout the Corentyne Coast.
- Approximately 15 people catch crab on a regular basis for sale.
- Approximately 15 people fish along the shoreline using pin seines and cast nets.
- There are approximately 30 shrimp ponds owned by 10 to 15 people from the NDC.
- As a result of the downturn in the sugar industry, grazing of cows, goats, and sheep along the sea dams and shoreline has increased.
- Cultivation of cash crops and fruits in close proximity to the sea dams at Letter Kenny and Whim occurs during the wet seasons when freshwater is easily available.
- Hindu religious activities are held between Bloomfield to Letter Kenny. People from within and outside of the NDC come to these areas for worship.
- There are three Hindu temples located in close proximity to the shoreline at Letter Kenny and Whim.
- There are cemeteries at Letter Kenny and Whim which are used by all religions.

- There is a nursery school located in close proximity to the seashore in Letter Kenny.
- A Guyana Water Inc. water pump is located in Letter Kenny and provides water to Whim, Bloomfield, Letter Kenny, and Auchlyne.

Other Data Collected

- The NDC population is approximately 4,000 and it is expected to increase because of new housing accommodations in Bloomfield.
- The owners of the fish and shrimp ponds destroy the mangroves to allow for emptying and refilling of their ponds. Some residents collect dried mangroves for use in their kitchen gardens and as firewood.
- The activities in the NDC are the same as a year ago, but participation in fishing, raising livestock, and cultivating crops has increased as a result of the downturn in the sugar industry.

1.2.8 Lancaster/ Hogstye NDC

Ecosystem Services Survey

- There are 12 boats that use the Hogstye/Adventure outfall for fishing. The number of large fishing boats landing at the Hogstye/Adventure outfall has increased, as there is easy access to the landing and alternative landing sites (e.g., Complex 66) are overcrowded. None of the boats at the outfall are owned by people from the NDC; however, NDC residents, mostly from Lancaster, work on the fishing boats that land at various sites along the Corentyne Coast.
- People throughout the NDC utilize pin seines and cast nets for fishing along the shoreline.
- There is one shrimp pond and one tilapia pond in Lancaster occupying 198 acres of land close to the seashore. Two people own these ponds.
- Iguanas are hunted daily for subsistence and sale by unemployed young people in the NDC. There is limited hunting of birds in the NDC.
- The beaches at Alness and Manchester are utilized for recreation, relaxation, and religious purposes. These activities have increased due to improved access.
- Grazing of cows, goats, sheep, and horses occurs throughout the shoreline of the NDC.
- Pig farming and grazing in Manchester has stopped; however, a new developer has requested permission from the NDC to construct pig pens along the shoreline.
- Natural regrowth of mangroves is continuing in the NDC.
- Cultivation of cash crops and fruits along the shoreline has increased, with more crops being planted during the wet seasons. In Lancaster, there have been land conflicts between farmers and owners of the fish and shrimp ponds. In addition, there are complaints from some residents of the NDC that spraying of pesticides on the crops adversely impacts their lives.

Other Data Collected

- The NDC's population is approximately 2,500 people and is relatively stable.
- There is squatting in Manchester, Ulverston, Liverpool, and Lancaster.

1.2.9 Bushlot/ Adventure NDC

Ecosystem Services Survey

- There are approximately 6 fishing boats that dock at the Bushlot/Kildonan outfall and 12 boats at the Adventure outfall.
- As a result of the downturn in the sugar industry, the number of residents who fish along the shoreline using pin seines and cast nets has increased.
- Shorebirds are hunted mostly in Bushlot for subsistence and sale. A few residents also hunt iguanas. This is mostly done by young people who have completed secondary school and are unemployed.
- Although a few residents regularly catch crabs for sale during off season, more residents are involved during crab season.
- There are three shrimp ponds in the NDC—two are in Bushlot Farm and are privately owned by two people, and one is in Bushlot and communal.
- There is no squatting along the seashore. There is only one structure in Kildonan and this is used by the sluice attendant.
- Approximately 100 people use the Bushlot beach on a weekly basis for recreation purposes, although several hundred people use the beach on special holidays like Easter.
- The use of the Bushlot beach for Hindu religious activities has also increased and people from other areas as far east as Hampshire use the beach for religious purposes.
- Cultivation of cash crops and fruits has increased along the sea dam from Bushlot to Adventure and is attributed to higher levels of unemployment resulting from the closure of the sugar estates. There is no farming on private lands.
- Mangrove cover at Kildonan has increased. People from the NDC use dried mangroves in their kitchen gardens and sometimes as firewood.

Other Data Collected

- The NDC population is estimated to be over 6,000, with 3,400 of voting age.

1.2.10 Maida/ Tarlogie NDC

Ecosystem Services Survey

- The mangrove seedlings planted in the NAREI restoration plot in Wellington Park have died, with sawdust washing up onshore being the likely cause. However, the mangroves in other areas in the NDC, such as Kilmarnock, have grown.
- More than 1,000 cows and sheep graze along the shoreline throughout the NDC. The owners of these animals reside in Wellington Park, Philippi, and Kilmarnock.
- Hindu religious activities are held in areas where there is access to the sea such as Wellington Park, Kilmarnock, Maida, and Tarlogie.
- Hunting of iguanas and seabirds for subsistence and sale in the mangroves has increased, with approximately 20 to 25 people participating daily.
- Crabbing for subsistence and recreation remains important in the NDC.
- Approximately 14 fishing boats land at Tarlogie, Maida, Kilmarnock, and Wellington Park depending on the ease of traversing the channels to access the sites. Approximately 60 people are employed in these boats.
- The number of residents who fish along the shoreline using pin seines and cast nets has increased.
- More people are planting cash crops and fruits along the sea dam in Maida. Cultivation on the sea dam and adjacent lands is also continuing in Tarlogie and Wellington Park.
- Additional privately owned shrimp ponds have been created on Wellington Park, Maida, and Kilmarnock, with approximately 125 buckets harvested from these ponds monthly. Approximately 8 to 10 people own these ponds.
- There are canals and swamp basins in Tarlogie open for communal fishing and shrimping.

Other Data Collected

- The NDC's population is approximately 3,500 people and is relatively stable.
- Rice cultivation is on the decline, as the farmers have encountered several challenges.
- Decline in mangrove cover resulted in saltwater intrusion in Wellington Park which affected cash crop farming.

1.2.11 Macedonia/ Joppa NDC

Ecosystem Services Survey

- There is extensive mangrove cover in the NDC and the mangrove stand has been increasing.
- More than 8,000 cows, goats, and sheep graze in Bengal, Joppa, Brighton, Eversham, Kiltaira, and No. 35 Village. The least amount of grazing occurs in Eversham. In addition, in between the rice crops, some animals are taken to the rice fields to graze.

- Fishing boats that use the outfall in No. 43 Village have declined, as larger boats use the landing at Complex 66. However, there are facilities for boat construction and maintenance and seine mending at the No. 43 outfall.
- There are approximately five boats that use the Eversham Outfall.
- There are five privately owned shrimp ponds on the sea dams of Bengal, Kiltyre, and No. 36 Village.
- Approximately 100 residents catch shrimp, tilapia, and hassar in the mangroves, canals, and shorelines using pin seines and cast nets daily for subsistence. If there is excess catch, it is sold within the NDC.
- Crabbing is important in the NDC, with residents from Canje visiting the NDC during crab season.
- Turtles are sometimes caught in the mangroves for subsistence.
- Cultivation of cash crops and fruits has continued on the government reserves in Brighton Canal, Kiltyre, and Eversham. However, there are challenges with saltwater intrusion and high water levels. Cultivation of cash crops and fruits increases during the wet seasons which fresh water is available.
- Hindu religious activities occur at the shoreline in No. 43 Village.

Other Data Collected

- The NDC population is 3,535 and remains relatively stable.
- The government has constructed sea defense dams from Wellington Park to Eversham in 2018 and 2019. Previously, there was erosion of the mangroves and breach of the sea defense that resulted in flooding of the shoreline area and public road of the No. 43 Village.
- The closure of the sugar estates has affected livelihoods in the NDC and former sugar workers are seeking alternative employment in the agriculture and fishing sectors.

1.2.12 Good Hope/ No. 51 NDC

Ecosystem Services Survey

- Wild bees are present in the mangroves in No. 45, No. 47, No. 48, No. 50, and No. 51. Honey is harvested from these hives for subsistence use. However, the numbers of bees are increasing and there have been complaints of bees swarming residences.
- Approximately 30 to 40 people from within and outside of the NDC catch crabs in the mangrove forests in the NDC for sale.
- Hunting of iguanas has increased significantly in the mangroves throughout the NDC. People from the Corentyne Coast, including New Amsterdam, visit the NDC to catch iguanas for sale.

- Hunting of shorebirds has increased and is done daily at No. 45, No. 48, No. 50, and No. 51 Villages. In addition, cage birds are caught for sale and training in the NDC at No. 45, No. 48, No. 50, and No. 51 Villages.
- One resident of No. 49 Village grazes goats on the sea dam and in the mangroves, while other residents graze cows, goats, and sheep at No. 45, No. 47, No. 48, No. 50, and No. 51 Villages.
- A few boats still use the landing site at No. 51 Village. No. 43 is outside of the NDC district.
- People fish along the shoreline using pin seines and cast nets daily throughout the NDC.
- There is brick burning by four to eight people on the sea dams of No. 51 Village.
- Cultivation of cash crops and fruits on the sea dam and adjacent lands in No. 47 Village has stopped due to significant saltwater intrusion where the dam was eroded and there were breaches in the mangroves. Farming is continuing on the sea dams on No. 50 and No. 51 Villages.
- There are four large shrimp ponds in the No. 49 Village, which are all privately owned.
- In the No. 51 Village, there is a swamp area where people catch fish and shrimp for subsistence use. This area is also used by residents from the No. 52 village, located outside of the NDC.
- Mangrove coverage throughout the NDC is increasing and the TC is actively trying to stop the mangrove harvesting.
- Religious activities are held in No. 49 and No. 51 Villages with the most people on Fridays and Sundays. There is easy access to the shoreline at No. 49 Village.

Other Data Collected

- There were 2,354 people and 735 households in the NDC in 2013. This is relatively stable.
- Following the breach of the sea defense at No. 47 Village, the government constructed a sand foundation for the sea dam. There was no future work and the sand dam has already experienced significant erosion. There were no sea defense works from No. 48 to No. 51 Villages.

1.2.13 No. 52/ No. 74 Villages NDC

Ecosystem Services Survey

- Approximately 4,000 people in the NDC are directly or indirectly employed in the fishing sector.
- The number of fishing boats using the landing at Complex 66 has increased to approximately 400. Fishing boats from Regions 4, 5 and along the Corentyne Coast use this landing site.
- There are approximately 100 boats at the No. 65 outfall.
- Approximately ten meters from the No. 65 outfall, construction of a fish processing plant has commenced, which is expected to employ 500 people. The owner of this processing plant has also purchased 45 new fishing boats.

- At No. 63 village, there are approximately 20 small boats that use pin seines to fish along the shoreline. In total, there are approximately 60 to 75 small boats in the NDC that practice pin seine fishing along the shoreline for sale.
- The number of people involved in hand seine and cast net fishing along the shoreline has increased.
- There is significant to complete erosion of mangroves in No. 52 – No. 63, No. 67, No. 69, No. 70, No. 73, and No. 74 Villages. There is no cutting of mangroves and it is likely that these are natural deaths due to the age of the stand.
- Due to the erosion of mangroves, crabbing has significantly declined and crabs are only caught during crab season.
- Hunting of iguanas in the mangroves has continued, while only a few people hunt birds (as they are not prevalent in the area).
- Grazing of animals along the shoreline has decreased significantly because of mangrove forest erosion. Grazing has shifted largely to the back dam areas, but cattle farmers face challenges with rustlers in the back dams.
- More people are involved in cattle rearing than before, but there is less livestock overall in the NDC.
- Cash-crop cultivation along the shoreline has decreased due loss of lands as a result of mangrove erosion.
- Boat building occurs on both sides of the dam at Complex 66. Surinamese fisherfolk order fishing boats at the boat-building sites at Complex 66 due to the quality of wood used in Guyana and the skills of the boat builders. A boat construction facility has also been opened adjacent to the new fish process plant at No. 65 Village.
- Religious activities are held throughout the NDC where there is easy access to the shoreline including No. 63, No. 69, No. 70, No. 71, and No. 73 Villages.

Other Data Collected

- The population of the NDC is approximately 20,000 and it is relatively stable.
- The closure of the sugar estates in Region 6 has had significant adverse impacts on livelihoods and well-being of people in the NDC. In particular, there has been a significant increase in the number of people involved in fishing and livestock farming in the NDC since the closure of the estates. It is estimated that over 1,000 people are involved in the fishing sector.

1.2.14 Corriverton Town Council

Ecosystem Services Survey

- A wind turbine with a capacity of 275 KVA was installed on the riverbank, but is not yet operational. The company is awaiting permission from the Government of Guyana before it can proceed.

- The wharf located at Line Path is used by farmers and loggers to transport their commodities from Orealla and Siparuta to Corriverton.
- Passengers use the "backtrack route" at No. 78 Village to access a ferry service to Suriname. When in operation, the ferry lands at Moleson Creek, which is not located in the municipality.
- There are approximately 40 boats at No. 79 Village that fish in the Corentyne River and catch various species of fish and shrimp.
- Approximately 10 to 50 people are engaged in daily use of seines for catching mullet and shrimp.
- Catching sardines is seasonal, with more than 100 people engaged during peak season using seines.
- Speed boat construction is done at the No. 78 Village.
- Hindu religious activities occur at Line Path, Scottsburg, Spring Garden, and Springlands. Some Christian groups also perform baptisms in these areas.
- There has been significant erosion of mangrove cover from No. 75 Village to Scottsburg. The municipality requested support from NAREI to replant mangroves in the area. Rip rap sea defense structures have been installed in Scottsburg.
- Mangroves are not harvested but some people collect dried mangroves to use as firewood.
- Erosion of the sand bank in No. 79 Village has decreased use of the area for recreational purposes.
- The area on the No. 78 Village shoreline, which was earmarked for developmental works by the municipality, is now being used by the Sea Defence Division to store materials and equipment.
- More than 10 people are engaged in the hunting of iguanas on a weekly basis along the shoreline in Scottsburg.
- There are fewer than 30 cows grazing along the shoreline in the NDC. According to the bylaws of the TC, there should be no livestock farming in the town.
- There are approximately five tour operators who provide trips down the Corentyne River. Sometimes regattas and other events like pageants are held in communities in the river, such as Orealla.
- Approximately 30 households squat along the sea dam in Line Path, Dukestown, and No. 78 and No. 79 Villages.
- Approximately 35 people are engaged in cultivation of cash crops and fruits along the shore and sea dams of Line Path, Scottsburg, Dukestown, and No. 75 Village.

Other Data Collected

- The NDC population is approximately 17,000 to 18,000 people in the municipality.

- The closure of the Skeldon Sugar Estate has resulted in increased fishing, crop cultivation, livestock farming, and hire car services operating on the municipality.
- The municipality has received a request to construct a Hindu temple on the No. 79 village seashore.
- There is significant dumping of garbage along the seashore of the municipality and there are certain areas where depressions in the ground cause garbage to accumulate.

Traffic Impact Assessment

ESSO EXPLORATION AND PRODUCTION GUYANA LIMITED

GUYANA, **Yellowtail Development Project** 2021

CARITRANS

AUGUST, 2021

Executive Summary

Caribbean Transportation Consultancy Services (CARITRANS) Company Limited was contracted by Environmental Resources Management (ERM) on behalf of Esso Exploration and Production Guyana Limited (EEPGL) to undertake a Traffic Impact Assessment (TIA) for 47 intersections around six key locations in the Georgetown area.

To conduct a TIA, base data are needed to calibrate a model of existing conditions from which the assessment can be made. Turning Movement Counts (TMCs) at intersections that were deemed to potentially be affected by EEPGL-related vehicle trips were collected between May 9 and 12, 2019. The road network was then analysed for 2026, selected to represent a time when EEPGL's proposed Yellowtail development is planned to be in production operations, with continued development well drilling. The scenarios analysed for this year included "with development" (i.e., "with EEPGL-related vehicle movements") and "without development." VISSIM microsimulation software was used to develop and analyse these scenarios through simulation.

Future base traffic volumes for the 2026 scenario were obtained by "growing" the May 2019 measured base model volumes using an annual growth rate of 5%. Outputs from the VISSIM model included predicted traffic queues and delays, the latter used to determine the Level of Service (LOS) for each approach at the study intersections.

Generally, the bulk of the existing intersections were found to be operating at **LOS A** (free-flowing of operations) under base traffic conditions. However, of the 47 intersections for which base condition LOS modelling was conducted, it was found that some individual approaches and, in most instances, individual movements (right, left, or through) were found to be experiencing unsatisfactory LOS (i.e., an **LOS E** or **LOS F**) under base conditions. Specifically, of the 355 approaches analysed across all the intersections, 70 (approximately 20%) were found to be operating at unsatisfactory LOS in the AM peak period under base conditions, and 57 (approximately 16%) were found to operate at unsatisfactory LOS in the PM peak period under base conditions. These typically occurred at signalized intersections, those with high intercity connectors, and around minibus stands.

The additional EEPGL-related vehicle trips predicted for 2026 are relatively low compared to current base and projected future traffic, resulting in a projected overall minimal impact on the existing road network from the addition of EEPGL-related traffic.

Introduction

Caribbean Transportation Consultancy Services (CARITRANS) Company Limited was contracted by Environmental Resources Management (ERM) on behalf of Esso Exploration and Production Guyana Limited (EEPGL) to undertake a Traffic Impact Assessment (TIA) for 47 intersections around six key locations in the Georgetown area. The TIA was conducted to support an Environmental Impact Assessment (EIA) for EEGPL's proposed Yellowtail Development Project and involved assessment of the potential impacts from future projected EEPGL-related traffic at intersections that were deemed to potentially be affected by EEPGL-related vehicle trips (inclusive of traffic related to the Yellowtail Development Project and other projected EEPGL-related activities; collectively referred to herein as "the development"). The intersections studied were generally clustered around six key locations in the Georgetown area (Figure 1).

The TIA involved the analysis and assessment of conditions for the surrounding road network with the existing 2019 measured "base" traffic, and assessment of the potential impacts the proposed development would have on projected traffic conditions in 2026.

Methodology

In order to assess the impact of the proposed development on the existing road network, the base or current year operating conditions were established. Base data were collected via Turning Movement Counts (TMCs) at forty-seven (47) intersections, grouped around six (6) key locations:

- *Marriott*
- *EEPGL Office Complex / Ogle*
- *Contractor Commercial Port A*
- *Contractor Inland Storage Yard*
- *Contractor Shorebase B*
- *Ramada Intersection*

A growth factor of five percent (5%) per annum was used to take the base year data and project it to 2026. This year was selected to represent a time when EEPGL's proposed Yellowtail development is planned to be in production operations, with continued development well drilling.

The trips generated by the proposed development were provided by ERM as daily volumes. The directional design hourly volume (DDHV) formula with general ranges of the 'K' (the proportion of daily traffic in the peak hour) and 'D' (the proportion of peak hour traffic travelling in the peak direction of flow) values were taken from the Institute of Transportation Engineers (ITE) Traffic Engineering Handbook 6th Edition, 2008 and used to calculate the volume of trips that occurred specifically during the morning and afternoon peak hours.

The analyses have been undertaken to assess traffic conditions for the noted future year for "without development" and "with development" scenarios. VISSIM microsimulation software was used to develop and analyse these models through simulation.

Capacity and Level of Service Analysis

Level of Service (LOS) is a key performance factor that is used to evaluate the operation of an intersection and is measured on a scale of A to F, A being the least congested and F being the most congested. It is a measure of the level of road-user comfort in traversing a roadway facility, usually taken as a measure of the delay experienced on/at the facility. Generally, LOS A-D is considered acceptable while LOS E-F is considered unacceptable.

The results of the TIA, presented by key location, are discussed below. The tables provided below (Tables 1-10) show the delays and queues calculated by the VISSIM analysis and the corresponding LOS for each approach at each study intersection.

For each of the key locations' associated study intersections, separate tables are provided presenting results for the following analyses:

- *LOS for Base Model – AM Peak (2019)*
- *LOS for Projected Model - AM Peak (2026 without projected development trips and 2026 with projected development trips)*
- *LOS for Base Model - PM Peak (2019)*
- *LOS for Projected Model - PM Peak (2026 without projected development trips and 2026 with projected development trips)*

Marriott

Figure 2: Marriott location and corresponding study intersections

- *M9 - Water Street at Barrack Street*
- *M10 - Camp Street at Seawall Road*
- *M11 - Camp Street at Carifesta Avenue and Young Street*

Base Model - 2019

Figure 2 shows the intersections modelled at the Marriott location. For the intersections around this location, the morning peak generally indicates an acceptable **LOS**. However, at the M11 intersection, the high delays indicate high congestion at the signalized intersections, as it was observed to have lengthy queues that, at times, spilled over to upstream intersections. This was because of traffic demand heading into Georgetown; the reverse was seen to occur in the afternoon peak, as cars were leaving Georgetown. Police presence was commonplace at peak hours at the M11 intersection to manage traffic operations.

Projected Model - 2026

The demand is greater than the capacity of several intersections in 2026 and as such the LOS at several intersections is seen to move from acceptable in 2019 to unacceptable in 2026. This was the case for M3, M7, M10 and M11 in the AM Peak and M5, M7 and M11 in the PM Peak. These intersections are either signalised (M11) or these are the intercity connections where most vehicles pass to access Georgetown. The signalized intersections have not been optimised to service the additional volumes projected in 2026.

LOS delay analysis indicates that there are minor impacts on capacity at the Marriott location due to the additional projected development trips in 2026. The minor impacts are due to a road network that is already performing at an unsatisfactory LOS at several intersections. Overall, the trips projected to be generated by the development are relatively small compared to the existing traffic volumes and generally do not result in substantial further deterioration of performance at the associated intersections. The results for the Marriott location are provided in Tables 1 and 2.

Queue Length = Distance (metres) of vehicles in queue behind the stop line

Delay = Vehicle Delay at the intersection (seconds)

LOS = Level of Service (A being the least congested and F being the most congested)

2026 Base = Projected conditions “without development”, assuming a 5% per annum growth factor applied to 2019 measured conditions

2026 + Trips = Projected conditions “with development”, assuming a 5% per annum growth factor applied to 2019 measured conditions

EEPGL Office Complex / Ogle

Figure 3: EEPGL Office Complex / Ogle location and corresponding study intersections

- *OGL 1 - Ogle Airstrip Road at unnamed Street*
- *OGL 2 - Ogle Airstrip Road at Railway Embankment Road*
- *OGL 3 - Ogle Airstrip Road at Rupert Craig Highway*
- *OGL 5 - unnamed streets*
- *OGL 6 - Railway Embankment Road at unnamed street*
- *GC 1 - Grand Coastal Intersection at Rupert Craig Highway*

Base Model - 2019

The LOS observed at 3 out of the 6 intersections for both the AM and PM peak are acceptable. However, this location's operations are characterized by heavy east-west peak volumes, as it is one of the major conduits for traffic into and out of Georgetown from communities to the east. As such, OGL 2 and OGL 6 typically experience high delays. Police presence was commonplace at peak hours at the signalized intersection (OGL 3) to aid operations.

Projected Model - 2026

The demand is greater than the capacity of several intersections in 2026 and as such the LOS is seen to move from acceptable in 2019 to unacceptable in 2026 for approaches in several intersections. This was the case for OGL 2, OGL 3, and OGL 6 in the AM Peak and OGL 2, OGL 3, OGL 5 and OGL 6 in the PM Peak. These intersections are either signalised (OGL 3) or these are the intercity connections where most vehicles pass to access Georgetown. The signalized intersections have not been optimised to service the additional volumes projected in 2026.

LOS delay analysis indicates that there are minor impacts on capacity due to the additional projected development trips in 2026. The minor impacts are due to a road network that is already performing at an unsatisfactory LOS at several intersections. The trips projected to be generated by the development are relatively small compared to the existing traffic volumes and generally do not result in substantial further deterioration of performance at the associated intersections. The results for the EEPGL Office Complex / Ogle location are provided in Tables 3 and 4.

Table 3: Level of Service for Base Model – EEPGL Office Complex / Ogle AM Peak (2019) and Projected Model – EEPGL Office Complex / Ogle AM Peak (2026 without projected development trips and 2026 with projected development trips)

Queue Length = Distance (metres) of vehicles in queue behind the stop line

Delay = Vehicle Delay at the intersection (seconds)

LOS = Level of Service (A being the least congested and F being the most congested)

2026 Base = Projected conditions “without development”, assuming a 5% per annum growth factor applied to 2019 measured conditions

2026 + Trips = Projected conditions “with development”, assuming a 5% per annum growth factor applied to 2019 measured conditions

Contractor Commercial Port A and Contractor Inland Storage Yard

Figure 4: Contractor Commercial Port and Contractor Inland Storage Yard locations and corresponding study intersections

Contractor Commercial Port A

- *JFL 1 - Saffon Street at Mandela Avenue*
- *JFL 2 - Saffon Street at First Street*
- *JFL 3 - Saffon Street at unnamed street*
- *JFL 4 - Saffon Street at Trench Street*

Contractor Inland Storage Yard

- *JF 1 - Mandela Avenue at Hunter Street*
- *JF 2 - Mandela Avenue at John Fernandes Container Terminal Road*
- *JF 3 - Mandela Avenue at Plumbago Street*
- *JF 4 - Mandela Avenue at Vessegen Road*
- *JF 6 - Unnamed Street intersection*
- *JF 7 - Unnamed Street intersection*

Base Model - 2019

This location has one of the major connector roads for vehicles coming from the East Bank Demerara Road into Georgetown. Consequently, the road is characterized by high traffic volumes and queues at the Mandela signalized intersection that spill over into the nearby intersections, particularly during peak hours. Police presence was noted during both the morning and afternoon peaks to assist with operations. The LOS at the JF1 intersection was unacceptable for both AM and PM peaks. The LOS at JFL1 to JFL4 was acceptable for both the AM and PM Peaks. JF2 – JF7 generally experience acceptable LOS in the AM peak except for the approaches attempting to traverse the intersection that already has minimum gaps because of the high volumes on the main roads. The LOS for JF2 – JF7 is acceptable for the PM Peak.

Projected Model - 2026

The demand is greater than the capacity of several intersections in 2026 and as such the LOS is seen to move from acceptable in 2019 to unacceptable in 2026 for approaches in several intersections. While some approaches remained acceptable, a number of the approaches went to unacceptable. The signalised intersection (JF1) was already performing at unacceptable service levels and with the increased demand the spill over to the surrounding intersections is greater. The signalized intersections have not been optimised to service the additional volumes projected in 2026.

LOS delay analysis indicates that there are minor impacts on capacity due to the additional projected development trips in 2026. The minor impacts are due to a road network that is already performing at unsatisfactory LOS at several intersections. The trips projected to be generated by the development are relatively small compared to the existing traffic volumes and generally do not result in substantial further deterioration of performance at the associated intersections. The results for the Contractor Commercial Port A and Contractor Inland Storage Yard locations are provided in Tables 5 and 6.

Table 5: Level of Service for Base Model – Contractor Commercial Port A and Contractor Inland Storage Yard - AM Peak (2019) and Projected Model - Contractor Commercial Port A and Contractor Inland Storage Yard AM Peak (2026 without projected development trips and 2026 with projected development trips)

Base Model - 2019

This location includes the Stabroek Market as well as a concentration of government buildings and business places. It is therefore characterized by the following:

- High pedestrian volumes and movements that hinder vehicular traffic flows.
- Roadside vending and commercial activity that restrict capacity of the sidewalk and hinder traffic flows.
- Multiple minibus and taxi stand operations that interrupt the free flow of traffic.

Due to these activities, a few intersections in the immediate vicinity of the market experience high delays. In the AM Peak, 2 out of the 15 study intersections and 5 out of the 15 study intersections in the PM peak experience at least one turning movement with an unacceptable LOS. These approaches are characterized by long queues, standstill traffic and high delays. Aside from these intersections the intersections outside of the immediate market are predicted to operate at acceptable LOS for both the AM and PM peak. Traffic police officers are frequently required to control operations at the signalised intersections.

Projected Model - 2026

The demand is greater in 2026 but the LOS is seen to generally remain the same. The intersections closest to the market show consistent, unacceptable LOS while the areas outside of the immediate market area generally remain at an acceptable LOS. The signalised intersections (JFS56 and JFS9) were already performing at unacceptable service levels and with the increased demand, the spill over to the surrounding intersections is greater. The signalized intersections have not been optimised to service the additional volumes projected in 2026.

LOS delay analysis indicates that there are minor impacts on capacity at the Contractor Shorebase B location due to the additional projected development trips in 2026. The minor impacts are due to a road network that is already performing at unsatisfactory LOS at several intersections. The trips projected to be generated by the development are relatively small compared to the existing traffic volumes and generally do not result in substantial further deterioration of performance at the associated intersections. The results for the Contractor Shorebase B location are provided in Tables 7 and 8.

Ramada Intersection

Figure 6: Ramada Intersection location and corresponding study intersections

- *LP2 Point-Houston - East Bank Public Road at Houston Split*
- *LP2 Point-Eccles - East Bank Public Road at Eccles Intersection*
- *LP2 Point-DH Bridge - East Bank Public Road at the Demerara Harbour Bridge*
- *LP2 Point-Nandy Park - East Bank Public Road at Nandy Park Intersection*
- *LP2 Point-Massy - East Bank Public Road at Massy Intersection*

Base Model - 2019

At the Ramada Intersection location, the morning peak is characterized by vehicles heading into Georgetown as the dominant movement, with increasing delays as motorists approach Georgetown. The exception is LP2 Point - Nandy Park, which is a signalized intersection immediately downstream of another signalized intersection, Eccles. The low delays experienced at LP2 Point - Nandy Park, however, appear to be due to traffic metering by the signals at LP2 Point - Eccles, reducing the demand approaching LP2 Point - Nandy Park. Northbound vehicles soon re-join queues as they continue into Georgetown at LP2 Point - Houston. In essence, northbound movements experience queuing spillbacks and delays originating in Georgetown and reaching as far south as the Demerara Harbour Bridge in the morning peak period. This is reversed in the afternoon peak with southbound movements experiencing high delays from the Harbour Bridge, spilling back towards Georgetown.

Projected Model - 2026

The demand is greater than the capacity of several intersections in 2026 and as such the LOS is seen to move from acceptable in 2019 to unacceptable in 2026 for the majority of approaches at all study intersections, in both the AM and PM peak. The signalized intersections have not been optimised to service the additional volumes projected in 2026.

LOS delay analysis indicates that there are minor impacts on capacity at the Ramada Intersection due to the additional projected development trips in 2026. The minor impacts are due to a road network that is already performing at unsatisfactory LOS. The trips projected to be generated by the development are relatively small compared to the existing traffic volumes and generally do not result in substantial further deterioration of performance at the associated intersections.

2026 Base = Projected conditions “without development”, assuming a 5% per annum growth factor applied to 2019 measured conditions

2026 + Trips = Projected conditions “with development”, assuming a 5% per annum growth factor applied to 2019 measured conditions

Discussion

Comparison of modelled LOS values between the "without development" and "with development" scenarios indicated that the additional projected development trips in 2026 will generally result in minimal changes to conditions on the existing road networks. This is due to the low percentage increase (relative to projected "without development" conditions) associated with the additional projected development trips.

Projecting the increased "without development" volumes to 2026 using a 5% growth factor results in an increase in demand and oversaturation of the road network at many intersections. This is seen in the deterioration of LOS at many intersections, particularly the signalised intersections with traffic signal timing that hasn't been optimised to efficiently service the extended queues. The prominence of high delays and extended queues at many intersections has a domino effect on the surrounding intersections, resulting in spillbacks, making it difficult for vehicles to traverse consecutive intersections uninterrupted. The analysis with the projected development trips in 2026 appears to show unsatisfactory LOS at a number of intersections. However, the assumed growth in non-development traffic volume on its own, appears to be the primary driver for the poor LOS in the majority of cases.

The growth rate utilized in this, and previous analyses has been 5%. This was the expected growth rate prior to the current pandemic and so can be considered the upper limit of what the estimated growth rate should be. Assuming that pre-pandemic conditions will exist by 2026 and that growth may spike considerably during the period, the upper limit may be considered practical for estimating purposes. The most important consideration in this analysis is, therefore, the state of current (pre-pandemic) traffic conditions of the network and the natural growth progression to 2026. In this context, it is predicted that the development will contribute minimally to the already unsatisfactory conditions in many intersections around Georgetown. EEPGL must then seek to adopt internal operational policies to facilitate the most efficient movements for its vehicles at the respective locations.

When undertaking analysis of a network of intersections where heavy flows occur in one main direction, it is expected that users of minor roads will experience poor LOS and high delays in attempting to traverse a common intersection. This is more so the case when dealing with unsignalised intersections. However, additional traffic on the major road segment may result in a reduction in vehicle flows and a slowing down of traffic at the intersection. There comes a point where the increased congestion creates more gaps in the traffic stream, allowing a greater volume of minor road users to access or cross the major road. Model

analysis results of queue length, delay, and LOS may therefore in some cases appear to show improved flows for minor roads with the addition of vehicles to the intersection. However, this is to be taken into context of the entire intersection, where overall delay is increased.

This concept also applies to a dense, connected network of intersections, where vehicles spilling back into upstream intersections create gaps in the minor and/or opposite directions, giving the appearance of improved operations.

Some of the existing road networks observed were characterised by less-than-ideal conditions, in particular the signalised intersections. It was observed that at all the signalised intersections included in the study, police officers were present during peak periods to regulate traffic and alleviate congestion at the intersections. The high delays and unacceptable **LOS** ratings for these intersections indicate a need to optimise signal timings to allow for more efficient operations at the intersection and network levels. The following is therefore noted:

- The Contractor Shorebase B location is in an area where there is a high level of activity that directly affects traffic flows, resulting in substantial delays on the surrounding streets and spill over congestion into several major intersections.
- The Ramada Intersection location features high levels of northbound traffic into Georgetown in the morning and the reverse in the afternoon, resulting in significant delay and congestion (i.e., unacceptable **LOS**).
- The EEPGL Office Complex / OGL location shows high volumes of east-west traffic as vehicles go to and from Georgetown. The signalized intersection is observed to not efficiently handle the elevated volumes.
- Some of the high volumes from the EEPGL Office Complex / Ogle location lead into the Marriott location and result in excessive delay, especially at the signalized M11 intersection. The spillbacks from M11 then affect M3, M7 and M10 in the AM Peak and M7 in the PM Peak.

Conclusion

The additional projected development trips are not predicted to significantly alter the traffic congestion conditions at the study intersections.

In general, the numbers of additional projected development trips at the study intersections are relatively small compared to projected non-development base traffic volumes (assuming a 5 percent annual growth rate in non-development traffic volumes). The road network in the vicinity of some of the study intersections is characterized by high levels of base congestion due to limited road capacity, sub-optimal signal timing, and/or excessive vehicle demand. It is noted, however, that even in these areas, the additional projected development trips are generally not predicted to contribute significantly to worsening congestion. It is also noted that the analysis was based on an upper-limit assumption of projected traffic growth to 2026 and as such, represents a reasonable "worst-case scenario" for traffic operations in 2026. Further, for the purpose of modelling, the additional development trips were assumed to occur during peak periods. Given the likelihood that a portion of these trips may occur outside of peak hours, further reduction of the already minimal projected impacts is expected.

Table 1: Responses to Consultants Comments on Yellowtail EIA Review (18 February 2022)

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
1	09-Dec-2021	EPA	**General Comments** Please note in the EIA Section 3 is assigned to both Administrative Framework and Project Impacts. Additionally, the table of contents has Section 3 Administrative Framework with no reference to Project Impacts. Conversely, the executive Summary has Section 3 labelled as Project Impacts with no mention of Administrative Framework. Kindly review and provide clarity.	While the Environmental Impact Statement (EIS) provides a summary of the Environmental Impact Assessment (EIA), the sections of the EIS and the chapters in the EIA do not align numerically. For example, EIS Section 3 summarizes Project impacts, and Project impacts are addressed in Chapters 6 through 10 of the EIA. Chapter 3 of the EIA describes the Administrative Framework applicable to the Project.	No	Accepted	N/A	N/A
2	09-Dec-2021	EPA	What will be done with the sulphate removed from the sea water in the sea water treatment? What/how are the residues resulting from the treatment of seawater e.g sulphates managed or disposed	Sulfates removed from seawater prior to injection of seawater into the reservoir would be contained in the Sulfate Removal, Ultrafiltration, and Wash Water Processing Brines effluent stream that would be discharged from the Floating Production, Storage, and Offloading (FPSO) vessel. Sulfate removal is discussed in Section 2.18.3.6, Seawater Treatment, and explained in detail in Sections 2.13.3., Discharges, and 2.18.3.6. Modeling of this discharge stream (documented in Appendix C, Water Quality Modeling Report, in Volume II of the EIA) predicts that this effluent stream would decrease in concentration by more than 98 percent within 100 meters (328.1 feet) of the discharge point.	No	Accepted	N/A	N/A
3	09-Dec-2021	EPA	**Section 2: Project Description** **2.3. Project Workforce. Page 119** There was no mention of Protected Species Observers as a part of the workforce.? Is this expected as part of the full-time work force? Or only for specific activities e.g seismic.	Section 2.3, Project Workforce, has been edited to reflect the fact that Protected Species Observers (PSOs) would provide support to the Project.	Yes	Accepted	N/A	p. 2-10
4	09-Dec-2021	EPA	**2.5.4. Well Control. Page 131** The EIA mentions personnel training and proficiency drills are to be conducted. Kindly provide more details. Kindly provide more details on specific training, requirements and frequency?	EEPGL conducts well-control training and drills to build drilling crew proficiency, specifically as it relates to detecting and efficiently responding to a potential influx. Drilling-crew leadership positions (e.g., toolpusher, driller, assistant driller) complete accredited classroom-based well control training commensurate with industry standards and drilling contractor internal requirements. Well-control drills are held on each drill ship with each drilling crew to reinforce training and build operational proficiency. With respect to EEPGL operations in Guyana, well-control drills include, but are not necessarily limited to, pit drills, trip drills, power choke drills, and emergency disconnect / hang-off drills. These drills are performed at regular intervals over the course of operations. Pit drills are conducted to reduce the time required for the drilling crew to detect and respond to a potential influx while drilling. Trip drills are conducted to reduce the time required for the drilling crew to detect and respond to a potential influx while running or retrieving pipe from the well. Power choke drills are conducted to provide drilling crew members practice in operating the rig chokes, as would be used during an influx circulation. Emergency disconnect / hang-off drills are conducted to provide the drillers practice in simulating the rig-specific emergency	Yes	Accepted	N/A	p. 2-22

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				disconnect sequence procedure, as would be implemented during an emergency disconnect event.				
5	09-Dec-2021	EPA	**2.7.1. General Description. Page 141** There was no mention of a safe limit for daily production. The EIA must also clearly identify the maximum production capacity of the rig within the prescribed safety limits for the vessel.	The FPSO design rates described in Table 2.7-1: FPSO Key Design Rates are annual averages, and daily peak rates could be higher during the lifetime of the Project, depending on multiple factors (e.g., reservoir pressure, number of wells, equipment reliability). Currently, the FPSO basic design has an upper production limit of 263,000 barrels per day (BPD) (42,080 cubic meters [m^3] per day) peak oil production rate, and the FPSO would be able to operate safely at this limit. The current production profile forecasts that the peak annual average rate for oil production would occur in approximately 2027. As the wells are drilled and early production is assessed, the production would continue to be optimized, and the timing to achieve peak production levels may vary from the current estimate. If during the detailed design stage or during production operations an opportunity to expand the upper production limit arises, the Project would document the evaluation and justification and an updated upper production limit would be available. This evaluation would include assessment of the potential for changes to the conclusions of the EIA.	Yes	Accepted	N/A	p. 2-33
6	09-Dec-2021	EPA	**Section 2.10.2 Hydrogen Sulfide Management. Page 177** There was mention made regarding training for handling Hydrogen Sulfide. What is the validity period for training? Is it a one-off session or will it be a continuous training regime that needs to be updated at increments?	The concentration of hydrogen sulfide (H_2S) would be negligible for the initial stage (i.e., 1 to 5 years) of production operations. H_2S would be monitored at various points throughout the facility to detect any increase in H_2S concentration. This would be outlined in sampling programs before field start-up. The monitoring program would be detailed in a written procedure. In the event that H_2S concentrations would increase to a level that could represent potential health or safety concerns for the Project's offshore workforce, H_2S initial training would be conducted for potentially affected workers, and refresher training would be conducted on an annual basis. The H_2S monitoring plans would be included in the facilities surveillance and operational manuals for chemical vendors. Both of these surveillance plans would be finalized before production start-up.	Yes	Accepted However, upon completion the H2S management plan should be made available to the Agency.	N/A	p. 2-69
7	09-Dec-2021	EPA	**Section 2.13-5 Estimated Annual Atmospheric Emissions Summary Table Footnote Page: 196** Does the current preliminary schedule take in to account all other projects that are in operation? If no, why not?	Table 2.13-5 provides estimated annual atmospheric emissions for only the Yellowtail Development Project. Estimated annual atmospheric emissions for the full suite of EEPGL activities reflected in the cumulative air dispersion modeling scenario (i.e., Liza Phase 1, Liza Phase 2, Payara, Yellowtail, FPSO #5, FPSO #6, and exploration drilling) are summarized in Table 2-4 of the Emissions Inventory and Air Quality Modeling Report (included as Appendix G in Volume II of the EIA).	No	Accepted	N/A	N/A
8	09-Dec-2021	EPA	**2.13.1. Materials Inventory. Page 189** The EIA makes multiple reference to international best practices and standards that will be utilize in the operations. However, the list provided seems to be limited. As such please state/list all the environmental standards and international best practices that will be utilised.	Table 2.4-1 in the Environmental and Socioeconomic Management Plan (ESMP)—included in Volume III of the EIA—provides a summary of key environmental and socioeconomic performance criteria the Project would utilize. These performance criteria are consistent with good international oilfield practice.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
9	09-Dec-2021	EPA	**Section 2.13.5. Radiation Emission Sources. Page 202.** The section highlighted that the project will follow good international oilfield practices…. to NORM or radiography sources. The section further discussed NORM, however there was no indication of EEPGL's role in the event of failed operation procedures. Failed operational procedures including breakage of source assembly, inadequate monitoring and failure to connect safety systems.	EEPGL and its contractors would adhere to a number of procedures that are in place to manage radioactive sources such as the use of multiphase flow meters, etc. These procedures would include the following: • API 17S Recommended Practice for the Design, Testing, and Operation of Subsea Multiphase Flow Meters • IAEA TS-R-1 Regulations for the Safe Transport of Radioactive Material • BSI BS EN ISO 361 Basic Ionizing Radiation Symbol • EP-HSE-PMS-SAF-SAF.GRP.INS.0059.ENG, Radiation Management Each FPSO has a Radiation Safety Officer, who is responsible for overseeing implementation of the above procedures. The information above has been added to EIA Section 2.13.5, Radiation Emission Sources.	Yes	Accepted	N/A	p. 2-99
10	09-Dec-2021	EPA	**2.18.2.4. Associated Gas Management Alternatives** Please specify what is meant by the gas compression required is considerable. Could it be quantified? If so, please state the quantities.	Gas re-injection pressure for the Yellowtail field would be expected to be no more than 8,200 pounds per square inch gauge (psig), as measured at the top of the gas injection risers on the FPSO. This pressure would be similar to that required for prior Guyana development projects. This information has been added to Section 2.18.2.4, Associated Gas Management Alternatives.	Yes	Accepted	N/A	p. 2-118
11	09-Dec-2021	EPA	**Section 5.2 Resources/Receptors Assessed in the EIA.** **Section 5.2.2. Assessment of Potential for Acoustic Impacts from Vessel Noise in Georgetown Harbour. Page 340.** Consultants conducted a screening level analysis and literature review. The EIA should indicate possible long-term noise exposure (irreversible). The section did not provide details of noise levels which can lead to annoyance and sleep disturbance. These effects are considered stressors and should be researched.	The predicted noise levels associated with the Project at the nearest residential portion of Vreed-en-Hoop are provided in Table 5.2-3. These noise levels were compared against recently adopted day/night noise guidelines and were estimated to be below these guidelines. Two additional noise recommendations that have been developed by other organizations to be protective of residential uses (including sleep disturbance and annoyance) are 55 dBA (A-weighted decibels) L_{dn} (day-night sound level), which is the noise level recommended by the U.S. Environmental Protection Agency (USEPA) for environmental noise to be protective of residential and other noise sensitive land uses, and 45 dBA L_{eq} (equivalent sound level), which is the most protective nighttime noise level recommended by the International Finance Corporation (IFC) for residential, institutional, and educational uses. The predicted Project noise levels in Table 5.2-3 are more than 10 decibels lower than the USEPA and IFC noise level recommendations, meaning that the predicted noise levels are less than half the applicable thresholds recommended by the USEPA and IFC (because decibels are calculated on a logarithmic scale). Therefore, noise levels associated with vessel traffic would not be anticipated to lead to annoyance or sleep disturbance or long-term/irreversible detrimental effects. EIA Section 5.2.2, Assessment of Potential for Acoustic Impacts from Vessel Noise in Georgetown Harbour, has been updated to include this information.	Yes	Accepted	N/A	p. 5-27
12	09-Dec-2021	EPA	**Section: Project Impacts** **Specific Comments** **3.1.1. Air Quality, Climate, and Climate Change. Page 63.** • Reference is made to "applicable guidelines", these "guidelines should be specified within the text.	1. The applicable guidelines referenced in EIS Section 3.1.1, Air Quality, Climate, and Climate Change, refer to the combined set of guidelines established by the World Health Organization (WHO) and the USEPA that are presented in EIA Section 6.1.1, Administrative Framework—Air Quality, Climate, and Climate Change. 2. Based on published corporate plans, EEPGL and its affiliates support the goals of the 2015 Paris Agreement and efforts of global Nationally Determined Contributions to achieve net-zero emissions, and have made meaningful progress, globally, in reducing greenhouse gas (GHG)	1. Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			• Given the outcomes of the recent COP 26 will EEPGL establish specific GHG targets in the absence of national regulatory criteria as part of their Corporate Social Responsibility? • The EIA highlighted that "non-routine flaring will be used to combust associated gas when not consumed as fuel gas on the FPSO or injected back into the reservoir." Provide projections of the quantity or percentage (min-max range) of gas that will be consumed as fuel gas or injected into the reservoir. • The assessment indicated that "*the Project has applied technologies aligned with good international oilfield practice to reduce GHG emissions*." Clearly outline the applied technologies to be implemented with this project.	emissions. In this regard, ExxonMobil affiliates are reported to be on track, collectively, to meet the 2025 GHG emission-reduction plans announced by ExxonMobil in December 2020, and ExxonMobil anticipates year-end 2021 results to show a reduction of 15 to 20% in GHG intensity from its upstream operations, as compared to 2016 levels - four years ahead of schedule. This is supported by an anticipated reduction of 40 to 50% in methane intensity and 35 to 45% in flaring intensity compared to 2016. ExxonMobil's recently announced GHG reduction plans for 2030 are consistent with Paris Agreement-aligned pathways and include reductions in Scope 1 and Scope 2 GHG emissions from assets operated by ExxonMobil affiliates by the end of 2030, as compared to 2016 levels. ExxonMobil has also reaffirmed plans to achieve the goals of the World Bank for Zero Routine Flaring by 2030. A reference to this information has been added to the EIA. The Yellowtail Project has been designed to incorporate a number of embedded controls that would serve to reduce GHG emissions from Project sources, and EEPGL would leverage its expertise to identify potential opportunities to optimize operations and further lower GHG emissions. As with previous developments, EEPGL has indicated its willingness to continue to engage with governmental stakeholders regarding GHG emissions in keeping with its corporate commitment to minimizing environmental impacts. 3. The gas injection rate is approximately the gas production rate minus the estimated fuel gas demand. A fuel gas consumption estimate of 35 million standard cubic feet per day (MMscfd) (0.99 million standard cubic meters per day [MMsm^3/d]) is used in the current forecast. This estimate may be adjusted during detailed design, and may vary over the Project life cycle. As detailed in EIA Table 2.7-1 (FPSO Key Design Rates), the design maximum annual average gas production rate would be 450 MMscfd (12.7 MMsm^3/d); accordingly, the design maximum annual average gas injection design rate would be 415 MMscfd (11.8 MMsm^3/d) (i.e., when the estimated 35 MMscfd (0.99 MMsm^3/d) fuel gas consumption is subtracted). Table 2.7-1 has been edited to reflect this additional detail, and additional text has been added to the EIA explaining the conditions that could lead to a different consumption of fuel gas rate compared to that provided in the EIA. Currently, the FPSO basic design has an upper gas injection limit of 439 MMscfd (12.4 MMsm^3/d) as a peak gas injection rate and a peak gas production of 474 MMscfd (13.4 MMsm^3/d) as peak gas production. If during the detailed design stage or during production operations an opportunity to expand the upper production limit arises, the Project would document the evaluation and justification and an updated upper production limit and gas injection would be available. This would include assessment of the potential for changes to the conclusions of the EIA. 4. The Project has been inherently designed to incorporate a number of embedded controls and mitigation measures that would serve to reduce GHG emissions, as well as criteria air pollutant emissions, from Project sources. EIA Tables 6.1-14 and 6.1-15 include a summary of these embedded controls and mitigation measures, respectively.				
13	09-Dec-2021	EPA	**Section 3.1.3. Marine Geology/Sediments and Marine Benthos. Page 22.** The document states that the significance of potential impacts on	Age-dating of sediments was conducted for the neighboring Liza field, and this indicated that localized small-scale failures likely occurred intermittently up until approximately 4,000 years ago. The age-dating indicated that large-scale failures along sediment transport pathways likely occurred up until approximately 25,000 years ago, and are unlikely to occur again due to the	Yes	Accepted	N/A	p. 2-112

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			marine benthos and sediment from FPSO and Surf installation will be negligible. However, there is little to no mention of how the drilling of wells, and the placement of various subsea equipment will be impacted by the already naturally changing seabed, and changes from sediment accumulation of metals found within the seabed from discharged drill cuttings. Please state if there is potential for these activities to impact the above mention activities? Also, what mitigation / alternative measures will be put in place to address the potential impacts of the changing seafloor on the drilling of wells, and the placement of various subsea equipment?	absence of major failure triggering mechanisms. Similar age-dating is planned in the Yellowtail field prior to installation of subsea infrastructure. It is expected that the chronological event timing for small-scale and large-scale failures in the Yellowtail field, to the extent these are identified, would be similar to that of the Liza field; this would indicate such failures would also be unlikely in the Yellowtail field. Additionally, potential seafloor instabilities, such as slope instability, have already been mapped in the Yellowtail field based on geophysical studies, and the results of this mapping have been incorporated in the Yellowtail design process for subsea infrastructure. The primary mitigation strategy based on these data has been adjustment of the subsea infrastructure layout to avoid features with slope stability concerns where possible. Interpretation of additional geotechnical study data (ongoing as of the time of the EIA) will provide further data regarding potential slope stability concerns, and the subsea infrastructure would be further adjusted, as needed, based on the review of these data. EEPGL is in the process of collecting these additional data to corroborate the current expectation that the last movement occurred sufficiently long ago that further movement of the seabed is not anticipated within the design life of the Project. Additional detail on slope stability analysis and strategies to address related concerns has been added to EIA Section 2.18.1, Location Alternatives. Drill cuttings deposition would not pose a risk to the structural integrity of the Subsea, Umbilicals, Risers, and Flowlines (SURF) equipment. In the case that there would be slight accumulations of cuttings in the vicinity of the SURF, remotely-operated vehicles (ROVs) with high-pressure pumps could be used to jet the cuttings away from the equipment, if needed.				
14	09-Dec-2021	EPA	**Section 3.1.6: Marine Mammals (including Status Species), page 23:** Please indicate: • What would be the duration and level of noise these marine mammals be exposed to? • Has there been any research/baseline done on the maximum limits and duration of sound/noise these marine mammals can be exposed to?	The duration and level of noise to which marine mammals would be exposed depends on the duration and nature of the noise-generating activity. Marine mammals could potentially be exposed to impulsive (instantaneous) noise on a short-term periodic basis during the drilling and installation phase and to comparatively low levels of non-impulsive (continuous) noise during all phases of the Project. Impulsive noise to which mammals could be exposed would not exceed 220 dB re 1 µPa². Non-impulsive noise exposure would not exceed 180 dB re 1 µPa². These maxima have been added to the text in EIA Section 7.5.3, Impact Assessment—Marine Mammals. Please refer to Section 7.5.3 for an explanation of the appropriate exposure thresholds for marine mammals. The Southall et al. (2007) and Finneran (2015) thresholds referenced in Figures 7.5-8 and 7.5-9 and subsequent discussions in that section represent widely accepted thresholds for acoustic injury.	Yes	Accepted	N/A	p. 7-120
15	09-Dec-2021	EPA	**Section 3.2.3: Discharge of Untreated Wastewater from FPSO. Page 30**: "*While there will be a number of controls to prevent a discharge of untreated black water to the ocean, an upset to this treatment system lasting for an extended period could result in untreated black water being*	EIA Section 9.1.11, Discharge of Untreated Wastewater from the FPSO, states that the FPSO design includes a large storage tank with capacity to store up to 7 days of sewage in the event of an upset to the treatment system and that, in the unlikely event of an upset to this treatment system lasting more than 7 days, this could result in untreated black water being discharged overboard for a short period. Section 9.1.11 has been edited to reflect that, in the event it is determined that the sewage treatment plant is not operating properly and wastewater is temporarily discharged outside of specification limits, the wastewater stream would be redirected to the black water holding tank and, if the treatment system could not be repaired within 7 days, alternative means of managing	Yes	Accepted	N/A	p. 9-99

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			discharged overboard for a short period of time." Please indicate: What is the course of action to be taken in the event that there is an accidental discharge of untreated wastewater?	black water would be implemented, including the option of re-directing the black water to the oily bilge tank for subsequent offload to a supply vessel or the option of pumping the black water directly to a supply vessel. The black water would be temporarily stored on the supply vessel and transferred back to the FPSO treatment system after it is repaired.				
16	09-Dec-2021	EPA	**Section 3.4. Cumulative Impacts. Page 84** The document indicates that EEPGL plans to develop a flare minimization plan for the Yellowtail Development Project. Please indicate whether the document will include provision for a detailed inventory of flaring activities which will aid in the reduction of methane emission.	As described in EIA Section 6.1.3.2, Emissions of Air Quality Pollutants, the purpose of the flaring minimization plan would be to document the design elements and operational practices that will serve to minimize non-routine flaring. As part of such documentation, EEPGL would identify various activities and scenarios that could result in flaring and how the FPSO's design was intended to minimize the potential for such flaring events. For each identified activity or scenario, the plan would also identify measures that can be applied, including potentially in some cases a series of actions, to reduce the frequency, duration, and/or volume of flaring. Flaring minimization would aid in the reduction of GHG emissions as a general matter, including methane. A flaring minimization plan would be developed once final design and equipment plans are complete.	No	Accepted	N/A	N/A
17	09-Dec-2021	EPA	**Section 6: Air Quality, Climate and Climate Change and Sound.** **General Comments** Given that the project activities will include support from onshore locations including but not limited to waste treatment facilities, mud plants, etc., justify why no modelling was done from these operations and their impacts were not assessed.	As discussed in EIA Section 5.1, The Area of Influence, while they would be used by the Project, the referenced ancillary facilities such as waste treatment facilities and mud plants are not components of the Project. EEPGL would use these existing onshore facilities, which are owned and operated by others and were assessed and authorized separately from the Project. For this reason, these facilities were not included in the air dispersion modeling completed for the Yellowtail Project EIA. Where EEPGL would have obligations to ensure its contractors were working within regulatory requirements and the measures established in the EIA and related Environmental Permit conditions, the EIA discusses measures to verify conformance with these requirements.	No	Accepted	N/A	N/A
18	09-Dec-2021	EPA	**Section 6.1.2 –Existing Conditions—Onshore Air Quality. Page 346 - Figure 6.1-1: Onshore Ambient Air Quality Monitoring Sites** • Why are those particular sites chosen to do air quality readings i.e. what was the site selection criteria used? • Why weren't other sites further downwind selected or other Regions along the coast e.g. Region 1, 2, 3 or 5? • Is there a system in place to capture/ model emissions data from land use vehicles?	1, 2. Onshore ambient air monitoring locations were selected in the Georgetown area to assess existing air quality where emissions sources are most heavily concentrated (i.e., in the most heavily populated area). This allows for conservative estimations of future air quality that incorporate impacts from the Project in the area where the highest concentrations of existing air pollutants are expected. EEPGL is in the process of developing a scope for additional ambient monitoring along the coast. Additional text explaining this rationale has been added to EIA Section 6.1.2.1, Existing Conditions—Air Quality. 3. Ambient air monitoring captured existing air quality from all emissions sources, in the vicinity of / downwind of monitoring sites, including existing vehicle emissions. As documented in EIA Section 8.5.3, Impact Assessment—Social Infrastructure and Services, anticipated additional vehicle trips associated with the EEPGL's activities in 2026 would not be expected to meaningfully change overall traffic conditions across the intersections studied in the Georgetown area. Accordingly, the additional air emissions from EEPGL-related vehicles would not represent a significant increase and were not included in air dispersion modeling.	Yes	1,2 see comment With the current location (Carifesta Ave), the majority of the area in a 3 mile diameter circle falls on uninhabited zones. A greater representation of the heavily populated areas would arise if the central location was shifted 1 km on an East South East bearing 3. Accepted	1,2. The Consultants acknowledge the comment, noting that the Carifesta location was a prior data monitoring location, for which data collection ended in March 2019. As described in Section 6.1.2.1 of the EIA, additional data were collected further to the south in the Georgetown urbanized area from April to August 2019 (New Guyana School site).	p. 6-8

19	09-Dec-2021	EPA	**Section 6.1.3.2. Emissions of Air Quality Pollutants - Embedded Controls. Page 360.** Air Quality Data was taken sporadically via campaigns during 2016, 2018 & 2019. It was noted that with time, BTEX increased, though below regulations, however, with the increased activity of Yellowtail, it is recommended that there be consistent AQ monitoring of non-methane VOCs & other WHO AQ parameters 3 proposed sites.	In support of the Gas to Energy Project, EEPGL is in the process of deploying the ambient air quality monitoring system at a fourth location. Independent of the Yellowtail Project assessment and authorization process, EEPGL has indicated its willingness to engage with the Guyana Environmental Protection Agency (EPA) and other government agencies as necessary with a view to progressing appropriate environmental initiatives such as air quality monitoring in keeping with its commitment to minimizing environmental impacts.	Yes	Accepted	N/A	p. 6-19
20	09-Dec-2021	EPA	**Table 6.1-14: Embedded Controls Contributing to Reductions in Atmospheric Emissions** There is no mention of heat recovery systems. Will there be usage of high efficient combustion equipment that utilizes a heat recovery system?	Table 6.1-14 includes an embedded control for the Project to install waste heat recovery units (WHRUs) on turbine generators to reduce the demand of more power generation or fired heaters, thus decreasing fuel gas consumption. The WHRUs would be installed in a 4 x 33% configuration.	No	Accepted	N/A	N/A
21	09-Dec-2021	EPA	**Section 6.1.3.2. Emissions of Air Quality Pollutants. Page 362.** It is highlighted in the document that non-routine flaring is used to combust produced gas when not consumed as fuel gas on the FPSO or injected back into the reservoir, and vents. Please indicate the methodology that would be used for the temporary non-routine flaring.	EIA Section 2.7.4.3, Flare and Blowdown System) describes the flare and blowdown system, including situations where non-routine flaring may occur. The methodologies used to estimate the emissions of air pollutants coming from temporary non-routine flaring are based on the publication AP-42: Compilation of Air Pollutant Emission Factors (USEPA Undated).	No	Accepted	N/A	N/A
22	09-Dec-2021	EPA	**Section 6.1.3.3. Characterization of Potential Impacts—Air Quality – Figure Page 369. 6.1-2: Air Quality Modeling Domain** For point source emission modelling, does the data take into account pollutants from other sources (CGX, Repsol etc) in the near vicinity? Will there be a cumulative impact study that shows modeling data gathered from other sources?	The scope and timing of these non-Project sources, and therefore the emissions from these sources, have too much uncertainty associated with them for accurate quantitative modeling at this time. However, it is the understanding of the Consultants that current plans for these projects involve only a limited number of wells, with an associated short duration of drilling. As such, it is anticipated that the contribution of these sources to onshore air quality impacts in the Area of Influence (AOI) would be negligible. EIA Chapter 10, Cumulative Impact Assessment, addresses cumulative impacts to air quality from other operators' activities on a qualitative basis.	No	Accepted	N/A	N/A
23	09-Dec-2021	EPA	**Section 6.1.3.3. Characterization of Potential Impacts—Air Quality – Table 6.1-17: Summary of Modelling Results – Maximum Predicted Impact at Onshore Locations.**	Potential air quality-related health impacts for Project workers would be addressed through standard occupational exposure guidelines. The relevant occupational health and safety guidelines have been referenced in EIA Section 6.1.3, Impact Assessment—Air Quality, Climate, and Climate Change. Potential exposures to non-Project-related offshore receptors (i.e., on non-Project vessels) would be limited due to the distance of the Project	Yes	Accepted	N/A	p. 6-18

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Justify why there were no modeled cases to predict the maximum offshore concentration of pollutants and their effects.	from areas of high non-Project vessel use (i.e., near shore). ExxonMobil, and its affiliates, generally follow the American Conference of Governmental Industrial Hygienist's Threshold Limit Values to set the exposure limits for chemical, physical, and biological substances.				
24	09-Dec-2021	EPA	**Section 6.1.3.1. Relevant Project Activities and Potential Impacts - Table 6.1-16: Annual Air Pollutant Emissions Summary—Yellowtail Project.** • Footnote (a) the annual estimated totals generally reflect the current preliminary Project schedule and production profile and remain subject to adjustment. Source category-specific sub-totals are rounded up to the next 5 tonnes and the totals reflect the sum of the rounded sub-totals. • Can you state what conditions may cause it to deviate from these readings on either side (positive and negative).	The air pollutant emissions summary provided in Chapter 6 was developed based on the current design of the Yellowtail Project and reflects the best available estimates of the components and activities of the Project that would generate air pollutant emissions. Actual pollutant emissions could differ from these estimates (either upward or downward) as a function of changes such as shorter or longer drilling duration, more or less oil and associated gas production, more or less upset or maintenance scenarios, more or less support vessel or helicopter trips, among others. Where appropriate, a degree of conservatism was reflected in the estimates. As an example, emissions estimates are provided for two cases designated as the "Design Case" and "Modeled Case." The Design Case emissions are based on estimated annual flaring, including an estimate of non-routine flaring in accordance with design basis assumptions for the Project. The Modeled Case emissions include an additional contingency for non-routine flaring volumes and are considered to reflect a credible worst case for non-routine flaring. Recognizing that range, a "low side" and "high side" estimation has been included to demonstrate the potential range for experience. For the purposes of modeling (on which assessment of potential air quality impacts is based), only the Modeled Case (i.e., "high side") emissions estimates are assessed. Examples of changes that could cause actual emissions to differ from those presented in EIA Table 6.1-16 have been added as a footnote to the table.	Yes	Accepted	N/A	p. 6-27
25	09-Dec-2021	EPA	**Section 6.2. Sound 6.2.2.2. Characterizing Existing Conditions in the PDA** Has there been any other (more recent) under water sound study conducted other than (Hildebrand (2009))? Current baseline in relation to marine mammals/fauna data. Can Hildebrand (2009) study be appropriate for these current conditions? If so, how?	EIA Section 6.2.2.2, Characterizing Existing Conditions in the PDA, discusses ambient noise in open ocean environments and notes that criteria associated with potential acoustic injury to marine fauna are much higher than existing ambient sound levels. Furthermore, ambient noise levels are inconsequential since sound levels add logarithmically, and a local noise source would be the controlling factor for any short-term noise. Several more recent studies including Wiggins et al. (2016), Hildebrand et al. (2021), and Haver et al. (2021) have been added to EIA Section 6.2, Sound.	Yes	Accepted	N/A	p. 6-50
26	09-Dec-2021	EPA	**Marine Water Quality, Marine Geology and Sediments, Biological Resources** **General Comment** • Was any updated EBS survey or ROV surveys conducted for the Stabroek Block for the period 2020-2021 as it pertains to obtaining benthic imagery? EIA makes reference to surveys conducted for the period 2014, 2016, 2017, 2018, 2019 and 2020.	1. As described in Appendix I, Recent Environmental Baseline Survey Reports (Volume II of the EIA), the Hammerhead Environmental Baseline Survey (EBS) was conducted in 2020 within the Stabroek Block, approximately 44 kilometers (approximately 27 miles) west of the Yellowtail Project Development Area (PDA), and included seabed video and still photography at 15 sample locations. As described in EIA Section 7.9, Marine Benthos, multiple EBSs have been conducted in the Stabroek Block, and as depicted in Figure 7.9-1 the 2019 EBS included one sample along the northern boundary of the Yellowtail PDA. While no other EBS data have been collected specifically within the Yellowtail PDA, as described in EIA Section 7.9, after more than 60 samples taken across several years in the Stabroek Block the weight of evidence suggests that benthic communities in the Stabroek Block are relatively homogeneous and typical of deep-sea sedimentary habitats. This supports the concept that	1. Yes 2. Yes 3. Yes 4. No 5. No.	1. Accepted 2. Accepted 3. Accepted 4. Accepted 5. Accepted	N/A	1. p. 7-261 2. p. 7-67, p. 7-91, p. 7-143, p. 7-165 3. p. 7-193 4. N/A 5. N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			• With the absence of updated benthic information and imagery, how can it be ascertained that those conditions remain the same from periods of past surveys? Further it is noted that updated EBS information was provided for the Hammerhead for 2020, does this fall within the Yellowtail development area? • It has been noted that there is a lot of baseline information (with exception of marine mammals and fish) with respect sighting periods that were conducted up to the year 2000. However, limited information is available for the year 2021. A list of all baseline work conducted must be provided for the year 2021 with regards biological surveys and how it was taken into consideration in the EIA. • Based on the conduct of marine fish surveys from 2017 to 2020, did you observe any trends and if yes, what was the trend? • Was any marine fish survey conducted in the year 2021 and would the conduct of marine fish survey be ongoing? • With regards to designing water intakes to prevent the entrainment of fish, was any thought given to the entrainment of fish eggs?	the deep sea environment within the Stabroek Block is a relatively stable environment and EBS data collected within the last several years would be expected to remain relevant to present day conditions. A conclusory statement with supporting rationale indicating why the existing benthic information is sufficient has been added to EIA Section 7.9.2.3, Existing Conditions in the Project Development Area. 2. No biological baseline surveys were conducted in 2021; however, most of the biological receptors assessed in EIA Chapter 7 are supported by multiple EEPGL-sponsored biological baseline data studies that have been conducted within the last several years (e.g., PSO Surveys, Marine and Coastal Bird Studies, Enhanced Coastal Sensitivity Mapping, and Nearshore and Offshore Fisheries Study). The Consultants consider these baseline data as representative and appropriate for inclusion in the EIA, for the reasons discussed in Response #26. Statements regarding the applicability of recent historical data to the EIA have been added to the marine turtles, riverine mammals, seabirds, and coastal wildlife sections in Chapter 7. 3. Although two study years (2017–2018 and 2018–2019) constitute too short a timeframe to identify temporal trends across multiple years, the studies did identify several seasonal and spatial trends. These include increased fish biodiversity on the continental shelf relative to other areas (i.e., deepwater and nearshore/estuarine area), fluctuations in the fish abundance in the nearshore and inner continental shelf regions in response to seasonal influx of freshwater from rivers, and a potential seasonal trend in plankton abundance in response to seasonal peaks in spawning activity. These observations are discussed in more detail in Section 6 of Appendix M, Nearshore and Offshore Fisheries Study Summary (Volume II of the EIA). The Participatory Fish Survey also identified some trends to date, including seasonal increases in fishing effort from October to April, the increasing effect that fuel prices are having on fishing practices, a recent increase in the demand for (and effort directed to) swim bladders, and the increasing effect of sargassum incursions on catches. Discussions of these trends have been added to Section 7.8.2.2 of the EIA. 4. As a continuation of the participatory fish study initiated in 2019, additional data collection is underway. A third Nearshore and Offshore Fisheries Study is not currently underway, but is planned to begin in 2022. 5. EIA Section 7.8.3, Impact Assessment—Marine Fish, discusses the impacts of entrainment of juvenile life stages, including eggs.				
27	09-Dec-2021	EPA	**Specific Comment** Table EIS-4 (Coastal Resources Potentially Impacted by an Oil Spill) and Table EIS -5: Marine Resources Potentially Impacted by an Oil Spill: Further justification for the moderate to minor ratings is required since the severity of the consequences on coastal and marine resources was significant in oil spills that have occurred globally. Further marine fish has not been included in Table	As discussed in EIA Section 4.8.2.2, Evaluating Potential Impacts from Unplanned Events, assessing the risk of unplanned events, including oil spills, requires incorporating both the potential consequence/severity of the unplanned event if it were to occur and the likelihood of the unplanned event occurring. The Consultant team agrees that in the event of a Tier III spill event, the consequences for coastal and marine resources could be severe. The sensitivity of the ecosystem to such an event is the primary reason that several of the environmental resources received a Moderate risk rating for unplanned events. However, the likelihood of such an event would be exceedingly low. Even if a Tier III spill event—which is a very remote possibility—were to occur, the ocean area through which oil would move would be greatly reduced and the chances of oil reaching most of the	Yes	Accepted	N/A	p. EIS-37

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			EIS-5 (Marine Resources Potentially Impacted by an Oil Spill).	Guyana coast would be small given the mitigation measures included in the Oil Spill Response Plan (OSRP). As discussed in EIA Section 9.12.2, Marine Oil Spill, fish are generally only slightly impacted by oil spills because of their limited exposure to surface slicks (unlike marine mammals and reptiles they do not need to breathe at the surface), and the dispersed oil being rapidly diluted to very low concentrations in open water environments. Fish may also actively avoid oil, as they can detect hydrocarbons in the water. This unique combination of physiological attributes makes them more resilient to the effects of oil than the other biological resources listed in Table EIS-5. This explanation has been added to Section 3.3. of the EIS as a footnote.				
28	09-Dec-2021	EPA	**Section 7.5.3 Impact Assessment. Page 571. – Marine Mammals:** physical injury to marine mammals was not discussed as a potential impact and must be included in the impact assessment.	Vessel collisions with marine mammals are not a planned Project activity, and are therefore not addressed in Chapter 7. As a potential unplanned event, vessel collisions (of all types used by the Project) with marine mammals are addressed in Chapter 9, specifically in Sections 9.1.10.2, Vessel Collision with a Marine Mammal, and 9.9.4, Vessel Collision. Additional text has been added to Section 9.9.4 to address the probability of collisions with the FPSO and other project vessels specifically.	Yes	Accepted	N/A	p. 9-152
29	09-Dec-2021	EPA	**Section 7.8.3.3. Characterization of Impacts. Page 664.—Changes in the Distribution of Fish Due to Altered Water Quality:** What are the potential impacts on fish that may be found before that 100-meter range, given that increase food availability may result in fish moving closer toward the FPSO?	Most of the fish species that occur in the mixing zone are highly migratory open ocean species, and as such would be expected to briefly pass through the mixing zone rather than loiter within it. Fish that pass through the 100-meter (328-foot) mixing zone surrounding the FPSO would be temporarily exposed to elevated concentrations of various constituents in the routine FPSO discharges. The effects of these constituents on the fish could manifest in several ways such as elevated metabolic rates and/or gill or skin irritation, but these effects would generally be expected to be temporary and to abate once the fish exited the mixing zone. To the extent that increased forage availability could induce the fish to remain within the mixing zone longer than they otherwise would, the negative effects of increased exposure to discharges would be balanced by the energetic benefits of increased forage availability. EIA Section 7.8, Marine Fish, has been revised to include this discussion.	Yes	Accepted	N/A	p. 7-212
30	09-Dec-2021	EPA	**Section 7.10.3.2 Magnitude of Impact. Page 734. – Ecological Balance and Ecosystems, Impact on Gene Flow:** it is mentioned that the project is not predicted to have any impact on regional current patters that define the North Brazil Shelf LME nor site-specific reproductive activities that could be considered significant, however the specific reasons for this conclusion is not clearly outlined and thus needs to be addressed.	As described in Section 7.10.2, Existing Conditions—Ecological Balance and Ecosystems, the defining characteristic of the North Brazil Large Marine Ecosystem (LME) is the influence of freshwater inputs from the Amazon River. This influence gives rise to the Guiana Current, which extends north and west along the coast of northern South America past the Project to the Orinoco River delta in Venezuela. The Project would not change any of the fundamental hydrological characteristics of the Amazon River or the macro-scale oceanographic characteristics of the eastern North Brazil LME, which drive the Guiana Current at the Project site. The volume of the aqueous discharges from the Project would be insignificant compared to the volume of the Guiana Current as it flows past the Project, so the Project would not be expected to significantly influence the oceanographic environment west of the Project within the North Brazil LME (or the Guiana Current's effects on this area). Site-specific reproductive events (such as spawning aggregations or migrations) occur at locations where a specific combination of physio-chemical conditions is uniquely favorable to support them. As described in various sections in Chapter 6, the effects of the Project on physical and chemical oceanographic parameters would be expected to diminish to near-	Yes	Accepted	N/A	p. 7-285

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				background conditions within a few hundred meters of the FPSO. No spawning aggregations, migration pathways, or other unique reproduction-related habitat features are known to occur within this zone, so the Project would not be expected to affect site-specific reproductive activity. EIA Section 7.10.3.2, Magnitude of Impact—Ecological Balance and Ecosystems, has been revised to elaborate on the oceanographic and biological rationale described above.				
31	09-Dec-2021	EPA	**Section 9.1.5 Oil Spill Modelling Results. Page 1000:** Has the assessment of impacts been conducted with respect to oil spill modelling scenarios presented in the EIA? If yes, should the oil spill volumes go beyond the model, what implications that will have on the impact ratings provided?	A detailed assessment of potential impacts from various oil spill scenarios was discussed in Chapter 9, Assessment and Mitigation of Potential Impacts from Unplanned Events. These scenarios included two Worst Case Discharge (WCD) scenarios, a Most Credible WCD and a Maximum Case WCD, associated with a loss-of-well-control event. As described in EIA Section 9.1.1.9, Summary of Spill Scenarios Considered, the U.S. Department of Interior Bureau of Safety and Environmental Enforcement's regulations stipulate that each facility operator calculate its own WCD for each OSRP. According to this regulation, for an oil production platform facility, the size of the WCD scenario must be based on the daily production volume from an uncontrolled blowout of the highest capacity well associated with the facility. In determining the daily discharge rate, the operator must consider reservoir characteristics, casing/production tubing sizes, and historical production and reservoir pressure data (RPS 2021). This was done for the Yellowtail WCD calculations. In addition, these scenarios assume an uncontrolled release for a period of 30 days; however, the OSRP outlines provisions for shutting in the well with a capping stack or other technology 5.5 days after the event (assuming no debris removal is required and mobilization of the capping stack out of the United States). For these reasons, the Consultants consider the release volumes reflected in the oil spill modeling, and the assessment of risks related to these volumes, to be reasonably conservative.	No	Accepted	N/A	N/A
32	09-Dec-2021	EPA	**Section 9.1.1.8 Production-Related Spills. Page 990:** As seen with Liza 1, there was a breach in the hose due to puncture by a sword fish. Therefore, this should be mentioned in the EIA as a source of potential breach in the hose barrier.	EIA Section 9.1.1.8, Production-Related Spills, covers unplanned spill events associated with production, which includes an example of a release of crude oil due to a failure of an offloading hose. There could be different causes of a hose failure, including the one provided in the comment, which are accommodated by the scenario, and the specific cause would not change the level of impact or risk associated with this spill event. EIA Section 9.1.1.8 has been updated to include this information.	Yes	Accepted	N/A	p. 9-9
33	09-Dec-2021	EPA	**Section 10.5.3 Potential Impacts from other Projects. Page 1255, Table 10.5-3:** With regards to marine water quality, what are the potential impacts from produced water discharge from the development projects?	As indicated in Table 10.5-3, changes in water quality and temperature would be expected from liquid effluent discharges from other EEPGL development projects. Section 4 of the Water Quality Modeling Report, Appendix C of the EIA, presents the results of modeling discharges from the four EEPGL development projects, including the Yellowtail Project. None of the modeled plumes showed potential for overlap during simultaneous FPSO operations, and the individual produced water plumes experience rapid dilution and mixing. Embedded controls and mitigation measures proposed for the Project are considered to be sufficient to address potential cumulative impacts to marine water quality.	No	Accepted	N/A	N/A
34	09-Dec-2021	EPA	**Section 8:** Assessment and Mitigation of Potential Impacts from Planned Activities	Comment acknowledged. Responses to specific comments are provided in Comments #35 through #38 below.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			General Comment This section, Section 8 of the Yellowtail Development Project's EIA, is clear and informative in identifying social and economic aspects affected by the Yellowtail Development Project within and around the boundaries of the Project's area of interest in keeping with the Terms and Scope. Leading issues such as waste management, potential job opportunities, food security, especially agriculture and fishing, and land use in indigenous areas, etc. are addressed according to their magnitude of impact however, there were some concerns for the management /mitigation measures which needs to address in the revised document Please see below for specific comments:					
35	09-Dec-2021	EPA	Throughout section 8, several impacted areas were highlighted with the challenges they pose. However, no mitigation measures were listed.	In the course of the impact assessment, the Consultants considered potential mitigation measures for impacts with a pre-mitigation significance of at least "minor"; impacts with a pre-mitigation significance of "negligible" would not be expected to result in a noticeable change and were therefore not a focus for defined mitigation. However, the Consultants also recognize that not all potential impacts would be reasonably managed by EEPGL, particularly where there would be complex external influences on an impact or receptor (such as cost of living). In these rare cases, the impact is clearly identified to have no direct mitigation measures (although there may be relevant and useful measures identified as embedded controls), and the pre-mitigation significance and residual significance are identical. For example, in EIA Section 8.3, Community Health and Wellbeing, public anxiety impacts are addressed through embedded controls for ongoing stakeholder engagement (and the Stakeholder Engagement Plan [SEP]), as well as oil spill response training/awareness. In EIA Section 8.5, Social Infrastructure and Services, increased traffic congestion is recognized to be a pre-existing issue in Georgetown, and this is conservatively reflected as a higher sensitivity leading to an impact of minor significance. Given the Project's small contribution to vehicle congestion (2 to 4%), no specific mitigation measures are identified.	No	Accepted	N/A	N/A
36	09-Dec-2021	EPA	Page 8-1 (i.e., 741), the EIA makes reference to community-based studies via surveys or interviews for local community members, however there are no transcripts on the results of the activities conducted with local members, only the organizational entities.	To protect the privacy of individuals, the Consultants do not typically include transcripts or detailed results for community-level surveys and/or key informant interviews. However, EIA Section 4.7, Stakeholder Engagement, provides a high-level summary of engagement that has informed the EIA development. In addition, a more detailed synopsis of stakeholder engagement topics, by stakeholder, is provided in Attachment B of the SEP (available in Volume III of the EIA). The synopsis table provided in the SEP includes engagement directly related to the Yellowtail Project and 2021 socioeconomic baseline updates, as well as engagement from past development projects that has also informed the Yellowtail EIA. In addition, a	Yes	Please amend in keeping with comments provided during Redford Group Meeting	Detailed records of consultation made during the development of the EIA have been provided in Appendix W of the EIA. Together with the stakeholder consultation process	pp. 4-41 to 4-43, Appendix W (new), SEP p. 39

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				summary of the public comments received from, and revisions made to the EIA in response to, consultation conducted during the 60-day public disclosure period has been added to EIA Chapter 4 of the EIA, and detailed comments and responses are provided in Appendix U, Stakeholder Comments (Volume II of the EIA).			and summaries provided in Chapter 4 and the attached SEP and SEP Attachment A, these records include the manner in which the public was notified, the groups targeted, a description of the stakeholder consultation process, listing of all stakeholder groups included in the process, the number of meetings held, location of the meetings, dates held, and minutes of all meetings. Personal information including specific names of participants have been withheld to respect the privacy of those involved. No surveys were performed.	
37	09-Dec-2021	EPA	Section 8.5.3.2, EEPGL already identified suitable alternatives in the event that the new cell at HBL is not ready for use when the short-term, 2-3 years, use for cell 2 is up? If so, what are avenues that are being considered by the company?	If it becomes apparent that suitable additional capacity at Haags Bosch Landfill (HBL) would not be available to support EEPGL's needs, EEPGL would pursue plans to construct an alternative industrial landfill to meet anticipated needs.	No	Response should be included in the EIA document	The subject language has been added to Section 8.6.3.2 of the EIA.	p. 8-168
38	09-Dec-2021	EPA	Do the current timelines for the HBL for short-term (2-3 years) and long-term (up to 10 years) take into account the increase in other commercial and industrial activities that will begin concurrently with EEPGL's project lifecycle and which will also be using the HBL?	At current disposal rates, Cell 2 is expected to last for approximately 4 to 6 years. This estimated life span of Cell 2 depends upon how much the waste volumes received at the landfill increase with the expanded economic development expected in the Georgetown area over the next five years. There remains space for additional cell(s) at the HBL location to be developed in the future. The currently available landfill capacity appears sufficient to support the Project and other users for the near term based on Cell 2 having entered service in March 2021, even considering the forecasted growth in waste volumes from expanding industrial activity. Presuming additional cell(s) would be constructed on a timely basis, the future HBL landfill capacity also appears reasonable for the longer-term (up to 10 years).	No	Accepted	N/A	N/A

39	09-Dec-2021	EPA	**Recommendations:** It is recommended that the Company highlights the applied technologies that they have indicated will be implemented to reduce GHG emissions.	The Project has been inherently designed to incorporate a number of embedded controls and mitigation measures that would serve to reduce GHG emissions, as well as criteria air pollutant emissions, from Project sources. Tables 6.1-14 and 6.1-15 include a summary of these embedded controls and mitigation measures, respectively.	No	Accepted	N/A	N/A
40	09-Dec-2021	EPA	**Volume II: Appendix D – Participatory Fishing Study Final Report January 2019 – March 2020.** The document seems to be more of a fish inventory and not a study, since it failed to identify the possible effects of the project on fish population and health (including bioaccumulation), nesting/spawning seasons and grounds, etc. This analysis must be included in the EIA.	The Participatory Fishing Study is a baseline study that provides information for use in the impact analysis, although in and of itself it does not, and is not intended to, provide an analysis of Project effects on fish and fishery resources. Additional baseline information used in the impact analysis is presented in various EIA appendices (e.g., Appendix M, Nearshore and Offshore Fisheries Study Summary; Appendix O, Coastal Sensitivity Maps; and Appendix S, Enhanced Coastal Sensitivity Mapping—Ecosystem Services Final Reports). Analyses of potential impacts on spawning, habitat, and general fish health are presented in Chapter 7 (protected areas and special status species, coastal habitats, and marine fish) and Chapter 8 (socioeconomic conditions, employment and livelihoods, and ecosystem services) of the EIA. The potential for bioaccumulation was considered but ultimately not assessed in the EIA because bioaccumulation is typically a long-term impact that occurs over time due to ongoing chronic exposure to a pollutant, and as described in the response to Comment #29, most of the fish species that occur in the mixing zone of operational effluent discharges would be expected to briefly pass through the mixing zone rather than remaining within it for any significant period of time.	No	Include explanation for not assessing bioaccumulation in the EIA document	The rationale provided in the Consultants' response has been added to Section 7.8.3.3 of the EIA as requested.	p. 7-213
41	09-Dec-2021	EPA	**Volume III: Esso Exploration and Production Guyana Limited (EEPGL) – Oil spill Response Plan for Guyana Operations** Why wasn't a strategy developed for the application, monitoring and evaluation of chemical dispersants at surface and subsea?	As a continuation of studies and activities related to the Payara Development Project approvals, EEPGL has been working with the EPA and other government agencies to refine OSRPs, including a strategy for application, monitoring, and evaluation of chemical dispersants, which is actively under development. The strategy is expected to be ready in the first half of 2022. Pending formal development of the strategy, good practices have been established by international groups such as International Petroleum Industry Environmental Conservation Association (IPIECA) and the International Oil and Gas Producers to guide the application, monitoring, and evaluation of chemical dispersants applied at the surface and subsea. If in the unlikely event the use of dispersants was deemed favorable to reduce the impact of spilled oil to the environment, the responders, including those from EEPGL and those from oil spill response organizations, would follow this guidance.	No	Accepted	N/A	N/A
42	25-Oct-2021	Region 4: Umana Yana	What are the resources available for oil spill response?	Yellowtail Development Project EIA Volume III OSRP Chapter 6 Table 6-1 lists or otherwise describes the international, regional, and local resources available to EEPGL for each potential response strategy. OSRP Tables 6-2 through 6-7 provide a further summary of the representative oil spill response equipment in Guyana.	No	Accepted	N/A	N/A
43	25-Oct-2021	Region 4: Umana Yana	How many Guyanese will actually benefit from the operation?	As discussed in Section 12.1, Planned Project Activities, the EIA predicts that the Project would generate benefits for the citizens of Guyana through revenue sharing with the Government of Guyana, an increase in employment, and in-country Project purchasing of goods and services from Guyanese businesses. While it is not possible at this stage to quantify the exact number of Guyanese that would benefit from the Project, as discussed	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				in Section 2.3, Project Workforce, the Project is expected to employ up to 600 persons at peak employment.				
44	25-Oct-2021	Region 4: Umana Yana	Who pays compensation to fishermen if there is an oil spill? Is there a plan in place?	EIA Section 9.1.9, Claims and Livelihood Remediation Processes, describes claims and livelihood remediation processes. In the unlikely event of an oil spill causing losses to stakeholders, EEPGL would establish a claims process and, depending on the magnitude of the oil spill, a livelihood remediation program. The purpose of the claims process would be to provide compensation as appropriate for asset losses; the purpose of a livelihood remediation program would be to restore the welfare and livelihoods of affected persons to conditions no less than pre-impact conditions. Both processes would be transparent, fair, and conducted in a timely manner. EEPGL, in consultation with the Government of Guyana and other jurisdictions (as required), would establish the designated geographic zones associated with the claims and, as applicable, livelihood remediation processes; these would be commensurate with the magnitude of the impacts of the spill. Eligible persons would be compensated as appropriate based on the magnitude of Project-related impacts they individually experienced, either in regard to human health or as a result of economic loss. It is anticipated that EEPGL would establish steering committees, working groups, and stakeholder engagement-specific entities to determine eligible stakeholders, standard entitlements, and eligibility criteria for further livelihood compensation and assistance. EEPGL would establish an independent implementation entity, as needed depending on the circumstances, as soon as reasonably practicable after the spill, to assist in the process of livelihood remediation planning while the initial compensation efforts were ongoing. Depending on the extent of losses, livelihood remediation efforts would potentially range from early support initiatives (within the first year), to transition support (typically from 1 to 2 years after impact), to longer-term support, as determined by the duration of spill impacts.	No	Accepted	N/A	N/A
45	25-Oct-2021	Region 4: Umana Yana	How will the fishery sector be impacted by the project?	EIA Section 7.8.3, Impact Assessment—Marine Fish, provides details on potential impacts on marine fish.	No	Accepted	N/A	N/A
46	25-Oct-2021	Region 4: Umana Yana	Was the marine survey a one-off study?	Biological resources were documented through a range of studies conducted over the last several years, in some cases going back to 2014. These included studies of seabirds, marine mammals, riverine mammals, marine turtles, marine fish, and marine benthos in the appropriate areas of the Guyana Exclusive Economic Zone (EEZ). These studies are described in Table 5.2-1, and are available to the public either in Volume II of the Yellowtail EIA, or for older studies, in technical appendices of prior development project EIAs (all of which are available on the EPA website). In most cases the studies were conducted in the Stabroek Block and adjacent continental shelf, but the riverine mammal study was conducted in the Demerara River. Monitoring of marine and riverine mammals is recommended in the ESMP, and EEPGL is currently considering the potential for additional biological data collection in the future.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
47	25-Oct-2021	Region 4: Umana Yana	Will there be updated studies throughout the life of the project?	Monitoring of marine and riverine mammals is recommended in the ESMP, and EEPGL is currently considering the potential for additional biological data collection in the future.	No	Accepted	N/A	N/A
48	25-Oct-2021	Region 4: Umana Yana	The EIA does not show what the benefits to the developer are.	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
49	25-Oct-2021	Region 4: Umana Yana	What is the length, breadth, and depth of the project area?	Work would be performed in a subsea area within the PDA that could potentially cover an estimated 3,534 hectares (8,733 acres). Work performed on the surface of the ocean could potentially occur within an estimated 4,576 hectares (11,308 acres). The Project facilities would be installed in water ranging from approximately 1,700 to 1,900 meters (5,577 to 6,234 feet) in depth. This information is included in Chapter 2 of the EIA.	No	Accepted	N/A	N/A
50	25-Oct-2021	Region 4: Umana Yana	Will there be consistent engagement with the public throughout the project?	EEPGL conducts regular and ongoing engagement with fisherfolk, communities, Toshaos, and other stakeholders. Through this engagement, EEPGL provides updates about the company's activities in the marine and onshore areas, and opportunities to be involved in local programs and initiatives.	No	Accepted	N/A	N/A
51	25-Oct-2021	Region 4: Umana Yana	Will there be a certificate issued after decommissioning?	As indicated in Section 8 of the Preliminary End of Operations Decommissioning Plan for Guyana Development Projects (included in Volume III of the EIA), the relevant Guyanese regulators would have access to the work site during the decommissioning activities to monitor and witness the final completion of the work. After the completion of well plugging and abandonment (P&A) and facilities decommissioning work, EEPGL would submit a final decommissioning report to the relevant Guyanese regulators that would include a description of the scope of work performed, work logs, final inspection reports, videos, and photos, as applicable. The relevant Guyanese regulators would be requested to review the submitted report and issue a certificate of completion of the decommissioning work as well as a certificate of release of liability within 60 days of completion of final inspection.	No	Accepted	N/A	N/A
52	25-Oct-2021	Region 4: Umana Yana	Who owns the information in the EIA?	The EIA and all the data contained within it is public information. Per the requirements of the Environmental Protection Act, EEPGL and the EPA will maintain copies of the EIA for the duration of the Project plus 5 years, and the public may request copies of these documents from the EPA at any time during this period.	No	Accepted	N/A	N/A
53	25-Oct-2021	Region 4: Umana Yana	Does EEPGL plan to provide insurance?	Insurance and financial security are addressed in EIA Table 4.7-4. The Stabroek Block co-venturers' first priority is to put in place mitigations and processes that prevent adverse events. In the unlikely case of an adverse event, the co-venturers would immediately minimize and rectify any impacts. The co-venturers have the financial capacity to meet the responsibilities for an event including obligations under Guyanese law and the respective petroleum agreements. Regarding insurance, the Stabroek Block co-venturers have secured comprehensive insurance for petroleum activities as required by environmental permits. Under the existing legal framework and agreements with the government, there are extensive assurances of EEPGL's and co-venturers' commitments, including environmental protection measures to respond to operational incidents. The Government of Guyana has multiple mechanisms in place, including the Stabroek Block Petroleum Agreement and the environmental permits, to ensure that the companies would take responsibility for any adverse events.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				Joint insurance coverage is obtained in the name of EEPGL and the other Stabroek block co-venturers for the appropriate lines of coverage, depending on the project and scope of work. Specifically for the Yellowtail Project, should the Yellowtail Project receive necessary approvals, the co-venturers would have insurance coverage including Third Party Liability and the cost of regaining control of a well.				
54	25-Oct-2021	Region 4: Umana Yana	What data was used to inform the risk analysis?	Where there is uncertainty in the details of the Project design, the EIA uses conservative assumptions. However, it is noted that in addition to information obtained from the first 2 years of operations in Guyana, the EIA also draws on information from ExxonMobil affiliates' operations globally, so there is a strong foundation forming the basis of the assessment. The project description chapter (Chapter 2) establishes the basis for the EIA, inclusive of the technologies used to inform the assumptions.	No	Accepted	N/A	N/A
55	25-Oct-2021	Region 4: Umana Yana	What are the statutory requirements for hazard analysis?	The Environmental Protection Act does not require specific hazard assessment methodologies to be used to the support the EIA, but it does require the EIA to include basic Project design-related information and analysis of anticipated impacts on a number of specific environmental receptors.	No	Accepted	N/A	N/A
56	27-Oct-2021	Region 2: Regina	Some fishermen have noted the smell of diesel in the water that is unusual, can this be addressed?	The Consultants acknowledge the question. The question is beyond the scope of the EIA. However, the comment of potential odors in the water has been noted and communicated to EPA and EEPGL.	No	Accepted	N/A	N/A
57	27-Oct-2021	Region 2: Anna Regina	What treatment process is used on produced water?	EIA Section 2.7.4.5, Produced Water Treatment, provides an overview on how produced water would be treated.	No	Accepted	N/A	N/A
58	27-Oct-2021	Region 2: Anna Regina	Why isn't treated water injected back into the well?	Based on the many supporting factors described in the EIA and consistent with the produced water reinjection study conducted for the Payara Development Project, overboard discharge of treated produced water was recommended for the Project after taking into account the technical feasibility and economic evaluations, with a consideration of regulatory requirements and predicted environmental impact. This recommendation, subject to EPA review and approval, also is consistent with good international oilfield practice. More details can be found in EIA Section 2.18.2.5, Produced Water Management Alternatives.	No	Accepted	N/A	N/A
59	27-Oct-2021	Region 2: Anna Regina	Does Guyana have insurance? Partial, full coverage?	The question of whether the country of Guyana has an insurance policy is beyond the scope of the EIA. For information regarding insurance coverage for the Project, see the response to Comment #53.	No	Accepted	N/A	N/A
60	27-Oct-2021	Region 2: Anna Regina	Is there any financial security in place after decommissioning, specifically to address changes to the seafloor structure?	The subsea equipment would generally be laid on the seafloor, with a minimal degree of restructuring of the seafloor. Likewise, the process of decommissioning would not include any activities that would result in seafloor stability concerns. As stated in EIA Volume III, Preliminary End of Operations Decommissioning Plan for Guyana Development Projects, the relevant Guyanese regulators would have access to the work site during the decommissioning activities to monitor and witness the final completion of the work. After the completion of well P&A and facilities decommissioning work, EEPGL would submit a final decommissioning report to the relevant Guyanese regulators for review and	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				approval, which would include a description of the scope of work performed, work logs, final inspection reports, videos, and photos, as applicable.				
61	27-Oct-2021	Region 2: Anna Regina	Are there any plans for compensation of fishermen?	EIA Section 9.1.9 describes claims and livelihood remediation processes. In the unlikely event of an oil spill causing losses to stakeholders, EEPGL would establish a claims process and, depending on the magnitude of the oil spill, a livelihood remediation program. The purpose of the claims process would be to provide compensation as appropriate for asset losses and the purpose of a livelihood remediation program would be to restore the welfare and livelihoods of affected persons to conditions no less than pre-impact conditions. Both processes would be transparent, fair, and conducted in a timely manner. EEPGL, in consultation with the Government of Guyana and other jurisdictions (as required), would establish the designated geographic zones associated with the claims and, as applicable, livelihood remediation processes; these would be commensurate with the magnitude of the impacts of the spill. Eligible persons would be compensated as appropriate based on the magnitude of Project-related impacts they individually experienced, either in regard to human health or as a result of economic loss. It is anticipated that EEPGL would establish steering committees, working groups, and stakeholder engagement-specific entities to determine eligible stakeholders, standard entitlements, and eligibility criteria for further livelihood compensation and assistance. EEPGL would establish an independent implementation entity, as needed depending on the circumstances, as soon as reasonably practicable after the spill, to assist in the process of livelihood remediation planning while the initial compensation efforts are ongoing. Depending on the extent of losses, livelihood remediation efforts would potentially range from early support initiatives (within the first year), to transition support (typically from 1 to 2 years after impact), to longer-term support, as defined by the duration of spill impacts.	No	Accepted	N/A	N/A
62	27-Oct-2021	Region 2: Anna Regina	How many Essequibians are employed by the company and how many can be employed by the project?	As of the first half of 2021, the total workforce supporting EEPGL's activities (including direct employees and contractors) amounted to more than 5,400, more than half of whom (more than 2,800 workers, or 53 percent of total) are Guyanese, representing all ten Regions of Guyana. Increases in total employment would be expected with the development of the Yellowtail Development Project, and, if the Project was approved, EEPGL intends to continue hiring Guyanese nationals to the extent reasonably practicable, in alignment with its Local Content Plan. Onshore jobs would be based in the Georgetown area (Region 4) although employment applications would be welcome from residents of all regions. EEPGL and its contractors publicly advertise for job opportunities on a regular basis. Opportunities are available in a wide variety of disciplines. For more information, see the EEPGL website, Facebook page. EEPGL also posts opportunities in newspapers and through the Centre for Local Business Development (CLBD).	No	Accepted	N/A	N/A
63	27-Oct-2021	Region 2: Anna Regina	Under management measures for marine fish, specify which standards the company intends to use.	There are no national or international standards for managing the impacts of offshore oil and gas projects on marine fish. However, many of the predicted effects on marine fish would be indirect effects caused by changing water quality. Guyana has no national marine water quality standards, but applicable international water quality standards are available and are	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				included in EIA Section 6.4.4.3, Characterization of Impacts—Changes to Water Quality and Temperature.				
64	27-Oct-2021	Region 2: Anna Regina	Will flaring be done on this project?	As per EIA Section 2.7.1, General Description, the FPSO would be designed to re-inject associated gas under routine conditions—except that which would be used as fuel gas, flare pilot gas, and background flare gas (e.g., purge, compressor seals) for FPSO operations and *de minimis* sources not captured by the Vapor Recovery Unit (VRU)—back into the reservoir except during times of injection / compression system unavailability, which would require temporary, non-routine flaring during maintenance/repair. Flaring of associated gas would occur on a non-routine basis during start-up and shutdown; equipment maintenance and process upsets scenarios; emergency pressure relieving scenarios; and other non-routine flaring events.	No	Accepted	N/A	N/A
65	27-Oct-2021	Region 2: Anna Regina	Was a Cumulative Impact Assessment of the burning of fossil fuels done?	Chapter 10, Cumulative Impact Assessment, and Appendix G, Emissions Inventory and Air Quality Modeling Report, discuss the assessment of cumulative air emissions.	No	Accepted	N/A	N/A
66	27-Oct-2021	Region 2: Anna Regina	What are the company's plans for monitoring emissions?	ESMP Table 3.6-1 includes quantification and reporting of direct emissions from Project offshore facilities and from offshore and onshore Project activities conducted by EEPGL and its dedicated contractors on an ongoing basis.	No	Accepted	N/A	N/A
67	27-Oct-2021	Region 2: Anna Regina	The EPA should monitor the conditions at Shell Beach	The question of whether the EPA should monitor Shell Beach generally is beyond the scope of the EIA; however, the monitoring component of the ESMP includes recommendations to monitor several types of marine wildlife within the PDA, and many of these species also occur at Shell Beach.	No	Accepted	N/A	N/A
68	27-Oct-2021	Region 2: Anna Regina	What considerations have been given to drill cuttings as litter on the ocean floor?	The EIA describes potential impacts to marine water quality, marine sediments, and marine life associated with drilling, including deposition of drill cuttings on the seafloor and temporary increases in suspended solids concentrations in the water column. The EIA includes computer modeling of these impacts, the results of which indicate the extent of minor impacts remains well offshore.	No	Accepted	N/A	N/A
69	27-Oct-2021	Region 2: Anna Regina	How will ballast water be managed?	Per the ESMP for the Yellowtail Development Project, the Project would comply with International Maritime Organization (IMO) guidelines for management of ballast water, which is the internationally recognized performance standard for managing potential environmental impacts associated with ballasting operations. Compliance with the relevant IMO requirements as recommended in the EIA should address potential impacts, and manage risks from ballast water discharges to the marine environment.	No	Accepted	N/A	N/A
70	27-Oct-2021	Region 2: Anna Regina	What is the quantity of ballast water that will be coming on the ships?	The FPSO would have a ballast capacity of up to 550,000 barrels (88,000 m^3). The market tankers that would accept the oil from the FPSO would have a maximum ballast water capacity of 629,000 barrels (100,000 m^3).	No	Accepted	N/A	N/A
71	27-Oct-2021	Region 2: Anna Regina	Are the drill cuttings responsible for the fish moving away?	As indicated in Chapter 7, deepwater fish would be expected to move away from disturbances at the sea floor during the drilling and installation stage of the Project. This effect would be expected to be temporary, and would not be expected to extend onto the continental shelf or the inshore zone where most fishing in Guyanese waters takes place. As a baseline matter, EIA Section 8.1, Socioeconomic Conditions, discusses the issue of declining fish catches. See additional information in the response to Comment #207.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
72	27-Oct-2021	Region 2: Anna Regina	What replaces oil when it is extracted?	Associated gas and seawater would be injected into the reservoir. This water and gas would replace the oil and maintains reservoir pressure during production operations. This is typical of offshore production operations around the world.	No	Accepted	N/A	N/A
73	27-Oct-2021	Region 2: Anna Regina	What is the distance of the project from specific regions?	For the purposes of the public disclosure meetings, the distances between the FPSO and the Atlantic Ocean shoreline nearest the disclosure meeting locations in the six coastal regions are as follows: • Region 1: 232 kilometers (144 miles) • Region 2: 207 kilometers (129 miles) • Region 3: 206 kilometers (128 miles) • Region 4: 191 kilometers (119 miles) • Region 5: 191 kilometers (119 miles) • Region 6: 198 kilometers (123 miles)	No	Accepted	N/A	N/A
74	27-Oct-2021	Region 2: Anna Regina	What is EXXON doing for Guyana?	The question is not specific to a project or a resource and as such is too broad to be answered within the resource-specific scope of the EIA; however, with respect to the Yellowtail Development Project specifically, as discussed in Section 12.1, Planned Project Activities, the EIA predicts that Project would generate benefits for the citizens of Guyana through revenue sharing with the Government of Guyana, an increase in employment, and in-country Project purchasing of goods and services from Guyanese businesses.	No	Accepted	N/A	N/A
75	27-Oct-2021	Region 2: Anna Regina	How is this project secured against piracy?	Marine safety is discussed in EIA Section 2.10.3. The Maritime Administration Department (MARAD) of the Ministry of Public Infrastructure is responsible for issuing notices to mariners concerning safety at sea. MARAD would be advised of the locations of drill ships during the drilling of the development wells and the performance of well workovers in the PDA so that mariners can be made aware of these activities. As shown on Figure 2.10-1, marine safety exclusion zones with a 500-meter (1,640-foot) radius would be established by MARAD around drill ships during drilling operations and around drill centers during well workovers, as well as around major installation vessels, in accordance with good international oilfield practice. Authorizations for major in-water activities would be obtained from MARAD and notices to mariners would be issued for all marine vessels, including the FPSO, supply and support vessels, tugs, and those vessels to be used during the installation, hook-up, and commissioning stage. As shown on Figure 2.10-1, MARAD would establish a 2-nautical mile-radius (2.7-kilometer-radius) marine safety exclusion zone centered on the FPSO during offloading activities, where marine support and tanker offloading would occur. No unauthorized vessels would be allowed to enter this approximately 4,310-hectare (10,650-acre) operational marine safety exclusion zone during offloading activities.	No	Accepted	N/A	N/A
76	27-Oct-2021	Region 2: Anna Regina	Will any oil spill affect international borders and how will this be addressed?	Chapter 9 includes an assessment of the potential risks of an oil spill on the various resources and receptors. Potential transboundary impacts from an oil spill are described in EIA Section 9.24.	No	Accepted	N/A	N/A
77	27-Oct-2021	Region 2: Anna Regina	What are the plans for monitoring wells?	As part of normal well tree installation on completed development wells, there is ROV support. At the conclusion of well tree installation, the ROVs survey the as-left condition and perform a visual survey of the location.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				EEPGL operations would have planned maintenance in place to have an ROV survey on a periodic basis to inspect wells / manifolds / subsea infrastructure. All of the trees would have the ability to monitor pressure, temperature, and flow rate. During normal operations, EEPGL would monitor flow rate, pressure, and temperature at different locations on the well tree and within the well, enabling it to identify any abnormal operating conditions.				
78	27-Oct-2021	Region 2: Anna Regina	How often will equipment be serviced?	The list of embedded controls for the Project (which are detailed in Chapter 2, Chapter 13, the ESMP, and the OSRP) includes a number of controls related to equipment maintenance and inspection. EEPGL would perform regular servicing and maintenance on equipment and, every few years, would complete a full overhaul. EEPGL would have dedicated teams who would manage these maintenance/servicing efforts as well as people on site who would monitor and test on a frequent basis. EEPGL would utilize a tracking system to manage its general equipment maintenance program.	No	Accepted	N/A	N/A
79	27-Oct-2021	Region 2: Anna Regina	If tankers moving fuel get into accidents in Guyana's waters, who is responsible for the cleanup?	EIA Section 2.10.4, Offloading Tankers, provides a summary of the operational procedures and controls (maritime navigation protocols, safety procedures, communication protocols, etc.) that would be implemented in relation to tanker activities, including tanker transit within Guyana waters and during offloading of oil from the FPSO to the tankers. In the event of a tanker accident in Guyanese waters, EEPGL would work with the tanker operator to assist with response.	No	Accepted	N/A	N/A
80	27-Oct-2021	Region 2: Anna Regina	Are there any plans to set up a refinery in Guyana?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
81	29-Oct-2021	Region 1: Santa Rosa	Would an oil spill affect our CARICOM neighbors?	Chapter 9 includes an assessment of the potential risks of an oil spill on the various resources and receptors. Potential transboundary impacts from an oil spill are described in EIA Section 9.24.	No	Accepted	N/A	N/A
82	29-Oct-2021	Region 1: Santa Rosa	Will oil spill response drills be conducted in villages?	EIA Volume III OSRP Table 7-3 provides information on oil spill exercises overview and schedule. Decisions on exercise locations would be determined during the exercise planning. Local communities would be offered the opportunity for involvement in oil spill exercises.	No	Accepted	N/A	N/A
83	29-Oct-2021	Region 1: Santa Rosa	Will there be compensation for villages, alternative livelihoods?	EIA Section 9.1.9 describes the claims and livelihood remediation processes. In the unlikely event of an oil spill causing losses to stakeholders, EEPGL would establish a claims process and, depending on the magnitude of the oil spill, a livelihood remediation program. The purpose of the claims process would be to provide compensation as appropriate for asset losses; the purpose of a livelihood remediation program would be to restore the welfare and livelihoods of affected persons to conditions no less than pre-impact conditions. Both processes would be transparent, fair, and conducted in a timely manner. EEPGL, in consultation with the Government of Guyana and other jurisdictions (as required), would establish the designated geographic zones associated with the claims and, as applicable, livelihood remediation processes; these would be commensurate with the magnitude of the impacts of the spill. Eligible persons would be compensated as appropriate based on	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				the magnitude of Project-related impacts they individually experienced, either in regard to human health or as a result of economic loss. It is anticipated that EEPGL would establish steering committees, working groups, and stakeholder engagement-specific entities to determine eligible stakeholders, standard entitlements, and eligibility criteria for further livelihood compensation and assistance. EEPGL would establish an independent implementation entity, as needed depending on the circumstances, as soon as reasonably practicable after the spill, to assist in the process of livelihood remediation planning while the initial compensation efforts are ongoing. Depending on the extent of losses, livelihood remediation efforts would potentially range from early support initiatives (within the first year), to transition support (typically from 1 to 2 years after impact), to longer-term support, as defined by the duration of spill impacts.				
84	29-Oct-2021	Region 1: Santa Rosa	Did Liza Phase 1 EIA take flaring into account? If yes, how is there still flaring from the FPSO?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
85	29-Oct-2021	Region 1: Santa Rosa	How does EEPGL intend to deal with flaring in the context of the LCDS?	As described in EIA Section 6.1, Air Quality, Climate, and Climate Change, the Project would implement a flaring minimization plan. Instead of continuous flaring of gas produced during crude oil production, associated gas that would not be used as fuel gas on the FPSO—excluding *de minimis* sources not captured by the VRU—would be reinjected into the reservoir, to avoid routine flaring of associated gas. In addition, a series of measures would be implemented to minimize non-routine flaring of associated gas.	No	Accepted	N/A	N/A
86	29-Oct-2021	Region 1: Santa Rosa	Is the LCDS captured in the EIA?	The 2009 Draft Low Carbon Development Strategy, updated in 2013, was captured in EIA Section 3.3.1, National Policy Framework.	No	Accepted	N/A	N/A
87	29-Oct-2021	Region 1: Santa Rosa	Would the reservoir have the same density after the oil is extracted?	The reservoir is comprised of both sandstone rock as well as oil, gas, and water fluids. The oil, gas, and water fluids are contained within the pore space between the solid sandstone particles. As a part of the Yellowtail depletion plan, when fluids would be produced from the pore space, water and associated gas would be injected into the pore space to maintain the reservoir pressure near original conditions. At original conditions, the primary fluid would be oil. As the field would be developed and oil produced, water would become a greater percentage of the fluids in the pore space. The density of water is greater than the density of oil. Therefore, as the field would be produced, the density of the fluids in the reservoir would increase. The depletion plan would be approved by the Ministry of Natural Resources as part of any approval of the Field Development Plan for the Project.	No	Accepted	N/A	N/A
88	29-Oct-2021	Region 1: Santa Rosa	Did the Fish Study involve people of Region 1?	Yes. The Participatory Fish Study involved respondents from Smith's Creek and Morawhanna.	No	Accepted	N/A	N/A
89	29-Oct-2021	Region 1: Santa Rosa	Other than government revenue, is EEPGL willing to support small development projects if approached?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
90	29-Oct-2021	Region 1: Santa Rosa	The time for the distribution of the EIA and the meetings is too short given the distance of most villages and the length of the document. Can	The Consultants acknowledge the question. In accordance with the Environmental Protection Act, the public was provided 60 days after publication of the EIA to provide comments to the EPA. Opportunities to	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			finance be provided to assist village leaders to distribute documents in a timely manner?	share information in advance would be considered when planning future community meetings.				
91	29-Oct-2021	Region 1: Santa Rosa	Can visits off shore be facilitated for village leaders?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
92	29-Oct-2021	Region 1: Santa Rosa	How will maintenance of the equipment be undertaken with respect to extraction rat e of oil and injection rate of water and gas?	The list of embedded controls for the Project (which are detailed in Chapter 2, Chapter 13, the ESMP, and the OSRP) includes a number of controls related to equipment maintenance and inspection. EEPGL would perform regular servicing and maintenance on equipment and, every few years, would complete a full overhaul. EEPGL would have dedicated teams to manage these maintenance/servicing efforts as well as people on site to monitor and test on a daily basis. EEPGL would utilize a tracking system to manage its general equipment maintenance program.	No	Accepted	N/A	N/A
93	01-Nov-2021	Region 3: Leonora Technical Institute	Are the standards used for treating produced water mandatory or voluntarily enforced by the developer?	Produced water discharge criteria identified in the EIA were adopted from international standards by the Project. If the Project receives an environmental authorization from the EPA, these criteria—if listed in the environmental authorization—would become mandatory.	No	What applicable international standard are you referring to? Comment relating to standard must be addressed in keeping with discussions following Redford Group Meeting	The produced water discharge criteria adopted by the Project (i.e., treat to achieve an oil in water content of 29 mg/L [monthly average] and 42 mg/L [daily maximum]) were sourced from the World Bank Group EHS Guidelines for Offshore Oil and Gas Development. This is stated in Table 2.4-1 of the Environmental and Socioeconomic Management Plan (Volume III).	N/A
94	01-Nov-2021	Region 3: Leonora Technical Institute	Is the produced water treated to international standards?	As described in the EIA Section 2.18.3.5, Produced Water Treatment, the World Bank Group has established Environmental, Health, and Safety Guidelines for offshore oil and gas development (World Bank 2015), which is a technical reference document with examples of good environmental practices. The offshore guideline has established an effluent guideline of oil and grease content in produced water of no more than 42 milligrams per liter (mg/L) daily maximum, and no more than 29 mg/L monthly average. The EEPGL produced water system design basis is consistent with the performance criteria of the above-referenced guidelines for oil and grease content.	No	Comment relating to standard must be addressed in keeping with discussions following Redford Group Meeting	Please see response to Comment #93.	N/A
95	01-Nov-2021	Region 3: Leonora Technical Institute	How will ballast water be managed?	Per the Yellowtail Development Project ESMP, the Project would comply with IMO guidelines for management of ballast water, which is the internationally recognized performance standard for managing potential environmental impacts associated with ballasting operations. Compliance with the relevant IMO requirements as recommended in the EIA should address potential	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				impacts, and would manage risks from ballast water discharges to the marine environment.				
96	01-Nov-2021	Region 3: Leonora Technical Institute	Will there be compensation for loss of livelihood of fisherfolk?	EIA Section 9.1.9 describes the claims and livelihood remediation processes.	No	Accepted	N/A	N/A
97	01-Nov-2021	Region 3: Leonora Technical Institute	If there is an environmental disaster, what is in place for citizens?	In the unlikely event of an oil spill causing losses to stakeholders, EEPGL would establish a claims process and, depending on the magnitude of the oil spill, a livelihood remediation program. The purpose of the claims process would be to provide compensation as appropriate for asset losses and the purpose of a livelihood remediation program would be to restore the welfare and livelihoods of affected persons to conditions no less than pre-impact conditions. Both processes would be transparent, fair, and conducted in a timely manner. EEPGL, in consultation with the Government of Guyana and other jurisdictions (as required), would establish the designated geographic zones associated with the claims and, as applicable, livelihood remediation processes; these would be commensurate with the magnitude of the impacts of the spill. Eligible persons would be compensated as appropriate based on the magnitude of Project-related impacts they individually experienced, either in regard to human health or as a result of economic loss. It is anticipated that EEPGL would establish steering committees, working groups, and stakeholder engagement-specific entities to determine eligible stakeholders, standard entitlements, and eligibility criteria for further livelihood compensation and assistance. EEPGL would establish an independent implementation entity, as needed depending on the circumstances, as soon as reasonably practicable after the spill, to assist in the process of livelihood remediation planning while the initial compensation efforts are ongoing. Depending on the extent of losses, livelihood remediation efforts would potentially range from early support initiatives (within the first year), to transition support (typically from 1 to 2 years after impact), to longer-term support, as defined by the duration of spill impacts.	No	Accepted	N/A	N/A
98	01-Nov-2021	Region 3: Leonora Technical Institute	The key to the EIA is mitigation measures, who will monitor the company, and will operations be shut down if the permit is breached?	The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
99	01-Nov-2021	Region 3: Leonora Technical Institute	Medium and lower water columns will have minor impacts, there is no mention of the top water columns.	EIA Section 6.4.3, Impact Assessment—Water Quality, describes the impacts that would occur from discharges from Project vessels to the upper portion of the water column. During the drilling and installation phase, the upper portion of the water column would receive discharges of treated cuttings and operational discharges (e.g., grey water, black water) from drilling and installation vessels. During production operations, the upper portion of the water column would be exposed primarily to operational discharges from the FPSO (e.g., produced water, wash water) as well as grey and black water and ballast water from the export tankers and FPSO.	No	Section 6.4.3 refers to the Impact Assessment - Marine Water Quality	The Consultants acknowledge that the correct title of Section 6.4.3 is “Impact Assessment—Marine Water Quality.” The remainder of the comment response is correct as stated.	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
.100	01-Nov-2021	Region 3: Leonora Technical Institute	Nitrous oxide levels are currently below the WHO standard; will these levels increase over the lifetime of the project?	Modeling of onshore nitrogen dioxide (NO_2) concentrations was based on the worst-case dispersion conditions (i.e., leading to the maximum predicted onshore concentrations) that would be expected at any time during the Project life cycle (at least 20 years) to calculate the maximum anticipated annual emissions for each source during each of three time periods over the Project life. For the Project-only modeling, maximum predicted NO_2 concentrations (without background) at any potential onshore receptor location would be no more than 6.3% of the applicable guideline for all pollutants and averaging periods. This indicates that, if the Yellowtail Development Project receives an Environmental Permit and it is executed, onshore NO_2 concentrations would not increase to more than 6.3% of the applicable guideline for all pollutants and averaging periods at any point in time over the life of the Project. For the cumulative scenario, this indicates that, if the Yellowtail Development Project receives an Environmental Permit and is executed, maximum predicted concentrations (without background) at any potential onshore receptor location would be no more than 28.4% of the applicable guideline for all averaging periods at any point in time over the life of the Project.	No	Accepted	N/A	N/A
101	01-Nov-2021	Region 3: Leonora Technical Institute	How dangerous will flaring be in combination with other projects undertaken by the company?	Flaring would be a safety measure that would be in place to keep people and the facility out of danger in an unexpected or emergency scenario in the process. The flare would be part of the safety system that relieves excess pressure in those scenarios. Without a flare, the same gases would be vented to the atmosphere, would have a greater impact on air quality, and would potentially form a gas cloud. A gas cloud would not be controlled and if contacted by a source of ignition, could result in an explosion, with potential impacts to people, facility, and the environment. The Liza Phase 1, Liza Phase 2, and Payara FPSOs would be located approximately 31 kilometers (19.2 miles), 22 kilometers (13.7 miles), and 41 kilometers (25 miles)—respectively—from the proposed location of the Yellowtail FPSO. Given these distances between the Yellowtail FPSO and other project FPSOs, flaring at the Yellowtail FPSO would not present safety hazards to other FPSOs.	No	Accepted	N/A	N/A
102	01-Nov-2021	Region 3: Leonora Technical Institute	Is there a plan for the restoration of plants and animals in the event of an oil spill?	Yes. EEPGL's OSRP Chapter 5, which is included in Volume III, contains measures to clean oil from affected shorelines and rehabilitate affected wildlife.	No	Accepted	N/A	N/A
103	01-Nov-2021	Region 3: Leonora Technical Institute	What are the tools used to remove crude oil? Will these tools affect the plants and animals?	OSRP Table 6-1 lists or otherwise describes the international, regional, and local resources available to EEPGL for each potential response strategy. OSRP Tables 6-2 through 6-7 provide a further summary of the representative oil spill response equipment in Guyana. The tools for a given spill would be selected using what is known as a Net Environmental Benefit Analysis (NEBA), which is a situation-specific analysis that would be conducted to result in the best overall outcome from an environmental perspective.	No	Accepted	N/A	N/A
104	01-Nov-2021	Region 3: Leonora Technical Institute	Is there a register of fisherfolk who participated in the study?	The identities of the individual fishermen that participated in the participatory fish study are kept confidential to ensure that business-sensitive information (e.g., personal fishing locations, financial information) is protected.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
105	01-Nov-2021	Region 3: Leonora Technical Institute	Please share the company's insurance policy as a potential oil spill will not only impact Guyana's waters.	Insurance and financial security are addressed in EIA Table 4.7-4. Also, see the response to Comment #53 for additional information regarding insurance coverage maintained for the Project.	No	Accepted	N/A	N/A
106	01-Nov-2021	Region 3: Leonora Technical Institute	What taxes does EEPGL pay to the government?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
107	01-Nov-2021	Region 3: Leonora Technical Institute	Why doesn't the EPA report the findings of the EIA to the public?	Comment should be referred to the EPA.	No	Accepted	N/A	N/A
108	01-Nov-2021	Region 3: Leonora Technical Institute	Does the baseline survey take into account all the other oil wells being drilled?	Various baseline studies of physical, biological, and socioeconomic resources were conducted to inform the impact assessment for the Project, as described in Chapters 6, 7, and 8. These studies included effects from existing projects, including drilling of wells. The combined effects from the Yellowtail Project plus other existing, planned, or reasonably foreseeable projects, including future oil and gas development, were evaluated in the cumulative impact assessment, described in Chapter 10.	No	Accepted	N/A	N/A
109	02-Nov-2021	Region 5: Mahaicony Technical Institute	The language used in the EIA about oil spills and response is not very specific. There is no mention on specific time intervals for drills to be conducted.	Oil spill response exercises are described in OSRP Section 7.3.	No	Accepted	N/A	N/A
110	02-Nov-2021	Region 5: Mahaicony Technical Institute	There is no PDF version of the Oil Spill Response Plan for the EIA. Where can this be found?	The OSRP is an integral part of the Yellowtail EIA Volume III submitted to the EPA and it is available on the EPA website.	No	Accepted	N/A	N/A
111	02-Nov-2021	Region 5: Mahaicony Technical Institute	There is an increase in GHG levels from Liza Phase 1. According to the Liza Phase 1 EIA, the maximum storage capacity is 120, 000 barrels per day and the FPSO is currently storing 130, 000 barrels per day. What measures will be put in place to monitor the numbers for this and other FPSOs?	The Liza Phase 1 Project was evaluated in a separate, approved EIA. The Yellowtail Development Project would be a separate project with different storage capacity. As such, details of the Liza Phase 1 Project are not relevant to the Yellowtail Project EIA; however, the cumulative impact assessment includes emissions from prior approved projects, including Liza Phase 1. As it relates to the Yellowtail Project, the ESMP (Volume III of the EIA) includes quantification and reporting of direct GHG emissions from Project offshore facilities and from offshore and onshore Project activities conducted by EEPGL and its dedicated contractors on an annual basis, should the Project be approved. For the Yellowtail Project, the FPSO design rates described in EIA Table 2.7-1: FPSO Key Design Rates, would be annual averages and daily peak rates that could be higher during the lifetime of the Project, depending on multiple factors (e.g., reservoir pressure, number of wells, equipment reliability). Currently, the FPSO basic design has an upper production limit of 263,000 BPD (42,080 m^3) peak oil production rate. If during the detailed design stage or during production operations, an opportunity to expand the upper production limit would arise, the Project /EEPGL would document the evaluation and justification and an updated upper production limit would be available.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
112	02-Nov-2021	Region 5: Latchmansingh Primary School	What is the anticipated volume of oil that can be spilled?	The EIA considers a range of potential oil spill scenarios, with varying assumed volumes. The EIA included modeling of two loss-of-well-control scenarios, both of which would be highly unlikely to occur. As described in EIA Section 9.1.1.9, Summary of Spill Scenarios Considered, two rates were modeled for a loss-of-well-control scenario: 88,728 BPD (14,196 m^3) (most credible worst-case discharge) and 177,157 BPD (28,345 m^3) (maximum worst-case discharge).	No	Accepted	N/A	N/A
113	02-Nov-2021	Region 5: Latchmansingh Primary School	Who pays for the cleanup of an oil spill?	The Stabroek Block co-venturers' first priority is to put in place mitigations and processes that prevent adverse events. In the unlikely case of an adverse event, the co-venturers would immediately minimize and rectify any impacts. The co-venturers have the financial capacity to meet the responsibilities for an event including obligations under Guyanese law and the respective petroleum agreements. Regarding insurance, the Stabroek Block co-venturers have secured comprehensive insurance for petroleum activities as required by environmental permits. Under the existing legal framework and agreements with the government, there are extensive assurances of EEPGL's and co-venturers' commitments, including environmental protection measures to respond to operational incidents. The Government of Guyana has multiple mechanisms in place, including the Stabroek Block Petroleum Agreement and the environmental permits, to ensure that the companies would take responsibility for any adverse events. Joint insurance coverage is obtained in the name of EEPGL and the other Stabroek block co-venturers for the appropriate lines of coverage, depending on the project and scope of work. Specifically for the Yellowtail Project, should the Yellowtail Project receive necessary approvals, the co-venturers would have insurance coverage including Third Party Liability and the cost of regaining control of a well.	No	Accepted	N/A	N/A
114	02-Nov-2021	Region 5: Latchmansingh Primary School	Were fishermen in the region engaged in the fish study?	The Participatory Fishing Study included landing sites in all coastal regions, including Region 5, which was used to inform the existing conditions for the EIA. A profile on fishing in Region 5, including landings, fishing areas, targeted species, seasonal considerations, and biometrics, is included in EIA Volume II (Appendix D, Participatory Fishing Study Final Report January 2019–March 2020).	No	Accepted	N/A	N/A
115	02-Nov-2021	Region 5: Latchmansingh Primary School	Fish catch is low in the region, what can be done for them?	As a baseline matter, EIA Section 8.1, Socioeconomic Conditions, discusses the issue of declining fish catches. See additional information in the response to Comment #207.	No	Accepted	N/A	N/A
116	02-Nov-2021	Region 5: Latchmansingh Primary School	What compensation is in place for fishermen if fish stocks continue to decline?	As a baseline matter, EIA Section 8.1, Socioeconomic Conditions, discusses the issue of declining fish catches. See additional information in the response to Comment #207.	No	Accepted	N/A	N/A
117	02-Nov-2021	Region 5: Latchmansingh Primary School	Is the gas being released by the project playing a role in climate change?	Flaring results in GHG emissions, which contribute to cumulative global GHG emissions. As explained in EIA Section 6.1.3.4, Management Measures—Air Quality, Climate, and Climate Change, potential climate / climate change impacts are a global concern and stem from cumulative worldwide GHG concentrations. The Global Circulation Models used to predict climate impacts from global concentrations are built around emissions on a global scale, and thus are not capable of modeling impacts from the GHG emissions contribution from a single project such as the Yellowtail Development Project. Statistical downscaling methods can be used to establish a statistical relationship between global climate and local climate	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				using observed data, and can be used to estimate future local climate changes based on the results of Global Circulation Models. However, the reverse approach of predicting the impact of local GHG emissions, including those from flaring, on global (or local) climate change is not feasible due to the multiple factors—beyond that of a single project—that drive global climate change predictions.				
118	02-Nov-2021	Region 5: Latchmansingh Primary School	Is flaring responsible for climate change?	See the response to Comment #117.	No	Accepted	N/A	N/A
119	02-Nov-2021	Region 5: Latchmansingh Primary School	Why doesn't EEPGL recycle some of its waste instead of taking it to the landfill?	There is limited recycling infrastructure in Guyana, and EEPGL and its contractors have implemented a number of steps to minimize the generation of waste that requires treatment and disposal. This includes waste minimization during development drilling and waste minimization during FPSO production which would apply to the Yellowtail Project.	No	Accepted	N/A	N/A
120	02-Nov-2021	Region 5: Latchmansingh Primary School	What will be done with the excess gas from the project?	As stated in the EIA Section 2.7.1, General Description, the FPSO would be designed to re-inject associated gas under routine conditions—except that which would be used as fuel gas, flare pilot gas, and background flare gas for FPSO operations and *de minimis* sources not captured by the VRU—back into the reservoir except during times of injection / compression system unavailability, which would require temporary, non-routine flaring during maintenance/repair. Gas re-injection would be used as needed to maintain reservoir pressure for optimal production over the life cycle of the Project.	No	Accepted	N/A	N/A
121	02-Nov-2021	Region 5: Latchmansingh Primary School	Employment outreaches are done in Georgetown alone, meaning that the opportunities for employment are only for those in Georgetown. These job fairs need to be taken to other regions as skilled people also reside outside of Georgetown.	As of the first half of 2021, the total workforce supporting EEPGL's activities (including direct employees and contractors) amounted to more than 5,400, more than half of whom (more than 2,800 workers, or 53% of total) are Guyanese representing all ten Regions of Guyana. Through the Greater Guyana Initiative, EEPGL and the other Stabroek Block co-venturers are working closely with the University of Guyana on a variety of educational initiatives and are supporting a pilot program at several technical and vocational education and training institutions in Guyana focused on safety, electrical, and welding programs. In addition, EEPGL's contributions programs provide support to a variety of education, training, development, and capacity-building initiatives across Guyana, including the New Amsterdam Technical Institute. Through the CLBD, EEPGL has conducted several regional outreaches to foster greater awareness of ExxonMobil's operations in Guyana and how Guyanese businesses can become suppliers to the oil and gas sector. EEPGL and its contractors publicly advertise for job opportunities on a regular basis. Opportunities are available in a wide variety of disciplines. For more information, visit the EEPGL website and Facebook page. EEPGL also posts opportunities in newspapers and through the CLBD.	No	Accepted	N/A	N/A
122	02-Nov-2021	Region 5: Latchmansingh Primary School	What measures are put in place to deal with potential vandalism of cables?	As the Yellowtail Development Project is within the EEZ of Guyana, the Guyana Defence Force Coast Guard has the responsibility to patrol the EEZ and to protect all activities within. EEPGL would maintain a security protocol to monitor for potential threats to the offshore infrastructure, working in coordination with the Guyana Defence Force, as appropriate.	No	Accepted	N/A	N/A

123	02-Nov-2021	Region 5: Latchmansingh Primary School	Who is paying for the EIA?	Consistent with the requirements of the Environmental Protection Act, EEPGL is paying for the Consultants' time.	No	Accepted	N/A	N/A
124	02-Nov-2021	Region 5: Latchmansingh Primary School	Has ERM done any other studies for EXXON around the world?	ERM is a global consultancy that has been conducting EIAs for 50 years around the world for numerous oil and gas companies, including ExxonMobil.	No	Accepted	N/A	N/A
125	03-Nov-2021	Region 6: #66 Fishport Complex	The location chosen for the drills were not practical.	EIA Volume III OSRP Table 7-3 provides information on oil spill exercises overview and schedule. A decision on exercise location would be determined during the exercise planning.	No	Accepted	N/A	N/A
126	03-Nov-2021	Region 6: #66 Fishport Complex	What are the names of the dispersants to be used in the event of an oil spill?	In alignment with the Guyana National Oil Spill Contingency Plan, the oil spill dispersants that have been cited in the OSRP for Guyana Operations (Volume III) are the following: • Corexit 9500 • Corexit 9527 • Dasic Slickgone • Finasol OSR 52 EPA approval would be required before dispersants could be applied in the field. Safety Data Sheets for all of the above-mentioned products have been provided in Appendix D of the OSRP (Volume III).	No	Accepted	N/A	N/A
127	03-Nov-2021	Region 6: #66 Fishport Complex	Is the time indicated to bring the well cap from Brazil practical?	As per Volume III OSRP Section 6.3.7, Subsea Well Response: • Capping stack mobilization time would depend on the availability of capping stack at the primary location and would potentially take from 5–21 days. • The primary resource would be the Boots & Coots Global Rapid Intervention Package (GRIP) capping stack from Houston, which would be mobilized by air/sea. The GRIP system, utilizing current logistics strategies, estimates that the capping stack deployment would be possible within 5 days, assuming no debris removal activities would be required. • Additionally, the Oil Spill Response Limited (OSRL) capping stacks located in Norway and Brazil could be deployed in approximately 9 and 21 days, respectively. The Norway capping stack would be air-freightable (via transport skid configured for transport by an Antonov AN124 aircraft) and its capability was demonstrated with a test flight out of the Solo Airport in late 2018. The Brazil capping stack would be transported to well location by vessel. OSRL, with Company involvement, conducted a major mobilization exercise (Guyana simulation) in November 2017 which evaluated the ability to export the Brazil capping stack outside of Brazil within 3 days.	No	Accepted	N/A	N/A
128	03-Nov-2021	Region 6: #66 Fishport Complex	Will any spill affect our CARICOM neighbours, and should they not be a part of the drills?	Impacts to other countries from an oil spill, if one occurs, would be a function of the size of the spill, but would be mitigated by the response tools and resources EEPGL has in place for such an event. As described in EIA Chapter 9, EEPGL would work with the Government of Guyana and other countries as appropriate to coordinate such a response and determine the need for such countries to participate in drills.	No	Accepted	N/A	N/A

				Potential transboundary impacts from an oil spill are described in EIA Section 9.24.				
129	03-Nov-2021	Region 6: #66 Fishport Complex	What is the level of preparation of the company in the event of an oil spill?	EIA Volume III OSRP Chapter 6 Table 6-1 lists or otherwise describes the international, regional, and local resources available to EEPGL for each potential response strategy. OSRP Tables 6-2 through 6-7 in the OSRP provide a further summary of the representative oil spill response equipment in Guyana.	No	Accepted	N/A	N/A
130	03-Nov-2021	Region 6: #66 Fishport Complex	Compensation should be done prior to any anticipated oil spill since the fish industry is already on the decline. Additionally, fishermen should be among the first to benefit from the Sovereign Wealth Fund.	See the response to Comment #116 regarding potential compensation. The Consultants acknowledge the question related to benefits from the Sovereign Wealth Fund. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
131	03-Nov-2021	Region 6: #66 Fishport Complex	Will EXXON really provide compensation? The contract does not indicate this.	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
132	03-Nov-2021	Region 6: #66 Fishport Complex	How efficient is the boom in the case of high tides and rough waters?	In rough water, booms may not be very effective as per EIA Volume III OSRP Appendix G Table G-1.	No	Accepted	N/A	N/A
133	03-Nov-2021	Region 6: #66 Fishport Complex	How quickly can the booms be replaced if damaged?	Trained oil spill responders are able to identify booms that are in need of replacement. Depending on the type of boom (inflatable, self-inflatable, or rigid), this can be done in a matter of hours.	No	Accepted	N/A	N/A
134	03-Nov-2021	Region 6: #66 Fishport Complex	No baseline study on plankton was done prior to drilling.	Baseline data were collected on plankton in 2018 and 2019. Plankton were abundant in the 2018 (dry season) samples but much less abundant in the 2019 (wet season) samples. These data are discussed in EIA Volume II, Appendix M, Nearshore and Offshore Fisheries Study Summary. This trend is consistent with traditional knowledge concerning the timing of most marine species' spawning behavior.	No	Accepted	N/A	N/A
135	03-Nov-2021	Region 6: #66 Fishport Complex	How will the project deal with flaring?	As noted in EIA Table 6.1-14, several of the embedded controls for the Project relate to minimization of flaring from the Project's FPSO production operations. These controls would include providing installed spares on compressors for the Flash Gas Compression, Main Gas Compression, and Re-Injection Gas Compression systems, such that when one compressor trips, the spare (backup) unit could be started, reducing non-routine flaring frequency and volume/duration. To support these embedded controls, EEPGL would develop a flaring minimization plan to document the design measures and operational practices that would minimize flaring during Project FPSO operations. See the responses to Comment #190 and Comment #191 for additional information related to the flaring minimization plan.	No	Accepted	N/A	N/A
136	03-Nov-2021	Region 6: #66 Fishport Complex	Mr. Orwin Abdulla requested collaboration with EEPGL to refine a nature reserve that he established at #66	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
137	03-Nov-2021	Region 6: #66 Fishport Complex	There is no feedback from EEPGL on the fish studies.	The report for the first year of the marine fish study was made public in Volume II of the Payara EIA. The report for the second year of the marine fish study and the report for the Participatory Fish Study are both included in	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				Volume II of the Yellowtail EIA (Appendix D, Participatory Fishing Study Final Report January 2019–March 2020).				
138	03-Nov-2021	Region 6: #66 Fishport Complex	What are the health and safety protocols on the ships?	ESMP Section 2.3 describes EEPGL's general health and safety policies. As described in ESMP Section 2.6, personnel would receive specialized health and safety training modules that are specifically tailored to each individual's designation.	No	Accepted	N/A	N/A
139	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	What job opportunities are available for the people of Region 01?	The Consultants acknowledge the question. The question is beyond the scope of the EIA. However, for informational purposes, as of the first half of 2021, the total workforce supporting EEPGL's activities (including direct employees and contractors) amounted to more than 5,400, more than half of whom (more than 2,800 workers, or 53% of total) are Guyanese representing all ten regions of Guyana. Modest increases in total employment would be expected with the development of the Yellowtail Development Project, and if the Project is approved EEPGL intends to continue hiring Guyanese nationals to the extent reasonably practicable, in alignment with its Local Content Plan. Onshore jobs would be based in the Georgetown area (Region 4) although employment applications would be welcome from residents of all regions. EEPGL and its contractors publicly advertise for job opportunities on a regular basis. Opportunities are available in a wide variety of disciplines. For more information, visit the EEPGL website and Facebook page. EEPGL also posts opportunities in newspapers and through the CLBD.	No	Accepted	N/A	N/A
140	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	What opportunities are available for structured training? For example, those related to oil spill response.	As described in EIA Section 2.3, Project Workforce, EEPGL is committed to exploring various training formats that may include, but are not limited to, on-the-job training, mentoring, classroom training, e-learning, and self-taught programs. In addition, contractors and subcontractors are evaluating other training options in collaboration with local institutions to build capacity of potential candidates prior to the start of the work, should the Project be approved. These institutions include existing vocational and technical education institutions and centers, Aeronautical Institute, and the University of Guyana.	No	Accepted	N/A	N/A
141	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	What plans are there with regards to provision of resources to agricultural activities and sports-related activities for the people of Region 01?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
142	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	What investment opportunities are there to support infrastructure in Region 01?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
143	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	Two species of birds have been listed for the first time and identified as vulnerable species. How is this being addressed in the EIA?	The EIA applies a higher sensitivity rating to listed (i.e., special status) species to account for their special conservation needs. This is explained in EIA Section 7.1.3, Impact Assessment—Protected Areas and Special Status Species.	No	Accepted	N/A	N/A
144	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	What are the impacts to aquatic animals from the operations, in more particular sound and vibrations	The EIA discusses the predicted impacts of sound individually for each taxonomic group (e.g., marine mammals, marine fish, etc.) as appropriate in several locations in Chapter 7. Generally, impacts were rated from Negligible to Minor depending on the type of sound, sensitivity of a particular taxonomic group to auditory impacts, and availability of appropriate management	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			generated by various activities associated with the project?	measures. These ratings were based in part on a re-analysis of underwater noise modeling that was originally conducted for the Liza Phase 1 Project and re-assessed using Yellowtail-specific inputs, as described in EIA Section 7.5.3, Impact Assessment—Marine Mammals.				
145	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	How will turtles be affected from the increase in marine traffic?	As described in EIA Section 7.7, Marine Turtles, the Project would not be expected to impact sea turtle migration patterns or behavior, primarily because marine turtles are transient in the PDA and are relatively resilient to auditory impacts, and the PDA would be too far away from sensitive habitat (i.e., nesting beaches) to significantly affect nesting behavior.	No	Accepted	N/A	N/A
146	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	Are there any impacts to tourism activities in the region from the proposed development? One of the areas identified was the Mora Passage.	The EIA did not identify any impacts to tourism in Region 1 due to the limited onshore impact from the Project. Impacts on ecosystems and biodiversity are described in Chapter 7; impacts on ecotourism would not be anticipated.	No	Accepted	N/A	N/A
147	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	Sensitization campaigns for young people of Region 01 regarding avoidance of teenage pregnancies, rape and other social crimes.	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
148	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	Are there any opportunities for the provision of scholarships?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
149	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	Reference was made to the 2014 air study conducted and thus the question was posed what has happened with respect to air quality since the conduct of that study. What are the cumulative air impacts?	To characterize existing offshore air quality conditions in the vicinity of the PDA, the Consultants drew from four offshore ambient air monitoring campaigns completed in the Stabroek Block in 2016, 2018, and 2019. The 2019 campaign included PM_{10} (particulate matter with an aerodynamic diameter of less than 10 micrometers), $PM_{2.5}$ (particulate matter with an aerodynamic diameter of less than 2.5 micrometers), carbon monoxide, sulfur dioxide, H_2S, NO_2, total non-methane volatile organic compounds (VOCs), and selected speciated VOCs. The offshore monitoring data were presented in prior EIAs. To characterize existing onshore air quality, the Consultants drew from four ambient air monitoring campaigns completed at onshore locations in 2018 and 2019. The air quality monitoring report documenting the onshore ambient air quality monitoring conducted to date is included in Appendix E, Ambient Onshore Air Quality Monitoring Report (EIA Volume II). These data were used in the modeling of predicted cumulative air pollution impacts for the Project combined with other planned projects.	No	Accepted	N/A	N/A
150	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	Would reinjection of gas contribute to seismic activities within the geological structures in the reservoir?	Associated gas and seawater would be injected into the reservoir to maintain reservoir pressure during production operations. This would be typical of offshore production operations around the world and would not be expected to pose a risk of seismic activity. Potential Project effects on seismic risk are evaluated in EIA Section 5.2.1, Assessment of Potential for Geological/Seismic Impacts.	No	Accepted	N/A	N/A
151	05-Nov-2021	Region 1: Mabaruma Rdc Boardroom	What is the equipment efficiency with respect to reliability, environmental safety and operations?	There is no one specific “efficiency” number applicable to the various pieces of equipment involved in the Project. However, as explained in EIA Section 2.8, Installation, Hook-up, and Commissioning, EEPGL would use the most appropriate industry-proven technologies in developing the Project. Technology selection includes consideration for equipment reliability and performance (e.g., proven vendor references in similar conditions as the Yellowtail Development Project). See EIA Section 2.18.3, Technology	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				Alternatives, for additional information regarding technology selection, including best available technologies.				
152	11-Nov-2021	Virtual Meeting	Where does the waste go after the hydrocyclone and other treatment of the produced water?	As described in Chapter 2, the produced water treatment system would be comprised of a flash vessel, hydrocyclones, and induced gas flotation units. Hydrocarbons recovered from this process would be recycled back into the oil processing system. Gas streams would be recovered/recycled to the Flash Gas Compression system and reject oil streams would be cycled back to the Intermediate Pressure Separator.	No	Accepted	N/A	N/A
153	11-Nov-2021	Virtual Meeting	Why will you be drilling wells to re-inject produced water?	As discussed in EIA Section 2.18.3.5, the alternative selected by EEPGL for produced water treatment for the Project, subject to EPA review and approval, is to treat it prior to discharge overboard, and not to re-inject it. Associated gas would be re-injected into the reservoir, along with treated seawater, to help maintain reservoir pressure.	No	Accepted	N/A	N/A
154	11-Nov-2021	Virtual Meeting	When the water is treated to remove the contaminants, where do the contaminants go?	As discussed in EIA Section 2.7.4.5, the produced water treatment system would be operated to maximize oil recovery from the produced water prior to discharge, and the recovered oil would be routed to the oil processing system.	No	Accepted	N/A	N/A
155	11-Nov-2021	Virtual Meeting	After these repeated cycles of treatment, what happens to the residues?	Any residual wastes generated from treatment of produced water would be managed onshore using permitted waste treatment and disposal facilities in accordance with the approved Comprehensive Waste Management Plan (CWMP).	No	Accepted	N/A	N/A
156	11-Nov-2021	Virtual Meeting	Where would the currents carry the oil to, and who will those countries sue? Will they sue Guyana or oil operators?	Mitigated oil spills from each of the two loss-of-well-control scenarios would have the potential to reach Venezuela and Trinidad and Tobago. Effects on other countries from an oil spill, if one occurs, would be a function of the size of the spill, but would be mitigated by the response tools and resources EEPGL has in place for such an event. As described in Chapter 9, EEPGL would work with the Government of Guyana and other countries as appropriate to coordinate such a response. As described in EIA Section 9.1.9, Claims and Livelihood Remediation Processes, in the event of an oil spill causing losses to stakeholders, EEPGL would establish a claims process and, depending on the magnitude of the oil spill, a livelihood remediation program. The purpose of the claims process would be to provide compensation as appropriate for asset losses; the purpose of a livelihood remediation program would be to restore the welfare and livelihoods of affected persons to conditions no less than pre-impact conditions. Both processes would be transparent, fair, and conducted in a timely manner.	No	Accepted	N/A	N/A
157	11-Nov-2021	Virtual Meeting	Trinidad, and the DR, and Haiti and all those other countries which stand to be affected. Where is the map showing this?	The Yellowtail Development Project EIA includes the following figures showing an impact from unmitigated oil spill: • Figure 9.1-22a: Deterministic Map for Scenario 14—Predicted Transport after 45 Days from an Unmitigated 88,728 BPD (28,345 m^3) Subsea Release (Most Credible WCD) of Crude Oil Lasting 30 Days, Showing Coastal Sensitivity Map Tiles for Trinidad and Tobago • Figure 9.1-22b: Deterministic Map for Scenario 15—Predicted Transport after 45 Days from an Unmitigated 177,157 BPD (28,345 m^3) Subsea Release (Maximum WCD) of Crude Oil Lasting 30 Days, Showing Coastal Sensitivity Map Tiles for Trinidad and Tobago	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				• Figure 9.1-29a: Deterministic Map for Scenario 14—Predicted Transport after 45 Days from an Unmitigated 88,728 BPD (14,196 m^3) Subsea Release (Most Credible WCD) of Crude Oil Lasting 30 Days, Showing Coastal Sensitivity Map Tiles for Dominican Republic • Figure 9.1-29b: Deterministic Map for Scenario 15—Predicted Transport after 45 Days from an Unmitigated 177,157 BPD (28,345 m^3) Subsea Release (Maximum WCD) of Crude Oil Lasting 30 Days, Showing Coastal Sensitivity Map Tiles for Dominican Republic • Figure 9.1-30a: Deterministic Map for Scenario 14—Predicted Transport after 45 Days from an Unmitigated 88,728 BPD (14,196 m^3) Subsea Release (Most Credible WCD) of Crude Oil Lasting 30 Days, Showing Coastal Sensitivity Map Tiles for Haiti • Figure 9.1-30b: Deterministic Map for Scenario 15—Predicted Transport after 45 Days from an Unmitigated 177,157 BPD (28,345 m^3) Subsea Release (Maximum WCD) of Crude Oil Lasting 30 Days, Showing Coastal Sensitivity Map Tiles for Haiti Mitigated oil spills from each of the two loss-of-well-control scenarios would only have the potential to reach Venezuela and Trinidad and Tobago, and would reduce the extent of shoreline oiling associated with spills under both scenarios relative to the corresponding unmitigated spill.				
158	11-Nov-2021	Virtual Meeting	Have the countries that are likely to be impacted by a spill, such as Jamaica, been consulted and informed of the extent of this project?	EIA Section 9.24 discusses potential transboundary impacts, including an identification of other countries that could be affected by a loss-of-well-control event. As described in Chapter 9, EEPGL would work with the Government of Guyana and other countries as appropriate to coordinate a response to an oil spill with the potential to affect other countries. The Yellowtail EIA process did not include consultation with stakeholders outside Guyana, but the EIA was available for review on the EPA's website and any comments from persons outside of Guyana could have been submitted to the EPA during the 60-day review period.	No	Accepted	N/A	N/A
159	11-Nov-2021	Virtual Meeting	An oil spill will affect many CARICOM countries, but do they know this?	The question relates to inter-government communications and is beyond the scope of the EIA. However, the EIA was available for review on the EPA's website and any comments from persons outside of Guyana could have been submitted to the EPA during the 60-day review period.	No	Accepted	N/A	N/A
160	11-Nov-2021	Virtual Meeting	What is the expected flow rate in the uncontrolled model in the event of an oil spill?	As described in the EIA Section 9.1.1.9, Summary of Spill Scenarios Considered, two rates were modeled for a loss-of-well-control scenario: 88,728 BPD (14,196 m^3) (most credible worst-case discharge) and 177,157 BPD (28,345 m^3) (maximum worst-case discharge). Both of these scenarios were run for uncontrolled release durations of 30 days.	No	Accepted	N/A	N/A
161	11-Nov-2021	Virtual Meeting	The impact on the Caribbean Sea was emphasized since the Lisa 1 ESIA process. At that time the consultants did not address the question.	Section 9.24 discusses potential transboundary impacts, including an identification of other countries that could be affected by a loss-of-well-control event.	No	Accepted	N/A	N/A
162	11-Nov-2021	Virtual Meeting	If an oil spill occurs what systems are in place to help with this?	If an oil spill occurs, EEPGL would respond to such a spill in accordance with the OSRP included in Volume III of the EIA as well as the National Oil Spill Contingency Plan.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
163	11-Nov-2021	Virtual Meeting	Does the EPA consider the proposed deposit of US $2B adequate for cleanup cost?	The Stabroek Block co-venturers' first priority is to put in place mitigations and processes that prevent adverse events. In the unlikely case of an adverse event, the co-venturers would immediately minimize and rectify any impacts. The co-venturers have the financial capacity to meet the responsibilities for an event including obligations under Guyanese law and the respective petroleum agreements. Regarding insurance, the Stabroek Block co-venturers have secured comprehensive insurance for petroleum activities as required by environmental permits. Under the existing legal framework and agreements with the government, there are extensive assurances of EEPGL's and co-venturers' commitments, including environmental protection measures to respond to operational incidents. The Government of Guyana has multiple mechanisms in place, including the Stabroek Block Petroleum Agreement and the environmental permits, to ensure that the companies would take responsibility for any adverse events. Joint insurance coverage is obtained in the name of EEPGL and the other Stabroek block co-venturers for the appropriate lines of coverage, depending on the project and scope of work. Specifically for the Yellowtail Project, should the Yellowtail Project receive necessary approvals, the co-venturers would have insurance coverage including Third Party Liability and the cost of regaining control of a well.	No	Accepted	N/A	N/A
164	11-Nov-2021	Virtual Meeting	How do you valuate the potential impact of a spill without consulting other Caribbean countries that will potentially be impacted?	Impact of an oil spill was determined in accordance with methodology described in the EIA Chapter 4, Methodology for Preparing the Environmental Impact Assessment. The EIA was available for review on the EPA's website and any comments from persons outside of Guyana could have been submitted to the EPA during the 60-day review period.	No	The potential impacts mentioned in section 4.1 does not include impacts for an oil spill.	The specific section in Chapter 4 to which the response is referring is Section 4.8.2.2, Evaluating Potential Impacts from Unplanned Events. This section describes the methodology used to evaluate risks to resources from unplanned events, including potential oil spills.	N/A
165	11-Nov-2021	Virtual Meeting	Whose responsibility will it be to pay compensation to Caribbean countries for damage to their economies – tourism, shipping, and fishing sectors in the event of a well blowout? Will Esso or the Guyanese people be responsible?	See the response to Comment #163.	No	Accepted	N/A	N/A
166	11-Nov-2021	Virtual Meeting	I don't see mention of formal monitoring programme, operated by XOM or by a contractor(s) on behalf of XOM, covering all aspects of the oil field development/operation/decommissioning/safe closure. Section 11(4)(a) of the EP Act specifies areas that should at least be covered in such a monitoring exercise. What is EEPGL	To the extent that the comment is not related to the Yellowtail Project, it is beyond the scope of the EIA. However, ESMP Table 3.6-1 (included in Volume III of the EIA) presents the monitoring measures recommended by the Consultants for the Yellowtail Project. EEPGL is also in the process of developing a framework for enhanced monitoring, reporting, and verification, including the EPA's opportunities to independently verify EEPGL's compliance data.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			currently undertaking this monitoring? Where in the EIA do you provide reference to the records and findings of such monitoring? Where can the records be found? Are these records in the public domain? What is the evidence that you have transmitted those records, as EPA alleges that you have not when/where?					
167	11-Nov-2021	Virtual Meeting	Can an availability study of the gas injection system be requested as a prerequisite for approval of this ESIA given the track record of poor compressor reliability, sensitivity and currency of hydrocarbon emissions?	The comment should be referred to the EPA.	No	Accepted	N/A	N/A
168	11-Nov-2021	Virtual Meeting	Will the gas injection system PFD shown below be spared? Is there a common mode of failure between the trains?	The FPSO would incorporate two trains of export / re-injection gas compression in normal operation plus a spare with a total design basis of 3 x 50% capacity (three at 50% capacity each), where the export gas compressor and injection gas compressor would be driven by a common mechanical drive. The 3 x 50% design was selected so that when one train would be down, the other trains could continue to operate until the installed spared compressor train is online. This three-train configuration was selected to enhance the facility's safety, minimize flaring, and reduce production down time. Compressor design for the Yellowtail Project has taken significant steps to incorporate lessons learned from other projects, including Liza Phase 1. However, there are some common modes of potential failure for compressors in general. The most common mode of failure on compressors is dry gas seals where associated gas could get into the seals and cause their failure, which could lead to compressor malfunction. The systems have been designed to protect against such dry gas contamination but upsets can occur from time to time. As described above, installed spare compressors, along with spare parts, would enhance reliability.	No	Accepted	N/A	N/A
169	11-Nov-2021	Virtual Meeting	The fisheries study is an ecological one and does not look at the socio-economic impacts. It is not a baseline study of the fishing industry.	Fish and fisheries were described from both a socioeconomic perspective (Volume II, Appendix D, Participatory Fishing Study Final Report January 2019–March 2020) and a biological perspective (Volume II, Appendix M, Nearshore and Offshore Fisheries Study Summary). These studies are complete and although an additional year of the participatory study is currently being conducted, the data provided in the existing study reports provide ample baseline data to conduct the EIA.	No	Accepted	N/A	N/A
170	11-Nov-2021	Virtual Meeting	What radioactive substances come to shore and how are they treated? How is the radioactive waste that is coming to shore being treated?	There would be no treatment or disposal of radioactive sources from the Project in Guyana. All radioactive sources used during operations would be managed in accordance with conditions or approvals granted by the EPA and strict safety standards such as those set out by the International Atomic Energy Agency.	No	Accepted	N/A	N/A
171	11-Nov-2021	Virtual Meeting	The Haags-Bosch is not licensed or engineered for chemical waste. It is an extremely basic landfill meant to	The EPA and the Ministry of Local Government and Regional Development have authority over the permitting and operation of the HBL. No hazardous waste would be disposed at the HBL.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			sequester household waste - not industrial waste.					
172	11-Nov-2021	Virtual Meeting	Where are you putting the material cleaned up from a potential spill?	As described in Response #128, waste generated as a result of a spill response would be managed using licensed waste treatment and disposal facilities in accordance with the approved CWMP (see EPA website) and in consultation with the EPA. These facilities could include licensed Guyana-based treatment and disposal facilities and/or other regional facilities. OSRP Section 5.11 (included in Volume III of the EIA) describes the categories of waste that could be generated and the key steps of the process by which waste produced in a response scenario would be managed.	No	Accepted	N/A	N/A
173	11-Nov-2021	Virtual Meeting	Did or does the fisheries study include Caribbean fisheries?	The marine fish study and the participatory fishing study were limited to Guyanese waters.	No	Accepted	N/A	N/A
174	11-Nov-2021	Virtual Meeting	How much produced water is or will be stored on the FPSO?	The FPSO would not store produced water, with the exception of off-specification produced water which would be routed to an off-specification produced water tank (9,700 m^3 capacity), where it would be temporarily stored prior to reintroduction into the produced water treatment process. Produced water would be discharged overboard after being treated to the discharge specification of less than 42 mg/L daily or 29 mg/L monthly average oil-in-water content.	No	Include justification in EIA	Section 2.7.4.5 of the EIA has been updated to clarify that the off-specification tank is the only location on the FPSO where produced water will be stored.	p. 2-48
175	11-Nov-2021	Virtual Meeting	Also, if a spill does occur and you clean up, where will you dump the toxic waste? The EIA says nothing about this.	The waste generated as a result of a spill response would be managed using licensed waste treatment and disposal facilities in accordance with the approved CWMP and in consultation with the EPA. These facilities could include licensed Guyana-based treatment and disposal facilities and/or other regional facilities. OSRP Section 5.11 (included in Volume III of the EIA) describes the categories of waste that could be generated and the key steps of the process by which waste produced in a response scenario would be managed.	No	Accepted	N/A	N/A
176	11-Nov-2021	Virtual Meeting	The Yellowtail proposal indicates flow lines, umbilicals, abandoned equipment, mooring lines, anchor piles, subsea equipment - all will be abandoned on Guyana's seashore. This is contrary to best practices in the oil industry? Which best practice standards have you applied to this study? Is this the World Bank and IFC (International Finance Corporation) standard?	For well P&A, ExxonMobil P&A guidelines are broadly consistent with Oil and Gas UK's Well Decommissioning Guidelines, Issue 6 (June 2018). As described in the Preliminary End of Operations Decommissioning Plan included in Volume III of the EIA, globally ExxonMobil employs good international oilfield practice for decommissioning and abandonment. For offshore facilities, this includes utilizing IMO Resolution A.672(16) Guidelines and Standards for the Removal of Offshore Installations and Structures on the Continental Shelf and in the EEZ as a basic standard worldwide, as well as the UK Offshore Petroleum Regulator for Environment and Decommissioning's (OPRED's) "Offshore Oil and Gas Decommissioning Guidance Notes" December 2018, (ANNEX A—A Guide to Comparative Assessments). These embody the principle that where a decision is made to allow an offshore installation, structure, or parts thereof to remain on the seabed, it should be based on a case-by-case evaluation (by the jurisdiction over the installation or structure). Abandonment of selected equipment on the seafloor as part of decommissioning is currently proposed but further approvals would be required before this plan could be implemented. The industry supports the use of a Multi-Criteria Decision Analysis (MCDA) as the facilities are approaching end of production life in order to holistically evaluate the decommissioning approach for the subject facilities. The MCDA	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				evaluates the potential safety and health, environmental, social, and economic risks; as well as technological challenges/developments that may be needed for the decommissioning options analysis (including reefing). Given the length of expected operational timelines and potential advancements in technology it is difficult to determine final disposition at this time. Therefore, industry general practice in these depths for SURF facilities is to remain in place at time of initial installation; however it will be re-evaluated as the field reaches end of life using an MCDA.				
177	11-Nov-2021	Virtual Meeting	What is the difference in risk between following international best practice and leaving all this toxic junk on the seafloor? How is this good decommissioning practice? Isn't the best practice to remove the structures when decommissioning. Leave the seafloor as you found it?	As described in the Preliminary End of Operations Decommissioning Plan included in Volume III of the EIA, globally ExxonMobil employs good international oilfield practice for decommissioning and abandonment. For offshore facilities, this includes utilizing IMO Resolution A.672(16) Guidelines and Standards for the Removal of Offshore Installations and Structures on the Continental Shelf and in the EEZ as a basic standard worldwide, as well as the UK Offshore Petroleum Regulator for Environment and Decommissioning's (OPRED's) "Offshore Oil and Gas Decommissioning Guidance Notes" December 2018, (ANNEX A—A Guide to Comparative Assessments). These embody that where a decision is made to allow an offshore installation, structure, or parts thereof to remain on the seabed, this should be based on a case-by-case evaluation (by the jurisdiction over the installation or structure). For well P&A, ExxonMobil P&A guidelines are broadly consistent with Oil and Gas UK's Well Decommissioning Guidelines, Issue 6 (June 2018).	No	Accepted	N/A	N/A
178	11-Nov-2021	Virtual Meeting	What guidelines are the EPA using to assess this EIA?	The comment should be referred to the EPA.	No	Accepted	N/A	N/A
179	11-Nov-2021	Virtual Meeting	Can you clarify if Yellowtail is not going to re-inject the produced water, then that appears to contradict clause 12 of the PSA 2016. And if XOM can unilaterally change the PSA 2016, you would agree that the government also change its mind on specific items in the PSA? Is the EPA willing to hold Exxon to reinjecting the produced water versus its preference for easier work in just releasing the water into our marine habitat? This is in addition to produced water released by the Liza One, Liza Two and Payara Projects. How does the EPA intend to monitor all of this? Does the EPA know what technologies will be used by ExxonMobil in this regard?	The Consultants acknowledge the statements and questions about the Production Sharing Agreement (PSA). The questions related to the content of the PSA are beyond the scope of the EIA. The Consultants acknowledge the questions about the EPA. These comments should be referred to the EPA.	No	Accepted	N/A	N/A
180	11-Nov-2021	Virtual Meeting	For seismic guns, at what distance can these noises be detected by whales? And how fast do whales swim?	The distance at which whales can detect a seismic impulse varies according to numerous factors, including but not limited to the type of seismic source, the species of whale, and the ambient sound levels in the environment at the time. Swimming speed also differs significantly by species, but the fastest	No	Kindly verify the speed of these marine mammals	The units included in the original response were incorrect. The statement should	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				whales can swim slightly faster than 20 kilometers per hour (746 miles per hour).			have read "…but the fastest whales can swim slightly faster than 32 km per hour (20 miles per hour).	
181	11-Nov-2021	Virtual Meeting	Can you say what will be the monthly average and daily maximum concentrations (mg/L) miligrams per litre of total oil destined for in produced water and other discharges for ocean disposal?	As noted in Chapter 2 of the EIA, the FPSO would be designed to accommodate an annual average produced water capacity of up to 225,000 BPD (36,000 m^3 per day). Peak rates would potentially be higher during the lifetime of the Project, depending on multiple factors (e.g., reservoir pressure, number of wells, equipment reliability, etc.). Produced water would be discharged overboard only after being treated to the discharge specification of less than 42 mg/L daily or 29 mg/L monthly average "oil-in-water" content. Details related to the treatment of produced water are provided in EIA Section 2.7.4.5.	No	Accepted	N/A	N/A
182	11-Nov-2021	Virtual Meeting	How are you going to treat the produced water from Yellowtail wells? To what standards? Name the standards that you will be using.	See the response to Comment #181.	No	Accepted	N/A	N/A
183	11-Nov-2021	Virtual Meeting	Can you say how and where you will be treating your produced 'waste-water'? Which components of the produced water will be treated?	See the response to Comment #181.	No	Accepted	N/A	N/A
184	11-Nov-2021	Virtual Meeting	What dynamic data do you have to allow you to make these assessments of negligible to minor impacts on fish? Please specify the international standards that you used.	There are no international standards for determining the significance of impacts on fish, so the Consultants used a combination of international standards (e.g., International Convention for the Prevention of Pollution by Ships, 1973, as modified by the Protocol of 1978 [MARPOL 73/78]) to establish the magnitude of impacts on physical habitat characteristics (e.g., water quality) that could have implications for fish, and a weight-of-evidence approach and literature reviews to assess impacts that were not related to physical habitat characteristics. All impact ratings were determined using the impact rating system described in Chapter 4 of the EIA.	No	Accepted	N/A	N/A
185	11-Nov-2021	Virtual Meeting	The question to explore is why is fish production declining and we have just a few wells now versus 162 wells when Liza 1, Liza 2, Payara, and Yellowtail gets going.	As a baseline matter, EIA Section 8.1, Socioeconomic Conditions, discusses the issue of declining fish catches. See additional information in the response to Comment #207.	No	Accepted	N/A	N/A
186	11-Nov-2021	Virtual Meeting	The gas compressor malfunctioning was a big challenge for Exxon. Can EPA say how much fines were collected for flaring and what amounts of flared gas?	Questions related to enforcement actions on a separate project are beyond the scope of the EIA.	No	Accepted	N/A	N/A
187	11-Nov-2021	Virtual Meeting	Which Caribbean countries would be affected for instance and have they been consulted or apprised?	EIA Section 9.24 discusses potential transboundary impacts, including an identification of other countries that could be affected by a loss-of-well-control event. The Yellowtail EIA process did not include consultation with stakeholders outside Guyana, but the EIA was available for review on the EPA's website and any comments from persons outside of Guyana could have been submitted to the EPA during the 60-day review period. As described in Chapter 9, EEPGL would work with the Government of Guyana	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				and other countries as appropriate to coordinate a response to an oil spill with the potential to affect other countries.				
188	11-Nov-2021	Virtual Meeting	Does Guyana have any specific legislation to command waste disposal? Or are we reduced to depending on extractor charity that they will be responsible for?	Relevant Guyana legislation includes the Environmental Protection Hazardous Waste Regulations (2000). Waste management procedures, described in the CWMP (see EPA website), would also be guided by applicable international standards. All waste treatment and disposal facilities that would be used by the Project would be permitted.	No	Accepted	N/A	N/A
189	11-Nov-2021	Virtual Meeting	Where are the drilling cuttings being discharged?	Water-based drill cuttings would be discharged at the seabed. Non-aqueous-based drill cuttings would be discharged overboard from the drill ship after treatment to relevant international standards.	No	Accepted	N/A	N/A
190	11-Nov-2021	Virtual Meeting	EEPGL ESMP speaks to a Flare Minimisation Plan being developed. Would this be a pre-requisite to approval of the ESIA?	Flaring minimization is discussed in the EIS and in EIA Section 6.1.3.2, Emissions of Air Quality Pollutants. As described, EEPGL would develop a flaring minimization plan to document the design measures, such as reinjection of associated gas, and operational practices that minimize flaring during Project FPSO operations.	No	Accepted	N/A	N/A
191	11-Nov-2021	Virtual Meeting	Does the flare minimisation plan include the re-injection of the up to 620 MMscfd as indicated in the Yellowtail Project Summary (see below)?	The Yellowtail Project Summary, submitted as a part of Application for Environmental Authorisation, refers to 620 MSCFD as a maximum gas production rate predicted at the time of the application submission on 1 April 2021. At the time of EIA development, EEPGL re-evaluated the gas production rate estimate to be 450 MSCFD (EIS Table EIS-1: FPSO Key Design Rates).	No	Accepted	N/A	N/A
192	11-Nov-2021	Virtual Meeting	A list of the Emergency Response Preparedness training equipment along with the cost and dates of arrival must be included in the EIA.	OSRP Table 6-1 lists or otherwise describes the international, regional, and local resources available to EEPGL for each potential response strategy. OSRP Tables 6-2 through 6-7 provide a further summary of the representative oil spill response equipment in Guyana.	No	Accepted	N/A	N/A
193	11-Nov-2021	Virtual Meeting	What legislation covers the cradle to grave waste generated by the company?	See the response to Comment #188.	No	Accepted	N/A	N/A
194	11-Nov-2021	Virtual Meeting	Will insurance cover biodiversity loss?	The Stabroek Block co-venturers' first priority is to put in place mitigations and processes that prevent adverse events. In the unlikely case of an adverse event, the co-venturers would immediately minimize and rectify any impacts, including potential impacts on biodiversity. The co-venturers have the financial capacity to meet their responsibilities in case of an event. Pollution insurance policies today are not designed to address natural resources damages such as biodiversity loss.	No	Accepted	N/A	N/A
195	11-Nov-2021	Virtual Meeting	What policy covers the transboundary movement of waste?	EIA Section 8.6, Waste Management Infrastructure Capacity, describes the protocols and international agreements that pertain to the transboundary movement of waste.	No	Accepted	N/A	N/A
196	11-Nov-2021	Virtual Meeting	Have you addressed the cumulative impacts of EEPGL's operations on global temperature?	See the response to Comment #117 for discussion of assessment of GHG emissions on global climate change. The predicted impacts from Project air emissions, including those from GHG emissions, are described in EIA Section 6.1, Air Quality, Climate, and Climate Change. Cumulative impacts to air quality and climate / climate change are addressed in Chapter 10, Cumulative Impacts Analysis.	No	Accepted	N/A	N/A
197	11-Nov-2021	Virtual Meeting	How will produced water be treated, and to what standards? How and where will the produced waste water	Details related to the treatment of produced water are provided in EIA Section 2.7.4.5, Produced Water Treatment.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			be treated and which components will be treated?					
198	11-Nov-2021	Virtual Meeting	How much produced water will be stored on the FPSO?	See the response to Comment #174.	No	Accepted	N/A	p. 2-48
199	11-Nov-2021	Virtual Meeting	Will Yellowtail re-inject the produced water? If not, that would be a contradiction of clause 12 of the 2016 PSA.	The Yellowtail Development Project proposes to manage produced water via treatment and discharge overboard in accordance with good international oilfield practices.	No	Accepted	N/A	N/A
200	11-Nov-2021	Virtual Meeting	There is no comprehensive mapping of the fish nurseries in Guyana or the neighbouring feed on. There is no indication of migratory patterns of commercial and non-commercial species.	Fish and fisheries were described from both a socioeconomic perspective (Volume II, Appendix D, Participatory Fishing Study Final Report January 2019–March 2020) and a biological perspective (Volume II, Appendix M, Nearshore and Offshore Fisheries Study Summary). These studies are complete and although an additional year of the participatory study is currently being conducted, the data provided in the existing study reports provide ample baseline data to conduct the EIA.	No	Accepted	N/A	N/A
201	11-Nov-2021	Virtual Meeting	There is no description of the fisheries value chain in terms of economic or social value to Guyana.	See the response to Comment #200.	No	Accepted	N/A	N/A
202	11-Nov-2021	Virtual Meeting	There is no information on chemical studies/testing conducted on fishes.	See the response to Comment #200.	No	Accepted	N/A	N/A
203	11-Nov-2021	Virtual Meeting	There was no baseline data collected on fishes and fisheries prior to the commencement of conducting seismic surveys.	See the response to Comment #200.	No	Accepted	N/A	N/A
204	11-Nov-2021	Virtual Meeting	Is there liability on the part of the company for disposing hazardous waste in the landfill when it does not function as it should?	The Project would utilize permitted waste management facilities, which could include the HBL for management of the Project's non-hazardous waste—pending its permitted and operational status at the time Project waste generation occurs. No hazardous waste would be disposed of at the HBL. The EPA and the Ministry of Local Government and Regional Development have authority over the permitting and operation of the HBL.	No	Accepted	N/A	N/A
205	11-Nov-2021	Virtual Meeting	How do you evaluate the impact of your activities in a country that is still undergoing training for radiation spill management?	Radioactive materials in some of the equipment utilized by the Project would be stored at controlled locations as approved by Guyana authorities and would not be disposed in Guyana-based facilities. All radioactive sources used during operations would be managed in accordance with conditions or approvals granted by the EPA, under appropriate safety standards such as those set out by the International Atomic Energy Agency.	No	Accepted	N/A	N/A
206	11-Nov-2021	Virtual Meeting	What kind of toxic waste will be coming to shore, what is the composition, how much will be coming to shore, how is it being treated, where will it be disposed of, and what standards are being used?	In developing its approved CWMP (see EPA website), EEPGL has completed a study known as the Cradle to Grave Waste Study that describes the management of all of EEPGL's wastes from point of generation.	No	Accepted	N/A	N/A
207	11-Nov-2021	Virtual Meeting	News today says we are now importing fish from Jamaica. The Bank of Guyana half year report says shrimp and fish production	The last Bank of Guyana report related to fisheries that the Consultants reviewed was from 2020, which indicated that declines in finfish and shrimp production were due to decreases in demand due to COVID-19 restrictions (fish) and weather conditions combined with an extended closed season for	Yes	Accepted	N/A	7-193 to 7-194

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			declining. Did ERM look at that study?	shrimp fishing (shrimp). Several comments were received during the EIA disclosure process indicating that fish catches had declined significantly in recent years. EIA Section 8.1.2, Existing Conditions—Socioeconomic Conditions, identifies several possible causes for perceived declines in catches over the last several years, including interference with fishing activities by sargassum, inclement weather, unsustainable/illegal fishing practices, and more recently, COVID-19-related declines in fishing effort. Additional information was added to EIA Section 7.8.2.2, Targeted Surveys of Continental Shelf Fish Community, to further address this issue.				
208	11-Nov-2021	Virtual Meeting	Increased cost of living is a minor impact? For whom is this considered minor?	The significance of impacts is rated according to the methods described in Chapter 4 of the EIA. The rating for cost-of-living increases is meant to apply generally to Guyanese society.	No	Accepted	N/A	N/A
209	11-Nov-2021	Virtual Meeting	Have cost of living surveys been commissioned or is this all speculative?	No cost-of-living surveys have been commissioned as part of the Yellowtail EIA. However, EIA Section 8.1, Socioeconomic Conditions, evaluates potential impacts to cost of living as a result of the Project, with reference to available data including primary information gathered through interviews in 2021.	No	Accepted	N/A	N/A
210	11-Nov-2021	Virtual Meeting	Oil is gobbling up prime real estate, waterfront property. How will this affect the non-oil sector?	Offshore developments such as Yellowtail consume relatively little real estate because most activity is offshore and most onshore oil and gas-related activity occurs at shorebases that are designated for industrial activities and service other maritime industries.	No	Accepted	N/A	N/A
211	11-Nov-2021	Virtual Meeting	The purpose of an EIA is to gather information to allow a comprehensive risk assessment of the USD >9 billion Yellowtail development. I don't see this in the EEPGL/ERM Study. It does not take a proper risk management approach. A corporate risk assessment should cover: • Exploration • The production of oil and of water and of associated gas. • The FPSO and its activities. • The tankers that are coming in to load from the FPSO. • All the support vessels • The shore bases • And the contractors What are the different kinds of risks? How did you determine the probability of each risk? And for each risk, where is your assessment of the range of intensities of negative impacts, and the probabilities which of course	Most of the elements listed in the comment are assessed in the EIA (produced water and associated gas, activities on the FPSO, tanker and support vessel activities). Operation of most Project facilities would be contracted, so contractor activities are covered within the scope of the relevant EIA sections for each Project component. Activities at shorebases are not covered in the EIA because they are owned and operated by third parties under separate environmental authorizations. Exploration activities are also subject to separate authorizations, and are thus not covered in the EIA. The Cumulative Impact Assessment in the EIA (Chapter 10) assesses other reasonably foreseeable non Project-related impacts—including shorebases and EEPGL exploration activities—that could potentially contribute to impacts on the same resources that would be affected by the Project. As discussed in Chapter 9, Unplanned Events, the impact assessment methodology for planned events is based on a worst-case assumption that all impacts associated with planned activities would be certain to occur with a 100% probability. The EIA also evaluated risks in terms of the potential for unplanned events to occur during the Project life. These include various types of hydrocarbon spills, marine vessel collision, offshore discharge of untreated wastewater from the FPSO, and an onshore vehicular accident. Likelihood was estimated on the basis of experience and/or evidence that such an outcome has previously occurred. Chapter 9 describes the potential consequence of each event, its likelihood of occurring, and resultant risk rating. Assessing risk for each of these events was based on the potential consequence/severity of the unplanned event if it were to occur and the likelihood of the unplanned event occurring. The consequence/severity	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			change over the range. Where in the EIA did you account for time?	element of the risk rating was assigned based on the sensitivity of the resource/receptor and the magnitude of the impact. Changes in impacts over time were addressed by Project stage for each resource with impact ratings provided for each stage.				
212	11-Nov-2021	Virtual Meeting	This is the 4th Project, but monitoring is still the 1st unknown after getting oil. Therefore evidence of monitoring of Guyana's assets and environment in the previous 3 projects MUST be a prerequisite to approval of any further project.	To the extent that the comment is not related to the Yellowtail Project, it is beyond the scope of the EIA. However, ESMP Table 3.6-1 (included in Volume III of the EIA) presents the monitoring measures recommended by the Consultants for the Yellowtail Project. EEPGL is also in the process of developing a framework for enhanced monitoring, reporting, and verification, including the EPA's opportunities to independently verify EEPGL's compliance data.	No	Accepted	N/A	N/A
213	11-Nov-2021	Virtual Meeting	What is sparing philosophy of these compressors given the sensitivity of this issue? What is the availability of the overall gas re-injection system from topsides down to reservoir given that only three(3) gas injection wells are show in the figure below of which two are daisy-chained?	There would be installed spares on compressors for the Flash Gas Compression, Main Gas Compression, and Re-Injection Gas Compression systems, such that when one compressor trips, the spare (backup) unit can could be started to allow partial or full production to continue, reducing non-routine flaring frequency and volume/duration. The Project would also maintain an inventory of spare parts in Guyana. The Yellowtail Project would have three gas injection lines and up to 25 water-alternating-gas injection wells. This would enable gas injection to continue even when one or more gas injection wells or one flowline is down.	No	Accepted	N/A	N/A
214	11-Nov-2021	Virtual Meeting	There is a neglect of transboundary issues.	Transboundary impacts are discussed in EIA Section 9.24.	No	Accepted	N/A	N/A
215	11-Nov-2021	Virtual Meeting	Where is the public disclosure on Insurance and assurance?	See the response to Comment #53.	No	Accepted	N/A	N/A
216	11-Nov-2021	Virtual Meeting	EIA must contain proof of insurance, coverage amount, and maximum third party coverage, transboundary coverage before it can be approved.	Insurance and financial security are addressed in EIA Table 4.7-4. Also, see the response to Comment #53 for additional information regarding insurance coverage maintained for the Project.	No	Accepted	N/A	N/A
217	11-Nov-2021	Virtual Meeting	Will all the questions asked here and answers be included in final documents?	The questions and responses have been included to the revised EIA in a dedicated appendix, and the affected sections of the EIA have been updated as needed.	No	Accepted	N/A	Appendix U
218	11-Nov-2021	Virtual Meeting	The EIA says that an oil spill has a high intensity of impact, very low probability. How do both intensities of impact and probability of occurrence change over time, from the time you open a deep well to the decommissioning?	The EIA evaluated risks in terms of the potential for unplanned events to occur during the Project life. The assessment of risk for each of these events was based on the potential consequence/severity of the unplanned event if it were to occur and the likelihood of the unplanned event occurring. The severity of impacts from an oil spill would depend on a variety of factors including but not limited to size, location, duration, and timing (seasonality) of the spill. The likelihood of an oil spill occurring would be somewhat dependent on project stage. While a loss-of-well-control scenario would be a highly unlikely event at all stages of a project, this type of event would be more likely to occur during the installation of the well than during the production operations phase.	No	Accepted	N/A	N/A
219	11-Nov-2021	Virtual Meeting	Is there insurance for Liza 1 and 2 wells? Which company issued the insurance, what is the third-party	The Liza Phase 1 and 2 Projects were evaluated in separate, approved EIAs. The question of insurance coverage for these projects is beyond the scope of the Yellowtail Development EIA.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			coverage, and where is the proof of the insurance?					
220	11-Nov-2021	Virtual Meeting	There is also no formal guarantee between ExxonMobil and the Guyana Government that it would cover in full the shortfall of costs associated with an unmitigated spill which are not covered by its subsidiary – the shell company, Esso Exploration and Production Guyana Limited (EEPGL). Does the EPA think that is acceptable?	The Consultants acknowledge the question. The question is beyond the scope of the EIA. For information regarding financial assurance for the Project, see the response to Comment #53.	No	Accepted	N/A	N/A
221	11-Nov-2021	Virtual Meeting	How about the Guyana Government's inability to audit oil expenses? Is that socioeconomic, and does that affect such monitoring?	The Consultants acknowledge the question. Assessment of oil expenses is not considered a socioeconomic impact in the context of the EIA, and is therefore beyond the scope of the EIA.	No	Accepted	N/A	N/A
222	11-Nov-2021	Virtual Meeting	Is Guyana fully covered with insurance in the event of a well blow out?	The question of whether the country of Guyana has an insurance policy is beyond the scope of the EIA. For information regarding insurance coverage maintained for the Project, see the response to Comment #53.	No	Accepted	N/A	N/A
223	11-Nov-2021	Virtual Meeting	If the project goes awry and damage the coastlines of others, who pays? Esso or Guyana?	The Stabroek Block co-venturers' first priority is to put in place mitigations and processes that prevent adverse events. In the unlikely case of an adverse event, the co-venturers would immediately minimize and rectify any impacts. The co-venturers have the financial capacity to meet the responsibilities for an event including obligations under Guyanese law and the respective petroleum agreements. Regarding insurance, the Stabroek Block co-venturers have secured comprehensive insurance for petroleum activities as required by environmental permits. Under the existing legal framework and agreements with the government, there are extensive assurances of EEPGL's and co-venturers' commitments, including environmental protection measures to respond to operational incidents. The Government of Guyana has multiple mechanisms in place, including the Stabroek Block Petroleum Agreement and the environmental permits, to ensure that the companies would take responsibility for any adverse events. Joint insurance coverage is obtained in the name of EEPGL and the other Stabroek block co-venturers for the appropriate lines of coverage, depending on the project and scope of work. Specifically for the Yellowtail Project, should the Yellowtail Project receive necessary approvals, the co-venturers would have insurance coverage including Third Party Liability and the cost of regaining control of a well.	No	Accepted	N/A	N/A
224	11-Nov-2021	Virtual Meeting	Which laws and procedures are being followed?	EIA Chapter 3, Administrative Framework, provides an overview of the relevant laws that affect the Project and the conduct of the EIA. More information on resource-specific requirements is included in the resource-specific sections in Chapters 6 through 8. The analytical procedure of rating impacts is described in Chapter 4, Methodology for Preparing the Environmental Impact Assessment.	No	Accepted	N/A	N/A
225	11-Nov-2021	Virtual Meeting	VP Jagdeo is reported to be asking Exxon to deposit $US2 billion for insurance. In light that the Macondo 2010 spill cleanup cost was $US 60	See the response to Comment #53.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			billion+, does the EPA consider $US2B to be adequate?					
226	11-Nov-2021	Virtual Meeting	The EIA should say which standards are obligatory in the industry and which best practices are being followed. Where are these obligatory standards documented? Where can we find these best practices? Where is the logbook of each best practice? What are the monitoring and reporting procedures in respect of each standard?	The EIA identifies applicable legal or regulatory requirements, as well as relevant national or international guidelines, that were applied in the design of the Project, in the impact assessment, and in recommendations for management measures—included in Chapter 2, Chapters 6 through 8, and in the ESMP. Chapter 3 and the applicable administrative framework tables at the beginning of each resource-specific section in Chapters 6 through 8, as applicable, along with recommended management measures and the ESMP, identify applicable requirements. If the Project is approved by the EPA, such requirements would also be considered a condition of the Environmental Permit issued for the Project. The ESMP, included in Volume III of the EIA, makes several recommendations regarding monitoring that should be conducted if the Project is approved.	No	Should be addressed following meeting with the Redford group	Per the response to Redford Group's comments, the legislation, policies, and treaties referenced in Chapters 6, 7, and 8 of the EIA have been added to Chapter 3, so that all administrative requirements to which the project would be subject can be reviewed in one place in the EIA.	pp. 3-10 to 3-22
227	11-Nov-2021	Virtual Meeting	Where are the reports from monitoring from Liza-1 wells?	Monitoring related to the Liza Phase 1 project is not within the scope of this EIA.	No	Accepted	N/A	N/A
228	11-Nov-2021	Virtual Meeting	Name the independent auditors that are verifying which aspects of your operation(s). Where are the audit reports published?	No auditing is currently being done for the Yellowtail Project because the Project has not been approved yet. The ESMP, included in Volume III of the EIA, makes several recommendations regarding monitoring that should be conducted if the Project is approved.	No	Accepted	N/A	N/A
229	11-Nov-2021	Virtual Meeting	Please share the pre-treatment and monitoring of pollutants and hazardous elements prior to discharge in accordance with permit requirements, international conventions, standards and best oil & gas industry practice.	EIA Section 2.7.4, FPSO Process Systems, discusses the treatment systems that would be used for effluent discharges from the FPSO. The ESMP describes the details of the commitments for monitoring and reporting to which the Project would adhere.	No	Accepted	N/A	N/A
230	11-Nov-2021	Virtual Meeting	Please take into account the closely interrelated impacts of the Exxon-Mobil related shore-based service hazardous waste facilities (such as Schlumberger radioactive waste facility at Houston EBD) and include these impacts on the general health and well-being of humans.	There is currently no proposal, design, or permit application for additional shore-based waste management facilities that would serve the Yellowtail Development Project, so there is no such project to include in the cumulative impact assessment in the EIA. Under the Environmental Protection Act, additional onshore support facilities, including waste management facilities, would require separate environmental permitting processes and associated environmental analyses to support those permitting processes. These environmental analyses would assess impacts on human health and wellbeing, as appropriate.	No	Accepted	N/A	N/A
231	11-Nov-2021	Virtual Meeting	What are the risks that you assessed? And how are the risk probabilities assigned?	The EIA evaluates risks in terms of the likelihood for unplanned events to occur during the Project life and the potential consequence/severity of the unplanned event if it were to occur. The consequence/severity element of the risk rating was assigned based on the sensitivity of the resource/receptor and the magnitude of the impact. Likelihood was estimated on the basis of experience and/or evidence that such an outcome has previously occurred. Chapter 4 outlines the methodology in greater detail and Chapter 9 describes the potential consequence of each event on the various resources and	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				receptors, their assessed likelihood of occurring, and the resultant risk ratings (e.g., “Minor,” “Moderate,” etc.).				
232	11-Nov-2021	Virtual Meeting	Please explain how you have complied with FPIC recommendations in relation to the Indigenous communities in Regions 1, 2, and 3?	EEPGL respects the rights and cultures of Indigenous Peoples and commits to conducting meaningful consultations with them, incorporating traditional knowledge and use into its plans, and seeking mutually beneficial long-term relationships. EEPGL further recognizes that Free, Prior and Informed Consent is a process by which accurate, accessible, and timely information is shared in regard to proposed developments, with opportunities for constructive and two-way dialogue. EEPGL’s stakeholder engagement program has included (and continues to include) indigenous communities and Toshaos in Regions 1 and 2. EEPGL has been responsive to the questions, concerns, and interests of indigenous stakeholders and continues to work with these communities to identify opportunities to support local benefits.	No	Include justification in EIA	This information has been added to Section 4.7.1 of the EIA.	pp. 4-8 to 4-9
233	11-Nov-2021	Virtual Meeting	How would you calculate “insurance” for the Caribbean Islands?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
234	11-Nov-2021	Virtual Meeting	At what stage of the EIA process does the EPA grant permission for the project to go ahead with or without insurance?	The Consultants acknowledge the question. The comment should be referred to the EPA.	No	Accepted	N/A	N/A
235	11-Nov-2021	Virtual Meeting	Why wasn’t the consultation extended to other Caribbean nations which will potentially be impacted by an oil spill?	The question is beyond the scope of the EIA. The Yellowtail EIA process did not include consultation with stakeholders outside Guyana, but the EIA was available for review on the EPA’s website and any comments from persons outside of Guyana could have been submitted to the EPA during the 60-day review period.	No	Accepted	N/A	N/A
236	11-Nov-2021	Virtual Meeting	How can the EIA and the consultant be trusted if the document was cosigned as being prepared by a member of the governing party? There is no indication of a conflict of interest in the document.	The Consultants did not engage with or involve the referenced individual to provide support to the Yellowtail Development Project EIA. The referenced individual's signature was inadvertently included on the cover of the version of the EIA Non-Technical Summary (NTS) for the Yellowtail Development Project that was posted on the EPA’s website. A corrected version of the NTS has been posted on the EPA website in place of the incorrect version.	No	Accepted	N/A	N/A
237	11-Nov-2021	Virtual Meeting	How do you present an EIA will still collecting baseline data, as in the case of fisheries?	Fish and fisheries are described from both a socioeconomic perspective (Appendix D, Participatory Fishing Study Final Report January 2019–March 2020) and a biological perspective (Appendix M, Nearshore and Offshore Fisheries Study Summary). These studies are complete and although an additional year of the participatory study is currently being conducted, the data provided in the existing study reports provide ample baseline data to conduct the EIA.	No	Accepted	N/A	
238	15-Dec-2021	Fair Deal for Guyana	**What are the Greenhouse Gas (GHG) Emissions from the proposed Yellowtail project?** Section 11 (4)(a) of the EP Act requires the developer to identify, describe and evaluate the direct and indirect effects of the proposed project on the environment. The environment includes the atmosphere and climate.	The estimated GHG emissions from the Yellowtail Project are presented in EIA Section 2.13.2, Emissions, and Section 6.1.3.4, Characterization of Potential Impacts—Climate / Climate Change. These represent the estimated Scope 1 and Scope 2 GHG emissions for the full Yellowtail Project life cycle, noting that estimated Scope 2 GHG emissions from the Project would be *de minimis*—as the components and activities comprising the Project would utilize a negligible amount of electricity, if any, from third-party sources. An estimate of end-use GHG emissions from the Project is not within the scope of the EIA, which complies with the Environmental Protection Act and applicable regulations. This is consistent with guidance for the oil and gas	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			(i) What are the total scope 1, scope 2 and scope 3 greenhouse gas emissions from the Yellowtail project? (ii) What would be the effect of those greenhouse emissions on the climate system? (iii) What would be the effect of those greenhouse emissions on the ocean?	industry which recognizes that reporting end-use (sometimes referred to as "Scope 3") GHG emissions may not be possible under circumstances such as the current Project. The guidance, published by the IPIECA states, "[I]n certain cases, the eventual end use of sold intermediate products may be unknown, and companies may be unable to reasonably estimate the downstream emissions associated with processing, end uses or waste of the intermediate product. In such cases, companies can disclose and justify the exclusion of downstream emissions in any account." See IPIECA, Estimating petroleum industry value chain (Scope 3) greenhouse gas emissions - Overview of methodologies, https://www.ipieca.org/resources/good-practice/estimating-petroleum-industry-value-chain-scope-3-greenhouse-gas-emissions-overview-of-methodologies (accessed 23 November 2021). As discussed in EIA Section 6.1.3.4, potential climate / climate change impacts are a global concern and stem from cumulative worldwide GHG concentrations. The Global Circulation Models used to predict climate impacts from global concentrations are built around emissions on a global scale, and thus are not capable of modeling impacts from the GHG emissions contribution from a single project such as the Yellowtail Project. Statistical downscaling methods can be used to establish a statistical relationship between global climate and local climate using observed data, and can be used to estimate future local climate changes based on the results of Global Circulation Models. However, the reverse approach of predicting the impact of local GHG emissions on global (or local) climate change is not feasible due to the multiple factors—beyond that of a single project—that drive global climate change predictions. For these reasons, while it is possible to quantify the total GHG emissions from the Project, it is difficult to assign an impact magnitude rating that reflects the potential effects the climate / climate change will experience specifically as a result of the Project (as is done for other resources assessed in the EIA). Recognizing this limitation, this EIA provides a qualitative rating for impact significance. The assessment of potential impact significance for the Project's impacts on global climate / climate change is conducted differently from the assessment for other resources. The approach taken in the EIA is to assign a significance rating for potential Project GHG emissions, as a proxy for impacts on global climate change, based on the following factors: • Comparison of Project GHG emissions to those of Guyana (i.e., without the Project) and to regional and global GHG emissions; and • Comparison of Project GHG emissions to those of the global oil and gas industry. Additionally, while the EIA cannot assess potential impacts of the Project emissions on climate / climate change, EIA Section 6.1.2.3, Current Scientific Understanding of Consequences of Climate Change, provides a discussion of the current scientific understanding of consequences of climate change. Section 6.1.2.3 provides a discussion of the current scientific understanding of consequences of climate change, including a discussion of potential sea level rise, ocean temperature, and ocean acidification.				
239	15-Dec-2021	Fair Deal for Guyana	**What would be the full extent of the climate damage caused by the proposed Yellowtail project?**	As noted in the response to Comment #238, an estimate of end-use (Scope 3) GHG emissions from the Project is not within the scope of the EIA. This complies with the Environmental Protection Act, and is consistent with	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Page 2 of the Project Summary states: "The production facilities to be installed include subsea equipment attached to the seafloor as well as processing equipment on the ocean's surface known as a Floating, Production, Storage, and Offloading (FPSO) vessel (see Figure 11). …. "The FPSO is an industrial floating complex that continuously separates produced water and associated gas from the oil. The anticipated production rate for the FPSO ranges between approximately 34 977 m3 (220,000 barrels) and 39 747 m3 (250,000 barrels) of oil per day." ExxonMobil Corporation's business model is to extract oil and convert it to energy, such as the transportation fuels the company sells. is the intention that nearly all such oil the project generates be combusted, resulting in emissions of CO2 that further raise atmospheric levels of CO2. It is well established that emissions of CO2 increases the global burden of adverse climate consequences caused by rising atmospheric levels of greenhouse gases. The EIA for the proposed Yellowtail Project must provide a full accounting of the cost of the climate damages associated with the project, including costs associated with emissions of CO2 from the intended ultimate use of the project's expected production of oil and gas. The most recent estimate of the cost of greenhouse emissions is $417 for every ton of CO2 emitted into the atmosphere under the most widely expected climate scenarios. See: Ricke, K., Drouet, L., Caldeira, K., & Tavoni, M. (2018). Country-level social cost of carbon. Nature Climate Change, 8(10), 895.	guidance for the oil and gas industry. The United Kingdom has similar statutes and regulations to the Environmental Protection Act, and does not require reporting of end-use GHG emissions from crude oil production projects. Like in Guyana, regulations in the United Kingdom require EIAs for petroleum production projects to include descriptions of the direct and indirect significant effects of the relevant project on human health, biodiversity and land, soil, water, air and climate (see United Kingdom Offshore Petroleum Production and Pipelines [Environmental Impact Assessment and Other Miscellaneous Provisions] [Amendment] Regulations 2017). Those regulations are not interpreted to require reporting of estimated end-use GHG emissions. Furthermore, the UK's Offshore Petroleum Regulator for Environment and Decommissioning uses similar language in its guidance for producing EIAs, but does not require reporting of end-use GHG emissions.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
240	15-Dec-2021	Fair Deal for Guyana	**Well blowout** The proposed Yellowtail project is in the Stabroek Block which is located in the Amazon-Orinoco influence zone an area of high biodiversity. The Yellowtail Development Project proposed by EEPGL involves wells that would be drilled at great depths. This ultra-deep water drilling is extremely dangerous and carries the risk of a well blow out like the Macondo/Deepwater Horizon catastrophe in 2010 which killed 11 people, devastated wildlife populations and destroyed livelihoods. It also cost BP more than US$68Bn.1 A well blow out would be a catastrophic event that could damage/destroy marine ecosystems in Guyana and the Caribbean. In testimony to the Hearing before the Subcommittee on Oversight and Investigations of the Committee on Energy and Commerce House of Representatives 111th Congress on 17 June 2010, Rex Tillerson the then CEO of ExxonMobil stated that the response capability to respond to a spill did not exist and probably never will. 1. Does the response capability to a spill exist now and if so what is it? 2. Can EEPGL guarantee that there will be no well blowout? 3. If a well blows out, how long will it take for EEPGL to bring a capping stack to the well? 4. How long will it take for EEPGL to fit the capping stack to the well? 5. Who will EEPGL employ to transport and fit the capping stack? 6. How will EEPGL remove from the ocean the oil that surges into the ocean from a well blow out?	1. EIA Volume III OSRP Table 6-1 lists or otherwise describes the international, regional, and local resources available to EEPGL for each potential response strategy. 2. EEPGL cannot guarantee that there would be no well blowouts. However, with all mitigation measures in place, a well blowout would be an exceptionally unlikely event. 3. As described in EIA Volume III OSRP Section 6.3.4, EEPGL has a subscription with Boots & Coots (in Houston, Texas) for access to the Boots & Coots GRIP system, which includes a 15k capping stack, debris removal equipment, and other associated equipment. The GRIP system is an air-freightable system that is located adjacent to George Bush Intercontinental Airport. A response time analysis indicates that the capping stack deployment would be possible within 5 days, assuming no debris removal activities are required. 4. Capping stack deployment and installation are influenced by a number of factors including, but not limited to, weather, sea state, capping stack type, deployment method, well discharge properties, and subsea hardware condition. Assuming no debris removal is required along with favorable installation conditions (e.g., good sea state, good ROV visibility at seafloor, vertical attachment point), capping stack deployment and installation are estimated to take 12 to 24 hours. However, adverse conditions (e.g., poor sea state, poor ROV visibility at seafloor, non-vertical attachment point) could complicate operations and result in prolonged capping stack deployment and installation time. 5. In the event that a capping stack is required, the GRIP system would be air-freight to Guyana from the United States by Boots & Coots and sea delivered to the location using existing EEPGL logistics' resources in Guyana. 6. For potential spills larger in nature, the use of all available response resources including mechanical recovery, burning product on water and dispersants is anticipated. Leveraging results of the NEBA for selection of response technologies is vital to the responses decision making process. A NEBA or the Spill Impact Mitigation Assessment is a process used by the response community for making the best choices to minimize impacts of oil spills on people and the environment. During spill modeling reviews, EEPGL completed NEBA studies for a Tier III (loss of well control) and Tier II (crude spill from FPSO loading operations) by applying different available response options. The NEBA process helps identify and select the option or combination of options that minimizes overall harm to environmental and socioeconomic resources (including cultural sensitivities). The combination of response options and strategies is factored into OSRP Table 3-1: Possible Hydrocarbon Release Scenarios by Tier content. 7. Response equipment is described in EIA Volume III OSRP Table 6-1. According to the table, 22 boats are available to support oil spill response. 8. See the response to Comment #53 for additional information regarding insurance coverage maintained for the Project. 9. In the very unlikely oil spill event that would have transboundary impacts on the neighboring Caribbean countries, EEPGL would work through the	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			7. How many boats and personnel will EEPGL have available for clean up? 8. How much money will set aside to pay for the costs of clean up? 9. Will EEPGL pay compensation to the Caribbean islands for damage to their fishing and tourism industries? 10. Is it possible for oil to reach Guyana's coast and rivers? 11. What would be the impact of oil on Guyana's coast and rivers, including the impact on marine and freshwater wildlife and ecoystems?	Ministry of Foreign Affairs, at the direction of the Government of Guyana, to establish appropriate claims and/or livelihood remediation processes. 10. Based on modeling, an unmitigated Most Credible and Worst Case oil spill could reach Guyana's coast and enter to the rivers with high tides. 11. EIA Table 9.6-3: Risk Ratings for Unplanned Event Impacts on Coastal Habitats illustrates potential impacts on coastal habitats as Minor to Moderate, depending on the nature of the event.				
241	15-Dec-2021	Fair Deal for Guyana	• How does EEPGL plan to comply with international best practices in regard to deep water wells? The inability to activate, or trigger, the blowout preventer and regain well control during the Macondo disaster in the Gulf of Mexico spill exposed a serious design defect of oil exploration wells in deep water. As a result of the Deepwater Horizon oil spill, the U.S. Bureau of Safety and Environmental Enforcement (BSEE) finalized a rule intended to prevent another similar disaster by imposing design requirements for blowout preventers and related equipment for controlling a well in the event of a serious accident. Please refer to 30 CFR Part 250, Subpart G - Well Operations and Equipment2 and 30 CFR 250.734 - What are the requirements for a subsea BOP system? • What systems will EEPGL put in place to prevent a well blowout? • The EIA for the proposed Yellowtail Project must provide an item-by-item account of how the project would comply with each applicable provision of 30 CFR Part 250, Subpart G - Well Operations and Equipment and in	Together with its drilling contractors and service partners, EEPGL places strong emphasis on prevention of source control events through implementation of appropriate safeguards. EEPGL leverages a structured and disciplined approach to planning and executing wells, and well design practices employ global standards and industry best practices. Wells are drilled dynamically overbalanced and are designed for expected formation pressures, accounting for a range of geologic outcomes. In addition, EEPGL utilizes a structured risk assessment process to identify, evaluate, and appropriately control potential hazards that may be encountered during operations. With respect to equipment, the drill ships supporting EEPGL operations in offshore Guyana utilize blowout preventer (BOP) equipment and safety systems. EEPGL well control practices apply global standards that were developed leveraging industry best practices, including API STD 53. A subsea BOP stack is deployed on riser from each drillship for any operations occurring below the surface casing. Key BOP components are tested at regular intervals over the course of operations to verify functionality and maintain subsea BOP system equipment readiness. Inspection, maintenance, and servicing of BOP equipment is performed leveraging industry best practices and manufacturer guidance. ROV intervention capability and emergency safety systems (i.e., autoshear, deadman, emergency disconnect sequence) are in place during riser connected operations to secure the well in the event of unforeseen operational circumstances. Additional drillship safety systems (i.e., power management, station keeping), which are developed with built-in redundancy, are utilized to further prevent source control events from occurring. The cited U.S. Code of Federal Regulations (i.e., 30 CFR Part 350, Subpart G) are not applicable in offshore Guyana. However, as previously discussed, EEPGL's well design, well control, and operational practices leverage global industry practices. Operationally, EEPGL utilizes industry best practices for pressure surveillance and well control. Drilling and logging data are closely monitored in real-time by trained rigsite personnel to ensure timely detection of potential abnormal pressure trends and influx indicators. Drilling crew leadership positions (e.g., toolpusher, driller, assistant driller) undertake accredited classroom-based well control training, which includes coverage of deepwater	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			particular 30 CFR section 250.734.	well control theory, concepts, and practices. Well control drills (e.g., pit drill, trip drill, power choke drill, emergency disconnect / hang-off drill), which are performed at regular intervals over the course of operations, are held on each drillship to reinforce training and build drilling crew operational proficiency, specifically as it relates to detecting and efficiently responding to a potential influx. In summary, prevention of source control events are managed effectively by EEPGL through well design and execution planning, readiness of BOP equipment and safety systems, and well control preparedness of rigsite personnel.				
242	15-Dec-2021	Fair Deal for Guyana	• How does EEPGL plan to comply with international best practices in regard to the prevention of flaring? • Since beginning operations in December 2019 EEPGL has flared billions of cubic feet of gas and continues to flare. Flaring of gas associated with oil & gas activities is a cause of substantial harm to the environment. • Page 1 of the Project Summary states: "In 2020, the FPSO Liza Destiny experienced unanticipated technical challenges and unplanned gas flaring during its startup and commissioning process. EEPGL has conducted comprehensive root cause analyses of these issues, and evaluated potential improvements to gas handling systems, sparing philosophy, and execution procedures. EEPGL plans to take significant steps to incorporate the lessons learned from the commissioning of the Liza Destiny into future projects, including Yellowtail." • Under rules enacted by the U.S. Bureau of Safety and Environmental Enforcement, flaring of associated gas is strictly regulated. If ExxonMobil were proposing the Yellowtail Development Project in waters of the United States, then the project would need to comply with restrictions on flaring under 30 CFR Subpart K - Oil and Gas	While the Yellowtail Project is not subject to US Federal regulations such as 30 CFR Subpart K, as described in EIA Chapter 2, the Project would be designed to re-inject associated gas under routine conditions—except that which would be used as fuel gas, flare pilot gas, and background flare gas (e.g., purge, compressor seals) for FPSO operations and *de minimis* sources not captured by the VRU—back into the reservoir except during times of injection/compression system unavailability, which would require temporary, non-routine flaring during maintenance/repair. With respect to incorporating lessons learned from the commissioning of the Liza Destiny, a key strategy integrated in the FPSO design to reduce the frequency and duration of non-routine flaring for upsets and maintenance on the compression system would be the inclusion of installed spare gas compression equipment capacity. During instances where one compression unit is offline for upset or maintenance, installed spare compression equipment could be used to allow partial or full production to continue while reducing the volume and duration of flared gas. The gas compression sparing capacity provided in the Yellowtail Project design exceeds that included in the designs of prior EEPGL development project FPSOs. Additionally, a VRU would collect vapors from the cargo tanks and other low-pressure sources. The low-pressure sources captured by the VRU would include vapors coming from the triethylene glycol regeneration and produced water treatment systems (vapors that would otherwise be directed to the flare). As described in EIA Section 2.7.5.3, Flaring System, there are three main ways in which flaring would be reduced during steady-state operations: maintenance programs, operational procedures, and monitoring. Implementation of proactive and preventative maintenance and testing programs would reduce flaring by minimizing downtime from equipment failure and would facilitate continuous maximum flare efficiency. Additionally, the operations team would follow specific developed procedures for starting up and shutting down equipment. The facility would be monitored on a 24-hour per day basis to manage operational events that may cause flaring. This monitoring would provide the capability to intercept and deflect events that may result in flaring to the extent possible. Finally, lessons learned from commissioning, start-up, and operation of other FPSOs in Guyana would be reviewed and appropriate mitigations put in place to avoid recurrence of issues found in the past. For example, as described above, the FPSO compression systems would be equipped with spare compression capacity to reduce non-routine flaring duration.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Production Requirements, § 250.1160 When may I flare or vent gas. • The EIA for the proposed Yellowtail Project must provide an item-by-item account of how the project will comply with each applicable provision of 30 CFR Subpart K - Oil and Gas Production Requirements, § 250.1160 When may I flare or vent gas.					
243	15-Dec-2021	Fair Deal for Guyana	**Noise** • How many decibels of noise will the project generate, over what period of time? Please set out this information on a graph. • What is the impact of noise on marine wildlife in particular whales, dolphins, turtles and fish? Please differentiate by species.	At the nearest onshore residential receptor (the shoreline portion of Vreed-en-Hoop) atmospheric noise (i.e., noise in the air) levels are predicted to be 34 dB and would last for the duration of the Project's operational life. This number is provided in EIA Table 5.2-3. Offshore, underwater impulsive noise would not be expected to exceed 220 dB re 1 µPa², and would be limited to the drilling and installation phase of the Project. Underwater non-impulsive noise exposure would not be expected to exceed 180 dB re 1 µPa², and would last for the duration of the Project's operational life. These offshore maxima have been added to the text in EIA Section 7.5.3, Impact Assessment—Marine Mammals. Regarding the potential impacts of marine noise on marine wildlife, see the response to Comment #144. Generally, these impacts were rated from Negligible to Minor depending on the type of sound, sensitivity of a particular taxonomic group to auditory impacts, and availability of appropriate management measures. The potential impacts of noise on whales and dolphins are discussed in Section 7.5.3; these depend on the functional hearing group to which the species belongs, as discussed in EIA Section 7.5.3.3, Characterization of Impacts—Injury or Disturbance from Underwater Sound. The potential impacts of noise on turtles are discussed in EIA Section 7.7.3, Impact Assessment—Marine Turtles. The potential impacts of noise on fish are discussed in EIA Section 7.8.3, Impact Assessment—Marine Fish.	Yes	Accepted	N/A	p. 7-120
244	15-Dec-2021	Fair Deal for Guyana	**Discharges** • What are the proposed discharges into the ocean? • What are the impacts of those discharges on the environment?	The planned discharges to the ocean from the Project are described in EIA Section 2.13.3, Discharges. Potential impacts of planned discharges to the ocean from the Project are discussed in EIA Section 6.3.3 (Marine Geology and Sediments), Section 6.4.3 (Marine Water Quality), Section 7.4.3 (Seabirds), Section 7.5.3 (Marine Mammals), Section 7.7.3 (Marine Turtles), Section 7.8.3 (Marine Fish), Section 7.9.3 (Marine Benthos), Section 7.10.3 (Ecological Balance and Ecosystems), Chapter 10 (Cumulative Impact Assessment), and Appendix C (Water Quality Modeling Report). 			1, Liza2 and Payara are taken into account?					
246	15-Dec-2021	Fair Deal for Guyana	**Decommissioning** The International Energy Agency has stated that there should be no new oil and gas developments if the world is to stay within safe limits of global heating. ExxonMobil shareholders have stated that, “Exxon’s current direction is premised on outdated assumptions about high oil prices, demand, and margins that are incompatible with the reality of climate change and the inevitable transition to renewable energy sources.” On May 26th, ExxonMobil shareholders voted on to ExxonMobil’s board 3 new directors who are committed to aligning the company’s business operations to achieve net zero emissions on an accelerated timeframe. Also on May 26th, a Dutch court ruled that in order to comply with the goals of the Paris Agreement, Royal Dutch Shell must reduce its CO2 emissions by 45% by 2030 from 2019 levels. There is a risk of similar cases and similar decisions being made against ExxonMobil. Consequently, there is a risk that decommissioning will occur earlier than expected. • What would be the cost of decommissioning of the Yellowtail project based on today’s costs? • Does EEPGL have the money to cover the costs of decommissioning? • How much equipment will be abandoned on the ocean floor? • What is the impact on the environment of abandoning equipment on the ocean floor?	• A Preliminary End of Operations Decommissioning Plan for Guyana Development Projects is included in Volume III of the EIA. As stated in the plan, near the time of decommissioning, EEPGL would develop a more detailed decommissioning plan, in consultation with the appropriate Guyanese regulators. EEPGL would perform comparative assessments for the various facility components. The comparative assessment is designed to evaluate five criteria, including safety, environmental, technical, impact to other users of the sea, and economics—and to select the best option for the final decommissioning plan. Consultation with stakeholders would also be conducted by EEPGL during decommissioning planning. A revised plan would be submitted to the appropriate Guyanese regulators in advance of commencing field work. The cost of the decommissioning is not within the scope of the EIA. • An assessment of the financial capacity of the Project proponent is not within the scope of the EIA. • As described in the Preliminary End of Operations Decommissioning Plan included in Volume III of the EIA, globally ExxonMobil employs good international oilfield practice for decommissioning and abandonment. For offshore facilities, this includes utilizing IMO Resolution A.672(16) Guidelines and Standards for the Removal of Offshore Installations and Structures on the Continental Shelf and in the EEZ as a basic standard worldwide, as well as the UK Offshore Petroleum Regulator for Environment and Decommissioning’s (OPRED’s) “Offshore Oil and Gas Decommissioning Guidance Notes” December 2018, (ANNEX A—A Guide to Comparative Assessments). These embody the principle that where a decision is made to allow an offshore installation, structure, or parts thereof to remain on the seabed, it should be based on a case-by-case evaluation (by the jurisdiction over the installation or structure). Abandonment of selected equipment on the seafloor as part of decommissioning is currently proposed, but further approvals would be required before this plan could be implemented. The industry supports the use of a Multi-Criteria Decision Analysis (MCDA) as the facilities are approaching end of production life to holistically evaluate the decommissioning approach for the subject facilities. The MCDA evaluates the potential safety and health, environmental, social, and economic risks, as well as technological challenges/developments that may be needed for the decommissioning options analysis (including reefing). Given the length of expected operational timelines and potential future advancements in technology, it is difficult to determine final decommissioning options at this time. Industry general practice in these depths for subsea components is, at the time of initial installation, to plan for such components to remain in place at decommissioning; however, this would be re-evaluated as the field reaches end of life. The comparative analysis described above, such as an MCDA process, would be employed to assess the best overall options based on the various factors, and leaving subsea components in situ would not be proposed at that time if it were determined that this would have a significant negative impact on the environment or users of the sea. • The Preliminary End of Operations Decommissioning Plan states that, as part of the decommissioning process, all risers, pipelines, umbilicals, and	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				other subsea equipment would be safely and properly isolated, de-energized, and flushed to remove hydrocarbons and any hazardous materials to a suitable level prior to being taken out of service. Accordingly, if the final approved decommissioning plan calls for subsea equipment to be left in situ on the seafloor, the potential for impacts related to exposure of environmental receptors to hazardous materials would be negligible. As discussed in EIA Section 7.9.3.5, Characterization of Impacts—Injury Due to Drill Cuttings Deposition, the addition of the small amounts of hard substrate would likely increase the diversity of the local benthic community as species that require hard substrate colonize the area where none existed before. However, this would be balanced with the loss of soft substrate that would continue to be unavailable within the footprint of the subsea infrastructure. This would only occur within the immediate footprint of the abandoned infrastructure and would be expected to affect a relatively small number of organisms.				
247	15-Dec-2021	Fair Deal for Guyana	**Financial ability to carry out the Yellowtail project.** What profit did EEPGL make in 2020?	The Consultants acknowledge the question. EEPGL's 2020 financial information is not within the scope of the EIA.	No	Accepted	N/A	N/A
248	15-Dec-2021	The Environmental Law Alliance Worldwide Science Team Submitted by Mark Chernaik, Ph.D	**1. The EIA fails to assess the substantial indirect impacts of the proposed project on the earth's climate.** Section 11(4)(a) of the Environmental Protection Act requires the following: "(4) Every environmental impact assessment shall be carried out by an independent and suitably qualified person approved by the Agency and shall— "(a) identify, describe and evaluate the direct and indirect effects of the proposed project on the environment including— human beings; flora and fauna and species habitats; soil; water; air and climatic factors; …' The proposed Yellowtail Development Project involves the extraction of oil and gas from deep offshore seabed deposits and marketing the recovered crude oil to refineries, and ultimately to consumers of petroleum products.	As noted in the response to Comment #238, an estimate of end-use (Scope 3) GHG emissions from the Project is not within the scope of the EIA.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			The Executive Summary of the EIA describes the nature of the project as follows: “The Project will consist of the drilling of approximately 41 to 67 development wells (including production, water injection, and gas re-injection wells); installation and operation of Subsea, Umbilicals, Risers, and Flowlines equipment; installation and operation of a Floating Production, Storage, and Offloading (FPSO) vessel in the eastern half of the Stabroek Block; and— ultimately—Project decommissioning. … “The initial production is expected to begin by end of 2025–early 2026, with operations continuing for at least 20 years. …. The FPSO will offload produced crude oil to conventional oil tankers on a regular basis. ….. Crude oil will be pumped from the FPSO storage tanks to the offloading tanker using a floating hose at a rate of approximately 1 million barrels (160,000m3) of oil in approximately 24 hours.” It is well understood that the combustion of petroleum products derived from crude oil is an indirect effect on the environment of proposed fossil fuel development projects. After EEPGL pumps oil into conventional oil tankers, it would be transported to petroleum refineries for the production of transportation fuels. Owner of cars and other vehicles would combust the transportation fuels, resulting in substantial indirect emissions of CO2. However, the EIA provides information only about the much smaller direct emissions of the proposed project. Page 6-36 states: “The primary sources of GHG emissions are the combustion turbines and flares on the FPSO, with smaller amounts from other fuel combustion sources. GHG					

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			emissions were calculated in three parts: the quantity of carbon dioxide (CO2) in the fuel that is emitted directly as CO2; products of combustion of various fuel components based on the potential for each component to contribute to GHG emissions; and the CO2-equivalent (CO2e) emissions of other emitted compounds such as methane and nitrous oxides. Emission factors from the AP-42 document noted above were used to calculate the combustion-related GHG emissions (USEPA Undated). "As shown in Table 6.1-19, GHG emissions will occur during all three of the time periods considered for atmospheric emissions. In the first time period (characterized by drilling and installation activities), GHG emissions will be relatively low. In the second time period, drilling will still be ongoing, commissioning and start-up will occur, and production operations will begin. "In the last time period, production operations will be ongoing, potentially with continued development drilling for up to 5 years. This period has an estimated average annual pre-mitigation GHG emission level of 1,328 kilotonnes of CO2e emissions per year for the Design Case and 1,613 kilotonnes of CO2e emissions per year for the Modeled Case; these average annual GHG emission rates during the third time period are the focus for the remainder of this assessment. GHG emissions during the decommissioning stage will be relatively low, comprising emissions principally from decommissioning vessels." Indirect emissions of the proposed Yellowtail development project can be estimated on the basis of its oil production rate, which, according to Table 2.7-1 is estimated to be 250,000 barrels per day.					

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Production rate of 250,000 barrels per day is equivalent to a production rate of 91.2 million barrels per year. The average CO2 emissions from production and eventual combustion of crude oil (including its refined products) is estimated at 0.43 metric tons CO2/barrel.1 Therefore, CO2 eamissions of the project, including indirect emissions, would be roughly 39 million metric tons of CO2 per year2 – nearly 25 times higher than the 1,613 kilotonnes of CO2e emissions EEPGL has presented to decision-makers in the EIA. Indirect emissions of 39 million metric tons of CO2 per year would have substantial impacts on human beings that EEPGL has not disclosed. In July of 2021, the number of expected deaths caused by the emission of one additional metric ton of CO2 was published in a study based on research conducted at the Columbia University School of International and Public Affairs: The study states the following: “In this study, we create an extension to DICE-2016 called DICE-EMR (Dynamic Integrated Climate-Economy Model with an Endogenous Mortality Response). We construct an additional reduced-form mortality damage function that projects the effect of climate change on the mortality rate using estimates from studies chosen from an interdisciplinary systematic research synthesis of the scholarly literature …. We use DICE-EMR to produce a new metric that avoids some of the limitations of the SCC: the mortality cost of carbon (MCC). The 2020 MCC is the number of expected temperature related excess deaths globally from 2020 to 2100 caused by the emission of one additional metric ton of carbon-dioxide equivalent emissions in 2020. “We find that optimal climate policy in DICE-EMR, however, involves					

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			large immediate emissions reductions and full decarbonization by 2050. This results in 2.4 °C warming by 2100. “If the world undertakes the optimal emissions path in DICEEMR and restrains global average temperatures to 2.4 °C, we largely avoid the temperatures where marginal increases in temperature resulting from a marginal emission today are most damaging. Therefore, the SCC and the MCC are highly sensitive to future climate policy. On the optimal emissions path the 2020 MCC drops by 53% from 2.26 × 10−4 lives per metric ton in the baseline emissions scenario to 1.07 × 10−4 lives per metric ton (**see Table 1, Appendix A**). This implies that under DICE-EMR’s optimal climate policy, adding (reducing) 9,318 tons of carbon dioxide …. causes (reduces) one excess death globally between 2020 and 2100. ….” This allows us to calculate the number of lives that would be lost if the Yellowtail Development Project is implemented. If the world undertakes an optimal emissions path and restrains global average temperatures to 2.4 °C by 2100, then emissions of 39 million metric tons of CO2 per year would be associated with more than 4000 lives lost over a subsequent eighty-year period. If the Yellowtail Development Project maintains a 250,000 barrels per day production rate for 20 years, then such emissions would be associated with a loss of more than 80,000 lives as a result of climate change. Direct emissions of the project, although much smaller - 1,613 kilotonnes of CO2e emissions per year for the Modeled Case – would still be associated with a significant loss of life: more than 3400 lives lost

			if the Yellowtail Development Project persisted for 20 years.					
249	15-Dec-2021	The Environmental Law Alliance Worldwide Science Team Submitted by Mark Chernaik, Ph.D	**The EIA fails to disclose how the proposed project is inconsistent with Guyana's international obligations under the Glasgow Climate Pact.** In November of 2021 at the 26th Conference of the Parties (COP26) to the United Nations Convention on Climate Change (UNFCC), countries around the world re-affirmed their commitment to hold the increase in the global average temperature to well below 2 °C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5 °C above pre-industrial levels.6 Specifically, at COP26, the Conference of the Parties agreed to the Glasgow Climate Pact, which includes the following provisions: "15. Reaffirms the long-term global goal to hold the increase in the global average temperature to well below 2 °C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5 °C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change; "16. Recognizes that the impacts of climate change will be much lower at the temperature increase of 1.5 °C compared with 2 °C, and resolves to pursue efforts to limit the temperature increase to 1.5 °C; "17. Also recognizes that limiting global warming to 1.5 °C requires rapid, deep and sustained reductions in global greenhouse gas emissions, including reducing global carbon dioxide emissions by 45 per cent by 2030 relative to the 2010 level and to net zero around mid-century, as well as deep reductions in other greenhouse gases; 18. Further recognizes that this requires accelerated action in this critical decade, on the basis of the	Any tax-related agreements between the Stabroek Block co-venture partners and the Government of Guyana are beyond the scope of the EIA and should be referred to the Government of Guyana. 			best available scientific knowledge and equity, reflecting common but differentiated responsibilities and respective capabilities and in the context of sustainable development and efforts to eradicate poverty; 19. Invites Parties to consider further actions to reduce by 2030 non-carbon dioxide greenhouse gas emissions, including methane; 20. Calls upon Parties to accelerate the development, deployment and dissemination of technologies, and the adoption of policies, to transition towards low-emission energy systems, including by rapidly scaling up the deployment of clean power generation and energy efficiency measures, including accelerating efforts towards the phasedown of unabated coal power and phase-out of inefficient fossil fuel subsidies, while providing targeted support to the poorest and most vulnerable in line with national circumstances and recognizing the need for support towards a just transition ….” Oil Change International defines a fossil fuel subsidy as follows: “A fossil fuel subsidy is any government action that lowers the cost of fossil fuel energy production, raises the price received by energy producers, or lowers the price paid by energy consumers. Essentially, it’s anything that rigs the game in favor of fossil fuels compared to other energy sources. “The most obvious subsidies are direct funding and tax giveaways, but there are many activities that count as subsidies – loans and guarantees at favorable rates, price controls, governments providing resources like land and water to fossil fuel companies at below-market rates, research and development funding, and more.”8 There is ample evidence that EEPGL receives subsidies that the Glasgow Climate Pact now requires					

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			countries to phase-out, and that the President of Guyana states must be removed. For example, the Institute for Energy Economics and Financial Analysis (IEEFA) has reported: "The Guyanese government has granted a tax concession to three companies (ExxonMobil, Hess and the China National Offshore Oil Company) that are drilling under the Stabroek oil profit-sharing agreement. The tax concession absolves the companies from paying annual income taxes to the Guyana government—taxes that other Guyanese companies and citizens would be required to pay. "The agreement with the companies establishes that the income made by the companies in Guyana is taxable under Guyana law. The normal corporate tax rate is 25%. The contract, however, requires the government of Guyana to pay the annual tax for the companies." In order to determine whether the proposed Yellowtail Development Project is consistent with the Glasgow Climate Pact and the Statement of the President of Guyana at the COP26 meeting, the EIA for the project must disclose the fossil-fuel subsidies it would receive.					
250	15-Dec-2021	The Environmental Law Alliance Worldwide Science Team Submitted by Mark Chernaik, Ph.D	**The EIA fails to contain required information about the effects of the elimination of waste associated with the proposed project and measures to mitigate adverse effects of the proposed onshore disposal of such waste.** Section 11(5)(c) of the Environmental Protection Act requires the following: "(5) Every environmental impact assessment shall contain the following information— "(c) a description of the likely significant effects of the proposed project on the environment resulting from—	To clarify, EIA Table 2.13-8 provides a summary of the estimated quantity of waste that would be generated by the Project during the referenced years—not all of which would be disposed in onshore facilities. No hazardous waste would be disposed in the HBL prior to treating such waste to render it non-hazardous. With respect to the potential impacts of Project waste generation on Guyana resources, EIA Section 8.6, Waste Management Infrastructure Capacity, is entirely devoted to the assessment of these impacts on Guyana's waste management infrastructure capacity. While the referenced excerpt from Section 8.6.2.3, Industrial/Hazardous Waste Management Facilities, describes the existing waste management infrastructure, the remainder of the section discusses the analysis of the capacity of this infrastructure in the context of its ability to accommodate Project waste generation as well as the other anticipated waste management demands of non-Project users. Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			the existence of the project; the use of natural resources; the emission of contaminants, the creation of nuisances and the elimination of waste." EEPGL proposes to use Guyana as a permanent depository of toxic wastes it would generate from offshore oil & gas activities associated with the Yellowtail Development Project. For example, with respect to oil bilge tank sludge, page 2-48 of the EIA states: "2.7.4.8. Bilge Water System "The bilge system is provided to dispose of oily water residue that may accumulate in machinery spaces and in various bilges throughout the vessel due to condensation, washing, maintenance, etc. It is also capable of controlling limited flooding in the aft machinery space, e.g., as a result of damage to piping systems. Bilge water collected in the machinery space bilge wells, doublebottoms, voids, cofferdams, etc., is transferred to the bilge holding tank using the oily bilge pump. Bilge water is sent from the bilge holding tank to the bilge water separator unit for oil/water separation, with separated water (with low oil-in-water content) passing through an OCM package for automatic monitoring of oil-in-water content prior to overboard discharge. In the event that the OCM package detects an oil-in-water content above 15 ppm, the overboard discharge line will close and the recirculation line will open automatically; the off-specification bilge water will then be recirculated to the Bilge Holding Tank. Separated oil is sent to the oily bilge tank. Sludge from the oily bilge tank is pumped periodically to a supply vessel, or tote tank, for ultimate onshore disposal."				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Table 2.13-8 on page 2-90 of the EIA (Summary of Estimated Annual Generation for Project Wastes that will be Managed Onshore) discloses that 5630 tons of hazardous waste would be shipped to Guyana for onshore disposal in 2024 and 2025. The impact on Guyana of the onshore disposal of more than 5000 tons of hazardous waste in 2024 and 2025 is not assessed in the EIA. However, page 8-161 of the EIA contains the following admission: "There is a limited number of facilities for the treatment of hazardous and industrial waste in Guyana, although the construction and proposal of additional such facilities are growing commensurate with the planned expansion of oil and gas activities. Tiger Rentals Guyana Inc. (TRG), located at the Guyana Shorebase Inc. (GYSBI) facility, is currently the primary provider of hazardous and non-hazardous waste treatment services in Guyana. TRG employs a variety of waste treatment technologies (sorting/segregation of recyclables, physical/chemical/thermal treatment of hazardous and non-hazardous wastes), discharges its treated fluids as permitted to the Demerara River, and sends its treated non-hazardous solid waste as well as other wastes received (including general waste, paper/cardboard, and scrap wood) to the HBL."					
251	15-Dec-2021	The Environmental Law Alliance Worldwide Science Team Submitted by Mark Chernaik, Ph.D	**The EIA contains no information about how bringing more hazardous waste from the Yellowtail Development Project to TRG located at the GYSBI would impact the environment of Guyana, including water quality of the Demerara River, which flows past Georgetown.** It is important to note that the Guyana EPA waived a requirement that TRG submit an EIA for its activities.10	Under the Environmental Protection Act, permitting of third-party onshore support facilities, including hazardous waste management facilities, is a separate process from the Yellowtail EIA and authorization process. With respect to the provision of the referenced CWMP, this document has been approved by the EPA and is publicly available on the EPA's website.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Section 11(5)(g) of the Environmental Protection Act requires the following: "(5) Every environmental impact assessment shall contain the following information— (g) a description of the measures which the proposed developer intends to use to mitigate any adverse effects and a statement of reasonable alternatives (if any), and reasons for their rejection; The EIA fails to contain a description of the measures which EEPGL intends to use to mitigate adverse effects of its generation and onshore disposal of hazardous waste. Instead, EEPGL proposes to defer such description until later and place it outside the scope of the EIA for the proposed Yellowtail Development Project. Page 2-75 of the EIA states: "All waste streams for the Project will be managed in accordance with a Comprehensive Waste Management Plan (CWMP) that will be used for the management of all EEPGL waste. The CWMP will be subject to final approval by the EPA. The CWMP is under development as of the time of this EIA, with an anticipated submittal to the EPA in 4Q2021." Failure to include in the EIA for the proposed project a Comprehensive Waste Management Plan (CWMP) that will be used for the management of all EEPGL waste is contrary to the requirement of Section 11(5)(g) of the Environmental Protection Act.					
252	15-Dec-2021	The Environmental Law Alliance Worldwide Science Team	**The impacts of an extended, large-scale, active oil and gas extraction project will not be negligible or positive for marine mammals.** The Environmental Impact Assessment (EIA) for the Yellowtail project explains the impact summary	The types of impacts of noise on marine mammals discussed by Duarte et al. (2021), e.g., injury, disturbance, and masking, are evaluated in EIA Section 7.5.3, Impact Assessment—Marine Mammals. The types of potential impacts of noise on marine mammals and their geographic extents, frequencies of occurrence, durations, and intensities are discussed in EIA Section 7.5.3.3, Characterization of Impacts—Injury or Disturbance from Underwater Sound. Section 7.5.3.3 and Appendix H, Underwater Sound Modeling Report, describe the quantitative sound modeling that forms the basis for the objective assessment of sound impacts on marine mammals. The intensity of	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			table for marine mammals as follows: "Table 7.5-15 summarizes the assessment of potential pre-mitigation and residual Project impacts on marine mammals. The significance of impacts was rated based on the general impact assessment methodology described in Chapter 4, as well as the marine mammals-specific methodology described in Sections 7.5.3.2 and 7.5.3.3." In essence, the Table tells the reader that there are no serious impacts to marine mammals from this oil and gas development project. And the very real concern of light pollution is—without offered evidence—flipped to be a positive impact. This characterization is not accurate. The impact of sound in the ocean on marine species was reviewed recently by Duarte et al. (2021) in the premier scientific journal Science (Figure 1, Appendix A). In their review, the authors concluded that "…construction and operation of oil and gas infrastructure (e.g., platforms, pipelines) increase anthrophony (56). [Anthrophony is defined as, "sounds generated by human activities." The dynamic positioning systems (i.e., propellers and thrusters) used to maintain the position of offshore structures, such as drilling platforms, produce low-frequency noise (57)." They reviewed 538 studies on the effects of noise on marine mammals. The authors stated, "There was high confidence that anthropogenic noise negatively affected marine animals. The evidence was strongest for marine mammals, for which 85 to 94% of quantitative studies found significant effects…" Many of the activities studied were directly or	potential impacts on marine mammals from underwater sound is defined according to the definitions provided in Table 7.5-5. Based on the definitions of receptor sensitivity levels provided in Table 7.5-6, the representative marine mammal assumed to be the receptor for potential impacts of noise is considered to have a Medium sensitivity. Following the methodology described in Chapter 4, Methodology for Preparing the Environmental Impact Assessment, the assumed sensitivity rating and the various magnitude ratings of potential impacts on marine mammals from sound led to the significance ratings summarized in Table 7.5-15. The Duarte et al. 2021 paper is a literature review that cites multiple other studies to conclude that antrophony generally has the potential to negatively affect a variety of marine life. This is consistent with the findings of the EIA, which acknowledges and quantifies the range at which these impacts could occur. Unlike Duarte et al. (2021), the findings of the EIA are supported by quantitative analysis that accounts for the unique location and equipment specific to the Yellowtail Project. The conclusion that the Project would have minor residual acoustic impacts on marine mammals is consistent with independent assessments conducted by the U.S. Minerals Management Service (MMS), National Oceanographic and Atmospheric Administration (NOAA), and Bureau of Ocean Energy Management, which determined that oil and gas activities since the 1970s had no had lasting effects on marine mammal populations. These studies are referenced in EIA Section 7.5.3.3, Characterization of Impacts—Injury or Disturbance from Underwater Sound. It is also noteworthy that the MMS and NOAA study reached this conclusion while including activities that predated the Joint Nature Conservation Committee (JNCC) guidelines, which have been accepted as industry best practice for managing acoustic impacts on marine mammals, and which the Consultants have recommended be applied to the Yellowtail Development Project. Artificial lighting on the FPSO and the concentration of food resources it would be expected to cause would represent changes to the natural environment in the immediate vicinity of the FPSO. EIA Section 7.5.3.5, Characterization of Impacts—Artificial Lighting, explicitly states that this effect would be limited to the immediate vicinity of Project vessels. While these changes would represent departures from baseline conditions in a small part of the AOI, it is the Consultants' opinion that concentrating food resources for a predator would represent an overall benefit to the predator species. This is the basis for rating the impacts of artificial lighting on marine mammals as positive. The potential for cumulative impacts on marine mammals is evaluated in Chapter 10, Cumulative Impacts, and recommendations to minimize cumulative impacts to marine mammals are included in Section 10.7.2.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			indirectly connected to oil and gas production. This kind of scientific analysis makes it difficult to find the EIA's conclusions of negligible impact credible. In addition to the substantial evidence gathered by Duarte et al. (2021), one of the central reasons why we can be fairly certain that the impact is not negligible is the sheer scale at which it is occurring. Figure 2 (See Appendix A) from their paper shows the spatial and temporal extent of the impact for oil and gas production. The EIA does not take this long-term, cumulative impact into account. The project is meant to include, "…drilling of approximately 41 to 67 development wells; installation and operation of Subsea, Umbilicals, Risers, and Flowlines (SURF) equipment; installation and operation of a Floating Production, Storage, and Offloading (FPSO) vessel; and ultimately, Project decommissioning." These actions will produce varying sounds over many years, an impact that cannot be simply written off as minor. The project proponents are aware that this impact is significant. The EIA states: "Underwater sound can potentially cause a variety of impacts on marine mammals, such as behavioral changes in life functions (e.g., feeding, breeding, migration route deviations) or direct physical impacts affecting auditory systems." Why, then, they have not adequately evaluated this known, dangerous impact to marine mammals begs asking.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
253	14-Dec-2021	Dr. Erik E Cordes	1. In general, I found the sections of the EIA I reviewed, like most projects at these depths (> 1000 m), to be missing critical information that is required to make an informed decision on the potential impacts of the proposed project. Very little data about the distribution of potentially sensitive species is provided, particularly for the benthic organisms that likely occur in the area. In addition, I found large parts of the EIA difficult to assess because of the poor quality of the maps provided. There was no position information (latitude and longitude) provided on the axes and the bathymetric data were extremely low resolution, which resulted in very wide-spaced depth contours in the images. Certainly, EEPGL and its partners have higher-resolution multibeam ecosounder (MBES) data in the project area, as well as high-resolution seismic reflectivity data that could reveal the presence of hard substrate in the vicinity of the proposed site. 2. In section 3.1.3., there is one particularly glaring statement that cannot be justified with the information presented: “While the mortality rate of immobile taxa individuals from physical disturbance resulting from installation of the subsea infrastructure will be high, the population is not anticipated to be sensitive to the reduction in individuals within the limited area affected.” I cannot imagine how they can reach this conclusion without any data on the population size of potentially sensitive species (see below) inside the area of impact and in the region. 3. Section 6.3.2.2. Here we see some effort to provide higher resolution bathymetry, which	1. The multi-beam echo sounder (MBES) data referenced in the comment was collected during the Yellowtail geophysical study referenced in EIA Section 6.2.2.2, Marine Stratigraphy, and is depicted in Figure 6.3-2. Figure 6.3-2 is low resolution because it is meant to show the results of the hard seafloor feature (HSF) survey across the entire Yellowtail survey area, which encompassed a much larger area than the Yellowtail PDA (although the Yellowtail PDA was located entirely within the survey area). The survey also produced much higher resolution imagery than is depicted in the main image in Figure 6.3-2, and analysis of this higher resolution imagery informed the conclusion in EIA Section 6.2.2.2 that no HSFs were detected in the Yellowtail PDA. This high-resolution analysis did detect HSFs as the comment suggests, but not within the Yellowtail PDA. For clarity, Figure 6.3-2 has been edited to include an inset of high resolution black and white imagery showing an area of high-density HSFs to the north of the Yellowtail PDA that were detected during this survey. EIA Section 7.9, Marine Benthos, discusses the presence of relatively sensitive species that are often associated with HSFs, but these are not discussed in detail because as stated earlier in Section 6.2.2.2 of the EIA, there are no reasonably foreseeable pathways for potential impacts on these features (or their biological communities) from planned Project activities. 2. Since geophysical data from the Yellowtail PDA and surrounding areas suggest that HSFs do not occur within the Yellowtail PDA, any populations of relatively sensitive immobile benthic organisms in the vicinity of the Project are therefore very likely also located outside the Yellowtail PDA. Accordingly, even if a small number of sensitive organisms occur within the PDA and most of these individuals were to be killed or injured by installation of the SURF, impacts at the population level would be very low because the core habitats for these species are outside the area of seafloor that would be affected by Project activities. 3. The MBES data depicted in Figure 6.3-2 were acquired from a series of 146 AUV dives. The primary line spacing was 150 meters (492 feet) and the AUVs were flown at a 40-meter (131-foot) altitude. AUV data were acquired within and outside of the Yellowtail PDA. The purple areas in Figure 6.3-2 do indicate HSFs, which the Consultants have clarified by including a higher-resolution inset in Figure 6.3-2. The closest area of HSF habitat to the Yellowtail PDA is approximately 2 kilometers (1.2 miles) to the northeast of the PDA. However, as described in EIA Section 7.9.3, Impact Assessment—Marine Benthos, and depicted in Figure 7.9-17, hydrodynamic modeling predicts that impacts of subsea activities (primarily smothering from drill cuttings deposited on the seafloor) would be expected to be minimal beyond 500 meters (1,640.4 feet) from a wellhead. 4. The text from EIA Section 7.8.2.1, Targeted Surveys of Deepwater and Offshore Pelagic Fish Community, quoted in the comment applies to a single type of fish sampling, specifically baited demersal trapping. Although this type of sampling did not collect fishes beyond 1,000 meters (3,281 feet), other survey techniques, including pelagic longlining, drop camera surveys, and incidental observations by PSOs have documented a variety of fish species in the deepwater portions of the Stabroek Block, including (as described in EIA Section 7.8.2, Existing Conditions—Marine Fish) grenadiers, rajiform fishes, tripodfish, eelpout, Robinson’s hagfish, sharptailed eel, and lanternfish. This species list is not as extensive as	Yes	Accepted	N/A	1. p. 6-54

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			indicates that EEPGL have access to these data. From this low-resolution version of the image, it is still apparent that there are submarine canyons in the area and possibly some hard-substrate areas near the project location. There is also one small area covered by side-scan sonar outside of the proposed project site. Were there no autonomous underwater vehicle (AUV) side-scan data acquired within the project area? These data would reveal areas of high relief that likely represent hard substrate habitats in the vicinity. There are also some areas delineated in purple on the map. I suspect that they represent areas of high surface acoustic reflectivity interpreted from the back-scatter of MBES data or from the 3D seismic data that surely exist for this project. These kinds of signals almost invariably indicate the presence of hard-substrate areas. If that is what they are, they are very close to the proposed site, possibly within 2 km, if I am interpreting the grid on the map correctly. 4. Section 7.8.2.1. Here is an instance where the general paucity of data for the area around the proposed site is apparent: "No fish were captured deeper than 1,000 meters." (p. 7-183). While there are exceedingly few studies of the deep-sea fauna of Guyana in the published literature (I had difficulty finding any public records, which in itself is telling), in a study of the deep-sea fishes off of the northern coast of Brazil (de M. Klautau et al. 2020, Neotropical Ichthyology) a total of 30 fish species are listed with a bathymetric distribution that exceeds 1000 m depth, and	the list from Brazil cited in de M. Klautau et al. (2020), but considering the substantial effort that has been expended to date sampling the deepwater environment in and around the Yellowtail PDA, the Consultants consider the comparative lack of deepwater fishes in the Stabroek Block as indicative of a sparse and widely dispersed fish community rather than an incomplete sampling effort. 5. The Consultants agree with some of the points made by the commenter regarding deepwater corals (e.g., the likely presence of additional coral colonies in unsurveyed portions of the Stabroek Block, and the uncertainty regarding whether the corals on the continental shelf are recovering). However; the seafloor imagery presented in EIA Section 6.2.2.2, Marine Stratigraphy, and the hydrodynamic modeling analysis presented in Section 7.9.3, Impact Assessment—Marine Benthos, strongly indicate that the hard seafloor areas required by these corals to attach and grow do not occur in sufficiently close proximity to the Yellowtail PDA to be negatively affected by the Project. 6. As the commenter suggests, the HSFs described in EIA Sections 6.2.2.2 and 7.9.3 are very likely associated with seeps, and were described as such in detail in the Fugro 2019 hard seafloor report, which was cited as a source document in the EIA. This report was also submitted to the EPA in its entirety as an appendix to the Payara Development Project EIA. The origin and nature of the HSFs are not discussed in detail in the Yellowtail EIA because, as described above, HSFs do not occur in close proximity to the Yellowtail PDA, and the Project would not significantly impact hard seafloor habitat that has been mapped outside the Yellowtail PDA. 7. It is true that the communities that colonize anthropogenic structures are not necessarily the same as those that occur on natural habitats. This is particularly true of the Yellowtail Development Project because, as demonstrated by the MBES data and the hydrodynamic analyses described in the responses above, the benthic communities that would be impacted by the Yellowtail Project are soft substrate communities, consisting primarily of burrowing and sifting organisms. The hard-bottom species that are likely to colonize the SURF occur only on hard substrates and are therefore more habitat-limited than soft-bottom species that can occur across a much wider expanse of the Stabroek Block seabed. In this sense, the Project would provide a benefit for the most sensitive benthic organisms.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			it is highly likely that the majority of these also occur off of Guyana, as deep-sea fishes in general have a very wide distribution. This demonstrates that their sampling of this community was obviously incomplete. 5. Section 7.9.2.2. Some of the statements in this section confirm some of my suspicions about the true abundance of sensitive species in the project area. In numerous places in this section (starting on p. 7-223), the presence of deep-sea coral species is mentioned, including the reef-forming species Madrepora oculata and Solenosmilia variabilis, as well as long-lived black corals (some colonies have been determined to be over 1000 yrs old,). Their presence is later dismissed by saying "it is unknown whether the corals represent the remnant of a long-established population or a nascent recovery of a previously degraded community." (p. 7-244). I cannot think of a way to reach the conclusion that these are just "remnant" populations or indications of "nascent recovery" of a past population, both of which suggest a small population and one that has suffered a drastic decline at some point in the recent past. There is also a relatively long list of coral species on p. 7-245, and clear pictures of hard substrates and corals in Fig. 7.9-13 and 7.9-14. Based on my 10+ years of experience with photographic surveys from AUVs, this certainly indicates that there are more deep-sea coral populations that remain to be discovered. Interestingly, the corals in Fig. 7.9-10 do NOT look like black corals, but rather gorgonian octocorals. These						

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			samples, and likely many more obtained during the impact assessment surveys, should be examined by a true expert. 6. The image of the octopus in Fig. 7.9-11 looks a lot like a species of octopus that we see around cold seeps in the region. In this image, there are (what look to me to be) authigenic carbonate rocks and stained sediments that are indicative of a seep environment. I could not find any mention of natural gas or oil seeps or their associated communities in the assessment. However, there are historical records of seep species in the region, including the type-specimen of Lamellibrachia luymesi (from lat 8.0167, long -57.4). This is a seep tubeworm (a close relative of the giant tubeworms at hydrothermal vents) that can live for over 200 years (Cordes et al. 2003, Ecology Letters) and is identified as one of the key indicators of sensitive seep habitats in the Gulf of Mexico. This species, along with many other seep and coral species, is therefore protected by the exclusion of any oil and gas activity within or near areas of "seismic anomalies" which are acoustically-reflective areas of the seafloor that indicate hard substrates (see U.S. Minerals Management Service Notice to Lessees No. 2009-G40). I am confident that the proponents have the 3D seismic data to locate these areas, but it is not presented here. 7. Finally, in section 7.9.3.5, the proponents describe the creation of hard substrate in the form of seafloor infrastructure as a reasonable replacement for any loss of hard substrate by burial from drill cuttings or other activities. This is simply not an					

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			acceptable one-for-one trade since the communities that colonize anthropogenic structures will not necessarily be the same as those on natural habitats. In conclusion, my recommendation is that additional data are required to properly evaluate the potential impacts of the proposed project. Without higher resolution multibeam bathymetry along with MBES backscatter or seismic reflectivity data, and review of imagery by experts, the EIA is deficient and the EPA does not have the scientific and technical information required to make an informed decision about the potential impacts of the proposed project in the Stabroek block. The distribution and abundance of hard substrata, and a complete assessment of the distribution and abundance of hard substrate fauna, including deep-sea corals and cold-seep endemic fauna (chemosynthetic tubeworms and mussels), are required before any conclusions about the impacts on regional populations of sensitive benthic species can be reached. Without this information, this project is highly likely to have greater impacts than those indicated here.					
254	15-Dec-2021	Malinda Janki	Ms Janki has attached the following studies which are incorporated into the matrix. For reference, please see below list of studies along with points extracted and presented in her submittal:	N/A	No			N/A
255	15-Dec-2021	Malinda Janki	**Dr Erik Cordes is an Associate Professor and Vice Chair of Biology at Temple University in Philadelphia.** He is an expert i.e. a person who is qualified, has over 20 years' experience of deep sea ecology hydrocarbon seeps, and is recognised by his peers as an expert. He has been chief scientist on 10 research cruises. His details	Detailed responses to each of Dr. Cordes' comments are included in Comment #253.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			are here https://schmidtocean.org/person/erik-cordes-pi/ Dr Cordes' report states that the sections of the EIA that he reviewed are, "missing critical information that is required to make an informed decision." For example, he points out the paucity of the data relating to fish. You will be aware of the recent collapse in fishing stocks as evidenced by the testimony of Guyana's fishing community and therefore of the need to have accurate and up to date information in order to protect marine wildlife. Dr Cordes' recommendation is that, "additional data are required to properly evaluate the potential impacts of the proposed project." His conclusion is that, "… the EIA is deficient and the EPA does not have the scientific and technical information required to make an informed decision about the potential impacts of the proposed project in the Stabroek Block." Dr Cordes also warns that without this information the Yellowtail project is highly likely to have greater impacts than those indicated.					
256	15-Dec-2021	Malinda Janki	**ELAW Comments on Marine Mammals as treated in EIA vol 1 rev 0 Yellowtail Development Project** I attach a review from the Environmental Law Alliance Worldwide Scientific Team. The team includes Dr Heidi Weiskel a marine expert. Her information is here: https://elaw.org/users/heidi-weiskel The ELAW science team point out that ERM's conclusions are incorrect and unsupported by evidence. ERM claims that the impact of the proposed Yellowtail Project will be negligible. ELAW points to a review of 538 studies of the effects of noise on marine mammals. They conclude	EIA Section 7.5, Marine Mammals, concludes that the potential adverse impacts of the proposed Project would range from Negligible to Minor and include a positive impact. Regarding the methodology used to reach these conclusions, see the response to Comment #252.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			that, "This kind of scientific analysis makes it difficult to find the EIA's conclusions of negligible impact credible." According to the ELAW review, ERM reviewed these studies. In that case the EPA must seriously question the competence of ERM in reaching a conclusion of 'negligible' impact that is contradicted by the science that ERM reviewed. This is particularly blatant as ERM admits that there is 'high confidence that anthropogenic noise negatively affected marine animals." The devastating impact of sound on marine mammals is no longer a matter of specialist scientific knowledge but has made its way into general and public knowledge. This is a matter of grave public concern given the rich marine life in the area, including rare and endangered cetaceans. The ELAW review also points out that the EIA treats light pollution as a positive impact not a negative impact.					
257	15-Dec-2021	Malinda Janki	**Evaluation of the EIA for the Proposed Yellowtail Development Project: Dr Mark Chernaik** I attach an independent review by Dr Mark Chernaik a science expert as well as a respected lawyer. Dr Chernaik's opinions have been cited in courts in various jurisdictions. Dr Chernaik points out that the EIA: 1. fails to address the indirect impacts of greenhouse gas emissions. 2. fails to disclose how the inconsistency with the Glasgow Climate Pact; and 3. fails to contain the required information about waste. • Study: Soundscape of the Anthropocene: Duarte et al.	Responses to the ELAW comments enumerated in items (i) through (iii) are provided above (Comments #248 to #250). 			I attach the above study which is referred to in the ELAW Comments.					
258	14-Dec-2021	WWF	• Guyana has committed to transitioning to renewable energy. • Guyana established several targets in its Nationally Determined Contributions to the UNFCCC to limit carbon emissions. • Guyana faces the reputational risk over the perception that it is forsaking a low-carbon and sustainable future through the way it is embracing the oil and gas industry. • The country's carbon emissions have increased because of gas flaring, and it has now become a carbon emissions exporter as a result of the offshore oil and gas development. **Supplemental Discussion:** Guyana has committed to transitioning to renewable energy to meet the demands of its households and the private sector; and established several targets in its Nationally Determined Contributions to the UNFCCC to limit carbon emissions. This goal in the wake of the recently launched new Low Carbon Development Strategy is timely and relevant particularly in the context of the recent IPCC report in which leading climate scientists have warned that there is only 12 years remaining for global warming to be kept to a maximum of 1.5 degrees Celsius. Beyond this, the risk will be worsened especially for most of the population that currently reside on the low coastal plain below sea level, for severe droughts, floods, extreme heat and poverty. However, Guyana faces the reputational risk over the perception that it is forsaking a low-carbon and sustainable future through the way it is embracing the oil and gas industry. And there is the reality that the country's carbon emissions have	The Consultants acknowledge the comment. Evaluation of the Government of Guyana's strategy for addressing its commitments under its international agreements is not within the scope of the EIA.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			increased because of gas flaring, and it has now become a carbon emissions exporter because of the offshore oil and gas development. Further, the displacement of mangroves (approx. 40 acres) along the mouth of the Demerara River for downstream oil and gas shore-based development, causing the displacement of some 11,000 tonnes of carbon dioxide to be released into the atmosphere, shows how some developers in the oil and gas industry are demonstrating low interest in keeping to their promises and acting in good faith at the very least, and at times, even flouting the nation's laws.					
259	14-Dec-2021	WWF	**Ratings are "romanticized" in the ESIA; for instance, GHG emissions are set to rise 24-30% (!), and the impact varies between "negligible" and "moderate".**	EIA Sections 6.1.3, Impact Assessment—Air Quality, Climate, and Climate Change, and 6.1.4, Management Measures—Air Quality, Climate, and Climate Change, describe the methodology used to assign impact significance ratings for potential impacts on climate / climate change. As described in these sections, the Negligible impact significance rating was assigned for the drilling and installation stages of the Project, during which GHG emissions would be relatively low. During the production operations stage, the estimated average annual GHG emission levels would be comparatively higher and the duration of this stage would be much longer; accordingly, the production operations stage average annual GHG emission rates are the focus of the assessment. For this stage, an impact significance rating of Moderate was assigned. This is based on a balancing of the following factors: (1) the referenced increase in national Guyana GHG emissions represented by the Project, taking into account that the mitigated emissions represent a relatively small percentage decrease of Guyana's net removals; (2) the fact that the Project would have applied technologies aligned with good international oil field practice to reduce GHG emissions; and (3) the fact that climate change nonetheless remains an issue of global importance.	No	Justification to be provided in the revised EIA	The justification for the residual significance ratings assigned for potential impacts on climate change during the production operations stage – including all of the points referenced in the comment response - is provided in Section 6.1.4.	N/A
260	14-Dec-2021	WWF	• Independent Technical Monitoring Needed • A lot of measures come down to adhering to standards, proper maintenance, and communication. This information is not provided. What kind of standards? What kind of maintenance (precision, predictive, preventive?) How is communication done from shift to shift? • Institutions charged to monitor oil exploration and exploitation lack	EEPGL employs an Operations Integrity Management System (OIMS) and Controls Integrity Management System to reduce environmental risks and increase production performance. OIMS has been certified by Lloyd's Register Quality Assurance to comply with the requirements of the international standards for Environmental Management Systems, ISO 14001:2015 and Occupational Health & Safety Management Systems, ISO 45001:2018. Training of and communications between personnel is covered by OIMS. Maintenance strategy and programs would be developed during Project planning and design and would continue to evolve during production.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			the capability to match the companies involved in the industry, independent monitoring will ensure adherence to mitigation actions and 'embedded controls' proposed in the ESIA. This was manifested in the flaring of gas which occurred at an alarming rate during the latter part of 2020 and the earlier part of this year on Exxon Mobil's first Oil and Gas Platform in the Stabroek Block. • 3rd parties being allowed to audit the degree of compliance with standards (international, independent annual monitoring, during the project and more-so during the production phase onward, to ensure that activities are being implemented in the best possible ways, utilizing most updated technologies and the best available standards). This implies: • Strengthening Capacity of National Regulatory Institutions • Monitoring Safety risks • Monitoring environmental risks • Create a transparent and accountable sector. **Supplemental Discussion:** The rapid expansion in exploration, seismic surveys and production will have an impact on marine species and ecosystems, particularly in the event of an oil spill. This continuous and expanding development in the Exclusive Economic Zone of Guyana is occurring against the backdrop of an area that is poorly studied and understood, including from the perspective of biodiversity - ecosystem functioning. In addition, Guyana's inexperience, and limited preparedness to manage the industry, in particular to respond timely and adequately in the event of an oil spill, further present serious threats to livelihood and the marine/coastal ecosystems.	The Consultants acknowledge the comment. The Government of Guyana's institutional capacity to oversee the oil and gas industry is not within the scope of the EIA. See the response to Comment #346.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Cognizant of the fact that the institutions charged to monitor oil exploration and exploitation lack the capability to match the companies involved in the industry, WWF recommends that independent technical monitoring be conducted throughout the project to ensure adherence to mitigation actions and 'embedded controls' proposed in the ESIA. This is particularly important to us, given that the level of monitoring exercised in the previously approved projects in the Stabroek Block leaves a lot to be desired. This was manifested in the flaring of gas which occurred at an alarming rate during the latter part of 2020 and the earlier part of this year on ExxonMobil"s first Oil and Gas Platform in the Stabroek Block. We note in this current ESIA, that EEPGL proposes to re-inject recovered natural gas that is not used as fuel on the FPSO back into the targeted Project reservoirs for reservoir pressure management, which contributes to a significant reduction in potential GHG emissions versus that which would result from continuous gas flaring. Adherence to this proposal is paramount in our opinion. The same applies to the discharges where it is mentioned that they will be disposed of in keeping with applicable standards such as the World Bank Environmental Health and Safety Guidelines on oil and grease content. ---------- At the same time, we recommend that regulatory agencies be supported with independent technical monitoring (as their capacity is being built) to ensure adherence to mitigation actions and embedded controls proposed in the EIA, and utilisation of updated technologies. The goal of independent monitoring would be to drive continuous improvement in policies and practices since the					

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			reliance on a prescriptive regulation with inspection model would not be effective. The developers should then be required to adapt based on monitoring recommendations and accommodate upgraded technology and practices during the lifetime of the project.					
261	14-Dec-2021	WWF	**Strengthen the capacity of national regulatory institutions** • It is obvious that the expansion of the oil and gas industry in Guyana has outmatched the pace at which regulatory institutions are benefiting from strengthening their resource base in terms of personnel, technical knowledge, and financial resources. • It is critical for agencies to be able to access and secure necessary resources to help them exercise their authority and enable them to respond to the demands of industry expansion. Waste streams and their effects have been addressed individually in the ESIA, but what are the synergetic? **Supplemental Discussion: Capacity building for monitoring and regulating the sector and associated industries.** WWF reiterates what we have advocated for in comments made in relation to previous ESIAs, that strengthening the capacity of national regulatory institutions be made a priority. It is obvious that the expansion of the oil and gas industry in Guyana has outmatched the pace at which regulatory institutions are benefiting from strengthening their resource base - in terms of personnel, technical knowledge, and financial resources. It is critical for agencies to be able to access and secure necessary resources to help them exercise their authority and enable them to respond to the demands of industry expansion.	The Consultants acknowledge the comment. The Government of Guyana's institutional capacity to regulate the oil and gas industry is not within the scope of the EIA. However, EEPGL has indicated its willingness to work with the Government of Guyana to support technical and regulatory capacity building.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			-------- The developers suggest a vast number of best practices and standards for reducing impacts to the environment and people. However, the EPA and other regulatory agencies do not currently have the required capacity to ensure that standards and practices are implemented by operators in the sector. Capacity development in some areas is ongoing and this is a positive indication, but much more investment in this is needed to improve human resources and technical capacity. It still holds true that the pace at which the oil and gas industry is expanding in Guyana has outmatched the pace at which regulatory institutions are strengthening their capacities - in terms of personnel, having specialist staff in all relevant levels of expertise, technical knowledge and financial resources. It is critical for agencies to be able to access and secure necessary resources to help them exercise their authority and enable them to respond to the demands of industry expansion. Sufficient budget and technical expertise must be a priority if effective national oversight is to be achieved for the sector. Further, political leaders must work to ensure that the regulatory agencies are empowered, including maintaining autonomy, to be able to ensure stringent safety regulations are maintained. --------- We also recommend continued and strengthening of a coordinated approach among regulatory agencies, which is essential for proper management of the sector. Communication, strong leadership, resource sharing and strong political commitment and the platforms necessary to support this, are needed.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
262	14-Dec-2021	WWF	**Onshore land-use planning** • As discovered quantities of offshore hydrocarbon resources continue to grow, there will be a corresponding increase in the demand/competition for land and other onshore resources in the city and surrounding areas. • EPA, Georgetown Mayor and City Council, Local Government bodies including RDC and NDCs, GLSC, Central Housing and Planning Authority, Civil Defense Commission, Ministry of Natural Resources, Ministry of Public Works, GGMC, civil society, and other relevant stakeholders should come together and plan for the effective, fair, and transparent use of onshore spaces and resources. **Supplemental Discussion:** Yellowtail represents the 4th major offshore oil development in 5 years and as discovered quantities of offshore hydrocarbon resources continue to grow, there will be a corresponding increase in the demand/competition for land and other onshore resources in the city and surrounding areas that directly or indirectly result from the project. This has been acknowledged by the developer as well as the Guyana Lands and Surveys Commission (GLSC), within the EIA. This necessitates an urgent need to strengthen land/urban planning and implementing and enforcing high standards of practice - including addressing challenges experienced over the years relating to financing, equipment and human resources short falls, hindrances to cooperation among decision-making and responsible agencies, and low levels of transparency and accountability.	Increased demand for goods, services, and housing are considered in EIA Section 8.1, Socioeconomic Conditions, and Section 8.5, Social Infrastructure and Services, respectively. These sections recognize that increased demand could lead to increased prices and/or competition for resources. However, the nature of onshore land use planning processes (and multi-stakeholder involvement in planning processes) is beyond the scope of the EIA.	No	Accepted	N/A	N/A
263	14-Dec-2021	WWF	**Biodiversity offsets and biodiversity monitoring and evaluation programmes**	The assumption that critical habitat likely exists in the Project area is premature without a formal Critical Habitat Assessment (CHA). CHA is a unique element of EIAs conducted under the IFC Performance Standards,	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			International best practices necessitate that the developer implements additional safeguards – such as biodiversity offsets and appropriately designed, long-term biodiversity monitoring and evaluation programmes, since it is likely that critical habitats exist in the area (given the areas offshore Guyana have been described as ecologically and biologically significant). **Supplement Discussion: Biological considerations** The EIA assesses the impacts on marine benthos, sea birds, marine fish, marine mammals, marine turtles, and the general marine ecosystem as largely negligible to minor. We believe that this assessment gives the impression that the marine ecosystem and the fauna which inhabits it will remain largely unchanged despite the Oil and Gas activities being conducted in the region over the next 20 years. This conclusion seems to have been arrived at by focussing on the more immediate areas where the actual FPSO is located, rather than considering the wider seascape. Regardless of what the impacts are assessed to be, there is a need to compensate for it by supporting marine protected areas and having a robust response in the event a major oil spill occurs, since the impacts to biodiversity would be significant affecting other parts of South America and large portions of the Caribbean region. Ballast water exchange during the production operations stage is predicted to have potential impacts on biodiversity due to the potential for the introduction of exotic or invasive species. WWF is concerned that this possibility is being downplayed based on embedded controls which have not been clearly spelt out in the document.	and is not generally included in EIAs that are not subject to the IFC Performance Standards (such as the Yellowtail Project). Nevertheless, the impact assessments for several biological resources (including marine birds, marine mammals, and marine fish) include components that would typically be included in a CHA (such as listing status, congregatory behavior, and migratory life histories) as factors when determining sensitivity to potential Project impacts. EIA Section 7.10, Ecobalance and Ecosystems, is specifically intended to describe biological impacts at the ecosystem/seascape scale as required by Guyana's Environmental Protection Act. As demonstrated by the residual impact ratings included throughout EIA Chapters 6 through 8 of the EIA, the combination of embedded controls and mitigations included in the EIA would be sufficient to manage the impacts of planned Project activities. The establishment of marine protected areas would constitute an offset under the mitigation hierarchy, and is only appropriate in cases where project impacts cannot be adequately managed through embedded controls and mitigation alone. As stated in several locations in Chapter 7 and in the ESMP, the Consultants recommend that the Yellowtail Project be required to comply with the IMO / MARPOL 73/78 requirements. As described in Section 7.10, these standards would require that all Project vessels would exchange ballast water just outside the Guyana EEZ, immediately before entering Guyanese waters. This practice is consistent with good shipping industry practice worldwide and is intended to minimize the potential of introducing invasive or exotic species. The EIA includes, either directly or by reference, several baseline biological studies covering numerous biological resources. In most cases, the impact assessments for specific biological resources were supported by data from multiple years of study. The Consultants' position is that, when considered in aggregate, the current body of biological knowledge as reflected in the EIA is sufficient to support an assessment of the Project's potential impacts on biological resources and development of appropriate embedded controls and mitigation measures.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			When compared to previous EIAs, this EIA has shown improvement and slightly a better understanding of specific data on biological resources within our coastal and marine space, however, WWF is still of the opinion that the area remains largely understudied and would still like to advocate for more long-term monitoring on our biological resources inclusive of all life stages and various breeding, migratory, foraging grounds etc, to gain better understanding their importance and values. There remain gaps on species data and sub-population to determine their direct impact as it relates to the activities proposed especially given that this EIA seems to be more focused on the impacts of the biodiversity that occurs within direct or specific range of the project area. It is also recommended that the Management Measures proposed for each biodiversity group follow international best practices and are closely monitored through the lifespan of the project.					
264	14-Dec-2021	WWF	**(Major) oil spill** • Precise role and processes of local partners and how they fit into the system of response remains unclear. • Local agencies have small budgets to fund their operation. • Decentralization of capacity to respond to oil spill is critical given the geography of Guyana's coastline. • Training and capacity building will need to be funded and undertaken **Supplemental Discussion: Unplanned events** The main unplanned events of concern to all are oil spills, especially since the Project will be producing, processing, storing, and offloading oil as its core activity. Models presented in the OSRP demonstrate that oil spills with the	OSRP Chapter 6 describes oil spill response resources available to support Tier I, II and III spills; Chapter 7 describes exercises and trainings scope. Sections of the OSRP describe systems for working with local stakeholders within Guyana and appropriate representatives of other jurisdictions (in coordination with the Government of Guyana) to respond to oil spills within Guyana and transboundary events in Sections 2 and 1.2.3, respectively. As further described in Section 1.2.3, the OSRP explicitly anticipates working with local communities within the impacted areas to raise awareness of oil spill planning and preparations. To facilitate localized responses, each operating location maintains an Emergency Response Team governed by their Facility Response Plan that addresses the immediate actions required upon the discovery of an abnormal condition or emergency. EEPGL recognizes the need to build local oil spill response capacity. As described in OSRP Section 2.3, EEPGL works cooperatively with Guyanese regulators, agencies, and interested stakeholders. To supplement in-country response resources, EEPGL is collaborating and pursuing other cooperatives with regional Oil Spill Response Organization(s) (OSROs) to support Tier II+ spill response efforts, should additional OSROs with appropriate capabilities be identified, and should there be interest among other regional organizations in industry to participate.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			right menu of circumstances can affect many neighbouring countries in South America and in the Caribbean as far as the Greater Antilles. As pointed out in the ESIA, even though the probability of a spill may be low, such an oil spill would likely have adverse impacts on marine resources such as marine water quality, seabirds, marine mammals, and marine turtles. Given that the modelling does not account for oil spill response, it therefore means that the difference between an oil spill and the scenarios presented in the modelling occurring is the oil spill response. WWF is therefore concerned with the capacity of local institutions identified to respond in the event of an oil spill. Decentralisation of capacity to respond to oil spill is critical given the geography of Guyana's coastline and against this background, training and capacity building will need to be funded and undertaken.					
265	14-Dec-2021	WWF	**Synergetic effects of waste streams** • Waste streams and their effects have been addressed individually in the ESIA, but what are the synergetic? • Cumulative impacts, not only from EEPGL project activities, but from other oil and gas projects both on and offshore should be evaluated bearing in mind earlier comments on impact ratings, lack of data, socio-economic impacts etc. The assessment should be done at the seascape-coastal level rather than being site specific. **Supplemental Discussion: Management of Wastes** As in previous EIAs, this EIA has also noted the lack of long-term capacity of waste disposal facilities to deal with non-hazardous wastes; and that the existing capacity will be exhausted and new areas will need	EIA Section 10.6.3, Waste Management, describes the combined impacts associated with hazardous and non-hazardous waste streams generated by the Project and by other offshore EEPGL activities included in the scope of the cumulative impact assessment (i.e., exploration through 2028, Liza Phase 1, Liza Phase 2, Payara, Yellowtail, FPSO #5, and FPSO #6 development projects, Fiber Optic Cable Project, Guyana Office Complex Project, and Gas to Energy Project operational by 2027), including a summary of estimated annual waste volumes. (The Consultants were unable to identify publicly available waste generation estimates for the non-EEPGL projects included in the cumulative impact assessment.) Conservatively assuming all of the non-hazardous waste and all of the treated hazardous waste (assuming no reduction in mass during treatment) ultimately is disposed in a non-hazardous landfill, this represents approximately 6.2 % of the total current demand on Georgetown-based landfill facilities (on the order of approximately 15,000 tonnes per month). Taking into consideration the opening of Cell 2, the reasonably anticipated development of additional cells at the HBL, and the limited percent contribution of the Project, this represents a relatively low level of impact on non-hazardous waste management infrastructure capacity for the longer-term (up to 10 years). New landfill development in the region may be appropriate for consideration going forward. Also, see the responses to Comments #37, 38 and 171.	No	Noted. Clarity to be provided in the EIA based on capacity of waste sites also taking into account discussions with Redford Group.	Section 10.6.3 of the EIA has been updated to reflect all of the points in the comment response.	p. 10-37

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			to become operational. Given that the Yellowtail project will be operating in Guyana for more than 20 years, this situation must be monitored and improved quickly, especially as the volumes of waste that will be generated will also grow from other sectors. Since new sites or expansion of current sites will be undertaken, we recommend a planning approach which gives first priority to human health and the environment. Challenges experienced by residents of communities located within the zone of impact of the Haggs Bosch Landfill site, for example, should not be allowed to recur. **Supplemental Discussion: Physical considerations** The EIA has noted the lack of long-term capacity of waste disposal facilities to deal with non-hazardous wastes; and that the existing capacity will be exhausted by 2019-2020. Given that this project will be operating in Guyana for more than 20 years, this situation must be improved quickly. Haggs Bosch Landfill site has been identified as one location in the menu of facilities for waste management but given the problems that have been ongoing on the site and general issues with waste management in the country, these local facilities are woefully inadequate. The plan should identify the quantities of hazardous substances and other waste materials which will be generated throughout the different phases of the project and require disposal onshore.					
266	14-Dec-2021	WWF	Thousands of tonnes of hazardous wastes will be generated during the lifetime of this project. Any treatment of hazardous wastes should be done in keeping with best available standards, technology and the need to safeguard human and environmental health. Although a comprehensive waste management	The CWMP, dated October 2021, is available on the EPA website. The regulations, standards, and guidelines described in the CWMP would be applicable to the Yellowtail Project, including those for hazardous waste management and treatment, as described in Section 3.1.4, Onshore Waste Management Operations, of CWMP Appendix C. See also the response to Comment #188.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			(CWMP) plan is referred to in the main document, the CWMP could not be located in the appendices or in any of the volumes of the EIA.					
267	14-Dec-2021	WWF	The management of some types of wastes generated will lie with sub-contractors. In the absence of adequate national standards to guide their operations, sub-contractors should operate in accordance with generally established standards for the industry or standards of EEPGL. We also recommend that EEPGL hold responsibility for negative impacts resulting from its subcontractors. The EIA was not clear on this aspect, although EEPGL committed to auditing contractors.	As described in EIA Chapter 2, Description of the Project, and Section 8.6, Waste Management Infrastructure Capacity, the Project will manage its wastes in accordance with a CWMP, which has been approved by the EPA. EEPGL will use waste management contractors that are licensed by the authorities, and will undertake its own assessments to assess whether contractors are operating to international environmental and health and safety standards. The responsibility for contractors' and subcontractors' activities would be determined in accordance with Guyana's laws and regulations.	No	Accepted	N/A	N/A
268	14-Dec-2021	WWF	In the Payara EIA, incineration onshore is mentioned as a waste disposal method in the EIA and EEPGL indicated that they are utilising a regional supplier who is operating an existing onshore waste treatment/incineration. Is this facility being utilized as part of the Yellowtail project?	As discussed in EIA Section 8.6, Waste Management Infrastructure Capacity, two facilities with thermal treatment capabilities are currently operational and identified as potential options to manage Project wastes requiring thermal treatment. The Tiger Rentals Guyana Inc. (TRG) facility has expanded its capabilities to include an additional thermal treatment unit and construction is continuing at the TRG facility to add additional thermal treatment capacity. Additionally, another third-party, Sustainable Environmental Solutions Guyana, Inc. (SES), has developed a new integrated waste management facility at Guyana Shore Base Inc. (GYSBI) designed to manage wastes that are generated from offshore oil and gas operations. The EIA has been updated to reflect that the SES facility is now fully operational and employs various hazardous and non-hazardous waste management technologies, including hot oil thermal desorption, incineration, decanter/centrifuge separation, wastewater treatment, waste shredding, container crusher/baling, and container washing operations. Both of these waste management facilities have a design/processing capacity sufficient to treat and store hazardous wastes. Several additional qualified third-party waste management operators are currently seeking authorization for facility developments or expansions, as discussed above. These are expected to further expand the capacity of onshore waste management infrastructure to manage the Project's hazardous, non-hazardous, and exempt hazardous waste storage, processing, treatment, and/or recycling needs.	Yes	Accepted	N/A	pp. 2-78, 8-163
269	14-Dec-2021	WWF	**Assist with depletion policy formulation** Development of a depletion policy as it could impact national investments, planning for the management of the industry, energy policies and transition to renewable energy, development	The Consultants acknowledge the comment. 			of other economic sectors and economic diversification etc.					
270	14-Dec-2021	WWF	**Socio Economic Impacts, Livelihoods and Community Wellbeing.** As part of its embedded controls for mitigating socio-economic impacts the developer states that it will implement a transparent, accessible, and consistent Community Grievance Mechanism (CGM) earlier on, prior to the onset of Project activities and ensure CGM is well publicized and understood by the public. Having the CGM in the EIA however does not ensure transparency and accessibility. The EPA should ensure that the CGM is accessible to stakeholders and there is transparency in dealing with issues arising from stakeholders' submissions. **Supplemental Discussion: Socio Economic Impacts, Livelihoods and Community Wellbeing.** As part of its embedded controls for mitigating socio-economic impacts the developer states that it will implement a transparent, accessible, and consistent Community Grievance Mechanism (CGM) earlier on, prior to the onset of Project activities and ensure CGM is well publicized and understood by the public. Having the CGM in the EIA however does not ensure transparency and accessibility.	As recommended in the EIA and stated in the SEP (Volume III of the EIA), EEPGL has in place a transparent, accessible, and consistent CGM that applies to Yellowtail, both prior to the onset of Project activities and throughout its life cycle. The SEP describes the objectives of the CGM, examples of how feedback is shared with the public, and contact information for the public to submit feedback by multiple means. CGM effectiveness would be periodically evaluated and the CGM would be updated as necessary.	No	Accepted	N/A	N/A
271	14-Dec-2021	WWF	The EIA assesses the impacts on artisanal fishing livelihoods as Minor while determining the potential impacts on employment and livelihoods as Positive as a result of Project employment, procurement, and worker spending. This is a narrow way to determine positive economic impacts especially in an environment where the local private sector continues to cry foul when it comes to local content. Project	The focus of the EIA is on the identification and management of potential adverse impacts of the proposed Project. As such, potential positive impacts (benefits) are acknowledged but are not assessed in terms of magnitude nor significance. In this manner, potential Project benefits such as employment and procurement are identified and described in EIA Section 8.1, Socioeconomic Conditions, and Section 8.2, Employment and Livelihoods. Although the Yellowtail Project will result in an incremental addition to local employment, the benefit to the Guyanese workforce is quantified for EEPGL's activities in Guyana to date, as stated in EIA Section 8.1.3.1, Relevant Project Activities and Potential Impacts: *As of the first half of 2021, the total workforce supporting EEPGL's activities (including direct employees and contractors) amounted to more*	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			employment and procurement is also limited to those with very direct relations with the Oil and Gas sector while worker spending cannot be seen as a broad-based game changer in the local economy. On the contrary, it may lead to inflation (already noticeable in the cost of housing, food and services) and the widening of the gap between the rich and poor.	*than 5,400, more than half of whom (more than 2,800 workers, or 53 percent of total) are Guyanese. The number of Guyanese workers has increased by [more than] 35 percent since June 2020... Roles held by Guyanese employees cover a range of skill levels and professions, including but not limited to entry level positions, apprentices, equipment operators, administrators, skilled trades, supervisors, professional personnel…and managerial staff.* The benefit of employment supported by the Project does not negate the potential adverse impacts on other livelihoods, including fisherfolk. For this reason, a potential adverse impact on fisherfolk is separately identified and assessed in EIA Section 8.2. Additionally, potential adverse economic impacts including inflation and increased cost of living are also identified and assessed in EIA Section 8.1. In reality, socioeconomic benefits and adverse impacts would co-exist. The relationship between impacts and benefits can be complex, and may be experienced differently by different stakeholders. The approach of the EIA is to identify both socioeconomic benefits and adverse impacts, and to assess the adverse impacts in greater detail, including consideration of mitigation and management measures to reduce the significance of the expected impact. This approach is aligned with the requirements of the Environmental Protection Act and with international good practice for environmental and social impact assessment.				
272	14-Dec-2021	WWF	The recent revelation by the Minister of Agriculture that there is uncertainty about why there is a decline in catch in the fisheries sector and that a study needs to be conducted to determine this shows the difficulty we are in with little or no credible baseline data in Guyana. On that basis, the only way that we can verify minor impacts on artisanal fisheries would be to provide support for credible research into what the baseline is for the fisheries sector. This is especially important for ExxonMobil since it is being accused by fisherfolk as being responsible for the current decline in fisheries catch.	The Consultants have added additional information to the EIA on potential causes for observed fisheries declines based on review of the latest fisheries-related report from Bank of Guyana and information collected from consultations with fisherfolk. Please see response to Comment #207 for further details on this issue.	Yes	Accepted	N/A	7-193 to 7-194
273	15-Dec-2021	Janet Bulkan	It is clear in appendices D and M in volume II of the EIA that ERM has tried to obtain access to longitudinal fish population and catch data which should be readily available from the government Fisheries Department. It is significant that ERM, through its sub-contractor EMC, has drawn on the 1962 publication by Rosemary Lowe-McConnell on the two seasons of research trawls in 1958 and 1959 (35 cruises, 2246 fishing	The Consultants contacted the Fisheries Department in 2021 with a request to meet and obtain updated data on fisheries. The Fisheries Department provided some information on seasons and general changes in the market for fisheries products, and these are reflected in EIA Chapter 8; however, no information on fish populations was available. The Consultants therefore relied on primary data from 2 years of direct biological surveys and participatory fishing studies, published sources, and more recent information on fishing activities collected from local fishing cooperatives and the other government sources to inform the baseline information on marine fish and fisheries in Chapters 7 and 8, respectively.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			hours, 1070 sampling stations) which yielded a total of 213 marine species. ERM apparently did not find government data on accessible file, and so commenced snapshot surveys in 2014 through sub-contractors, including the local consultancy EMC in 2018. The two appendices D and M in volume II of the Yellowtail EIA provide confirmatory evidence about marine biodiversity, following Lowe-McConnell. That is, there is no evidence in the EIA that marine biodiversity has declined between 1959 and 2015. The EIA volume I notes that EEPGL/XOM commissioned environmental baselines studies (EBS) which include campaigns in 2014 (by Maxon Consulting and TDI-Brooks), 2016 (Fugro GB Marine), 2017 (ESL), 2018 (Canje tract, Maxon and Fugro), 2019 and 2020 (Hammerhead oil field in the Stabroek tract, Maxon et al.). Some of the baseline studies have been included in Appendix I of volume II of the Yellowhead EIA. They include results of benthic sampling of the sea floor but do not cover fish populations. However, right at the end of this Appendix I are a few charts of salinity and dissolved oxygen against depth in the ocean. Marine water quality studies (snapshot data) are reported in section 6.4.2 (physical pages >428) of volume I of the Yellowtail EIA and may be helpful in interpreting fish population data at some future date. Only a few of the EBS are included in Appendix 1; some others were provided with the Payara EIA. It is not clear why all the EBS have not been provided in Yellowtail Appendices. Small-scale fish surveys were carried out by EMC and by ERM, in September-October 2017 (dry season), April 2018 (wet),	Including all of the EBS reports that informed the baseline discussions in EIA Chapters 6 and 7 would have increased the Volume II page count by thousands of pages. All of the EBS reports detailing the findings of the studies that informed the Yellowtail EIA (including the appendices with data tables) have been made available to the EPA. Following precedent, new reports that have not been provided previously are included in Volume II of the Yellowtail EIA. Historical reports were previously made available in Volume II of either the Liza Phase 2 or Payara EIAs. These documents are available to the public on the EPA's website. Sampling was conducted inside mangroves. Attachment G of Appendix M, Nearshore and Offshore Fisheries Study Summary (Volume II of the EIA), includes photographs of samples being taken in mangroves. These areas were sampled specifically because they tend to function as nursery areas for fish and shellfish. This effort was supplemented by including a participatory/Traditional Ecological Knowledge element to the coastal sensitivity mapping that was provided to the EPA and the public in Volume II of the Payara Development Project EIA (specifically Appendices P and V) in 2020. The important fish habitat areas included in the maps in Appendix P include nursery areas.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			November 2018-January 2019 (dry), and April-June 2019 (wet) in four depth zones: Stabroek tract deepwater, on the continental shelf, near-shore, and estuarine. It seems that some sampling was done on the fringes of some mangroves, but no systematic study inside mangroves. If correct, this was a major omission because of the importance of Guyana mangroves as spawning grounds and nurseries for shrimp and young fish of some demersal species. Ms Simone Mangal-Joly has already pointed out that that ERM did not try to locate the breeding or nursery grounds for even the main commercial species, nor was there any attempt to study the annual patterns of migration of major fish species (Stabroek News, 2021). Anecdotal evidence from fishermen and fish market stallholders confirms that there are seasonal patterns of variation in fish catches and icthyoplankton presence. Some variation may be linked to the tremendous outflows of freshwater during the wet seasons from the major north-flowing rivers of Guyana, especially Essequibo, which affect both salinity and water temperature. As surface sea temperatures in the near-shore and continental shelf zones are close to the natural upper limit of comfort for ocean fish (32°C) even a small rise because of hotter river water may drive fish further offshore. Likewise, anecdotally, fishermen are aware of the continuous discharge of heated cooling water from the FPSO Liza Destiny, but probably not aware that ERM claims that the extra heat does not exceed 3°C at a distance of 100 metres from the FPSO. The Yellowtail EIA volumes spend many pages on the claimed insignificant negative impacts of pile-driving for SURF components and the vertical seismic profiles	Historical 3D and 4D seismic surveys are not assessed in the Yellowtail Development Project EIA because they have already been completed and as such, any effects of these surveys would be reflected in the existing biological and socioeconomic baselines presented in the EIA. Future seismic exploration projects are not specifically discussed in EIA Chapter 10 because there are no reasonably foreseeable seismic exploration programs that would overlap temporally with the drilling and installation phase of the Yellowtail Development Project, which is the only phase of the project that could potentially include seismic activities.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			(VSPs) planned within each oil field to help determine the locations and flows of the petroleum resources. It is not the VSPs which concern the fishermen but the widespread knowledge and rumour of the very long distances at which the air guns of the exploratory seismic mapping can be heard underwater and the reports of damage from these air guns to cetacean biology and social communications. I have been unable to see if these 3-D and 4-D seismic surveys are covered by the EPA's environmental authorisations for the three fields Liza-1, Liza-2 and Payara. Anecdotal information from fishermen includes a frequent comment that 'vibrations' from the vessels of XOM contractors are driving populations of commercial fish species away from the customary fishing grounds. seems to be some confusion among fishermen, possibly because of the absence of culturally appropriate information from ERM/EEPGL. The fishermen are not able to distinguish the functional differences between the anchored FPSO, the 25 platform supply and service boats, the vessels used to lay the fibre-optic control cables between the Liza-1 field and the Georgetown office, and the geo-technical and sea bottom survey vessels. It seems unlikely that the coastal fishermen have access to the MARAD Notices to Mariners which announce the arrival, movement and departure of drillships and the Marine Safety Information notes which announce survey ships for geotechnical study of sea bottom and sub-surface conditions. In 2021 there have been at least the following campaigns, some of which may have been visible from the coastline or from near offshore, and some have been covered by retrospective MARAD Notices.	The Consultants recognize the challenges to effective communication with small-scale fishing operations and communities. The ESMP includes a recommendation to augment EEPGL's ongoing stakeholder engagement process (along with relevant authorities) to identify both commercial and subsistence fishing vessel operators who might not ordinarily receive Notices to Mariners and, where possible, communicate with them regarding major vessel movements and marine safety exclusion zones. Additionally, as described in several responses above, an additional year of the participatory fishing study is currently being conducted by EEPGL. EEPGL frequently uses the periodic engagements that are integral to the participatory fishing study methodology to disseminate information on offshore activities at the local level within fishing communities in Regions 1through 6.				

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Fibre-optic cable work – MARAD Notice 66, 18 June for 1 June – 30 August (6 vessels); MARAD Notice 95, 30 July for 26 August to 10 October (1 vessel); MARAD Notice 103, 24 August for 28 August – 31 October (1 vessel); Geo-technical and bottom surveys – MARAD Notice 43, 23 April for 18 March – 30 June (2 vessels); MARAD Notice 76, 02 July for up to 31 October (2 vessels for bottom surveys off Plantation Best); MARAD Notice 85, 08 July for 08 July – 31 October (3 vessels for the Demerara River and coastline westwards); MARAD Notice 92, 30 July for 04 August – 04 November (1 vessel); MARAD Notice 128, 18 October for 19-31 October (2 vessels for survey NW of the Demerara Main Ship Channel). It is not surprising that fishermen believe that such near-shore work may include activities which could be causing declining fish catches, in the apparent absence of efforts by ERM/EEPGL to explain what the various oil-related vessels are doing and why. I do not find in the EIA volumes for the Yellowtail EIA any consideration of these matters. There are widespread beliefs among fishermen and fish traders that the activities of XOM and its contractors are affecting negatively the declining populations of commercial fish species. Although XOM has carried out some awareness-raising activities in some coastal locations, it seems that the style of communication was neither culturally meaningful nor encouraged retention of the information. There seems to be no provision in the EIA for regular systematic monitoring of the commercial fish populations which may be affected negatively by XOM activities, or for public reporting of such monitoring. Given that artisanal

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				The EPA-approved CWMP, dated October 2021, is publicly available on the EPA's website.				
276	10-Dec-2021	Concerned Citizens	How will the waste be transported and offloaded at treatment site(s)?	As described in the CWMP, which is publicly available on the EPA's website, the wastes generated from the Project's offshore operations would be off-loaded to other marine support vessels for transport to shore-based waste management facilities. Support vessels used to transport wastes would have the necessary licenses and approvals from the Guyana authorities. Vessels transporting wastes would carry both a completed Marine Transport Manifest and a completed Waste Manifest. These documents must contain the name, description, and quantity of all wastes being transported. Offshore wastes received at the GYSBI shorebase would be first off-loaded from the vessels using onshore cranes. After off-loading is complete, the waste containers would be transferred to the appropriate waste management facilities (e.g., TRG, SES) located at GYSBI, or to a temporary transit area adjacent to TRG/SES pending transfer to these waste management facilities.	No	Accepted	N/A	N/A
277	10-Dec-2021	Concerned Citizens	What specific risks does its transport pose at the specific sites of treatment giving surrounding receptors?	As illustrated in the CWMP, dated October 2021, waste characterization and classification is conducted to support the following management measures to address risks associated with waste transportation, including worker exposure, waste mishandling, improper waste treatment/disposal, and spillage: • Proper selection of appropriate personnel protective clothing and equipment to mitigate worker exposure during waste handling, storage and transportation; • Training of workers to manage and mitigate hazards related to waste handling, storage, and transport; • Development of appropriate emergency response measures in case of spills or other incidents; • Proper container selection for safe containment, handling, and transportation of waste; and • Proper segregated storage of wastes based on incompatibility, reactivity, or other physical/chemical characteristics. Additionally, the existing waste TRG and SES management facilities are located at the GYSBI Shorebase. All offshore wastes received at this shorebase are transferred directly to these adjacent waste management facilities. The transportation of wastes to co-located facilities instead of off-site third-party facilities for treatment reduces the risks associated with waste transportation services. Finally, various mitigation measures would provide protection for surrounding air/water/land receptors, such as secondary containment, spill control, and air pollution control on all treatment systems.	No	Accepted	N/A	N/A
278	10-Dec-2021	Concerned Citizens	What are the specific toxicities and risks to human health and ecology of each component, and specifically how will the waste be treated to remove toxic components?	EEPGL has identified and characterized each waste stream generated from the Projects to date. This waste characterization has included an evaluation of processes and process knowledge, and review of manufacturers' SDS and product specifications. Where SDS and generator knowledge is not sufficient for proper characterization of wastes, sampling and laboratory analysis is conducted so that information is available to assess the hazards for each waste, including whether they are flammable, corrosive (acid or base), reactive (oxidizer, pyrophoric, reducer), and/or toxic. This characterization informs the treatment process that is applied to the specific waste. As	No	Accepted	N/A	

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				described in the response to Comment #268, the TRG and SES facilities currently in operation employ a variety of different treatment technologies. This information is discussed in further detail in the CWMP, dated October 2021, which is available on the EPA's website.				
279	10-Dec-2021	Concerned Citizens	What discharges will there be to air, water, and ground during treatment and what are the chemical compositions of these discharges and what risk do they pose to human health and ecology?	The TRG and SES facilities at the GYSBI are operating under independent permits issued by the EPA. The current permits require environmental testing of treated wastewater before discharge and testing of treated solid wastes for various parameters prior to landfill disposal.	No	Accepted	N/A	N/A
280	10-Dec-2021	Concerned Citizens	Will any discharge be directly into rivers and estuaries with protected forest species, and if so, what threats do they pose to such bodies over the full life of the Yellowtail project?	Treated wastewater from the TRG and SES facilities is discharged to the Demerara River though a permitted outfall at the GYSBI facility. These discharges are conducted in accordance with the provisions of permits issued by the EPA. There are no other discharges of wastewater from these waste facilities into other rivers or estuaries.	No	Accepted	N/A	N/A
281	10-Dec-2021	Concerned Citizens	Will this discharge affect fisheries and other activities into any estuary?	Treatment of wastewater discharges from the TRG and SES facilities is conducted in accordance with the provisions of permits issued by the EPA. Treated wastewater is discharged through the permitted GYSBI outfall and into the Demerara River. There are no other discharges of wastewater from these waste facilities into other rivers or estuaries.	No	Accepted	N/A	N/A
282	10-Dec-2021	Concerned Citizens	What is the chemical composition and risks of the residues that will be taken to a landfill?	All treated solid wastes are tested before landfill disposal. Treated wastes are tested for total petroleum hydrocarbons, total oil and grease, and Toxicity Characteristic Leaching Procedure (TCLP) extractable metals content (arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, and zinc) to confirm they have been rendered non-hazardous in the treatment process. Wastes are re-treated if they do not meet non-hazardous classification criteria. See also response to Comment #275.	No	Accepted	N/A	N/A
283	10-Dec-2021	Concerned Citizens	What is the total volume of waste bound for landfills during the life of the project?	EIA Table 8.6-2 provides a summary of the estimated annual generation of Project wastes that will be managed onshore. See the response to Comment #274. A conservative assumption is that all of the estimated nonhazardous waste and the treated hazardous waste (assuming no reduction in mass during treatment) ultimately would be disposed in a non-hazardous landfill.	No	Accepted	N/A	N/A
284	10-Dec-2021	Concerned Citizens	What is the total land demand for such landfill given the volume of waste produced over the life of the project?	At current disposal rates, Cell 2 at HBL is expected to last for approximately 4 to 6 years. This estimated life span of Cell 2 depends upon how much the waste volumes received at the landfill increase with the expanded economic development expected in the Georgetown area over the next 5 years. There remain two additional cells at the site (Cell 3 and Cell 4) for future development. Each cell is 6.5 hectares (16 acres) in size and could be anticipated to last for 5 to 6 years each. New landfill development in the region may be appropriate for consideration going forward.	No	Accepted	N/A	N/A
285	10-Dec-2021	Concerned Citizens	What are the standards for operation of such landfill, and what are the risks of these standards are violated?	All non-hazardous solid wastes generated to date from the EEPGL projects have been disposed at the HBL. The HBL is the only engineered landfill in Guyana and started operations in early 2011. Key engineered features of the HBL include: • Liner System (geotextile over 20-meter (65.6-foot) thick native clay) • Landfill Leachate Collection System (drainage layer for leachate collection)	No	Accepted	N/A	

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				• Leachate Treatment System (two facultative ponds, two stabilization ponds) operational since March 2018 • Waste Compaction and Cover • Litter Fences • Environmental Monitoring (leachate, groundwater, surface water) ExxonMobil has a corporate-level Approved Waste Site List (AWSL) Program that governs usage of third-party waste management facilities globally. Specifically, the purpose of the system is to mitigate potential Safety, Security, Health & Environment concerns associated with the recycle, treatment, storage, transfer, and disposal of wastes generated by ExxonMobil Corporation and its affiliates globally. The third-party waste management facilities currently being used in Guyana by EEPGL are subject to the requirements of the AWSL Program.				
286	10-Dec-2021	Concerned Citizens	**The cumulative impacts of total volume of waste brought to shore for treatment and disposal for the lifetime of Liza1, Liza 2, Payara, and Yellowtail:** What is the total volume of waste produced by all four production platforms, and what would be the cumulative impact of transport, treatment, and disposal of the total volume of waste?	Although it is not possible to project an exact quantity of waste that would be generated and brought ashore for treatment/disposal during the life cycle of EEPGL projects, EIA Table 10.6-1 provides a summary of the estimated annual generation of wastes that will be brought onshore for treatment and/or disposal for i.e., exploration through 2028, Liza Phase 1, Liza Phase 2, Payara, Yellowtail, FPSO #5, and FPSO #6 development projects, Guyana Office Complex Project, and Gas to Energy Project operational by 2027). **Table 10.6-1: Summary of Estimated Annual Project Waste Generation and Management Methods—Cumulative EEPGL Activities** Waste Generated by Category / Volume by Year/Metric Tonnes[a] 2023 / 2024 / 2025 / 2026 / 2027 / 2028 / 2029 / 2030 / 2031–2032 / 2033–2044 Non-Hazardous wastes (total)[b, c]: 5,370 / 4,830 / 5,290 / 5,240 / 4,940 / 4,810 / 3,310 / 1,750 / 3,310 / 1,750 Hazardous wastes (total)[b, d]: 4,310 / 3,270 / 5,970 / 5,070 / 3,090 / 1,790 / 1,180 / 580 / 1,180 / 580 [a] The annual totals reflect the current preliminary Project schedules and the production profiles for development projects and exploration drilling, which could change. The Yellowtail portion of the annual totals conservatively assumes drilling up to 2032. [b] Totals may not sum exactly due to rounding. [c] Includes wastes that will be directly shipped to an approved landfill and wastes that can be recycled, reclaimed, or reused. Volumes include estimated quantities of residue from treatment of hazardous waste. [d] Includes wastes that are treated to produce residual non-hazardous effluent than can be discharged through permitted outfalls and wastes that are treated to produce residual non-hazardous solid wastes that can then be recycled, reclaimed, reused, or transported for disposal in an approved landfill.	No	Accepted	N/A	N/A
287	10-Dec-2021	Concerned Citizens	What is the total amount of land that will be required for waste disposal and how will this land use requirement be met in terms of volume of waste and land fill requirements?	See the response to Comment #284.	No	Accepted	N/A	N/A
288	10-Dec-2021	Concerned Citizens	**Baseline information on Guyana's fisheries sector:** Where is the baseline data on the fisheries industry that specifies total number of informal and informal operators, size, catch per unit effort in the dry versus the wet season, economic value of formal and informal production, livelihood dependency, economic linkages,	A complete inventory of number of participants in each fishery and seasonal catch per unit effort is beyond the scope of the EIA, and is the type of data that are typically included in a fisheries management plan. However, information on total economic productivity of the sector over the last several years, estimated size of the artisanal fishing fleet, and various economic concerns affecting the industry are described in EIA Section 8.1, Socioeconomic Conditions, and Appendix D, Participatory Fishing Study Final Report January 2019–March 2020 (Volume II of the EIA).	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			and total economic value of the sector considering linkages with other sectors?					
289	10-Dec-2021	Concerned Citizens	Where are the nearshore and offshore fish nurseries located and mapped by geospatial coordinates?	Important nearshore fish habitats (many of which serve as nurseries) are delineated in the coastal sensitivity maps included in Appendix O (Volume II of the EIA). Offshore pelagic species have many different preferred spawning and nursery habitats, some of which are poorly documented. Marine species known from Guyana waters spawn and complete their early lifestages at various locations throughout the entire Atlantic basin, depending on species. Although the ichthyoplankton data cited in EIA Section 7.8.2.1 indicates that many of these marine species spawn and mature in Guyana waters, no important offshore nursery habitats have been mapped within the Guyana EEZ to date.	No	Accepted	N/A	N/A
290	10-Dec-2021	Concerned Citizens	What are the life cycle migration patterns relative to the offshore oil blocks and locations of offshore and nearshore nurseries?	As described in the previous response, the specific areas that are important to Guyana's marine fishes are extremely varied. Some species, particularly the demersal fishes such as snappers, grunts, and seatrouts, are known to use estuaries and mangroves as nursery habitats and gradually move offshore as they mature. Many of these inshore areas have been mapped as important fish habitat areas in the coastal sensitivity maps included in Appendix O (Volume II of the EIA).	No	Accepted	N/A	N/A
291	10-Dec-2021	Concerned Citizens	Where is the document proving that this information was collected and analysed and publicly ventilated for feedback from fisherfolk prior to extensive 2015 seismic surveys and disturbances conducted by EEPGL?	The coastal sensitivity maps in Appendix O were created with the input from knowledgeable residents from coastal communities in the coastal regions as described in Appendix S, Enhanced Coastal Sensitivity Mapping—Ecosystem Services Final Reports. Both Appendices are available in Volume II of the EIA.	No	Accepted	N/A	N/A
292	10-Dec-2021	Concerned Citizens	Where is the ongoing monitoring and evaluation data since 2015 covering the start-up and production at Liza 1 and all exploratory drilling activities conducted to date, their effects on said nurseries in population samples collected and the change in catch per unit effort of fisheries?	The first and second year fish studies described in Appendix M, Nearshore and Offshore Fisheries Study Summary, were completed in 2018 and 2019, respectively; the participatory fish study included in Appendix D, Participatory Fishing Study Final Report January 2019–March 2020, was completed in 2020. Liza Destiny (Liza Phase 1) began production activities in 2019, so the data presented in these appendices spans the pre-production (i.e.; exploration) and production phases of EEPGL's activities offshore Guyana. Catch per unit effort is not formally monitored for Guyana's fisheries at a national scale, but EIA Section 8.1, Socioeconomic Conditions, contains data on total production of the fishery sector for several recent years.	No	Accepted	N/A	N/A
293	10-Dec-2021	Concerned Citizens	Where has this data been made available for public scrutiny?	Please see the response to Comment #292 for the location of marine fish and fisheries data in the Yellowtail EIA.	No	Accepted	N/A	N/A
294	10-Dec-2021	Concerned Citizens	Where are the offshore and near shore fish nurseries for the species of commercial fish and their prey located on a map with geospatial coordinates relative to the Yellowtail production area, effluent discharge, and current patterns?	Please see the response to Comment #289.	No	Accepted	N/A	N/A
295	10-Dec-2021	Concerned Citizens	What is the cumulative geospatial area of production areas for Liza 1, Liza2, Payara, Yellowtail and other	The total area of long term exclusion zones surrounding the Liza 1, Liza 2, Payara, and Yellowtail FPSOs is 17,200 hectares (42,400 acres). This area represents a total of 0.6% of the Stabroek Block and does not overlap with	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			exploratory well operations in relation to offshore and nearshore nurseries and current patterns and what is the cumulative effect of effluent discharge on these areas?	any mapped fish nursery zones. The cumulative impacts of the Project and other reasonably foreseeable projects (including oil and gas projects and non-oil and gas projects) on marine water quality (including the effects of effluent discharges) received a priority ranking of Low. As described in Chapter 10, Cumulative Effects Assessment, this ranking was assigned primarily because impacts on marine water quality from non-Project activities are not expected to overlap (temporally and/or spatially) with those of the Project.				
296	10-Dec-2021	Concerned Citizens	Where is the geospatial assessment of no-go areas for fisheries to avoid offshore activities and service vessels in the offshore, nearshore and Demerara Estuary and the cumulative geospatial exclusion area of Liza 1, Liza 2, Payara, Yellowtail and all exploration drilling activities?	Please see the response in Comment #295 for information on the total area included in the safety exclusion zones for the Liza 1, Liza 2, Payara, and Yellowtail FPSOs. There are no safety exclusion zones planned for any of these projects in nearshore or estuarine areas.	No	Accepted	N/A	N/A
297	10-Dec-2021	Concerned Citizens	Where is the log of the fishers who use those areas and the cumulative amount of time and geospatial area they have been excluded from since the 2015 seismic surveys commenced?	All exclusion zones are established following the regulatory process including approval by MARAD and alignment with the Department of Fisheries. The Department of Fisheries issues fishing licenses and advises EEPGL in is the event of a conflict with an issued and active license within an exclusion zone. MARAD publishes all restrictions on navigation areas (exclusion zones) in the Notice to Mariners on the MARAD website at Notice to Mariners—Maritime Administration Department (marad.gov.gy) Exclusion zones, except zones around permanent Projects' facilities (e.g., FPSO, drill centers), are temporary in nature. To date, the Consultants are unaware of any incidents where fishing vessels have been intercepted or turned away from the exclusion zones.	No	Accepted	N/A	N/A
298	10-Dec-2021	Concerned Citizens	Where is the monitoring information on how periods of exclusion have affected fisheries vessels, catch, and the income of informal and formal fishers?	As mentioned in the response to Comment #297, all exclusion zones are established based on the regulatory process and in alignment with the Department of Fisheries and MARAD. The exclusion zone for the Yellowtail Development Project has not been established to date so there are no data available on how it may affect fishing vessels. However, the Department of Fisheries has not indicated that they anticipate Project activities would impact any licensed fishing activities.	No	Accepted	N/A	N/A
299	10-Dec-2021	Concerned Citizens	Where is the monitoring log of affected fisheries vessels for all exclusion areas to date?	Please see the response to Comment #298.	No	Accepted	N/A	N/A
300	10-Dec-2021	Concerned Citizens	**Baseline for fisheries loss claims:** Where is the baseline data on formal and informal production that will used for claims of losses from fishermen in the event of an oil spill?	Please see the response to Comment #44 for information on how the claims and livelihoods remediation processes would be implemented in the event of an oil spill, if appropriate. The participatory fish study included in Appendix D, Participatory Fishing Study Final Report January 2019–March 2020, includes information on prices at the dock for various types of fish, and EIA Section 8.1, socioeconomic conditions, contains data on total production of the fishery sector for several recent years, both of which could be used to inform these processes.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
301	10-Dec-2021	Concerned Citizens	How has this data been produced?	The participatory fish study report included in Appendix D includes a methodology section describing how the study was conducted, and Chapter 8 of the EIA cites the sources of data used to prepare the analyses in that chapter.	No	Accepted	N/A	N/A
302	10-Dec-2021	Concerned Citizens	Where is the proof that the methodology has been subject to public scrutiny?	The EIA methodology is described in detail in Chapter 4, and the participatory fish study report included in Appendix D, Participatory Fishing Study Final Report January 2019–March 2020, includes a methodology section describing how the study was conducted. These materials were provided for public review for 60 days per the requirements of the Environmental Protection Act, as described in EIA Chapter 4.	No	Accepted	N/A	N/A
303	10-Dec-2021	Concerned Citizens	Where is there proof that the claims process has been consulted upon and agreed to by fisherfolk and other impacted parties?	As mentioned in the response to Comment #270, EEPGL has in place a transparent, accessible, and consistent CGM that would apply to the Yellowtail Project prior to onset of Project activities and throughout its lifecycle. Any claims from fisherfolk may be submitted through the CGM process. Claims may also be submitted to the Department of Fisheries, such that they would be able to bring them to EEPGL's attention. Each claim will be reviewed on a case-by-case basis following the established process. The CGM is described in EEPGL's SEP (EIA Volume III). The CGM is therefore available to the public, including fisherfolk, and was available for review and comment during the EIA disclosure and public comment period. Additionally EEPGL meets with fisherfolk on a regular basis and has provided contact information for grievances and claims submission. EEPGL periodically evaluates the CGM effectiveness and the CGM would be updated going forward as necessary.	No	Accepted	N/A	N/A
304	10-Dec-2021	Concerned Citizens	Where is the baseline data on fisheries value in neighbouring Caribbean countries that could be impacted and claim losses in the event of an oil spill?	As the Yellowtail Development Project is located within the Guyana EEZ, there is no requirement to collect fisheries baseline data outside of Guyana. However, in instances where fishing is a significant driver of the local economy and/or important fishing areas or ports have been mapped in neighboring countries' territorial waters, this information is included in Section 9.24.2, and in the coastal sensitivity maps provided to the EPA and public as Appendix P of the Payara EIA. These maps informed the Geographical Strategic Response Maps developed by EEPGL, examples of which are provided in OSRP Appendix E in Volume III of the Yellowtail Development Project EIA. In the very unlikely event of an oil spill that could have a transboundary impact on neighboring Caribbean countries, EEPGL would work through the Ministry of Foreign Affairs, at the direction of the Government of Guyana, to determine financial liability and establish claims and/or livelihood remediation processes.	No	Accepted	N/A	N/A
305	15-Dec-2021	Conservation International	**General Remarks** **Abide by high standards.** Given EEPGL developments are the first of their kind in Guyana, they will set the benchmark for future oil and gas exploration and development projects in the country. It is therefore paramount that the project abides by high industry standards of	See response to Comment #226.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			accountability and good governance.					
306	15-Dec-2021	Conservation International	**Adopt the precautionary principle.** The high level of complexity in the technical aspects of this kind of project's operations, inherent high variability and complexity of oceanic systems (and more broadly, water as a medium) and the relative paucity of knowledge of Guyana's marine ecosystems, create conditions in which there could be far-reaching unknown impacts. This warrants application of the Precautionary Principle encompassed in Section 4(a) of the Environmental Protection Act, (2006). Considering this principle, we recommend the use of independent, third-party monitoring on a periodic basis to verify management plans and data, as well as structuring independent research programs to enhance the information available for improved decision-making.	The Consultants agree that monitoring is vital to performance assurance. The ESMP for the Project does not envision stand-alone, open-ended research programs because such programs are not required to assess the accuracy and effectiveness of the EIA or ESMP, respectively. However, as indicated in ESMP Section 3.7, the results of the proposed monitoring program would be externally reported. Volume III of the EIA contains the ESMP, and ESMP Section 3 describes the proposed monitoring program for the Project. Table 3.6-1 contains over 40 resource-specific monitoring measures, and additional monitoring measures are included in the CWMP, SEP, Preliminary Decommissioning Plan, and OSRP, which are included in Volume III of the EIA and/or on the EPA website. These measures are intended to monitor the effectiveness of the proposed management measures and inform the EPA and EEPGL of any potential impacts not identified in the EIA, should they arise.	No	Accepted	N/A	N/A
307	15-Dec-2021	Conservation International	**Undertake a cumulative EIA encompassing all current development projects.** We echo recommendations that EEPGL produce a cumulative EIA covering all projects, in addition to the stand-alone EIAs for each project. This should also be done for the other development projects currently planned by EEPGL in the Stabroek and Kaieteur Blocks. This is essential since the cumulative effects of the EEPGL and non-EEPGL projects in these and adjacent blocks could exacerbate potential negative impacts to the environmental and social conditions of Guyana. Similarly, increased development along the banks of the Demerara River for increased shore-based activities will result in significant impacts to mangrove and mud flat ecosystems.	The Consultants acknowledge the question of a programmatic EIA, which is beyond the scope of the Yellowtail EIA and should be referred to the EPA. However, the cumulative impact assessment in the EIA (Chapter 10) meets the requirements for cumulative impact analysis established in Part IV Section 17 of the Environmental Protection Act. It considers future offshore oil and gas development projects in the Stabroek Block, future exploration projects in the Stabroek and adjacent blocks, and other development activities including development of the Gas to Energy Project and a fiber optic cable installation (the Fiber Optic Cable Project), among others.	No	Accepted	N/A	N/A
308	15-Dec-2021	Conservation International	**Aim at achieving net gain for biodiversity and communities.** Given the important precedent the	The Consultants acknowledge the comment, noting that net gain for biodiversity receptors is neither a requirement of the Environmental Protection Act nor within the scope of the Yellowtail Development Project	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			EEPGL projects are setting, we recommend that the company adopts a net gain goal for biodiversity and communities. This is especially given the current uncertainties around Guyana's marine biodiversity and ecosystems, and the potential future additional oil and gas development which might increase the effects of indirect and cumulative impacts. We believe that this should be done regardless of whether the project would cause significant residual impacts from any planned activities. The project could achieve net gains by identifying additional opportunities to enhance habitat, conserve biodiversity, support communities' livelihoods and well-being, and contribute to research and knowledge about the country's marine and coastal resources.	EIA; accordingly, it is not an appropriate standard to apply to the EIA. That said, the Consultants note that EEPGL has conducted extensive research regarding Guyana's biological resources, in programs that have spanned multiple years and contributed significantly to scientific knowledge for the country. These data have been shared publicly as appendices to the Liza Phase 2, Payara, and Yellowtail EIAs, all of which were available to the public on the EPA's website as of December 2021.				
309	15-Dec-2021	Conservation International	**Adopt continuous and meaningful engagement with communities and Indigenous Peoples.** As per IFC Performance Standards, there should be continuous robust stakeholder engagement during the life of the project. For each of those engagements the Project should ensure deliberative spaces and appropriate communication tools that are inclusive and tailored to the different audiences and enable effective participation of vulnerable and underrepresented stakeholders. We note efforts made in previous EIA submissions to create user friendly formats, however, we are of the view that this was not adequately distributed publicly and may result in many stakeholders being unable to sufficiently comprehend the information contained in the EIA documents to constructively comment on it. This lack of follow through can no doubt negatively affected the credibility of the management processes undertaken by the company and impressions of the proposed development.	EEPGL has been responsive to the questions, concerns, and interests of indigenous stakeholders and continues to work with these communities to identify opportunities to support local benefits. The SEP (EIA Volume III) describes the Consultant team and EEPGL's engagement with communities, including indigenous communities. Engagement of indigenous communities has always included an indigenous leader representative from the National Toshaos Council (NTC) to ensure all the engagements are fair and impartial and the concerns of the indigenous communities are raised and addressed. The participation of the NTC is beneficial since communities are generally more comfortable during the engagements as a result of the presence of the representative of the NTC and, as such, have more confidence in the process and participate freely in the discussions. While the Yellowtail Project EIA is not subject to the IFC Performance Standards, EEPGL agrees that engagement is an ongoing activity that continues throughout the life of a project and that it should be appropriate and inclusive to the audience. The SEP documents the multiple years of engagement that have taken place by EEPGL and its consultants. In reference to the comment regarding user-friendly material, in response to comments received in other EEPGL Project consultations about the complexity of the materials, the Consultants developed for the Yellowtail EIA a highly visual NTS as well as other materials to help in messaging the Project risks and benefits. This NTS was distributed at EIA disclosure meetings early in the EIA disclosure period to support an informed understanding of the Project within the public comment period. The Consultants also facilitated two in-person discussions with indigenous communities in Region 1, including non-technical presentations of the Project and EIA process and results, and extensive question-and-answer sessions.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
310	15-Dec-2021	Conservation International	**Execute on-going monitoring programs for vulnerable species to inform a Critical Habitat Assessment (CHA).** We recommend the project, following a Precautionary Principle (referenced in point 3b above), execute an on-going monitoring program for vulnerable species identified through the field studies, even if residual impacts affecting them are considered negligible. Special emphasis should also be placed on a comprehensive baseline assessment of herpetofauna along the coast, as these are usually the first indicators of ecosystem health. The results of all these additional studies should help eventually inform a Critical Habitat Assessment (CHA) to determine if critical habitats are likely be impacted and to what degree.	The Consultants note that the ESMP includes a recommendation for ongoing monitoring of marine and riverine mammals as well as marine turtles. The Consultants have not recommended monitoring of terrestrial coastal herpetofauna because there is no credible pathway for significant impacts on those species from planned Project activities. With respect to critical habitat, a CHA is a unique element of EIAs conducted under the IFC Performance Standards, and is not generally included in EIAs that are not subject to the IFC Performance Standards (such as the Yellowtail Project). Compliance with the IFC Performance Standards is not required by the Environmental Protection Act and was not within the scope of the Yellowtail EIA, so it would be inappropriate to require a CHA for the Project. The inappropriateness of a CHA in the context of the Yellowtail Development Project notwithstanding, the impact assessments for several biological resources (including marine birds, marine mammals, and marine fish) include several attributes that would typically be considered in a CHA (such as listing status, congregatory behavior, and migratory life histories) as factors when determining sensitivity to potential Project impacts.	No	Accepted	N/A	N/A
311	15-Dec-2021	Conservation International	**Support mechanisms for strengthening data collection to improve knowledge and management of Guyana's marine natural resources and ecosystems.** The development of the sector offshore in ecosystems that are poorly understood also present unique challenges especially when combined with the pace of this development. The environmental data collection that is being undertaken in the marine environment by EIA consultants for the various oil and gas developments is exceedingly valuable because of the paucity of research in Guyana's EEZ. It is therefore of great importance that measures be put in place to manage this data and result in progressively improved knowledge of the space within which these projects are being developed, especially given that the research is almost entirely new. One possible means of doing this is the establishment of a data management system to which the EIA consultants conform and use to collate and submit their data. This	The Consultants agree that much of the information that has been generated through ongoing studies, including those that informed the Yellowtail EIA, is new and of significant value to the Government of Guyana, academic institutions, non-governmental organizations (NGOs), and other stakeholders with an interest in conserving Guyana's natural heritage. All of the reports detailing the findings of the studies that informed the Yellowtail EIA (including the appendices with data tables) have been made available to the EPA. Following prior precedent, new reports that have not been provided previously are included in Volume II of the Yellowtail EIA. Historical reports were previously made available in Volume II of either the Liza Phase 2 or Payara EIAs. These documents are available to the public on the EPA's website.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			would allow for future research to build on prior set of work and support further research activities and identification of gaps. The Project should consider sharing the information collected from baseline and monitoring assessments more broadly in ways and formats that are useful for wider use by the EPA, the conservation community, academia and the general public. Additionally, EEPGL has a great opportunity to support research efforts and initiatives that can contribute to increasing knowledge and understanding of the marine ecosystems and natural resources of Guyana.					
312	15-Dec-2021	Conservation International	**Development of a Biodiversity Action/Management Plan (BAP/BMP) to protect threatened species.** Considering the high biodiversity value of the coasts of Guyana, as well as the potential uncertainties about project impacts, a stand-alone BAP/BMP Is important to communicate clearly to stakeholders the company's selected mitigation strategy, and its working philosophy and ability to operate responsibly in areas of known conservation value. EEPGL could also opt to incorporate biodiversity-related mitigation and management measures into more general Environmental Management Plans or Action Plans, but the risk in this case, is that commitments might appear less evident or buried among many others, and possibly be less focused.	The ESMP included in Volume III contains several biodiversity-related management measures as suggested in the comment. The biodiversity-focused measures are grouped together in ESMP Table 3.6-1, although many of the air quality- and marine water quality-focused measures included in prior sections of the ESMP would also contribute to management of impacts on biodiversity by minimizing potential impacts on habitat.	No	Accepted	N/A	N/A
313	15-Dec-2021	Conservation International	**Expand the scope of IUCN assessment to include all observable species.** We commend the EIA's identification of IUCN Red List species in Guyana and overlap with respect to coastal bird species, however, clarity is needed for observed marine bird, marine mammal, fishes, flora, fauna, and turtle species and whether they are	Not every species that has been observed in Guyana has been assessed by the International Union for Conservation of Nature (IUCN). EIA Section 7.1.2.2, Special Status Species, provides the number of species that have been documented in Guyana and which appear on the IUCN Red List (296 species at the time the EIA was prepared).	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			on the IUCN Red List of Threatened Species.					
314	15-Dec-2021	Conservation International	**The marine mammal observation data presented should be strengthened.** We believe this data lacks structured attempts to catalogue these species and relies largely on opportunistic sightings from marine vessels over a period of 10 years. This method is limited as it is neither systematic nor structured and assumes that vessel captains can correctly identify species.	The Consultants agree that there has been an element of opportunism to the marine mammal observer data collected to date; however, as indicated above, the ESMP includes a recommendation to report detections of marine mammals and marine turtles made from the FPSO, drill ships, installation/decommissioning vessels, and support vessels over the operational lifetime of the Project (see ESMP Table 3.2-1). The FPSO would remain stationary for the entire monitoring period, which will effectively create a permanent, full-time monitoring point within the Project AOI. Responsibility for observing marine mammals does not rest solely with vessel captains; crews for the FPSO, support vessels, and installation vessels receive basic training on the need to watch for and record sightings of marine mammals and turtles.	No	Accepted	N/A	N/A
315	15-Dec-2021	Conservation International	**The turtle telemetry data presented should be strengthened.** This data was collected from few turtles and over only one nesting season. This data is therefore not sufficiently indicative of the migratory routes all nesting species utilize. More robust data is needed to formulate a clearer picture.	The Consultant team considers the turtle telemetry data presented in the EIA (which includes data from two nesting seasons for the most common species that use Guyana's beaches) as adequate to support the analysis of potential Project effects on migrating turtles. The 12 turtles that have been satellite tagged to date generally showed consistent movement patterns during both the internesting and postnesting periods, so the Consultants consider the existing turtle telemetry data to be sufficient for the purposes of rating the anticipated impacts on the Yellowtail Development Project on marine turtles.	No	Accepted	N/A	N/A
316	15-Dec-2021	Conservation International	**Adopt recommendations that the sampling area be widened to appropriately assess baseline conditions of areas potentially impacted by indirect or cumulative impacts.**	The Consultants note that biological resource data have been collected from across the Stabroek Block (and between the Stabroek Block and the shoreline), specifically for marine fish, marine birds, and marine mammals. Further, coastal bird data have been collected across the Guyana coast. With respect to future monitoring, the monitoring program described in the ESMP focuses on the Direct AOI because the Direct AOI (specifically the immediate vicinity of the FPSO and drill centers) is where the most significant Project-related environmental impacts would be expected to occur. To the extent that low-level impacts could occur farther away from the Direct AOI, the EIA predicts that their significance would be too low to warrant a seascape-level monitoring program. However, some marine receptors that are vulnerable to potential impacts outside of the immediate vicinity of the FPSO and wells (such as vessel collisions with marine mammals and sea turtles, for example) would be monitored wherever Project vessels are operating.	No	Accepted	N/A	N/A
317	15-Dec-2021	Conservation International	**Present information on sampling dates and locations in a clearer manner to better convey their seasonal and temporal variations.** It was previously recommended that "additional sampling periods be carried out to better capture temporal variations in baseline conditions." While additional sampling has been proposed for various studies it is still not clear whether capturing seasonal or temporal variation has been factored in the studies associated with this	The biological field studies referenced in EIA Chapter 7 were conducted with seasonal variations in mind. Not all taxonomic groups (deep marine benthos for example) are likely to be affected by seasonal changes, but efforts were made to collect data in the wet and dry seasons for the major taxonomic groups that are likely to be affected by seasonal changes. In addition, sampling events have been conducted over multiple years for most taxonomic groups. Information on when and where the field studies for each of the major taxonomic groups is included in the relevant reports in Volume II of the EIA, or in the appropriate study report for historical studies.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			EIA. We suggest presenting this information in a clearer way, by including an additional column to better denote the studies done to date, and when they were done, including aspects such as the season during which they were performed. This will allow for better and easier assessment of the robustness of sampling conducted and gaps can be clearly assessed.					
318	15-Dec-2021	Conservation International	**Project Generated Impacts** We recognize that the EIA references the World Bank's Environmental, Health and Safety Guidelines (EHS Guidelines) for the evaluation and selection of resource efficiency and pollution prevention and control techniques for the Project. However, we recommend the following:	N/A	No	Accepted	N/A	N/A
319	15-Dec-2021	Conservation International	It is important to also consider the risks and potential impacts on priority ecosystem services that may be exacerbated by climate change, as per IFC PS4. For instance, socio-economic impacts on fisheries and fishing communities due to climate change which might also be exacerbated by the Project's exclusion zones.	While the Yellowtail Project EIA is not subject to the IFC Performance Standards, as discussed in EIA Section 8.3.2, Guyana's marine fisheries and food security have exhibited a high degree of vulnerability to climate-related effects. Both changes in rainfall patterns and predicted sea-level rise associated with climate change pose significant threats to the Guyanese population and its livelihoods, including fishing and shore-based livelihoods. However, specific to potential Project impacts, which is the focus of the EIA, Section 8.9, Ecosystem Services, does not identify potential impacts to ecosystem services as a result of planned Project activities, and potential exacerbation by climate change is not expected to change the conclusion that planned Project activities and Project use of the Guyana shorebases and onshore support facilities would not result in significant impacts on coastal habitats. In regard to the example of how impacts of climate change on fisheries and fishing communities could be exacerbated by the Project's exclusion zones, EIA Section 8.2, Employment and Livelihoods, and Section 8.4, Marine Use and Transportation, highlight that subsistence fishing and most commercial fishing occurs between the coast and the PDA and would not be affected by the exclusion zones. Very few commercial vessels are engaged in deepwater fishing that may approach the boundary of the PDA. As such, impacts of the Project would not be expected to exacerbate any potential challenges related to climate change.	No	Accepted	N/A	N/A
320	15-Dec-2021	Conservation International	Vessel offshore anchoring and specific drilling activities might disturb seabed habitats; this is an additional project interaction with environmental resources/receptors that should also be considered.	It is noted that only the FPSO would be moored; no other Project vessels would be anchored, moored, or otherwise attached to the seafloor at any time. The potential physical impacts associated with the FPSO's mooring spread are assessed in Section 6.3 and the biological impacts of the mooring spread are assessed in several locations in Chapter 7, including EIA Section 7.5 (Marine Mammals), Section 7.8 (Marine Fish), and Section 7.9 (Marine Benthos).	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
321	15-Dec-2021	Conservation International	The proposed disposal of solid waste detailed in the EIA must take into consideration the already insufficient capacity of current landfills in Georgetown; these may not have enough capacity for the additional waste the project will generate. Special emphasis should be placed on the efficient and effective disposal of the project's hazardous waste, taking into consideration that Guyana does not currently have a functioning commercial incinerator.	The Yellowtail EIA did take into consideration the types and quantities of solid and hazardous waste to be generated by the Project. See the responses to Comment #265 regarding solid waste disposal capacity. With respect to hazardous waste treatment capacity, there has been significant expansion of third-party commercial hazardous waste handling, storage, and treatment facilities in Georgetown in recent years. TRG, located at the GYSBI facility, is currently the primary provider of hazardous and non-hazardous waste treatment services in Guyana. As described in Section 4.3.3, Current and Future Waste Treatment, of Appendix C of the CWMP, certain hazardous wastes, including oily rags, spent solvents, paint cans, brushes, biomedical wastes, etc., are treated in an incinerator unit at TRG. In addition to TRG, several additional private waste management facilities have come online or are expected to come online in the near-term for hazardous (and non-hazardous) waste treatment. These are expected to further expand the capacity of onshore waste management infrastructure to manage the Project's hazardous, non-hazardous, and exempt hazardous waste storage, processing, treatment, and/or recycling needs. EIA Chapter 8 discusses the mitigation measures that were already in the process of being implemented at the time the EIA was written to address potential infrastructure capacity constraints. Based on the progress with these measures, the Consultants have concluded that sufficient waste management infrastructure would be in place to manage the wastes from the Project.	No	Accepted	N/A	N/A
322	15-Dec-2021	Conservation International	Impacts from unplanned events (i.e. oil spill): We consider that the rating of impacts on marine species, coastal habitats as well as communities and indigenous peoples from a potential oil spill or natural geological event should be conservative and follow a precautionary principle. We recommend evaluating these potential impacts from the perspective of the possible magnitude, alongside the likelihood of their occurrence. The likelihood of these event might be low but the magnitude and irreversibility of the impacts which would result should they occur could be very significant, as it could take decades or more for all these receptors/resources to fully recover.	Consistent with the typical approach taken for assessment of unplanned events, a risk assessment approach was taken in order to incorporate the aspect of likelihood (i.e., to distinguish from assessment of an event which is planned or practically certain to occur). The Consultants agree that there are a number of resources for which the consequence/severity of an oil spill would be high, and many of the resources have therefore been assigned the highest consequence/severity rating in the methodology. That said, the likelihood of an oil spill of sufficient magnitude to produce this type of consequence is very low and it is therefore appropriate to assign a likelihood rating of Unlikely. It is acknowledged that this produces a combined risk rating that is Moderate (rather than Major), and this is consistent with typical risk assessment methodology—which does not automatically assume a very rare event will happen. It is further noted that the measures proposed by EEPGL represent good international industry practice, and different/additional measures would not be proposed even if the risk rating were to be raised to Major.	No	Accepted	N/A	N/A
323	15-Dec-2021	Conservation International	An economic assessment and valuation of all resources which can potentially be impacted by an unplanned event should be conducted to ensure an accurate economic baseline exists should an unplanned event occur.	A baseline economic evaluation of resources that could be affected by a hypothetical spill scenario is neither practical (because the scope of such an event is impossible to predict and therefore the scope of an assessment cannot be defined) nor typical for an EIA.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
324	15-Dec-2021	Conservation International	The Precautionary Principle should also be applied when assessing potential cumulative impacts, given the additional exploration projects projected by EEPGL and other companies. The project should actively manage, where feasible, the spatial and temporal overlap of their additional projects' activities.	See the responses to Comments #306 and 307, regarding application of the Precautionary Principle and cumulative effects. It is noted that the cumulative impact assessment (Chapter 10) makes specific recommendations relative to management of EEPGL's multiple development project and exploration operations—with the express purpose of reducing the additive potential for impacts associated with an increased activity level.	No	Accepted	N/A	N/A
325	15-Dec-2021	Conservation International	Ensuring costs of expected activities and social benefits, unplanned events and/or unanticipated post-decommissioning environmental and social risks are covered: Measures such as performance bonds, insurance agreements, escrow accounts, etc., should be considered to ensure costs of managing environmental and social risks from expected on-going events, unplanned events and/or unanticipated post-decommissioning risks will be adequately covered, as well as all promised social benefits are delivered.	Whether social benefits can ultimately be delivered as estimated by the Consultants is beyond the scope of the EIA. Regarding costs associated with potential environmental risks, the Stabroek Block co-venturers' first priority is to put in place mitigations and processes that prevent adverse events. In the unlikely case of an adverse event, the co-venturers would immediately minimize and rectify any impacts. The co-venturers have the financial capacity to meet the responsibilities for an event including obligations under Guyanese law and the respective petroleum agreements. Regarding insurance, the Stabroek Block co-venturers have secured comprehensive insurance for petroleum activities as required by environmental permits. Under the existing legal framework and agreements with the government, there are extensive assurances of EEPGL's and co-venturers' commitments, including environmental protection measures to respond to operational incidents. The Government of Guyana has multiple mechanisms in place, including the Stabroek Block Petroleum Agreement and the environmental permits, to ensure that the companies would take responsibility for any adverse events. Joint insurance coverage is obtained in the name of EEPGL and the other Stabroek block co-venturers for the appropriate lines of coverage, depending on the project and scope of work. Specifically for the Yellowtail Project, should the Yellowtail Project receive necessary approvals, the co-venturers would have insurance coverage including Third Party Liability and the cost of regaining control of a well.	No	Accepted	N/A	N/A
326	15-Dec-2021	Conservation International	**Stakeholder Engagement** **Adopt permanent, meaningful and inclusive stakeholder engagement.** EEPGL has been engaging with different stakeholders in a variety of ways during the development of the various projects within the Stabroek Block. We recommend moving forward that for each of those engagements the Project demonstrates engagement through deliberative spaces and simple communication tools that are inclusive and tailored to the different audiences, as well as enable effective participation of vulnerable and underrepresented stakeholders.	EEPGL agrees that engagement is an ongoing activity that continues throughout the life of a project and that it should be appropriate and inclusive to the audience. EEPGL's and its consultants' engagement with communities, including indigenous communities, is described in the SEP (EIA Volume III). The SEP details the multiple years of engagement that have taken place by EEPGL and its consultants. The SEP also describes how EEPGL identifies and engages with vulnerable and underrepresented stakeholders. In response to comments received in other EEPGL project consultations about the complexity of the materials, the Consultants developed a highly-visual NTS, as well as other visual communication materials, to help in messaging the Project risks and benefits. This NTS was distributed at EIA disclosure meetings early in the EIA disclosure period to support an informed understanding of the Project within the public comment period. The Consultants also facilitated in-person and virtual meetings in all six coastal regions (including indigenous communities in Region 1), including non-technical presentations of the Project and EIA process/results, and question-and-answer sessions. EEPGL is committed to providing stakeholders with regular access to information about the activities as well as access to feedback mechanisms through which stakeholders may provide input and receive response to	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				feedback. To date, in addition to active updates and information sharing on social media and traditional media channels, this has included, but is not limited to, oil spill management training in Regions 1 and 6, waste management training, capacity-building efforts and training, supplier forums, offshore oil and gas seminars through the CLBD, and community outreach events (e.g., job fairs, schools, informational booths) in Regions 1, 2, 3, 4, 5, 6, 9, and 10.				
327	15-Dec-2021	Conservation International	**Adopt ongoing reporting to potentially affected communities**. We also recommend that the project ensures ongoing reporting to potentially affected communities and transparency about consultation reports. These should capture stakeholder concerns and comments during all consultation activities and show how they were addressed or otherwise treated	EEPGL's engagement with affected communities is described in the SEP, which also includes a publicly disclosed summary of concerns and comments received during engagements. Furthermore, ongoing engagements and resulting actions are tracked by EEPGL through an automated, stakeholder engagement database. EIA Chapter 4 provides a summary of stakeholder concerns and comments received in relation to the Yellowtail Project, and how comments have been addressed.	No	Accepted	N/A	N/A
328	15-Dec-2021	Conservation International	**Ensure Informed Consultation and Participation (ICP) and Free, Prior and Informed Consent (FPIC).** The Project should ensure the ICP of the indigenous peoples about the potential risks, impacts and proposed mitigation actions pertaining to the possibility of an oil spill. This can be effectively achieved through guidance and relationships with partners, such as indigenous NGOs, who have great experience and expertise in effective engagement with these communities. According to IFC PS1, an oil spill stemming from offshore drilling would constitute "(ii) impacts from unplanned but predictable developments caused by the project that may occur later or at a different location." While the offshore drilling is not being developed on indigenous peoples' lands per se, its adverse impacts (an accidental spill) could significantly impact the lands and resources traditionally owned or under the customary use of indigenous peoples. Therefore, ICP is required, and the case for FPIC as the preferred course of action is a strong one, because of the following: • The potential unplanned event (oil spill) could impact the Indigenous	While the Yellowtail Project EIA is not subject to the IFC Performance Standards, EEPGL respects the rights and cultures of Indigenous Peoples and commits to conducting meaningful consultations with them, incorporating traditional knowledge and use into its plans, and seeking mutually beneficial long-term relationships. EEPGL further recognizes that Informed Consultation and Participation and Free, Prior and Informed Consent are processes by which accurate, accessible, and timely information is shared in regard to proposed developments, with opportunities for constructive and two-way dialogue. EEPGL's stakeholder engagement program has included (and continues to include) indigenous communities and Toshaos in Regions 1 and 2. EEPGL has been responsive to the questions, concerns, and interests of indigenous stakeholders and continues to work with these communities to identify opportunities to support local benefits. EEPGL further recognizes the importance of effective communication and engagement with Guyanese society (and especially potentially vulnerable communities) to obtaining and maintaining a "social license" to construct and operate the Project. The Consultants likewise recognize the importance of communication and engagement to the execution of a robust and defensible EIA. With these needs in mind and as described in the SEP, EEPGL has engaged in a multi-year engagement process with communities across the coast (including indigenous communities) and these engagements informed both the scope and findings of the EIA.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Peoples' related natural resources (particularly the marine resource, given that they are fishing communities). • iFPIC would allow the project to develop more robust required emergency preparedness plans, mitigation plans, and compensation schemes. • The indigenous communities in question may fall into the particularly vulnerable status, thereby requiring extra measures per IFC PS1. • The benefit would outweigh the cost over the long-term.					
329	15-Dec-2021	Conservation International	**Environmental and Socioeconomic Management Plans** **Lessons from the Environmental and Social Management Plan (ESMP) implementation should inform policies and decision-making.** Considering the oil and gas sector within Guyana is in its infancy, we reiterate the recommendation that the ESMP and its implementation be used as an organizational learning process in which the lessons experienced are fed back into policy, institutions and subsequent project designs, thus building the country's capacity to better manage such large-scale projects in the future. We recommend having clarity on the institution and mechanisms responsible for implementing this.	This comment addresses recommended actions and policy concerns that are beyond the scope of the EIA and would more appropriately be directed to the Government of Guyana.	No	Accepted	N/A	N/A
330	15-Dec-2021	Conservation International	**The socioeconomic management plan should include important emphasis on local capacity for delivering sector related services**. The Project should ensure assistance to build capacity of local businesses (to an accredited level acceptable to EEGPL) to cater to the needs of the sector, e.g. Solid Waste Management (incineration services, solid waste disposal, treatment of hazardous chemicals, etc.), Oil Spill Wildlife Response	EEPGL along with the Stabroek block co-venturers launched the Greater Guyana Initiative (GGI) in 2021, a $100 million USD ($20.9 billion GYD) investment over 10 years to support capacity building, economic development, and diversification across all regions of the country. The CLBD, supported as part of GGI, builds capacity for local businesses including, but not limited to, mentoring for ISO 9001 certification. GGI also provides support to a variety of projects and programs at the University of Guyana as well as supporting a pilot program of capacity building with the Council for Technical and Vocational Education and Training. Capacity building and local content is covered in EEPGL's Local Content Plan, which is provided under separate cover to the government. The ESMP also includes related measures including employing Guyanese citizens having the appropriate qualifications and experience where reasonably	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			(training at the University, schools of Veterinary Medicine and the Guyana Wildlife Conservation and Management Commission how to care for, clean and rehabilitate oiled wildlife).	practicable, partnering with select local institutions and agencies to support workforce development programs, proactively messaging Project-related employment opportunities, and procuring Project goods and services locally when available on a timely basis and when they meet minimum standards and are commercially competitive. Additional information about EEPGL's Local Content Plan and local initiatives to support workforce and business development are provided in EIA Chapters 2 and 8.				
331	15-Dec-2021	Conservation International	**Decommissioning of equipment should ensure coral reef inoculation.** It is expected that upon decommissioning the drilling equipment, pipes and anchor piles will be disconnected and abandoned in place on the seafloor and we recommend that the strategy encourage coral reef inoculation on substrate metals or ensure that all EEPGL equipment will not pose danger to wildlife. While it is likely that natural ecosystem succession will occur, abandoning equipment on the seafloor would potentially reduce the aesthetic quality of the area and can create safety hazards, such as injuring wildlife (e.g. sharp metal edges. ingesting inedible materials, poisonous materials, and entanglement).	As described in the Preliminary End of Operations Decommissioning Plan included in Volume III of the EIA, a proposal for subsea infrastructure to remain on the seabed after decommissioning would be based on a case-by-case evaluation. The industry supports the use of a Multi-Criteria Decision Analysis (MCDA) as the facilities are approaching end of production life to holistically evaluate the decommissioning approach for the subject facilities. The MCDA evaluates the potential safety and health, environmental, social, and economic risks, as well as technological challenges/developments that may be needed for the decommissioning options analysis (including reefing). Given the length of expected operational timelines and potential advancements in technology, it is difficult to determine final disposition at this time. Industry general practice in these depths for SURF facilities is, at the time of initial installation, to plan for such facilities to remain in place at decommissioning; however, this will be re-evaluated as the field reaches end of life. Abandonment of selected equipment on the seafloor as part of decommissioning is thus currently proposed, but further approvals would be required before this plan could be implemented. If the approved alternative at the time of decommissioning calls for subsea infrastructure to remain on the seabed, given the length of time that the SURF would be in use, it is likely that encrusting benthic species would have colonized the equipment before decommissioning begins. This could make coral inoculation difficult to accomplish without disturbing the existing biological community; however, an assessment would be made at that time to identify the least disruptive/most beneficial method of decommissioning the subsea infrastructure.	No	Accepted	N/A	N/A
332	15-Dec-2021	Conservation International	**Monitoring should be carried out on three levels and ensure adaptive management.** In addition to the consultant's Environmental Management Plan, we would like to clarify a few best practice principles for biodiversity monitorization. These are • In field monitoring of relevant biodiversity values; • Monitoring of implementation and effectiveness of mitigation measures and management controls; and	The monitoring program described in the ESMP (Volume III of the EIA) is focused on the Direct AOI because the Direct AOI (specifically the immediate vicinity of the AOI and drill centers) is where the most significant Project-related environmental impacts would be expected to occur. In the Consultants' view, when taken in aggregate, the monitoring measures proposed in the ESMP are adequate to validate the findings of the EIA and support effective oversight by the EPA for several reasons. These reasons include inclusion of direct sampling and testing of physical parameters that can be compared to quantitative performance criteria that are widely used in the oil and gas industry and relevant to Guyana's environmental treaty obligations (e.g., residual oil on cuttings, oil content and temperature of discharged water, etc.), as well as a long-term focus on protected marine species (marine mammals and turtles) that can be considered indicators of general marine ecosystem health. The ESMP would be revised periodically to ensure that the various measures described in the plan remain aligned with Project needs and reflect current technologies, The "evergreen" nature	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			• Monitoring of status of non-project related ongoing threats to biodiversity values in the project's vicinity and the extent to which the project might exacerbate them. • Finally, the Project should ensure adaptive management practices to adjust methodologies and practices to the ways ecosystems and biodiversity are being managed and monitored. Additionally, the following suggestions could ensure a robust and impactful monitoring programme: • Increased training for ANY vessels (not just EEPGL associated vessels) moving to and from the FPSO and drilling ships to identify marine mammals and adjust course/speed accordingly to prevent collisions. • Better preventative protocols in place to avoid an influx of invasive alien species from untreated ballast water. • Continuous monitoring of water quality surrounding FPSO by independent labs to determine temperatures, pollutants levels, algal blooms etc. iv. The inclusion of measures to enable community participation, especially Indigenous People and communities, in the project's research and monitoring would be of great value to effective monitoring, amongst other things.	of the ESMP reflects an adaptive management approach to management of Project-related impacts.				
333	15-Dec-2021	Conservation International	• Transboundary considerations and ability to respond • Support development of frameworks that clearly organizes roles, priorities and devote resources for responding to an unplanned event. There needs to be a clear plan with respect to who is responsible for cleanup activities, who funds initial response, who funds recovery	i. As stated in OSRP Section 1.2.3 (included in Volume III of the Yellowtail EIA), EEPGL has developed a system for working with appropriate representatives of other jurisdictions (in coordination with the Government of Guyana) to respond to a potential transboundary event. This system considers operational and administrative details including but not limited to communications, waste management (including the potential for transporting wastes across international borders and the legal ramifications thereof), movement of equipment and personnel between jurisdictions, and community involvement in affected jurisdictions. These preparations have been further operationalized through the preparations of Geographical Strategic Response Maps, examples of which are included in the OSRP.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			from culminative effects, who is responsible for loss of country revenue (sea/sand/sun product). • Establish an environmental bond for unplanned events. The very limited mechanisms in place for the regulatory agencies to deal with an oil spill, along with weak legal frameworks that exist within the region, suggest that impacted countries would be in a highly disadvantageous position, and highly dependent on the developer, to respond to a transboundary oil spill event. We reiterate the recommendation for the establishment of an environmental bond or the triggering of an immediate imposition of an early payment (within the fee structure of the environmental permit) that can be immediately used by the Government of Guyana to work with its neighboring countries and other affected parties in the event of an oil spill. We note that this matter becomes increasingly important as the number of wells increases. • We recommend the inclusion of a terrorist response scenario or plan for both offshore and shore-based sites. There are references to several emergency response plans triggered by events such as bomb threats or civil disturbances, however given Guyana's limited capacity to respond to a mass casualty event (medical, terrestrial security forces, mortuary services, emergency Coast Guard deployment, etc.), there needs to be a clear emergency plan which can be efficiently implemented.	ii. EEPGL recognizes the overall initiative the Government of Guyana has taken with the development of the National Oil Spill Contingency Plan (NOSCP) under the chairmanship of the Civil Defence Commission. Within the NOSCP, EEPGL would be considered the Responsible Party in the unlikely event of a spill from one of its offshore facilities, with obligations to provide notification to MARAD (as the National Focal Point—Marine) upon identification of an oil spill event. The EEPGL OSRP works in conjunction with the NOSCP, addressing how, as the Responsible Party, EEPGL would respond. Initially, EEPGL would appoint an Incident Commander to lead the Incident Management Team (IMT), utilizing the internationally recognized Incident Command Systems processes. An appropriately resourced IMT would be established in Georgetown, including relevant agencies. EEPGL would remain as the Incident Commander (either as overall, or as part of Unified Command with the Competent National Authority) unless the Competent National Authority considered it necessary to assume the Incident Commander role. Per the Yellowtail EIA Vol. 1, Section 9.1.9, in the unlikely event of an oil spill, EEPGL will establish a claims process and, depending on the magnitude of the spill, a livelihood remediation program. In addition, EEPGL and its co-venture partners have entered into agreements with insurance companies which require verification that adequate financial resources are in place to satisfy environmental obligations, including those in the unlikely event of a spill. iii. The Yellowtail EIA Vol. 1, Section 9.1.9 outlines the Claims and Livelihood Remediation Processes, which includes in the unlikely event of an oil spill causing losses to stakeholders that EEPGL will establish a claims process and, depending on the magnitude of the spill, a livelihood remediation program. Further, EEPGL and its co-venturers carry insurance coverage consistent with global industry practice to enhance their financial resources to respond in the event of a spill, and will comply with Guyana's regulatory requirements related to demonstration of financial responsibility. iv. ExxonMobil Global Security has conducted formal risk assessments on all operations in Guyana, which included the threat from terrorism. Emergency response plans for security incidents have been implemented. Additionally, shorebase and offshore assets fully comply with the International Ship and Port Facility Security Code. As stated in OSRP Section 3.3.1, EEPGL has a country-level (i.e., not specific to Yellowtail) Emergency Response Plan that describes the overall emergency response model utilized by EEPGL, with a focus on how emergencies are managed at the country level in Guyana. It provides structured processes, tools, and guidelines to assist the various management teams that exist within the company in effectively responding to an emergency that originates from or escalates into EEPGL operations. OSRP Figure 3.3-1 illustrates how EEPGL's Emergency Response Plan would integrate with other company or contractor plans in an implementation scenario.				
334	15-Dec-2021	Conservation International	**Additional studies** **Continue subsea noise pollution monitoring. We** acknowledge that monitorization efforts now also include a subsea noise pollution study component to gauge and track	Although the EIA includes a marine noise modeling analysis, it does not include a recommendation to monitor marine noise. The EIA does recommend that operational activities are conducted in accordance with good international oilfield practice regarding mitigation of noise impacts on marine mammals, including adherence to the JNCC guidelines during seismic	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			potential impacts of sound arising from Liza and Payara project-related activities, as this was one of CI's recommendations from an earlier EIA review. Furthermore, we are pleased to learn that the deeper water at Payara lowers the sound levels, and therefore presents less danger to marine populations.	activities, which the Consultants consider adequate to manage noise impacts on marine mammals.				
335	15-Dec-2021	Conservation International	**Establish baselines for the Shell Beach Protected Area (SBPA).** Given the potential for significant impacts to the SBPA from unplanned events such as oil spills, we recommend that baselines be establish for the protected area, especially for the elements that would be the most affected by such events. The SBPA should also be included as part of the continuous biodiversity monitoring over the life of the project.	The Shell Beach Protected Area (SBPA) is unlike other portions of Guyana's coast in that it is the only large coastal area in the country that has been the subject of a formal, relatively recent biodiversity study (the 2011 Proposed Shell Beach Delineation Process Report). Although the 2011 delineation report is the most comprehensive government report on environmental aspects of the Region 1 coastline and contains valuable information on the biodiversity of the SBPA, this information, together with more recent survey data from other sites with similar habitats (coast beach, intertidal mud flats, mangroves, etc.), were deemed sufficient by the Consultants to credibly assess potential Project-related effects on the SBPA.	No	Accepted	N/A	N/A
336	15-Dec-2021	Conservation International	**Specific Recommendations and Observations** All specific recommendations are detailed and Attached in Appendix B (Stakeholder comments register- CI-Guyana - Yellowtail ESIA).	N/A	No	Accepted	N/A	N/A
337	15-Dec-2021	Conservation International (Appendix B)	• NTS – Impacts – p. 14 – Impacts to Marine Benthos • Vol. 1 – 3.1.2 – p. EIS-22 – Marine Geology / Sediment and Marine Benthos • Vol. 1 – 3.1.9 – p. EIS-24 – Ecological Balance and Ecosystems There is significant potential to disrupt and negatively impact the micro and macro organisms that form the basis of the fisheries and marine food chains from volume of drill fluids, wastewater, effluent and ballast water throughout the life of the project. . This coupled with the cumulative effects from other extractive activities (Liza1, Liza 2, Payara), the potential for irreparable damage to the foundation of these food chains is significant.	These comments refer to the summary information presented in the NTS and the EIS, both of which are intended as high-level summaries of the EIA content. The technical basis for the ratings of impacts on marine biota is included in EIA Chapters 6, 7, and 10.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
338	15-Dec-2021	Conservation International (Appendix B)	• NTS – p. 18 - Socioeconomic conditions, employment and livelihoods • Vol. 1 – 3.1.12 – p. EIS-26 - Marine Use And Transportation There needs to be more evaluation on what effects Oil and Gas Support Infrastructure such as Shore bases and Deep-Water harbors will have on local artisanal fishing activities, loss of access to landing sites, increased traffic between FPSOs and Shore bases, etc.	Under the Environmental Protection Act, onshore support facilities require separate environmental permitting processes and associated environmental analyses to support those permitting processes. However, the EIA does assess impacts associated with project activities, including those from traffic between the FPSOs and shorebases. In addition, Chapter 10, Cumulative Impact Assessment, evaluates the combined impact of the Project with that of other developments, including potential cumulative impacts on artisanal fishing and vessel movements. Chapter 10 contemplates the impacts of other projects including but not limited to the West Demerara Shore Base and the Vreed en Hoop Port Facility. Finally, EEPGL's ongoing participatory fishing study includes the participation of fisherfolk at landing sites in all coastal regions. Findings of this study have informed the EIA and continue to comprise an important part of ongoing monitoring and stakeholder engagement activities. The most recent report is included in Appendix D, Participatory Fishing Study Final Report January 2019–March 2020, of the EIA (Volume II), including a profile of landing sites, fishing areas, targeted species, seasonal considerations, and biometrics. Findings of the participatory fishing study will continue to inform EEPGL's engagement and adaptive management activities.	No	Comment to be addressed in keeping with Redford group discussion (onshore support facilities and marine transportation)	See the response to Comment #17 in Table 2.	N/A
339	15-Dec-2021	Conservation International (Appendix B)	• NTS – p. 20 - Waste Management and Infrastructure Capacity • Vol. 1 – 3.1.14 – p. EIS-28 - Waste Management and Infrastructure Capacity This has been a deficit identified since the initial Liza1 discovery and EIA, yet there has been little significant effort by EEGPL to create a facility to process the hazardous waste created by their activities. While there are mentions of proposed facilities (applications to the EPA for creation and operation), the cumulative effects of Liza 1, Liza1, Payara and now Yellowtail developments highlight the increasing need for the creation of such processing facilities away from population centers to deal with the volume of hazardous and radioactive waste generated by these developments.	Wastes received from offshore are managed at TRG and the recently permitted SES, which are located at the GYSBI shorebase in Georgetown. Both of these waste management facilities have a design/processing capacity sufficient to manage hazardous wastes estimated from EEPGL's projects. Creating another waste management facility, when the current expectation is that these existing licensed facilities would have sufficient capacity for EEPGL's needs, would not be warranted. See the response to Comments #268 and 277 for additional information on hazardous waste facilities and measures employed to protect workers and the public. All radioactive sources used for EEPGL operations are managed in accordance with environmental permits and strict safety standards such as those set out by the International Atomic Energy Agency. EEPGL is not proposing treatment or disposal of radioactive wastes in Guyana.	No	Accepted	N/A	N/A
340	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – Introduction – p. EIS-8 - Project Life Cycle (2023-2032) • Vol. 1 – 3.1.2 – p. EIS-20 - Marine Water Quality The significant cumulative impact of drilling and installation activities on	These comments refer to the summary information presented in the NTS and the EIS, both of which are intended as high-level summaries of the EIA content. The technical basis for the ratings of impacts on marine mammals, turtles, and fish is included in EIA Chapters 6, 7, and 10.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			Marine life (mammals, fish, turtles). The continuous years of activities for each of these developments (Liza1, Liza2, Payara and Yellowtail) will cause significant disturbances to subsea life as well as migratory routes for sea turtles during nesting seasons.					
341	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 3.1.8 – p. EIS-24 – Marine Turtles While one FPSO and associated subsurface activities my pose negligible effects on sea turtle movements, the cumulative effects of 4-5 developments occurring at the same time across much of the length of the coast will pose significant negative effects on nesting females. There needs to be more monitoring than just a few tracked turtles to substantiate the data that the effects are negligible.	None of EEPGL's FPSOs are (or would be) installed near the coast—they all are/would be located more than 180 kilometers (112 miles) offshore. At this distance, the offshore developments currently envisioned would have little to no likelihood of affecting nesting activities, which occur at the coast.	No	Acceptable. However, clarity to be provided to avoid any misconceptions.	Clarifying language has been added to the EIS per the request.	p. EIS-26
342	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – Table EIS-7 – p. EIS-49 - Summary of Residual Impact Significance Ratings There is a positive rating for the effects of production operations and decommissioning activities on the Marine Benthos - contrary to ratings outlined in the text before.	The positive rating for marine benthos in Table EIS-7 is only for the production operations and decommissioning stages. The discharges and cuttings deposition at the seafloor (which would have negative effects on marine benthos, as described in EIA Section 7.9.3, Impact Assessment—Marine Benthos) would have ceased by this point in the project life cycle. The positive effects of increased hard substrate provided by the SURF would persist through the production operations and decommissioning stages and beyond. Taking these temporal aspects into account, the ratings depicted in Table EIS-7 are accurate.	No	The justification here provided in relation to the comment posed should be highlighted in the revised EIA for clarity	Further explanation has been added to the EIS as requested.	p. EIS-24
343	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – 2.7.5.3 – p. 2-53 - Flare and Blowdown System There is no mention of minimum safe limits for flaring as compared to the proposed emissions guide throughout the project's life cycle. Additionally, the cumulative effects flaring from of Liza1, Liza2, Payara, and Yellowtail developments need to be examined. As emissions from all these developments will put Guyana in the realm of one of the largest polluters in the Caribbean.	As discussed in EIA Section 2.7.4.3, Flare and Blowdown System, the flare system will be designed to safely accommodate flaring of associated gas during start-up and shutdown; equipment maintenance and process upsets scenarios; emergency pressure relieving scenarios, including facility blowdown; and other non-routine flaring events, including blowdown of the subsea gas re-injection system. While the flare system is designed for no routine flaring of associated gas, the preliminary design includes a *de minimis* level of continuously flared sources including pilot gas, purge gas, and back-up gas systems critical to the safe and reliable operation of the flare; and primary vent gas from compressor dry gas seals, analyzers, cooling medium/heating medium/chemical tanks blanket gas and potentially other *de minimis* sources, which are not practical to recover for routing to the vapor recovery unit. With respect to cumulative effects of flaring, EIA Section 10.6.1.1, Air Quality, and Appendix G, Emissions Inventory and Air Quality Modeling Report, describe the air dispersion modeling performed for the cumulative emissions from the Liza Phase 1, Liza Phase 2, Payara, and Yellowtail projects, as well as from two prospective future FPSO projects. This cumulative emissions modeling included estimated non-routine flaring for each of these projects.	No	Accepted	N/A	N/A

346	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – 2.19.3 – p. 2-149 – Internal and External Auditing There needs to be a more scope for Environmental auditing by independent firms (other than EPA), or the leeway for the EPA to outsource an environmental audit to a third party. EPA's capacity for environmental auditing of practices onboard the FPSO is lacking. Similarly, the time between notification of an assessment/ audit and execution of the audit needs to be minimal.	The EPA's capacity for environmental auditing or its ability to use an independent firm to conduct audits is beyond the scope of the EIA. EEPGL would comply with applicable legal requirements regarding audits and cooperate with the EPA in conducting environmental audits.	No	Accepted	N/A	N/A
347	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – 4.7.1.3 – Engagement Strategy – Consultation The email address and contact number listed should be included on every bit of communication shared with the public. Meaningful stakeholder engagement about developments and their long-term benefits/disadvantages on communities need to be extended beyond EPA lead engagements.	As described in EIA Section 4.7, a robust stakeholder engagement process was undertaken to inform the EIA and document stakeholder concerns. This engagement included both EPA-led and Consultant-led engagements and included engagement intended to inform the development of the EIA, and disclosure of the EIA, including inquiry and discussion about Project-related benefits and adverse impacts on communities. EEPGL also maintains a separate, ongoing stakeholder engagement program and agrees that engagement is an ongoing activity that continues throughout the life of a project and that it should be appropriate and inclusive to the audience. A synopsis of stakeholder engagement topics, by stakeholder, is provided in Attachment B of the SEP (provided in Volume III of the EIA). The synopsis table provided in the SEP includes engagement directly related to the Yellowtail Project and 2021 socioeconomic baseline updates, as well as engagement from past development projects that has also informed the Yellowtail EIA. In addition, a summary of the public comments received from, and revisions made to the EIA in response to, consultation conducted during the 60-day public disclosure period is included in EIA Chapter 4; Detailed comments and responses are provided in Appendix U, Stakeholder Comments. The Consultants acknowledge the recommendation to include contact information on all communication materials, and will consider that suggestion in undertaking future engagement programs. EEPGL's contact information is broadly communicated and is shared on all project and operations information materials.	No	Accepted	N/A	N/A
348	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – 6.4.3 – p. 6-102 - Impact Assessment—Marine Water Quality While the cumulative effects of associated Oil and Gas activities for Liza1, Liza 2, Payara and Yellowtail will not be known for years, it should be noted that the potential impact of changes to water quality and the associated negative effects (reduction of biodiversity, increased temperatures, degraded water	No transboundary impacts on water quality (or associated induced effects) would be expected as a result of planned Project activities or from the combined planned activities of the cited development projects. Unplanned events such as oil spills could have transboundary impacts on a variety of receptors, including but not limited to water quality. These potential impacts are assessed in detail in EIA Chapter 9.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			quality, etc) on our closest neighbours should also be considered. How can changes (negative or positive) in our water quality impact their livelihoods (fisheries, ecotourism, biodiversity - especially IBAs).					
349	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – 7.1.3.1 – p. 7-16 – Protected Areas "The Project's only potential impacts on SBPA would be as a result of an unplanned event (i.e., an oil spill)" - While not impacting the PA itself, seismic exploration and subsurface activities will impact the routes nesting sea turtles take to approach the Protected Area. The resulting disturbances may negatively affect the turtle's trajectory as well as cause them to seek other less desirable nesting grounds. One solution would be to suspend activities during the height of the nesting season to reduce negative effects to these endangered species.	There is no credible evidence to suggest that marine turtles' ability to navigate while at sea would be negatively affected by seismic exploration or other subsurface activities associated with the Project. The primary effect pathway of seismic exploration is acoustic, and as described in EIA Section 7.7.3, Impact Assessment—Marine Turtles, impulsive underwater sound from vertical seismic profiling is expected to attenuate to injury thresholds at maximum horizontal distances of 73 meters (239.5 feet) from the seismic source. The area of ocean within this radius is insignificant at the ecosystem level, and soft-start procedures as recommended in the ESMP would further reduce the potential for injury or significant disturbance-level impacts from seismic activities.	No	Accepted	N/A	N/A
350	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – 8.1.2.4 – p. 8-23 - Economic Conditions- Marine Fisheries It is uncontested that there is a significant decline in marine fisheries production. Perhaps as an offset to unscheduled flaring, an in-depth study of commercial marine fish and seabob population numbers and ecosystem health.	Please refer to the discussion regarding declining fisheries provided in the response to Comment #207. Fish and fisheries were described from both a socioeconomic perspective (Volume II, Appendix D, Participatory Fishing Study Final Report January 2019–March 2020) and a biological perspective (Volume II, Appendix M, Nearshore and Offshore Fisheries Study Summary). These studies are complete and although an additional year of the participatory study is currently being conducted, the data provided in the existing study reports provide ample baseline data to conduct the EIA.	No	Accepted	N/A	N/A
351	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – 8.9.2.6 – p. 8-198 - Summary of Findings by Region - Figure 8.9-3 Map illustrating Ecosystem Services in Region 1 can benefit from updating, especially concerning the Carbon Sequestration potential. There has been a recent study by Conservation International that highlights most of coastal Region 1 as a hotspot for global irrecoverable carbon.	EIA Section 8.9.2, Existing Conditions—Ecosystem Services, explores the ecosystem services that are potentially present along the coastlines and shorelines in Regions 1 through 6. Using a combination of local knowledge and field mapping, teams followed a screening and scoping process to determine whether a service was likely to be present in each coastal or shore zone and create an ecosystem services baseline. Findings related to ecosystem services were validated and, where relevant, updated through targeted engagement efforts in 2021. While a carbon sequestration inventory is beyond the scope of the EIA, the aforementioned process included mapping the location of mangroves and characterizing their condition. This inventory would be used to direct any oil spill response activity, in the unlikely event of a major spill, to protect the mangroves (see the response to Comment #359). No impacts to mangroves would be expected from planned Project activities.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
352	15-Dec-2021	Conservation International (Appendix B)	• Vol. 1 – 9.1.4 – p. 9-56 - 9.1.5.3. Scenario 15—Loss-of-Well-Control Resulting in 30-Day Subsea Release of Crude Oil at 177,157 BPD (28,345 m3; Maximum WCD)- Figure 9.1-20b: (Zoomed In) Deterministic Map for Scenario 15 In all scenarios run, there will be heavy impacts on the Shell Beach Protected Area (both from oil spills and clean-up activities). It is proposed that an economic analysis be completed to VALUE the Ecosystem services provided by this area as well as a VALUE assigned to the lost livelihoods and ecotourism potential. This should be completed soon as there are now 4 major oil extraction sites managed by Exxon, thus multiplying the risk to the SBPA by 4.	The oil spill scenarios modeled are intended to show the worst-case (probable and maximum) scenarios in the exceedingly unlikely event of an oil spill. If an event were to occur, the factors influencing the extent and duration of an impact are varied and complex, and economic analysis of a hypothetical scenario would not prove useful to response or recovery. Additionally, in accordance with EEPGL's OSRP, areas of high importance for ecosystem services, livelihoods, and/or ecotourism would be prioritized for protection in the event of an oil spill, so as to minimize impacts on these values and receptors. EIA Section 9.1.9, Claims and Livelihood Remediation Processes, describes claims and livelihood remediation processes. More details are provided in the response to Comment #44.	No	Accepted	N/A	N/A
353	10-Dec-2021	EAB	**Oil Spill** With respect to oil spill discharge scenarios, how were possible impacts outside of Guyana's EEZ considered?	Potential impacts of an oil spill outside of Guyana's EEZ are discussed in EIA Section 9.24, Transboundary Impacts. This section discusses how other countries may be affected from a modeled WCD loss-of-well-control scenario, including a discussion of coastal resources that could potentially be affected. EIA Table 9.24-1 summarizes the countries with a predicted risk of oil landfall for both unmitigated and mitigated loss-of-well-control modeling scenarios.	No	Accepted	N/A	N/A
354	10-Dec-2021	EAB	**Environmental Impacts** Offshore lighting is seen as an attractant of food sources for marine mammals. Isn't the lighting and apparent abundance of food a disruption to the natural feeding patterns of these mammals?	The lighting and increase in abundance of food would represent changes to the natural environment in the immediate vicinity of the FPSO. While these changes would represent departures from baseline conditions in a small part of the AOI, it is the Consultants' opinion that concentrating food resources for a predator would represent an overall benefit to the predator species. This potential impact is described in EIA Section 7.5.3.5, Characterization of Impacts—Artificial Lighting.	No	Accepted	N/A	N/A
355	10-Dec-2021	EAB	• The idea that birds will use these vessels to rest has been classified as a positive. • Where would these birds normally go in the absence of the vessels? Rather than the vessels being seen as a positive, won't it be more accurate to describe what you observed as a disturbance to the birds natural behavior?	1. The answer depends on the species. Some species would have to go to a landmass such as an island to rest, as they are not able to rest on the water. For these species, the vessel would serve as a place where they can rest over their taxing migration—representing a benefit. Some species are able to rest on the ocean surface, and for these species the presence of the vessels would likely represent a negligible benefit. 2. If birds were to use the FPSO as a resting or foraging area, this would be expected to alter their distribution, but not their natural behaviors, as they would continue to forage by diving and swimming, and they would continue to rest by perching in sheltered areas; they would simply do these things in a place that they didn't previously do them (i.e., on or around the vessels). The potential effect of disorientation at night from vessel lights would be a type of disturbance because it would create a new, unnatural flight pattern around the vessel.	Yes	Accepted	N/A	pp. 7-93 to 7-94

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				Additional detail regarding the above has been added to EIA Section 7.4.3.2, Magnitude of Impacts—Seabirds.				
356	10-Dec-2021	EAB	Please indicate the times for the eight air quality studies; when were these sessions done?	Four onshore and four offshore air quality monitoring campaigns have been conducted. These are described in EIA Section 6.1.2.1, Existing Conditions—Air Quality. The offshore monitoring campaign dates include October 2016, April 2018, May 2018, and April 2019. The onshore monitoring campaign dates include Berbice (New Amsterdam)—October 2018-December 2018; Georgetown (Carifesta Ave.)—August-October 2018 and December 2018-March 2019; and Georgetown (New Guyana School)—April 2019-August 2019.	No	Accepted	N/A	N/A
357	10-Dec-2021	EAB	Would the rating/risk change for cumulative impacts when other operations are considered?	The impact significance ratings provided in EIA Chapters 6 through 8 correspond to ratings of potential impacts from planned activities of the Project only. Potential cumulative impacts resulting from the impacts of the Project combined with the impacts of other non-Project activities are rated in terms of priority ratings. These cumulative impact priority ratings are discussed in EIA Chapter 10. Table 10.6-2, Summary of Cumulative Impact Assessment, summarizes the priority rankings for all resources. Since cumulative impact priority ratings consider the combined impacts from the Project plus other non-Project activities, they differ from impact significance ratings for the Project alone.	No	Accepted	N/A	N/A
358	10-Dec-2021	EAB	Would the gas to shore project have an impact on flaring from this project?	No—the proposed Gas to Energy Project would not impact flaring for the Yellowtail Project because the associated gas from the Yellowtail Project is not part of the proposed Gas to Energy Project.	No	Accepted	N/A	N/A
359	10-Dec-2021	EAB	Is there an interconnectivity between oil spill models and the biological resources e.g. sea turtles and mangroves?	EIA Section 9.1.6, Coastal Sensitivity Mapping, discusses the coastal sensitivity mapping completed for coastal areas identified in the oil spill modeling as having the potential for oiling as a result of modeling of an unmitigated marine oil spill scenario. As described in this section, the mapping included characterization of a number of environmental and socioeconomic resources, including protected areas, mangroves, shoreline types, seagrass beds, coral reefs, coastal fish habitats, coastal bird habitats, and other sensitive habitats. This information is intended to enable EEPGL to prioritize the mobilization of emergency response resources (personnel and equipment) to those areas most sensitive to a spill. The coastal sensitivity maps are provided in Appendix O, Coastal Sensitivity Maps. Additionally, as outlined in OSRP Section 5.6.2 (included in Volume III of the EIA), Geographical Strategic Response Maps have also been developed to define the equipment needs in specific coastline areas of portions of the geographic response area, considering sensitive areas, access points, and likely response actions. Examples of these Geographical Strategic Response Maps are provided in OSRP Appendix E.	No	Recommends adding language to further address this point more specifically	Additional detail consistent with the response has been added to Section 9.1.6 of the EIA.	p. 9-60
360	10-Dec-2021	EAB	What is the current capacity of the landfill? How will waste from future FPSOs be disposed of?	As discussed in EIA Section 8.6, Waste Management Infrastructure Capacity, at current disposal rates, Cell 2 is expected to last for approximately 4 to 6 years. This estimated life span of Cell 2 depends upon how much the waste volumes received at the landfill increase with the expanded economic development expected in the Georgetown area over the next 5 years. There remain two additional cells at the site (Cell 3 and Cell 4) for future	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				development. Each cell is 6.5 hectares (16 acres) in size and each could be anticipated to extend landfill capacity by 5 to 6 years. The currently available landfill capacity appears sufficient over the near term based on Cell 2 having entered service in March 2021, even considering the forecasted growth in waste volumes from industrial use. Presuming Cells 3 and 4 would be constructed, the future HBL landfill capacity also appears reasonable for the long term (up to 10 years). Waste from future development projects, if proposed and approved, would likely be managed using the same or similar processes and facilities as those that would be utilized for the Yellowtail Project.				
361	10-Dec-2021	EAB	Was any study/research done to show any correlation to oil field development and the fishing industry in other countries?	The most recent Bank of Guyana report related to fisheries that the Consultants reviewed was from 2020, which indicated that declines in finfish and shrimp production were due to decreases in demand due to COVID-19 restrictions (fish) and weather conditions combined with an extended closed season for shrimp fishing (shrimp). Several comments were received during the EIA disclosure process indicating that fish catches had declined significantly in recent years. EIA Section 8.1.2, Existing Conditions—Socioeconomic Conditions, identifies several possible causes for perceived declines in catches over the last several years, including interference with fishing activities by sargassum, inclement weather, unsustainable/illegal fishing practices, and more recently COVID-19-related declines in fishing effort, based on baseline information collected through literature reviews as well as selected studies and key informant interviews referenced in responses to Comments #364 and #365. Additional information was added to EIA Section 7.8.2.2, Targeted Surveys of Continental Shelf Fish Community, to further address this issue.	Yes	Accepted	N/A	7-193 to 7-194
362	10-Dec-2021	EAB	**Other** Some impacts are described as short term, what timeline can be reasonably described as short term?	The definitions of the terminology used for duration are included in Chapter 4, Methodology for Preparing the Environmental Impact Assessment. As outlined in EIA Section 4.8.1.1, Predicting Magnitude of Impacts, “short-term” is used for any impact with a duration from instantaneous up to less than a week in aggregate. “Medium-term” is used for any impact with a duration that is more than week, but less than a year in aggregate. “Long-term” is used for any impact with a duration that is more than one year in aggregate.	No	Should be addressed following discussions with Redford group	The Consultants have reviewed the Redford group comments, and based on this review the Consultant team considers their original response to be responsive to the EAB’s comment.	N/A
363	10-Dec-2021	EAB	A complaint was received by the EAB on the local consultant’s name being used on the non-technical summary. What steps are being out in place to ensure that this does not happen again? Can you confirm that the persons listed on the EIA did conduct the study?	The Consultants did not engage with or involve the referenced individual to provide support to the Yellowtail Development Project EIA. The referenced individual's signature was inadvertently included on the cover of the version of the EIA NTS for the Yellowtail Development Project that was posted on the EPA’s website. A corrected version of the NTS has been posted on the EPA website in place of the incorrect version. To avoid this type of error in the future, signatures will not be included on submitted documents unless necessary and the name of the individual and the role they played will be incorporated where signatures are determined to be necessary. The individuals listed in Appendix A, List of Preparers (Volume II of the EIA), contributed to the preparation of the EIA.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
364	10-Dec-2021	EAB	Were the studies done as a part of the Yellowtail EIA, or was the information presented from permit conditions of previous projects?	The following studies were conducted between 2017 and 2018 to satisfy conditions of the Environmental Permit issued for the Liza Phase 1 Development Project, and the results of these studies, where relevant, and were used to support the Yellowtail EIA: • Final Environmental Baseline Assessment of Sediment Quality Along the Continental Shelf Guyana—Phase 2 • Remotely Operated Vehicle Imagery Analysis • PSO Surveys (Year 1) • 2018 Turtle Tagging and Telemetry Program (Year 1) • Marine Bird Study (Year 1) • Enhanced Coastal Sensitivity Mapping—Biodiversity and Ecosystem Services (Regions 1–4) • Nearshore and Offshore Fisheries Study Summary Report 2017–2018 (Year 1) In addition, EEPGL elected to extend most of the Permit condition-driven studies beyond the timeframes required by the Liza Phase 1 Environmental Permit. Further, several new studies have been completed by EEPGL or its contractors since the Permit condition-driven studies listed above were completed. The data from the original Permit condition-driven studies, from the extended portions of these studies, and from the new studies have been considered—where relevant—in development project EIAs completed since the Liza Phase 1 Development Project EIA, including the Yellowtail Development Project EIA. Baseline information from several studies (including some of those that originated as a permit condition but have since been expanded beyond the timeframes required by the Liza Phase 1 Environmental Permit, and several others) was utilized for EIA purposes for the first time in the Yellowtail EIA. These studies were not used in any prior EEPGL EIA and are being provided to the EPA and the public for the first time in the Yellowtail EIA. These study reports include the following, each of which are included as an appendix to the Yellowtail EIA (Volume II): • Marine Bird Study Report: Marine Bird Survey Year 2 (Volume II, Appendix K) • Coastal Bird Survey Report: Coastal Bird Study Year 2 (Volume II, Appendix L) • Shell Beach Sea Turtle Tracking Study Year 2 (Volume II, Appendix Q) • Nearshore and Offshore Fisheries Study Year 2 (Volume II, Appendix M) • Environmental Baseline Survey and Habitat Assessment: Continental Slope AUV Survey, Hammerhead Development, Offshore Guyana (Volume II, Appendix I) • Environmental Baseline Survey ExxonMobil Hammerhead Development Offshore (Volume II, Appendix I) • ExxonMobil Multi-AUV Geophysical Survey: Seabed Constructor and Normand Frontier (PSO Report) (Volume II, Appendix N) • Enhanced Coastal Sensitivity Mapping—Ecosystem Services (Regions 5 and 6) • 2Q-4Q Participatory fish data (1Q data were reported in the Payara EIA).	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
365	10-Dec-2021	EAB	What were the actual studies done to conduct the EIA?	In addition to utilizing the information from the several studies provided in Volume II of the EIA for the first time in the Yellowtail EIA (see response to Comment #364), baseline and other data collection efforts conducted exclusively to support the Yellowtail EIA included the following, consistent with various Yellowtail EIA Terms and Scope requirements to "update existing information where appropriate" and assess Project-related impacts: • Collection of various socioeconomic data via key informant interviews (topics covered in interviews summarized in Chapter 4; data referenced throughout EIA Chapter 8) • Air Quality Modeling Analysis (Volume II, Appendix G) • Water Quality Modeling Analysis (Volume II, Appendix C) • Oil Spill Modeling (EIA Section 9.1.5) • Vehicular Traffic Study (Volume II, Appendix T) • Underwater Noise Analysis (Volume II, Appendix H)	No	Accepted	N/A	N/A
366	25-Oct-2021	Public	What oil spill response equipment is in Guyana and what has to be imported, which will lead to a delay in response?	Table 6-1 of the OSRP provides detail on the specific types and quantities of oil spill response resources and their locations within and outside of Guyana. Table H-8 (in Appendix H of the OSRP) provides a day-by-day plan for implementation of various response activities, taking into account lead times for assets that would need to be imported (as applicable).	No	Accepted	N/A	N/A
367	25-Oct-2021	Public	After the Project is decommissioned, what if something happens the day after Exxon leaves? Who will be liable for the clean-up?	As indicated in Section 8 of the Preliminary End of Operations Decommissioning Plan for Guyana Development Projects (included in Volume III of the EIA), the relevant Guyanese regulators would have access to the work site during the decommissioning activities to monitor and witness the final completion of the work. After the completion of well plugging and abandonment (P&A) and facilities decommissioning work, EEPGL would submit a final decommissioning report to the relevant Guyanese regulators that would include a description of the scope of work performed, work logs, final inspection reports, videos, and photos, as applicable. As described in the Preliminary End of Operations Decommissioning Plan for Guyana Development Projects, decommissioned wells are plugged and abandoned such that the well is secured against future leaks. Based on the question, in the unlikely event that shortly after decommissioning a leak occurred indicating that the plugging and abandonment work was potentially defective, EEPGL would be responsible to address the leak and clean up the oil.	No	Accepted	N/A	N/A
368	25-Oct-2021	Public	Will EEPGL share detailed design information with the EPA?	EIA Chapter 2, Project Description, includes Project design information with sufficient detail to support the EIA; further, EEPGL has indicated its willingness to provide the additional available information the EPA requires to inform its review of the EIA.	No	Accepted	N/A	N/A
369	27-Oct-2021	Public	I have been a fisherman in my community for four years and, in the last 1.5 years, I have noticed the amount of fish decreasing as well as a lot of weeds and water coming ashore along the Demerara River and the water smells similar to diesel.	Several participants in the participatory fish study included in Volume 2 of the EIA indicated recent declines in catches. EEPGL is currently conducting additional participatory fish survey work with the goal of detecting long-term trends in fish catches across the coast. The Consultants are aware of the recent increasing trend of sargassum in Guyana's coastal waters; Section 7.8 of the EIA discusses the prevalence of sargassum incursions in Guyana and elsewhere, and its potential role in declining fish catches. The complaint of odors in the water has been noted and communicated to EPA and EEPGL.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
370	27-Oct-2021	Public	I am concerned about the assistance for fishermen in the community. In the event of an oil spill, we would not have any response equipment as it is being stored in Georgetown.	In the unlikely event of an oil spill causing losses to stakeholders, EEPGL would establish a claims process and, depending on the magnitude of the oil spill, a livelihood remediation program. The purpose of the claims process would be to provide compensation as appropriate for asset losses and the purpose of a livelihood remediation program would be to restore the welfare and livelihoods of affected persons to conditions no less than pre-impact conditions. Both processes would be transparent, fair, and conducted in a timely manner. EEPGL, in consultation with the Government of Guyana and other jurisdictions (as required), would establish the designated geographic zones associated with the claims and, as applicable, livelihood remediation processes; these would be commensurate with the magnitude of the impacts of the spill. Eligible persons would be compensated as appropriate based on the magnitude of Project-related impacts they individually experienced, either in regard to human health or as a result of economic loss. It is anticipated that EEPGL would establish steering committees, working groups, and stakeholder engagement-specific entities to determine eligible stakeholders, standard entitlements, and eligibility criteria for further livelihood compensation and assistance. EEPGL would consider establishing an independent implementation entity as soon as reasonably practicable after the spill, to assist in the process of livelihood remediation planning while the initial compensation efforts are ongoing. Depending on the extent of losses, livelihood remediation efforts may potentially range from early support initiatives (within the first year), to transition support (typically from 1 to 2 years after impact), to longer-term support, as defined by the duration of spill impacts. Yellowtail Development Project EIA Volume III Oil Spill Response Plan Chapter 6 Table 6-1: lists or otherwise describes the international, regional, and local resources available to EEPGL for each potential response strategy. Tables 6-2 through 6-7 provide a further summary of the representative oil spill response equipment in Guyana. Based on the expected duration of time (6.5 to 8.5 days) that it will take oil to travel from the proposed Project location to the Guyanese shoreline, the time needed to mobilize oil spill response equipment and personnel from Georgetown is ample to implement oil spill recovery and shoreline protection strategies. For example, in 2019 a mobilization of equipment was carried out from Georgetown to Region 1 (Waini Point near Mabaruma) in less than 48 hours. In addition, by centralizing the storage of the oil spill equipment in the Georgetown area, the preventive maintenance schedule of oil spill equipment is streamlined and more efficient EIA Section 9.1.9 describes claims and livelihood remediation processes.	No	Accepted	N/A	N/A
371	27-Oct-2021	Public	Is there a reason the government is not developing Essequibo Port?	The Consultants acknowledge the question. The question is outside the scope of the EIA.	No	Accepted	N/A	N/A
372	27-Oct-2021	Public	Overall, I feel that fishermen are often overlooked in our community, despite the fishing sector being one of the largest in Guyana. When I have reached out to the EPA that we need more	The Consultants acknowledge the question. The question is outside the scope of the EIA.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			community centres and high schools, I have never received a response.					
373	27-Oct-2021	Public	While I don't doubt what is being said during this presentation, I'm curious why I should believe it? I am a rice farmer and am having a hard time following the technical material.	The Consultants acknowledge that much of the material is technical and complex in nature. The EIA was prepared by an experienced and qualified team of technical experts. The Non-Technical Summary (NTS), posters (for in-person events), and EIA Summary Presentation are intended to share the outcomes of the EIA with a non-technically oriented audience. Please also see the response to Comment #326.	No	Accepted	N/A	N/A
374	27-Oct-2021	Public	Will you be providing any security in terms of cash liquidity in case something happens?	Please see the response to Comment #53.	No	Accepted	N/A	N/A
375	27-Oct-2021	Public	We seem to have the worst deal in the world in terms of the percentage of money that Guyana receives. Can you share the interest rates with us if you were to put the money up front?	The Consultants acknowledge the question. The question is outside the scope of the EIA.	No	Accepted	N/A	N/A
376	27-Oct-2021	Public	I can recall the Mexico spill when they had a lot of oil on the beach. What are you going to do if there is an oil spill? Region 2 is a coastal belt below the sea level and the majority of our population lives on the coast. I am concerned about border security if, in the event of an oil spill, oil drifted north to Venezuela, as it would become an international issue.	Details on oil spill response measures are described in EIA Volume III, Oil Spill Response Plan. Impacts to other countries from an oil spill, if one occurs, would be a function of the size of the spill, but would be mitigated by the response tools and resources EEPGL has in place for such an event. As described in EIA Chapter 9, EEPGL would work with the Government of Guyana and other countries as appropriate to coordinate such a response.		Accepted	N/A	N/A
377	27-Oct-2021	Public	What if someone's water well is contaminated by an oil spill reaching shore?	Please see the response to Comment #44.	No	Accepted	N/A	N/A
378	27-Oct-2021	Public	When you drill, 40+ species of animals will move in different directions. Animals, such as the many species of turtles at Shell Beach, are vital to our tourism. What happens if they move away?	Section 8.1.2.4 of the EIA recognizes the value of ecotourism to the Guyanese economy and that, with additional investments in supporting infrastructure, the potential for ecotourism (and the value of attractions such as the sea turtles) could grow in the future. As stated in Section 7.7 of the EIA, Project effects on sea turtle movements and habitat usage are expected to be negligible, so sea turtles are not expected to move because of the Project activities and no significant impacts on tourism are expected.	No	Accepted	N/A	N/A
379	27-Oct-2021	Public	You said you invest a lot in Guyana, but do you truly think this profit sharing is good for us as a country?	As discussed in Section 12.1, Planned Project Activities, the EIA predicts that Project would generate benefits for the citizens of Guyana through revenue sharing with the Government of Guyana, an increase in employment, and in-country Project purchasing of goods and services from Guyanese businesses.	No	Accepted	N/A	N/A
380	27-Oct-2021	Public	There is a lot of fishing around the Demerara, and I'm curious how fishermen will be able to work when	Section 8.4 of the EIA describes the assessment of potential impacts on marine use and transportation, including potential impacts to fishing vessels. As detailed in this section, Project-related vessel activity in Georgetown	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			there are big ships coming and disrupting the water. Fish catches are already decreasing, which is not good for fishermen, so what will Exxon do to prevent that from getting worse? The installation of the fiber optic cable has also restricted fishing in some areas.	Harbour is expected to increase the existing marine traffic in Georgetown Harbour by approximately 2 to 4 percent. This level of increased traffic is not expected to have a lasting adverse effect on fishing activities. As discussed in Section 7.8.2 of the EIA, Marine Fish Existing Conditions, there are many potential factors contributing to declining fish catches, but oil and gas activities are not likely to be driving these declines. See additional information in the response to Comment #207. EEPGL continues to monitor the fishing sector through its ongoing participatory fishing study, which includes the participation of fisherfolk at landing sites in all coastal regions. Findings from this study informed the Yellowtail Development Project EIA and continue to comprise an important part of EEPGL's ongoing monitoring and stakeholder engagement activities for all its projects. The most recent report is included in Appendix D, Participatory Fishing Study Final Report January 2019–March 2020, of the EIA (Volume II), including a profile of landing sites, fishing areas, targeted species, seasonal considerations, and biometrics. Findings of the participatory fishing study will continue to inform EEPGL's engagement and adaptive management activities.				
381	27-Oct-2021	Public	What protection will Exxon offer rice farmers facing heavy rain or fishermen whose fish may move away because of underwater noise? Exxon needs to help the fishermen because we're not getting enough fish and we think it's because of the company.	As mentioned in the response to Comment #270, EEPGL has in place a transparent, accessible, and consistent CGM that would apply to the Yellowtail Project prior to onset of Project activities and throughout its lifecycle. The CGM is described in EEPGL's SEP (EIA Volume III). EEPGL periodically evaluates the CGM effectiveness and the CGM would be updated going forward as necessary.	No	Accepted	N/A	N/A
382	27-Oct-2021	Public	Why are water and gas injected back into the well rather than just water?	As discussed in Section 2.18.2.4, Associated Gas Management Alternatives, subsurface studies have established that the associated gas in the Yellowtail and Redtail fields is miscible with the reservoir fluid for several of the developed reservoir segments, meaning that use of gas re-injection—particularly as part of a water-alternating-gas strategy (i.e., a strategy that employs injection of both water and gas)—results in considerable uplift in recovery. This is typical of offshore production operations around the world.	No	Accepted	N/A	N/A
383	27-Oct-2021	Public	Are the GHG emissions and rising sea level good for Guyana? With another mega project such as this, we need to receive enough money to be able to move to higher ground because we are still poor.	As discussed in the response to Comment #238, while the EIA cannot assess potential impacts of the Project emissions on climate / climate change, EIA Section 6.1.2.3, Current Scientific Understanding of Consequences of Climate Change, provides a discussion of the current scientific understanding of consequences of climate change, including a discussion of potential sea level rise.	No	Accepted	N/A	N/A
384	27-Oct-2021	Public	I hope that the president and government of Guyana come to a good resolution for Exxon and the people of Guyana.	The Consultants acknowledge the comment. The comment is directed to the Government of Guyana.	No	Accepted	N/A	N/A
385	27-Oct-2021	Public	There is only a short period to review the EIA.	Please see the response to Comment #90.	No	Accepted	N/A	N/A
386	29-Oct-2021	Public	I hope the EPA makes informed decisions based on a factual basis.	The Consultants acknowledge the comment. The comment is direct at the EPA. However, various baseline studies of physical, biological, and socioeconomic resources that could potentially be affected by the Yellowtail Project were conducted, as described in Chapters 6, 7, and 8. These studies	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				were augmented by research of existing information and data. Data from baseline studies and research were used to inform the impact assessment for the Project. Please see the response to Comment #108 for additional details.				
387	29-Oct-2021	Public	For future meetings, it would be helpful to share the presentation and the NTS a month in advance so that the Moruca District Council and National Toshaos Council could meet with members of our villages. We need to be able to explain the information to our members and more training would be helpful for doing so. We have had a resource person work in our village in the past, and more funding is needed so that we can do so again.	Please see the response to Comment #90. The question of funding is beyond the scope of the EIA.	No	Accepted	N/A	N/A
388	29-Oct-2021	Public	We need people trained by the EPA who can collect on-the-ground information in our villages. Some of the information that has been presented here, but it may have been more accurate if we can share it with the villagers.	The comment is directed to the Government of Guyana. However, please see the responses to Comment #121 and Comment #330 for information on EEPGL education, training, development, and local capacity-building initiatives.	No	Accepted	N/A	N/A
389	29-Oct-2021	Public	After the oil is extracted, would there be issues in the future? As you know, much of our shoreline is below sea level. If there was even a small tremor, the land would collapse, particularly in Georgetown.	Please see the response to Comment #150.	No	Accepted	N/A	N/A
390	29-Oct-2021	Public	Are our people from Region 1 being employed? I know there are not many people with degrees, but we have a lot of people who know the environmental science. Future studies must involve our people.	Please see the response to Comment #139.	No	Accepted	N/A	N/A
391	29-Oct-2021	Public	Who conducted the EIA? Did the report take into account the flaring of other vessels? Can Exxon provide assurance that there will be no flaring?	As described in Section 1.1, Purpose of this EIA, the EIA, including studies and data gathering, was conducted by a team of consultants approved by the EPA. With respect to cumulative effects of flaring, EIA Section 10.6.1.1, Air Quality, and Appendix G, Emissions Inventory and Air Quality Modeling Report, describe the air dispersion modeling performed for the cumulative emissions from the Liza Phase 1, Liza Phase 2, Payara, and Yellowtail projects, as well as from two prospective future FPSO projects. This cumulative emissions modeling included estimated non-routine flaring for each of these projects. As noted in the response to Comment #64, EIA Section 2.7.1, General Description, states that the FPSO would be designed to re-inject associated gas under routine conditions—except that which would be used as fuel gas, flare pilot gas, and background flare gas (e.g., purge, compressor seals) for	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				FPSO operations and other *de minimis* sources not captured by the Vapor Recovery Unit (VRU)—back into the reservoir except during times of injection / compression system unavailability, which would require temporary, non-routine flaring during maintenance/repair. Flaring of associated gas would occur on a non-routine basis during start-up and shutdown; equipment maintenance and process upsets scenarios; emergency pressure relieving scenarios; and other non-routine flaring events.				
392	29-Oct-2021	Public	Is there a point in which we will begin noticing the socio-economic benefits? Exxon has been in Guyana for some time, but we're an indigenous community and have not benefited from anything related to EEPGL directly. We want to see benefits and change in our lifestyle, but you've been coming here for some time and we have not seen any of that.	As summarized in Section 12.1, Planned Project Activities, and further detailed in Chapter 8, Assessment and Mitigation of Potential Impacts from Planned Activities—Socioeconomic Resources, the EIA predicts that the Project would generate benefits for the citizens of Guyana through revenue sharing with the Government of Guyana, an increase in employment, and in-country Project purchasing of goods and services from Guyanese businesses. Whether social benefits can ultimately be delivered as estimated by the Consultants is beyond the scope of the EIA.	No	Accepted	N/A	N/A
393	29-Oct-2021	Public	You say you are doing this training for students at the Santa Rosa school. Can it be more publicized so that we know more about it? We have 12 villages and it would be good if they could know about it and be able to participate.	Please see the responses to Comment #140 and Comment #326.	No	Accepted	N/A	N/A
394	29-Oct-2021	Public	How are we rated in terms of global oil production?	The Consultants acknowledge the question. The question is outside the scope of the EIA.	No	Accepted	N/A	N/A
395	1-Nov-2021	Public	Has this project compiled a registry of fishermen in this region to say what they used to catch and what they catch now so that you can compare any effects and provide compensation for lost livelihoods? I noticed in the NTS on page 19 that there is marine use and transportation and could be potential residual impact with the disturbance from commercial fishing vessels and disturbance from subsistence vessel movement, albeit a minor/negligible amount.	The Participatory Fish Study provided a baseline of the types of fish caught and the methods used to catch them in each region, but did not create a complete registry of all fisherfolk in every region or a history of catches for each person involved in the fishing industry. With respect to compensation for lost livelihoods, please see the response to Comment #303.	No	Accepted	N/A	N/A
396	1-Nov-2021	Public	Will I get answers to these questions? I've asked EEPGL for a recording, and they said to ask the government who I received no response from.	Please see the response to Comment #327.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
397	1-Nov-2021	Public	I submitted my question about monitoring to the government and cc'd the EPA but did not get a response. If the EPA is monitoring, why are they not reporting this to citizens?	The comment is directed to the Government of Guyana. However, please see the responses to Comments #166 and #327.	No	Accepted	N/A	N/A
398	1-Nov-2021	Public	There was a significant drop in aquacultural production last year. Sea-bob fishery has significantly dropped and artisanal fishers report a similar drop in white belly shrimp by as much as 90%. These drops are causing them to believe that oil production is responsible.	The Consultants are aware of the decline in fisheries productivity. Many potential causes have been suggested including incursions of sargassum seaweed, increased market competition, and restrictions imposed to control the COVID-19 pandemic. Recent media reports in Guyana have cited Guyanese fisherfolks' suspicions that declines in whitebelly shrimp catches could be due to changes in salinity of coastal waters or poor fisheries management. Section 8.1.2.4 of the EIA notes that the largest decline in seabob landings in the most recent 6 years for which the Department of Agriculture has landing data occurred from 2013 to 2014, well before oil production began in Guyana. The Consultants further note that shrimp catches increased from 2014 through 2018, when exploration activities were occurring. Without a longer term data set to establish longer term trends, it is impossible to assign causes for these recent declines in catches, but additional information has been added to the EIA to describe these recent trends. As discussed in the response to Comment #369, EEPGL is currently conducting additional participatory fish survey work with the goal of detecting long-term trends in fish catches across the coast.	Yes	Accepted	N/A	7-193 to 7-194
399	1-Nov-2021	Public	What provisions are in place for environmental impact and will people be compensated accordingly if an event occurs?	Please see the response to Comment #44.	No	Accepted	N/A	N/A
400	1-Nov-2021	Public	These meetings are often a show of public consultation. I have been here before and asked questions and was told that I would get an answer later but never did.	Please see the responses to Comment #36 and Comment #327	No	Accepted	N/A	N/A
401	1-Nov-2021	Public	I work in the fishing industry and we can see the effects of industry on our fishing and marine life. Are you going to establish data systems for fisher folk so that we can later determine what the impacts were?	Information on total economic productivity of the sector over the last several years, estimated size of the artisanal fishing fleet, and various economic concerns affecting the industry are described in EIA Section 8.1, Socioeconomic Conditions, and Appendix D, Participatory Fishing Study Final Report January 2019–March 2020 (Volume II of the EIA). As discussed in several responses above, EEPGL is currently conducting additional participatory fish survey work with the goal of further describing long-term trends in fish catches across the coast.	No	Accepted	N/A	N/A
402	1-Nov-2021	Public	What contributions are you making to institutions like this to train people, without a requirement that they come work for EEPGL?	Through the Greater Guyana Initiative, EEPGL and its Co-Venturers are working closely with University of Guyana on a variety of educational initiatives and are supporting a pilot program at several TVETs in Guyana focused on safety, electrical and welding programmes. In addition, EEPGL's contributions programs provide support to a variety of education, training, development, and capacity building initiatives across Guyana. For example, at Leonora, the Institute has been a part of the TVET initiative through a safety training program, and other locations have been encompassed by the broad reach of this program. Through the Centre for Local Business Development (CLBD), EEPGL has also conducted several regional outreaches to foster greater awareness of	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				ExxonMobil's operations in Guyana and how Guyanese businesses can become suppliers to the O&G sector. These programs are meant to upskill Guyanese in areas would could benefit the O&G as well as other sectors. EEPGL believes in supporting efforts that generate broad and sustainable economic development for Guyana. There is no requirement that participants in community initiatives supported by EEPGL or GGI come to work for EEPGL or its contractors.				
403	1-Nov-2021	Public	Is there a plan to protect the plants, animals, and fishes?	The ESMP, which is included in Volume III of the EIA, is a compendium of all measures recommended by the independent Consultants to manage impacts on all resources, including biological resources.	No	Accepted	N/A	N/A
404	2-Nov-2021	Public	I went through Volume 1 of the EIA. Although we hope there will be no spill, it is still possible. In the Volume, I notice that the chance of an oil spill is expected to be 5-40%, which is higher than what was predicted for Liza 1, which was 5-10% chance. Despite the lower probability, there was also a recent issue with Liza 1. It is evident that production is higher than the maximum safety level – 8.3% increase. What guarantees can you make that it will be safe given the significant strain on the equipment you're using?	To clarify, the referenced range of 5-40% refers to the probability, based on stochastic modeling, of an unmitigated spill reaching the Guyana shoreline in Region 1 – in the highly unlikely event that a loss-of-well-control scenario equivalent to the Most Credible Worst Case Discharge or the Maximum Worst Case Discharge scenario were to occur. This range does *not* refer to the probability of a loss-of-well-control occurring. The production rate for the Liza Phase 1 Project is not within the scope of the EIA. With respect to the production rate for the Yellowtail Project, please see the response to Comment #5.	No	Accepted	N/A	N/A
405	2-Nov-2021	Public	The waters of Guyana and all of the rivers interlock. So, if the water is polluted anywhere, it would affect all of the water in Guyana. You say that the water flows away from our shoreline but the fish can travel anywhere so we can still be affected.	As described in Chapters 6 and 9 of the EIA, the trajectory of a pollution plume from the Project would depend on the dominant currents and metocean conditions at the time of the release. Under some modeled scenarios, an oil spill could reach Guyana's coast, but as described in Chapter 9 such a scenario is very unlikely. Although seasonal connections between some watersheds in Guyana exist, that does not mean that the effects of pollution originating or entering one river would reach another. It is true that fish would be able to enter and exit the mixing zone around the FPSO and that if an unplanned event created additional pollution, fish could also move in and out of the affected area at will. However, for the reasons stated in Section 9.12 of the EIA, fish would be expected to have relatively low exposure to such an event.	No	Accepted	N/A	N/A
406	2-Nov-2021	Public	How much flaring and air emissions will come from this project?	Estimated emissions to air from the Project are summarized in Table 2.13-5: Estimated Annual Atmospheric Emissions Summary. As described in Section 2.7.5.3, the Project FPSO has been designed to re-inject associated gas under routine conditions, except that which will be used as fuel gas, flare pilot gas, and background flare gas (e.g., purge, compressor seals) for FPSO operations and other *de minimis* sources not captured by the VRU. The estimated flaring volumes from FPSO commissioning and start-up through the end of the production operations stage are presented in Table 2.7-2: Estimated Flaring Volumes during Yellowtail Commissioning, Start-up, and Production Operations Stages.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
407	2-Nov-2021	Public	We have been told about compressors, but from the beginning of this project they have had a compressor that wasn't activating. Why, as such a big company, does Exxon not have the right systems in place to avoid this?	Compressor design for the Yellowtail Project has taken significant steps to incorporate lessons learned from other projects, including Liza Phase 1. The Yellowtail FPSO would incorporate two trains of export / re-injection gas compression in normal operation plus a spare with a total design basis of 3 x 50% capacity (three at 50% capacity each), where the export gas compressor and injection gas compressor would be driven by a common mechanical drive. The 3 x 50% design was selected so that when one train is down, the other trains could continue to operate until the installed spared compressor train is online. This three-train configuration was selected to enhance the facility's safety, minimize flaring, and reduce production down time.	No	Accepted	N/A	N/A
408	2-Nov-2021	Public	Exxon is going to give Guyana a lot of tax revenue, but it is going to be the Guyanese people who end up paying the taxes.	Any tax-related agreements between the Stabroek Block co-venture partners and the Government of Guyana are beyond the scope of the EIA and should be referred to the Government of Guyana.	No	Accepted	N/A	N/A
409	2-Nov-2021	Public	Where are the fish going?	As stated in the response to Comment #207, EIA Section 8.1.2, Existing Conditions—Socioeconomic Conditions, identifies several possible causes for perceived declines in catches over the last several years, including interference with fishing activities by sargassum, inclement weather, unsustainable/illegal fishing practices, and more recently, COVID-19-related declines in fishing effort. Additional information was added to EIA Section 7.8.2.2, Targeted Surveys of Continental Shelf Fish Community, to further address this issue.	Yes	Accepted	N/A	7-193 to 7-194
410	2-Nov-2021	Public	Why was all of the information you're sharing now not shared during Phase 1 but rather, during Phase 4?	While the Yellowtail engagement program benefited from the learnings of past development projects, much of the environmental and socioeconomic data that is included in the EIA was collected prior to the Yellowtail Project and shared with the public in prior EIAs. Technical reports that were shared as part of previous EIAs were not attached to the Yellowtail EIA as technical appendices, but at the time the Yellowtail EIA was published all technical appendices from the Liza Phase 1, Liza Phase 2, and Payara EIAs were available to the public on the EPA website.	No	Accepted	N/A	N/A
411	2-Nov-2021	Public	Will this project help improve recycling in Guyana?	While the development of recycling capability in Guyana is not within the scope of the EIA, Chapter 8.6, Waste Management Infrastructure Capacity, describes that several additional private waste management facilities have come online or are expected to come online in the near-term for waste treatment. These are expected to further expand the capacity of onshore waste management infrastructure to manage waste storage, processing, treatment, and/or recycling needs.	No	Accepted	N/A	N/A
412	2-Nov-2021	Public	Is this project contributing to the bad weather and sea levels that the rice farmers have been experiencing?	As described in the response to Comment #117 and in EIA Section 6.1.3.4, Management Measures—Air Quality, Climate, and Climate Change, potential climate / climate change impacts are a global concern and stem from cumulative worldwide GHG concentrations. The Global Circulation Models used to predict climate impacts from global concentrations are built around emissions on a global scale, and thus are not capable of modeling impacts from the GHG emissions contribution from a single project such as the Yellowtail Development Project. Statistical downscaling methods can be used to establish a statistical relationship between global climate and local climate using observed data, and can be used to estimate future local climate changes based on the results of Global Circulation Models. However, the reverse approach of predicting the impact of local GHG emissions on global (or local) climate change is not feasible due to the multiple factors—beyond	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				that of a single project—that drive global climate change predictions. It is also noted that the Yellowtail Project has not been approved or constructed yet, so would not have had contributed to any past impacts to resources.				
413	2-Nov-2021	Public	Why isn't the contract going into the public domain?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
414	2-Nov-2021	Public	You mention that the impacts will be focused on Georgetown, but we all rely on Georgetown and would experience subsequent impacts.	As indicated in Chapter 8 of the EIA, while some impacts may be felt principally in Region 4, impacts would also be realized in other regions as people from other regions also rely on many of the same services and infrastructure.	No	Accepted	N/A	N/A
415	2-Nov-2021	Public	Why are there no stakeholder engagement programs for Region 5, only for Georgetown?	Notice of all engagements related to the Project EIA were published in local newspapers, advertised on radio and televisions channels, and communicated by howlers ahead of the engagements. The Consultants facilitated in-person and virtual meetings in all six coastal regions, and EEPGL's ongoing stakeholder engagement program includes outreach throughout Guyana, including Region 5. For additional information, please see the response to Comment #326 and refer to Chapter 4 of the EIA.	No	Accepted	N/A	N/A
416	2-Nov-2021	Public	All of these activities will eventually come to a head and we will be left with no fish.	Please see the response to Comment #207.	Yes	Accepted	N/A	7-193 to 7-194
417	2-Nov-2021	Public	In case of a decline in harvesting is there any consideration of inland fish farming?	The ESMP does not envision freshwater aquaculture as a management measure because the EIA does not predict significant declines in fish catches as a result of the Project.	No	Accepted	N/A	N/A
418	3-Nov-2021	Public	I have 3 plantations that have been in shrimp production since the 1980s. Since starting my plantation, I have seen consistent reduction in the loss of fish catch. The focus is always on the oil spill, but I find that the oil exploration causes a lot of other problems for the fish like slurry from drillings and blocking the channels.	The EIA describes potential impacts to marine water quality, marine sediments, and marine life associated with drilling, including deposition of drill cuttings on the seafloor and temporary increases in suspended solids concentrations in the water column. The EIA includes computer modeling of these impacts, the results of which indicate the extent of minor impacts remains well offshore.	No	Accepted	N/A	N/A
419	3-Nov-2021	Public	The fishers from the Upper Correntyne area have been experiencing very low catches for the last two years. There is a lot of speculation, but since oil production has started, our catches have been declining.	Please see the response to Comment #207.	Yes	Accepted	N/A	7-193 to 7-194
420	3-Nov-2021	Public	On October 10, 2021, there was a mid-year financial report in one of the newspapers that stated that white-bellied shrimp populations declined by 75%, and finfish by 23% - changes that were due to chemical shifts in the ocean. The chemicals	As stated in the response to Comment #207, EIA Section 8.1.2, Existing Conditions—Socioeconomic Conditions, identifies several possible causes for perceived declines in catches over the last several years, including interference with fishing activities by sargassum, inclement weather, unsustainable/illegal fishing practices, and more recently, COVID-19-related declines in fishing effort. Additional information was added to EIA Section	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			being used to cool the drills are said to be water soluble. However, no studies have been done to show what chemicals are released when the drills go into the earth's crust. Proper studies need to be done and we call for drilling to cease until those studies are completed, as it impacts our once-profitable fishing business.	7.8.2.2, Targeted Surveys of Continental Shelf Fish Community, to further address this issue. The only materials that would be released to the environment based on planned activities during drilling would drilling fluid and drill cuttings. The physical and chemical composition of the seafloor (which would influence the composition of the cuttings in the early stages of drilling) is described in Chapter 6 of the EIA. The compositions of the aqueous and non-aqueous drilling fluids are described in Chapter 2. As described in that chapter, during subsequent stages of the drilling process when non-aqueous drilling fluid would be used, EEPGL would implement cuttings management techniques to reduce the amount of non-aqueous base fluid retained on cuttings to less than 6.9 percent by weight, which is good international oilfield practice for offshore discharge.				
421	3-Nov-2021	Public	We used to bring in 1 tonne of shrimp per day but that amount has declined tremendously. Whatever is in the earth's crust (cyanide, cadmium, selenium) is being brought up by the drilling and affecting the water. You say that the water won't affect us in the Correntyne because the currents go the other way, but the ecosystem is connected. My 1500 acres of tree plantation that meet the water is directly in front of the Stabroek Block and will be directly impacted.	Please see the response to Comment #207 regarding concerns related to declining fisheries production. With respect to impacts on coastal resources, as discussed in Sections 6.3.3 and 6.4.3, the impacts of the Project on marine sediments and water quality are expected to be limited to the vicinity of the FPSO and not to extend to coastal areas. This analysis is supported by the results of hydrodynamic modeling analyses which are explained in detail in Appendix C.	Yes	Accepted	N/A	7-193 to 7-194
422	3-Nov-2021	Public	I have not yet heard acknowledgement about whether or not the increased activity in the open sea could be causing more muddying of the water. Since our shrimp are the smallest they may be the most susceptible to impacts. So, while there may not be direct drilling impacts, the increased activity on the open sea may be impacting shrimp populations.	As discussed in Section 7.8.1.3 of the EIA, turbidity is expected to temporarily increase in the immediate vicinity of the wells during the drilling and installation phase of the Project, but this temporary effect would not be expected to extend to the relatively shallow areas where shrimp are harvested.	No	Accepted	N/A	N/A
423	3-Nov-2021	Public	Are they dredging on the Berbice?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
424	3-Nov-2021	Public	There is no area of the shoreline that is not inundated with mangroves. I hope the final analysis will include a concerted effort to trace whether some species are moving to other habitats.	The EIA did not conclude that the Project will cause any coastal species to move into new or different habitats, and Consultant does not recommend monitoring of habitat usage by coastal species.	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
425	3-Nov-2021	Public	What assurances can you give to us as fishermen in case the fish larvae and eggs are impacted by drilling?	Please see the response to Comment #303.	No	Accepted	N/A	N/A
426	3-Nov-2021	Public	750 KBD a day will lead to increases in traffic. You need to ensure that human resources tests sobriety for captains and all other positions.	Section 2.3 of the ESMP (Volume III of the EIA) describes EEPGL's Operations Integrity Management System, its framework for managing safety, security, health, and environmental risks. In accordance with OIMS, the placement of personnel into key positions is subject to verification that personnel meet the identified competencies, undergo appropriate medical and security screening, meet regulatory and license requirements, complete any needed training and experience, and demonstrate the required competencies in the performance of their job responsibilities. The selection and placement criteria are also consistent with EEPGL's Alcohol and Drug Policy. Additionally, OIMS job-specific requirements are defined and communicated to third parties during the contracting process and included in third party contracts. These requirements include EEPGL's Alcohol and Drug requirements.	No	Accepted	N/A	N/A
427	3-Nov-2021	Public	The lopsided contract requires Guyana to pay Exxon for operating costs, despite the company saying it will make the country a lot of revenue.	The Consultants acknowledge the comment. The question is beyond the scope of the EIA.	No	Accepted	N/A	N/A
428	3-Nov-2021	Public	We are not adequately protected in the event of an oil spill – the proposal is not feasible, it is vague and unsubstantiated.	Please see the response to Comment #44.	No	Accepted	N/A	N/A
429	3-Nov-2021	Public	Recent weather patterns show the effects of climate change, and fishing is at the mercy of this. When Exxon Mobil flares, it not only impacts the fishermen but we are also not seeing the financial benefits of projects such as these.	As described in the response to Comment #117 and in EIA Section 6.1.3.4, Management Measures—Air Quality, Climate, and Climate Change, potential climate / climate change impacts are a global concern and stem from cumulative worldwide GHG concentrations. The Global Circulation Models used to predict climate impacts from global concentrations are built around emissions on a global scale, and thus are not capable of modeling impacts from the GHG emissions contribution from a single project such as the Yellowtail Development Project. Statistical downscaling methods can be used to establish a statistical relationship between global climate and local climate using observed data, and can be used to estimate future local climate changes based on the results of Global Circulation Models. However, the reverse approach of predicting the impact of local GHG emissions, including those from flaring, on global (or local) climate change is not feasible due to the multiple factors—beyond that of a single project—that drive global climate change predictions.	No	Accepted	N/A	N/A
430	5-Nov-2021	Public	How will multiple projects at the same time cumulatively affect air quality?	EIA Section 10.6.1.1, Air Quality, and Appendix G, Emissions Inventory and Air Quality Modeling Report, describe the air dispersion modeling performed for the cumulative emissions from the Liza Phase 1, Liza Phase 2, Payara, and Yellowtail projects, as well as from two prospective future FPSO projects.	No	Accepted	N/A	N/A
431	5-Nov-2021	Public	If you were to have to pause production because of something like the global pandemic, would the rapid re-start impact the environment? If all the fish and	The Project is not expected to cause wildlife to vacate the area around the FPSO during normal production operations. Should the Project be temporarily shut down and then re-started, the restart would effectively re-institute the conditions that previously existed during normal operations, so	No	Accepted	N/A	N/A

			animals return, they may be impacted when operations start up again.	re-starting the Project after a temporary shutdown would not be expected to cause wildlife to move away from the FPSO.				
432	5-Nov-2021	Public	We have limited access to internet so, when you put things online, you're not catering to all areas. Some people lack the technology, literacy, or general abilities to access the information. We need to have more engagement in person, do not rely on the internet. To share information, I recommend printing information in a booklet, speaking on the radio, and generally diversifying information distribution away from the internet.	The Consultants acknowledge the comment. These recommendations will be considered when planning future community engagement programs. For the Yellowtail EIA disclosure, printed flyers and printed copies of the EIA were distributed to RDCs and NDCs in Regions 1 to 6 in advance of in-person meetings. Eight in-person meetings were held (including 1-2 meetings in each of Regions 1 6) including presentations and question/answer sessions. Printed non-technical summaries of the EIA were available at these meetings. The dates and locations of meetings, and the opportunity to review and comments on the EIA, were also communicated through RDCs, NDCs, and howlers in communities.	No	Accepted	N/A	N/A
433	5-Nov-2021	Public	Since COVID, there has been a lot of change of how people access classes/education but many don't have computers or internet. Is Exxon able to provide sponsorships for people from Region 1 to go the University of Guyana?	The Consultants acknowledge the question. The question is beyond the scope of the EIA.		Accepted	N/A	N/A
434	11-Nov-2021	Public	If Yellowtail is not going to reinject the produced water, then that appears to contradict clause 12 of the PSA 2016. And if XOM can unilaterally change the PSA 2016, you would agree that the government also change its mind on specific items in the PSA? Is the EPA willing to hold Exxon to reinjecting the produced water versus its preference for easier work in just releasing the water into our marine habitat? The EIS 3 table does not document the minimum acceptable standards for each of these discharges, just cites regulatory bodies. So we do not know the expected pollutants of different kinds which will be discharged.	The first part of the comment should be referred to the EPA. Table EIS-3 is an executive summary of production discharges. Additional detail regarding Project-related discharges, including discharge criteria, is provided in Table 6.4-8: Summary of Project-Related Discharges.	No	Accepted	N/A	N/A
435	11-Nov-2021	Public	Exxon's gas compressor problems have resulted in excessive flaring for a long time and is not quite inspiring, but ERM is predicting it will be okay.	Compressor design for the Yellowtail Project has taken significant steps to incorporate lessons learned from other projects, including Liza Phase 1. The Yellowtail FPSO would incorporate two trains of export / re-injection gas compression in normal operation plus a spare with a total design basis of 3 x 50% capacity (three at 50% capacity each), where the export gas	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
				compressor and injection gas compressor would be driven by a common mechanical drive. The 3 x 50% design was selected so that when one train is down, the other trains could continue to operate until the installed spared compressor train is online. This three-train configuration was selected to enhance the facility's safety, minimize flaring, and reduce production down time.				
436	11-Nov-2021	Public	But what about cumulative effects? Fish, mammals, and birds will be affected by all the bilge and waste water and other toxic discharges into the sea water around these multiple floating oil rigs.	As indicated in Table 10.5-3 of the EIA, changes in water quality and temperature would be expected from liquid effluent discharges from other EEPGL development projects. Section 4 of the Water Quality Modeling Report, Appendix C of the EIA, presents the results of modeling discharges from the four EEPGL development projects, including the Yellowtail Project. None of the modeled plumes showed potential for overlap during simultaneous FPSO operations, and the individual produced water plumes experience rapid dilution and mixing. Embedded controls and mitigation measures proposed for the Project are considered to be sufficient to address potential cumulative impacts to marine water quality. Based on these results, cumulative effects of degraded water quality on marine wildlife were given a low priority ranking.	No	Accepted	N/A	N/A
437	11-Nov-2021	Public	Are Guyana taxpayers subsidizing landfills for a company that pays no taxes?	Any tax-related agreements between the Stabroek Block co-venture partners and the Government of Guyana are beyond the scope of the EIA and should be referred to the Government of Guyana	No	Accepted	N/A	N/A
438	11-Nov-2021	Public	Where are the preventative measures described for oil spills? 			want an insurance that covers for biodiversity loss. What is the long term bond or the emergency response capacity and who bares the costs for events after the well has been decommissioned? Cradle to grave					
443	11-Nov-2021	Public	The Guyanese should be receiving royalties from this project. We risk our ecosystems, health, heritage, etc.	The Consultants acknowledge the comment. The comment is beyond the scope of the EIA and should be referred to the Government of Guyana.		Accepted	N/A	N/A
444	11-Nov-2021	Public	What are legitimate costs? That is an ambiguous term. Does it include the tens of thousands of fishermen, tourist industries in other countries, etc.?	EEGPL would implement claims and livelihood remediation processes in the unlikely event of an oil spill causing losses to stakeholders. In addition, EEPGL has in place a transparent, accessible, and consistent Community Grievance Mechanism that would apply to Yellowtail, both prior to the onset of Project activities and throughout its life cycle. Please see the responses to Comment #44 and Comment #303 for additional information.	No	Accepted	N/A	N/A
445	11-Nov-2021	Public	What is the process of the consultations?	Please see the response to Comment #326.	No	Accepted	N/A	N/A
446	11-Nov-2021	Public	What is the methodology of arriving at your ranking of the risk assessment? I cannot see where the scientific rigor of the EIA is. The question of cost and benefits has not been addressed. There is not a robust description of costs, you only focus on the benefits. For every barrel of oil, what are we dealing with as the public? What are the toxins that are coming into our water, air, etc.?	Please see the responses to Comment #211, Comment #231, and Comment #325.	No	Accepted	N/A	N/A
447	11-Nov-2021	Public	The amount of ballast water on these ships? Where does the produced water go?	Regarding ballast water, please see response to Comment #70. Regarding produced water, the Yellowtail Development Project proposes to manage produced water via treatment and discharge overboard in accordance with good international oilfield practices.	No	Accepted	N/A	N/A
448	11-Nov-2021	Public	Will the region be fully covered if there is a spill?	With respect to insurance coverage in the event of a spill, please see the response to Comment #53. With respect to the areas of Guyana that could be affected (i.e.; “covered”) by oil coming ashore from a marine oil spill, stochastic modeling of the Most Credible Worst Case Discharge and Maximum Worst Case Discharge indicates a 5 to 40 percent probability of an unmitigated spill reaching the shoreline in Region 1 and a 5 to 10 percent probability of an unmitigated spill reaching the shoreline in Region 2, depending on wind and current conditions at the time of the spill. These scenarios and probabilities are explained in further detail in Section 9.1.5.	No	Accepted	N/A	N/A
449	11-Nov-2021	Public	For the record: a baseline is something you collect before doing a project or activity that alters the conditions that you can come back	As described in the response in row #380, EEPGL continues to monitor the fishing sector from a socioeconomic perspective through its ongoing participatory fishing study. The most recent report is included in Appendix D, Participatory Fishing Study Final Report January 2019–March 2020, of the	No	Accepted	N/A	N/A

Comment	Date	Stakeholder	Comment	Response	EIA Edit?	EPA Response	Consultant Response	Page Numbers with EIA Edit
			to later on to see how things have changed. The fish studies were ecological, not socioecological studies. And that is not a baseline. The absence of the baseline absolves you of responsibility when there are issues later on.	EIA (Volume II), including a profile of landing sites, fishing areas, targeted species, seasonal considerations, and biometrics. Findings of the participatory fishing study will continue to inform EEPGL's engagement and adaptive management activities. As described in the response in row #169, fish were described from a biological perspective in the Volume II, Appendix M, Nearshore and Offshore Fisheries Study Summary. Both of these studies were initiated before the first offshore development project (Liza Phase 1) became operational, and although subsequent work on both studies continued after production operations began and an additional year of the participatory study is currently being conducted, the data provided in the existing study reports provide ample baseline data to support the Yellowtail EIA.				

Table 2: Final Matrix of Compiled Comments and Responses—Yellowtail Development Project (25 February 2022)

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
1.	EIA Scope and Context	The EIA is very comprehensive and contains a significant amount of support detail, but it lacks conclusive summaries of key commitments and management actions for key environmental and social risks	Tables 13.1 and 13.2 provide comprehensive lists of commitments that have been incorporated in the Project design as embedded controls, and mitigation measures that have been suggested by the Consultant, respectively. Tables 3.1-1, 3.1-2, 3.2-1, 3.2-2, 3.2-3, and 3.2-4 of the Environmental and Socioeconomic Management Plan (ESMP) together provide additional details regarding the planned implementation of these measures. However, recognizing that there are additional Project commitments within other portions of the EIA that would reduce/mitigate environmental or socioeconomic impacts, the Consultants have created a combined commitments register, which has been added to the EIA as Appendix V.	Response noted. Please see attached Project commitments register Volume 3 Appendix J for format and guidance.	The Commitment Register in Appendix V has been organized using the example provided as a guide.	Appendix V (new)
2.	Adequacy of Impact Assessment Process	The assessment of project impacts follows standard practice, however only four criteria were considered in the assessment of project impacts - geographical extent, intensity, frequency, and duration. Consideration of uncertainty and reversibility as impact criteria is good EIA practice and should have been incorporated into the impact assessment and prediction process. Similarly, the mitigation hierarchy was presented in the EIA but only to the extent of mitigation to reduce impact severity. Consideration of compensation and offsets beyond mitigation efforts was not presented in the EIA and leaves the impression that all impacts can be adequately mitigated by embedded controls and prescribed mitigation measures.	The Consultants believe that the criteria that were rated individually for each potential impact (i.e., geographical extent, intensity, frequency, and duration) were sufficient for the purpose of assigning significance ratings. That said, the Consultants acknowledge that uncertainty and reversibility are relevant factors in an impact assessment. While the process employed did not include individual ratings for these factors, the concepts of uncertainty and reversibility were incorporated into the impact assessment process. For example, the resource-specific definitions used for impact intensity and resource/receptor sensitivity typically include components related to the degree to which a resource/receptor is expected to be able to recover from a particular impact (i.e., effecting the same endpoint as a reversibility rating). With respect to uncertainty, the general approach taken in the EIA is to conservatively assume that a specific planned Project activity will result in an associated impact, and then to assess the significance on that basis. Acknowledging there will always be some level of uncertainty as to the response of a resource to an impact, the Consultants applied professional judgment to assess the response that could reasonably be expected to occur.	Closed	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		Residual impacts need to be more fully addressed in the EIA. A strategy for managing these residual impacts, including compensatory and offset mitigation efforts to achieve net gain. This will be particularly important when considering impacts to important biodiversity components.				
3.	Air Quality	Air quality and climate impacts are not considered for local Guyana or project related activities. The air quality impact assessment was limited to consideration of potential onshore community receptors.	The EIA does assess the impacts of Project-related activities on air quality in Guyana. These impacts were assessed at the coastline rather than "locally" – i.e., at the Project itself – because the receptor of air quality impacts (the general public) is located on land rather than on the open ocean over 200 kilometers offshore, where the Project will be located. Although the EIA did not assign a magnitude rating to climate impacts as is done for other resources assessed in the EIA, it did assess the significance of impacts on climate. The significance of impacts on climate as rated in the EIA is based on consideration of Project GHG emissions with respect to Guyana's GHG emissions, in addition to considering regional and global increases in GHG emissions.	Closed	N/A	N/A
4.	Waste Management	Waste management risks regarding current and future onshore waste capacity and treatment options are not adequately discussed in the EIA. The Comprehensive Waste Management Plan (CWMP) is not fully developed.	Since the initial draft of the EIA was submitted, the Comprehensive Waste Management Plan (CWMP) has been completed and approved by the EPA. The current version of the EIA has been edited to reflect this current status. Between the Cradle-to-Grave Waste Analysis (referenced in the CWMP) conducted by EEPGL, the other parts of the CWMP, and the discussion of potential impacts to waste management infrastructure capacity in the EIA, the Consultants believe that potential risks regarding waste management capacity in Guyana have been adequately identified. The EIA concludes that the currently available landfill capacity appears sufficient for the short-term (2 to 3 years), even considering forecasted growth in waste volumes from industrial use and, presuming the additional HBL cell(s) would be constructed on a timely basis, the future HBL capacity also appears reasonable for the longer-term (up to 10 years). Recognizing the fact that these conclusions are dependent on these presumptions, the EIA provides mitigation measures for waste management infrastructure capacity within both Chapter 8 and Chapter 10 (Cumulative Impact Assessment).	Closed	N/A	pp. 2-79, 8-165, 8-166

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
5.	Drill Cuttings	The EIA does not present a robust alternative analysis concerning the disposal of drill cuttings on shore and defaults to the argument that only discharge to sea is viable. The limits used to assess the disposal of cuttings in the EIA should be re-evaluated. Limits for Total Suspended Solids (TSS) used to interpret the modeling should be based on the recent literature and/or deviation from baseline conditions. The assessment of alternatives for disposal of drill cuttings should follow a holistic approach considering feasibility, cost, health, and safety as well as environmental and social issues. This assessment should be quantitative or semi quantitative. The option to dispose of cuttings to shore is also not assessed in detail and there is no economic appraisal of the disposal options.	The Consultants acknowledge that the EIA does not include details of a multi-factor analysis demonstrating the pros/cons of onshore vs offshore drill cuttings management. The alternatives analysis provides a summary conclusion that while transport to land may limit the impact offshore, transportation, emissions from transportation, treatment, and disposal onshore have an impact on the environment and require infrastructure for transportation, handling, and treatment of the cuttings. That said, the Consultants' opinion is that treatment of drill cuttings to an international performance criterion followed by offshore discharge is consistent with global drilling practices in other jurisdictions, and the EIA therefore focused on alternatives for achieving this criterion. With respect to the TSS threshold selected for the EIA, the Consultants believe this is a valid threshold based on scientific studies. Modeling predicts that TSS concentrations above this threshold will occur mostly during drilling of the initial well sections, and these instances are confined to within a localized area around the well locations, near the seafloor. In the case of bottom-hole well sections involving overboard cuttings discharges, only slight exceedances above the threshold are predicted to occur near the surface, also over a very localized area. Further, modeling indicates TSS concentrations will be reduced to below the threshold through settling and dispersion within approximately 12 hours of cessation of drilling for top-hole well sections and within approximately 2 hours of cessation of drilling for bottom-hole well sections. The Consultants are not aware of alternative thresholds that are substantially lower than the one used in the EIA. On this basis, it is expected that use of an alternative threshold would not change the conclusions of the EIA with respect to this potential impact.	Closed	N/A	N/A
6.	Discharge Standards	While reference is made to numerous discharge standards for project emissions, no single source of reference standard is presented in the EIA. Rather than set specific standards, where none currently exist, and also in light of the time requirements to do so, it is recommended that Project adopt a risk-based approach to defining project standards in the	In the absence of a single source of standards for all Project emissions and discharges, the Consultants identified several internationally used environmental and socioeconomic performance criteria (see Table 2.4-1 in the Environmental and Socioeconomic Management Plan). The Consultants believe these are appropriate criteria to apply to the Project. The Consultants acknowledge that the referenced MARPOL standard dates from 2006, but these requirements are still in effect and widely used by the marine industry.	Closed	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		context of the local baseline environmental and social sensitivity. These should be benchmarked against contemporary best practice standards for specific oil and gas operating regions, with an emphasis on examples from Central and South America. Some standards are clearly outdated - e.g., use of MARPOL applied to total suspended solids standards on drill cuttings.				
7.	Baseline Data	Lack of adequate and multiyear baseline data is a common problem in EIA and the Yellowtail Development project EIA is no different in this regard. While multiple studies have been conducted as part of previous project level EIAs (Liza and Payara) and the studies cited in the EIA provide general data on the broader area of influence, further surveys specific to the Yellowtail Project development footprint should be undertaken where potential impacts have been identified, or where there are uncertainties in data availability or impact prediction. Such studies will provide an explicit current and future baseline against which further changes in environmental parameters can be identified. The focus of these studies should be on parameters that will be directly affected by the	The physical and biological baselines in the EIA are supported by multiple (EEPGL-sponsored) studies that have been conducted within the last several years (e.g., multiple EBS studies, Ambient Air Quality Studies, Protected Species Observer Surveys, Marine and Coastal Bird Studies, Enhanced Coastal Sensitivity Mapping, and Nearshore and Offshore Fisheries Studies). The Consultants have addressed similar concerns about the baseline data in previous comments on the EIA, and at the EPA's request, the Consultants have added text to the EIA describing why the prior studies are representative and appropriate for inclusion in the EIA, and adequate to describe the environmental conditions that currently exist in the Project AOI. The environmental monitoring measures included in the ESMP are intended to track environmental conditions as they change over time. Data provided from the monitoring program will indicate the effectiveness of the management measures and changes in ambient conditions over time.	Closed	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		development, or are at high risk (e.g., special status species).				
8.	Good International Oil Field Practice	Throughout the EIA, the use of the term, good international oilfield practice, is made extensively. This term is misleading in that there are no specific standards or practices listed in the EIA nor are there reference examples to back it up or define the context to which it is applied. This term typically represents a compilation of multiple standards without specific reference to best available technology (BAT), best available control technology (BACT) or specific jurisdictional reference and supporting examples. Where good practices are cited, they should reference the jurisdiction or context and a justification as to why they have been used.	The term good international oilfield practice is typically used in the EIA in cases where the Project is not applying a specific regulation, standard, or guideline, or is characterizing the Project's approach as a general matter where the context does not call for discussion of specific applicable standards. Where appropriate, the EIA identifies the specific regulation, standard, or guideline applied by the Project. The term good international oilfield practice means petroleum industry practices generally accepted in the global petroleum industry that are considered prudent, safe, and efficient in conducting petroleum production operations, including those necessary and appropriate to minimize impacts to the environment. EEPGL's design draws on ExxonMobil affiliates' many decades of experience developing and producing oil and gas resources, as well as global industry experience. Application of good international oilfield practices is consistent with Regulation 6 of the Petroleum (Exploration and Production) Regulations 1986, the Petroleum Production License granted for e.g. the Payara Project, and is required by Article 28 (Social Responsibility and Protection of the Environment) of the Stabroek Block Petroleum Agreement. In response to the comment, the Consultants have reviewed the instances in the EIA where the term good international oilfield practice is used, and have added reference to a related jurisdiction or source, where applicable. With respect to BAT, the EIA contains a discussion of this topic in Section 2.18.3.	Where the EIA uses the term "good international oilfield practice," evaluate its usage and, where possible, replace or cross-reference the term with a more specific standard or term. Consultant's proposal also accepted.	The Consultants have evaluated every instance where the term "good international oilfield practice" is used. In cases where the term is used as general reference to a specific standard, the Consultant team has added a reference to the source document for that standard.	EIS-22, EIS-23, 1-5, 2-15, 2-18, 2-20, 2-25, 2-69, 2-77, 2-94, 2-103, 2-143, 2-146, 2-131, 2-136, 2-150, 6-45, 6-79, 6-81, 6-106, 6-115, 10-7
9.	Analysis of Alternatives	The analysis of alternatives presented in the EIA is not robust and is structured to justify the project rather than adequately discuss all possible alternatives that could be considered in the project. A number of alternatives were rejected at the start rather than subject to detailed assessment, particularly relating to cutting and produced water disposal.	The requirements of the Guyana Environmental Protection Act are that the EIA outlines the main alternatives studied by the developer and an indication of the main reasons for the developer's choice, taking into account environmental factors. To this end, the purpose of the EIA was not to present the details of the alternatives analysis performed by EEPGL, but instead to summarize the alternatives considered and present the principal reasons that drove the selected alternative. Please see above regarding drill cuttings disposal alternatives. With respect to produced water management alternatives, comprehensive studies were completed as part of the Payara Production License including a Produced Water Reinjection Study. This study has informed the design of the Yellowtail Project. As an	Revise and strengthen the analysis of alternatives in keeping with Section 5.4 (page 21) of the ToR, which doesn't ask for a summary but a detailed analysis. Including detailed reasoning for the selection of the proposed project compared to other options. The analysis should be specific to Yellowtail and not previous projects. In reference to PW the analysis should focus on the data for Yellowtail rather than Payara/previous projects.	The Consultants believe that the discussion of alternatives for drill cuttings and produced water management alternatives provides sufficient information to support the EIA, with respect to a description of the key alternatives for these aspects of the Project, and the reasoning for selection of the preferred alternatives. Based on the Consultants' experience, and the fact that the same management alternatives have been selected for the previously permitted projects, it is unlikely that the requested assessment would change the conclusions of the Yellowtail EIA. That said, if the EPA requires additional information on these topics, the Consultants recommend that EEPGL conduct such assessments when the necessary data become available.At the current	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		The assessment of alternatives should follow a holistic approach considering feasibility, cost, health, and safety as well as environmental and social issues. This assessment should be quantitative or semi quantitative in nature. The project should adopt a risk-based approach to impact assessment, and if economic feasibility is claimed as an important decision-making factor, then it needs to be supported by economic data and analysis.	example, the Produced Water Reinjection Study assessed global experience in produced water reinjection, environmental impacts of reinjection compared to treated water discharge overboard, reservoir and facility implications of reinjection, and lifecycle costs. As a component of the Payara Produced Water Reinjection Study, a produced water discharge environmental risk assessment was completed based on predicted concentrations of constituents and compounds in the treated produced water to be discharged from the Payara FPSO. The results of the risk assessment indicate that risk to marine organisms from exposure to the produced water discharge from the FPSO is low. Based on this study's conclusions, treatment and overboard discharge of produced water to international standards is proposed for Yellowtail.		Project stage, the technical data required to conduct the requested quantitative or semi-quantitative Yellowtail-specific drill cuttings or produced water management studies are not available. In the unlikely event the assessment identifies different alternatives with significant environmental and socioeconomic benefits over the selected alternatives, EEPGL and the EPA could then discuss these alternatives with respect to application for the Project and other similar EEPGL activities in Guyana.	
10.	Environmental and Social Management Plans	The level of detail of environmental and social management plans presented in the EIA is poor and more could be expected at this level of project development and engineering. Provision should be made for the subsequent development of specific detailed management plans as a license condition – e.g., a) sediments, b) light, noise and vibration c) biodiversity (specific species) d) fisheries management e) OHS f) fuel and chemical g) drilling waste (need more specific) h) construction management h) GHG management i) monitoring and follow-up plan (note this is a preliminary list and should be further discussed and developed.	The ESMP is intended to be an "evergreen document" and will be updated as appropriate prior to initiation of activities that could have impacts on environmental or socioeconomic receptors and periodically thereafter.	Closed	N/A	N/A
11.	Monitoring and Compliance Framework	The EIA as presented does not include a comprehensive monitoring and follow up framework for a) assessing the credibility	It is the Consultants' position that the scope of monitoring recommended in the ESMP is commensurate with the impacts predicted in the EIA. The ESMP provides the framework for monitoring environmental and socioeconomic conditions going forward, and comparing the data to the baseline data	Closed	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		of impact predictions b) assessing the effectiveness of mitigation measures and c) expanding the environmental and social baseline condition and assessing the impacts of project activities on important environmental and social components. develop a comprehensive monitoring and follow-up mechanism to assess mitigation effectiveness and to address gaps in baseline data. This should include specification of key performance indicators and fixing the frequency of reporting for non-compliance.	in the EIA will be critical to assessing the ways and extent to which environmental and socioeconomic conditions change over time, but the ESMP is not intended to establish future baselines. As such, comparison of data provided from the monitoring program with the baseline data provided for receptors of concern in Chapters 6, 7, and 8, as well as the technical appendices in Volume II of the EIA, will be vital to assessing the effectiveness of the management measures recommended in the EIA. As described in the response to RG-7, these data will also indicate the effectiveness of the management measures and changes in ambient conditions over time.			
12.	Oil Spill Risk and Response Plan	Oil spill risks as presented in the EIA focus on spill trajectory and potential consequence and do not quantitatively assess the likelihood of occurrence. This gives an incomplete and partially subjective assessment of the overall oil spill risk. Unplanned events should leverage quantitative data from publicly available sources such as IOGP and, were available detailed risk assessments, QRAs, HAZIDs etc.	While the unplanned event risk assessment in the EIA does not include a quantitative analysis of the expected frequency at which an unplanned event would be expected to occur, the oil spill modeling includes a quantitative analysis of the likelihood that a particular location would be impacted in the event of a loss-of-well-control event. Consistent with the typical approach taken for assessment of unplanned events, a risk assessment approach was taken in order to incorporate the aspect of likelihood (i.e., to distinguish from assessment of an event which is planned or practically certain to occur). Likelihood was estimated on the basis of experience and/or evidence that such an outcome has previously occurred. The consequence/severity element of the risk rating was assigned based on the sensitivity of the resource/receptor and the magnitude of the impact – assuming the event occurs (however unlikely). Accordingly, there are a number of resources for which the consequence/ severity of an oil spill would be high, and many of the resources have therefore been assigned the highest consequence/severity rating. That said, the likelihood of an oil spill of sufficient magnitude to produce this type of consequence is very low and it is therefore appropriate to assign a likelihood rating of Unlikely – even if this is assigned qualitatively. It is further noted	Closed	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
			that the measures proposed by EEPGL to prevent and respond to an oil spill represent good international industry practice, and different/additional measures would not be proposed even if the likelihood factor were quantified in terms of a numerical probability. However, in response to the comment, the next revision of the OSRP (which will be prepared after the final Yellowtail EIA and submitted to the EPA separately from the Yellowtail Development Project EIA) will include an assessment of the frequency of oil spill scenarios, based on global experience in the industry.			
13.	Marine Traffic Risk	management approach is taken to mitigate potential collision impacts which are estimated as unlikely. Risks to marine traffic in the port area and vicinity are not clearly addressed particularly for those smaller vessels that are much more vulnerable to collisions and lacking radar or collision avoidance systems. It is also not clear that a HAZID or risk assessment of potential vessel collision with the FPSO has been done. A more detailed HAZID assessment of marine traffic risk from the port to the FPSO and the potential for collision with the FPSO should be more fully evaluated.	The Consultants acknowledge that a quantitative analysis (i.e., including determination of the statistical probability of a vessel collision) has not been conducted as part of the assessment of the potential unplanned event of a Project vessel collision with a third-party vessel. However, quantitative data have been collected to characterize the increase in existing marine traffic in Georgetown Harbour that would be expected as a result of the Project (i.e., on the order of 2 to 4 percent). Accordingly, it is reasonable to expect that a more detailed statistical probability determination would not yield data that would change the measures recommended to prevent or reduce the consequence of such a collision. With respect to a collision of a vessel with the FPSO, Chapter 9 of the EIA provides the basis by which quantitative modeling of spills from a collision between the FPSO and an offloading tanker or the FPSO and another third-party vessel are not considered reasonably foreseeable. That said, from an environmental perspective, the impact of collision resulting in a breach of the FPSO's crude oil storage tanks would be covered – in terms of potential quantity of oil released – by the modeling conducted for the Worst Case Discharge events described in Chapter 9. However, in response to the comment, the Consultants have updated the EIA with additional information from MARAD's process for managing these types of risk, to provide further context for the risk assessment process that will be undertaken in relation to the Yellowtail FPSO.	Closed	N/A	N/A
14.	Public Consultation and Engagement	The level of public consultation and engagement undertaken in the EIA is not adequate for a project of this scale and complexity, regardless of whether it is located far offshore. The scope, extent and	EEPGL's and its consultants' engagement with various stakeholders communities is described in the SEP (EIA Volume III). The SEP details the diverse range of stakeholders engaged, including vulnerable and underrepresented groups, and the multiple years of engagement that have taken place by EEPGL and its consultants.	The record of consultation as presented in the EIA should meet requirements stated in the Terms and Scope as follows (p. 24): These records shall also contain details on the manner in which the public was notified, the groups targeted, a description of the stakeholder consultation process, a list of all	Detailed records of consultation made during the development of the EIA have been provided in Appendix W of the EIA. Together with the stakeholder consultation process and summaries provided in Chapter 4 and the attached SEP and SEP Attachment A, these records include the manner in which the public was notified, the groups targeted, a description of the stakeholder consultation process, listing of all stakeholder	Appendix W (new)

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		frequency of consultation should be extended in a wider and more inclusive approach geographically and include a broader consideration of potential onshore effects. Stakeholder mapping should be fulsome and geographically demonstrated with evidence of proof, as required. Once developed, the Stakeholder Engagement Plan should systematically allow for engagement records for all interactions with stakeholders to be documented. Stakeholder feedback must be fully integrated into EIA documents by demonstrating session reports in an Appendix rather than only providing a roll-up of findings in a table format in the EIA.	Engagement occurred during EIA scoping, development, and disclosure phases, and broad consideration was given to potential concerns and impacts of the Project both on and offshore. The Consultants facilitated in-person meetings in all six coastal regions (including indigenous communities in Region 1) as well as broadly accessible virtual meetings in light of the Covid-19 pandemic, including non-technical presentations of the Project and EIA process/results, and question-and-answer sessions. EEPGL is committed to continuing to provide stakeholders with regular access to information about the activities as well as access to feedback mechanisms through which stakeholders may provide input and receive response to feedback. To date, in addition to active updates and information sharing on social media and traditional media channels, this has included, but is not limited to, oil spill management training in Regions 1 and 6, waste management training, capacity-building efforts and training, supplier forums, offshore oil and gas seminars through the CLBD, and community outreach events (e.g., job fairs, schools, informational booths) in Regions 1, 2, 3, 4, 5, 6, 9, and 10. Chapter 4 of the EIA provides a summary of stakeholder concerns and comments received in relation to the Yellowtail Project, and how comments have been addressed. EEPGL's engagement with affected communities is also described in the SEP, which includes a publicly disclosed summary of concerns and comments received during engagements. Furthermore, ongoing engagements and resulting actions are tracked by EEPGL.	stakeholder groups included in the process, the number of meetings held, location of the meetings, dates held, minutes of all meetings, a copy of the survey questionnaires used (if any), and the results of surveys. Records presented should detailed and thorough and attributed to each consultation session. These records can be presented in such a way where privacy concerns can be respected. Particular attention should be paid towards presenting the full minutes of all meetings rather than in a roll-up summary.	groups included in the process, the number of meetings held, location of the meetings, dates held, and minutes of all meetings. Personal information including specific names of participants have been withheld to respect the privacy of those involved. No surveys were performed.	
15.	Grievance Mechanism	A more detailed grievance mechanism as to how compensation of damages or impacts should be assessed and mitigated is required. The grievance mechanism should be developed following a World Bank approach, one that is practical, inclusive, and accessible for all project affected stakeholders and that it is shared in appropriate manner and used effectively. It should allow for anonymous complaints, provide a	EEPGL's Community Grievance Mechanism (CGM) is an integral part of the Company's stakeholder engagement program, and is aligned with international guidance including the World Bank. The CGM is referenced in Section 3.3.2 of EEPGL's Stakeholder Engagement Plan for Guyana Operations (included in Volume III of the Yellowtail EIA), and Project-specific detail is provided in the ESMP (also included in Volume II of the Yellowtail EIA). Grievances are evaluated in accordance with the 5-step grievance management procedure including investigation, resolution, and response. Compensation for damages or impacts may be considered as part of this process, and would be considered on a case-by-case basis with the involvement of affected parties.	Closed	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		multi-level dispute resolution mechanism and provision of compensation for damages and project related impacts.	An important element of any grievance mechanism is to incorporate local input into the nature and design of the mechanism. Accordingly, EEPGL's CGM has evolved over recent years, as it has been publicly disclosed and subject to comments for the Yellowtail EIA and earlier EIAs (Payara, Liza Phase 2, and Liza Phase 1), and has been iteratively updated to reflect this input. Grievances are tracked via EEPGL's internal ESMS and compliance systems to ensure follow-up. Anonymous submissions are allowed and the process to address them is described in the CGM. As described in the CGM, potential grievances can be communicated to EEPGL through various means of communication, including phone, email, and in-person. The CGM applies to communications that occur directly with EEPGL, as well as via contractors or government agencies. EEPGL also tracks concerns and issues that are raised through Facebook and other social media outlets, so that relevant issues can be registered and addressed via the CGM.			
16.	Applicable Project Regulatory Standards	The EIA and Supporting Management Plans contain numerous sections referencing legislative and regulatory frameworks. While in some cases this formatting is consistent with that requested in the Final Terms and Scope for the Conduct of the Environmental Impact Assessment, there is not one aggregate accumulation of all of the legal references and commitments made in the report (see above). This should be included as a separate section or Appendix. The description of the legislative and regulatory framework in Chapter 3 is very brief and may not be complete. The legislative references in Chapters 6-	Chapter 3 reviews the laws and regulations in Guyana that are relevant to the assessment of potential environmental and social impacts arising from the Project. Additionally, Chapters 6, 7, and 8 include sections that summarize the legislation, policies, or treaties that are related to the subject covered by the specific section. However, in response to the comment, the legislation, policies, and treaties information in Chapters 6, 7, and 8 has been added to Chapter 3, so that all administrative framework information can be reviewed in one place in the EIA.	Include information from administrative framework tables in Chapters 6-8 and 11 in Chapter 3	The legislation, policies, or treaty commitments from Chapters 6 through 8 have been compiled and added to Chapter 3 in Table 3-1.	pp. 3-10 to 3-22

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		8, 11 and the Management Plans could be more detailed.				
17.	Onshore Impacts	As in many EIAs of offshore oil and gas projects, the potential impacts onshore are not fully assessed and justification is often given that due to its distance from shore, offshore oil and gas projects will not have onshore impacts. This is far from the case as shore-based activities are required to support offshore oil and gas development and the extent and frequency of these activities is only expected to increase in future with the expansion of EEPGL activities and the arrival of other offshore players. This is further compounded when assessing the cumulative impacts of a range of onshore development projects and activities independently. A further assessment of onshore impacts should be considered as an addendum to the EIA. Onshore impacts associated with supply bases and logistics routes should also be more fully addressed as part of this effort. There should also be a greater effort taken to assess onshore socio-economic and livelihood impacts and their mitigation and management and dedication of specific sections within the EIA.	The distance of the Project activities from the coast is only factored into impact ratings when the distance acts as a control on the mechanism of impact. This occurs in cases where the specific Project activity that would generate the impact would only occur offshore, and the distance between activity and receptor effectively eliminates the potential impact pathway (e.g., impacts on ecosystem services provided by mangroves). It can also occur where an impact mechanism exists despite the distance, but the distance between activity and receptor implies a degree of dilution, dissipation, or assimilation that significantly affects impact magnitude at the receptor's location (e.g., air quality impacts on human health). The Consultants recognize that although the Project is fundamentally an offshore project, there will be impacts on shore-based receptors, and the EIA reflects this. Most of the shore-based receptors that would be affected are socioeconomic, which is why all of the socioeconomic receptor discussions in Chapter 8 rate at least one impact (and many rate several impacts) that will occur onshore. Additionally, under the Environmental Protection Act, permitting of third-party onshore support facilities, including shorebases and waste management facilities, is a separate process from the Yellowtail EIA and authorization process.	Impacts of third-party facilities outside of Yellowtail Project Development needs to be addressed in the EIA.	As indicated by a map in Chapter 5, Scope of the Environmental Impact Assessment, the Direct Area of Influence within which impacts were assessed includes the marine/aviation transit corridor between the FPSO and the Guyana shorebases that will be used by the Project. Chapter 10, Cumulative Impact Assessment, discusses potential cumulative impacts on several resources from the anticipated cumulative marine vessel movements. The Consultants did not include a more detailed evaluation of onshore impacts from third-party owned onshore facilities for the following reasons: 1) The Yellowtail Project does not have a dedicated onshore shorebase and would utilize existing and separately approved onshore shorebases. Under the Environmental Protection Act, permitting of such facilities has been conducted by the EPA under separate evaluation processes. 2) The onshore shorebases planned to be utilized by the Project are existing facilities and their impacts onshore are already factored in to the baseline for the Yellowtail Development Project EIA. If the EPA requires an analysis of the impacts from third-party facilities, the Consultants recommend that the EPA and EEPGL conduct a separate study to assess the overall environmental and socioeconomic impacts from these facilities. In order to support such a study, the following information would need to be obtained: • Project summaries submitted to the EPA in support of Applications for Environmental Authorisation for these facilities; • Supporting analyses submitted as part of these Applications (e.g., EIA, EMP, EA&MP, etc.); • Recent compliance or monitoring reports submitted to the EPA by operators of these facilities; and • Any relevant supplemental environmental performance information submitted to the EPA for these facilities.	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
18.	Produced Water	The assessment of options for disposal of produced water claims in part an economic justification but no economic analysis is provided. It is also mentioned that discharge to sea is consistent with Good Industry Oil Field Practice but data from the International Association of Oil and Gas Producers (IOGP) indicates that 56% of produced water is re-injected (although it is not indicated whether this is offshore or onshore). The discharge limit for oil in water is 29 mg/L (Monthly Average 42 mg/L (daily Maximum). This is high relation to OGP average data for offshore of 20 mg/L (2019)[i].	With respect to produced water management alternatives and the consideration of economic factors, comprehensive studies were completed as part of the Payara Production License and Environmental Permit, including a Produced Water Reinjection Study. This study has informed the design of the Yellowtail Project. The Produced Water Reinjection Study assessed global experience in produced water reinjection, environmental impacts of reinjection compared to treated water discharge overboard, reservoir and facility implications of reinjection, and lifecycle costs. With respect to oil-in-water concentrations in discharges, EEPGL is committed to operating in compliance with the prescribed limits while striving for continuous improvement. For example, Destiny's average daily oil-in-water content in produced water discharge in 2021 was consistently below the oil-in-water limit. While EEPGL is operating well below the limits established by international standards and adopted by the Project, use of these standards provides some level of operational flexibility in case of unforeseen equipment upsets.	A commitment to use a risk-based approach to produced water discharge standards must be included in the EIA.	An additional mitigation measure recommending completion of FPSO effluent discharges characterization and environmental risk assessment has been added to Chapters 6, 7, and 13, and Appendix V.	pp. 6-119, 6-120, 7-99, 7-131, 7-179, 7-223, 7-273, 7-287, 13-13, App V p. V-5
19.	Transboundary and Cumulative Impacts	The scope of planned transboundary impacts is restricted to the Guyana EEZ. Impact of transboundary spill (estimated to be Trinidad and Tobago, Venezuela, Aruba, Bonaire, Curaçao, Barbados, St. Lucia, Grenada, St. Vincent and the Grenadines, the Dominican Republic, Haiti, and Jamaica) is estimated as Unlikely. Spill from loss of well control event would affect three regions a) Trinidad/Tobago, northern south American coast, and ABC b) southern lesser Antilles islands and southwestern Greater Antilles. The extent of the spill extent depends on the season.	The Consultants agree with the reviewers' summary of the EIA's findings with respect to transboundary impacts. Section 10.7 of the EIA recommends a three-tiered framework for managing cumulative impacts. The first tier focuses on managing the Project's contribution to cumulative impacts. The second tier focuses on managing contributions to cumulative impacts at the company level, across all of EEPGL's activities. The third level focuses on managing cumulative impacts at the regional level, through working groups and/or industry organizations. The second and third tiers of the management framework are not as detailed as the first tier in terms of specific measures and implementation plans, because the EIA is focused on activities that are part of the Yellowtail Project, and the scope of the EIA does not include development of detailed management plans for other projects or other proponents' activities, because EEPGL does not have influence over the impacts management at the projects operated by others. Nevertheless, Section 10.7 of the EIA identifies the resources that could benefit from management of cumulative impacts and	Closed	N/A	

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		Cumulative impacts are described but largely restricted to existing EEPGL project development plans. No detailed framework is presented as to how cumulative impacts should be managed. Temporal boundaries are not adequately assessed into the future.	the types of activities that could lead to these impacts at a company-wide level. As described in Section 10.3.4 of the EIA, the temporal boundary of the cumulative impacts assessment is different for EEPGL and non-EEPGL projects, and reflects the differences in certainty concerning future EEPGL projects as compared to non-EEPGL projects.			
20.	Fisheries: Data and Potential Impacts	The EIA notes that fish catches declined in the two years studied by EEPGL and this was noted during public consultations. The EIA states that more data is needed to scientifically establish whether fish abundance is declining and to identify potential causality. The EIA attributes the potential causes to interference with fishing activities by sargassum, inclement weather, unsustainable/illegal fishing practices, and more recently, COVID-19-related declines in fishing effort, rather than due to oil and gas activity. There is a lack of supporting evidence and a lack of public confidence in this conclusion.	The EIA acknowledges a sustained decline in fishery production since 2013. Although some stakeholders may question the potential causes for these declines identified in the EIA, the Consultants would emphasize that the potential causes cited in the EIA were identified by knowledgeable sources in Guyana, including the Bank of Guyana and fisherfolk participating in the Participatory Fishing Study. As indicated in previous responses to similar comments on the EIA, the timing of the initial declines in 2013 (two years before EEPGL's first oil exploration well was drilled in Guyana) strongly suggests that oil and gas activity did not drive the initial decline. Increases in certain fisheries since 2013 (e.g., growth in fish and shrimp outputs in 2016 and increases in fish catches in 2019) concurrent with increased oil and gas activity and the start of oil production (also in 2019), coupled with the Ministry of Agriculture's recent announcement that overall fish production increased by more than 10 percent last year, also suggest that oil and gas is not driving declines in fisheries production. In response to the comment, the EIA has been updated to include additional information regarding the ongoing Participatory Fishing Study.	Closed	N/A	
21.	Terminology	There are important discrepancies in language between the legislation/Terms and Scope for EIA and the actual EIA report with regards to terminology regarding the extent of environmental impacts. Of note - the legislation and Section 4 (g) of the Terms and Scope for EIA require that the EIA include a "description of	Please see response to RG-9 with respect to the alternatives analysis in the EIA. Tables 13.1 and 13.2 provide comprehensive lists of all commitments that have been incorporated in the Project design as embedded controls, and mitigation measures that have been suggested by the Consultants, respectively. Section 4.1 of the EIA describes the types of impacts assessed in the EIA, including a definition of the term "impact." This definition of "impact" incorporates by direct citation the term "adverse effects" as defined in the Environmental Protection Act. As indicated in Section 4.1 of the EIA, potential Project effects that	Closed	N/A	

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		the measures which the proposed developer intends to use to mitigate any adverse effects (defined term) and a statement of reasonable alternatives (if any) and reasons for their rejection." While the EIA does assess the risks of an extensive list of items to the environment, the EIA and Supporting Management Plans do not seem to tie their assessment, risk classification or conclusions back to the EPA term "adverse effects" which is a defined legislative term and is a term used in the Terms and Scope for EIA. In Chapter 4, section 4.1 Types of Potential Impacts, the EIA sets out the EPA's definition of "Adverse effects". The latter part of Chapter 4, being Section 4.8 proceeds to describe the classification system and terms used in the EIA to assess and categorize impacts. However, it does not appear that these classifications tie back to the legislative/TOR term "adverse effects". It would seem that this will make assessing the compliance of environmental impact assessments against the legislative requirement challenging. Note that Environmental Protection Act Section 4(1)(g) also charges the	met the legal definition of an "adverse effect," were considered "impacts" and were considered for scoping into the EIA. The terms used in the subsequent "assessment, risk classification, or conclusions" in later sections of the EIA and/or ESMP were not used to modify or constrain the meaning of the term "impact" as defined in Section 4.1 of the EIA. These terms were used to describe the attributes of specific impacts in a consistent fashion that allowed the significance of those impacts to be rated systematically. Section 4.1 has been updated to provide additional clarity on this topic.			

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		EPA with a responsibility to ensure that any development activity (defined term) which may cause an adverse effect (defined term) on the natural environment (defined term) be assessed before such activity is commenced and that such adverse effect be taken into account in deciding whether or not such activity should be authorized.				
22.	Defined Terms from the EIA	The EIA and Supporting Management Plans contain a variety of Defined Terms (Terms that are explained in their first occurrence and then identified as a defined term in their subsequent use in the documents through the use of Capital Letters or Abbreviations). While the EIA and Supporting Management Plans include a Glossary as requested in the Terms of Reference, there does not appear to be a Definitions Section which contains a listing of all Defined Terms (Term name and its definition) contained throughout the documents. Furthermore, the EIA includes instances where a term is defined but then not subsequently identified as having been defined through the use of Capital Letters. An example can be found on page 4-2 in Chapter 4: "For the purposes of the EIA, an impact is defined as any alteration of	The EIA uses acronyms throughout the document - which are capitalized, as well as defined terms - which are not acronyms and are not capitalized. The beginning of the document includes a list of acronyms along with a separate glossary that lists defined terms and their corresponding definitions. In response to the comment, the EIA glossary has been updated to include definitions of key terms from the Act that are used in the EIA.	Closed	N/A	

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		existing conditions (adverse or beneficial) caused directly or indirectly by the Project."				
23.	1.3 Goal and Objectives of the EIA (pg. 101)	Under Bullet 2 on Page 101, include after production, maintenance activities (inclusive of preventative maintenance, planned shutdown and unscheduled repairs) also. **Note:** With the addition of this major element the implications to the environment (including social aspects such as worker health and safety etc.) will also have to be assessed.	The EIA has been edited to include the requested additional text in the bullet that reads "Production operations, including offloading tankers." The Consultants have considered the scope of normal FPSO operations (inclusive of routine maintenance) in the assessment of potential impacts from the production stage of the Project. That said, the scope of the EIA excludes consideration of occupational health and safety aspects for workers. EEPGL addresses the safety, security, and health of its employees and contractors by employing a robust and effective management system to protect its Project workforce. EEPGL will implement its OIMS during each Project stage. This program is designed to manage occupational risks to Project workers.	Closed	N/A	
24.	2.1 Project Area	Page 115 Para. 2, Lines 1 and 2 - The exact locations of the Yellowtail development wells should be stated and made available in the form of longitude and latitude coordinates of each of the six (6) drilling center positions. For illustrative purposes, it would be useful to also make available within this section of the document the Proposed Drawings for the New Infrastructure Layout and Locations of the development wells with exact georeferenced positions for each of the elements to be installed on the seafloor. **Note:** For greater clarity reference Table 2-1 on Page 17, and Figures 2-3 and 2-4 on Pages 22 and 23 respectively of the Van Gogh Infill Development Phase II	The Consultants believe that the preliminary layout of the subsea infrastructure – inclusive of drill centers and wells, as well as other SURF infrastructure – presented in the EIA is sufficient for the purpose of informing the assessment of potential impacts associated with these Project features. Please note that the exact coordinates of development wells – when they are drilled - will be provided to the EPA as part of routine well completion reporting and are present in Field Development Plan Table 6-1. 		(VGID2) Installation Environmental Plan at https://docs.nopsema.gov.au/A772352				
25.	2.4.2 Applicable Codes, Standards and Management Systems	Page 123 - In the absence of local environmental guidelines which dictate how the Exploration and Production activities of the Oil and Gas Sector ought to be done, International Guidelines, Standards and Industry Practice will be applicable and should be included. All O&G Companies operational in Guyana will be expected to conform to the requirements contained within the following: a. World Bank EHS Guidelines (General and Industry Specific) o EHS Guidelines for Onshore Oil and Gas Development o EHS Guidelines for Offshore Oil and Gas Development o EHS Guidelines for Ports, Harbors and Terminals b. International Petroleum Industry Environmental Conservation Association (IPIECA) Guidelines International Association of Oil and Gas Producers (IOGP) Guidelines	The Consultants are not aware of a specific regulatory requirement for oil and gas projects to conform to the World Bank EHS Guidelines, IPIECA, or IOGP Guidelines. In the absence of a single source of standards for all Project emissions and discharges, the Consultants identified several internationally used environmental and socioeconomic performance criteria (see Table 2.4-1 in the Environmental and Socioeconomic Management Plan) The Terms and Scope identifies World Bank EHS Guidelines, IPIECA, or IOGP Guidelines as examples of "international standards and guidelines" to which the EIA must adhere in three specific areas: organization of the EIA, selection of the preferred alternative, and water quality. The World Bank EHS Guidelines for Offshore Oil and Gas Development are non-prescriptive in terms of EIA organization. They include specific numerical standards for certain effluent streams, most of which the Project has committed to achieving. The EHS guidelines allow alternative performance standards to be applied if they are shown to be protective of human health and the environment. The impact assessment in Chapter 6 of the EIA provides a robust analysis of impacts on human health and the environment for all anticipated effluent streams. The Oil Spill Response Plan in Volume III of the EIA incorporates the relevant IPIECA and IOGP guidelines by reference as appropriate. References to the additional "Good Practice" guides that were jointly developed by IPIECA, IOGP, and/or the American Petroleum Institute will be considered for the next revision of the OSRP. 29.	2.7.4.5 Produced Water Treatment (Pgs. 155-157)	Produced water as is discussed in the identified section of the document is deliberately oversimplified since literature on the subject indicates to the reviewer that this waste stream contains much more than water and just hydrocarbons as we are being led to believe. Its physical and chemical properties vary widely depending on the geological age, depth and geochemistry of the hydrocarbon bearing formation, as well as the chemical composition of the oil and gas phases in the reservior, and the process chemical added during production. According to Kenneth Lee and Jerry Neff in Produced Water - Environmental Risks and Advances in Mitigation Technologies, produced water contains inorganic salts, metals, radioisotopes and a wide variety of organic chemicals, primarily hydrocarbons.	Comprehensive studies were completed as part of the Payara Production License including a Produced Water Reinjection Study. This study has informed the design of the Yellowtail Project. As a component of the Payara Produced Water Reinjection Study, a produced water discharge environmental risk assessment was completed based on predicted concentrations of constituents and compounds in the treated produced water to be discharged from the Payara FPSO. The results of the risk assessment indicate that risk to marine organisms from exposure to the produced water discharge from the FPSO is low. Based on this study's conclusions, treatment and overboard discharge of produced water to international standards is proposed for Yellowtail. Results of the Payara produced water risk assessment not withstanding, EEPGL is working with the EPA on a program for sampling and risk assessment of effluent discharges – inclusive of produced water.	Please refer to EPA's response in Item 9 above. Further , please note that comment must be addressed in Revised ESIA. The Payara Produced Water Study is specific to the Payara Development Project. How are they relevant to Yellowtail?	Please see responses to Comments #9 and #18 of Table 2.	

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		It therefore means that since only one constituent (i.e. oil content) of the produced water waste stream is being treated onboard the FPSO to bring its concentration down to the legally defined allowable limits, all of the other constituents which pose considerable environmental risk are virtually untreated and simply discharged into the ocean over the productive life of the well. Given the above reality we have the following questions in relation to the chemical composition of the produced water before and after treatment at point of discharge with the technologies onboard the FPSO: 1. What are the concentrations of the following elements/ inorganic ions present in the produced water: Sodium, Chloride, Calcium, Magnesium, Potassium, Sulfate, Bromide, Strontium, Ammonium, Bicarbonate, Iodide, Boron, Carbonate and Lithium? 2. What are the concentration of the following parameters (i.e. Biological Oxygen Demand, Total Organic Content, Nitrate, Nitrite, Ammonia, Orthophosphate and Total Phosphorus which help to				

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		determine Total Organic Carbon of the Produced Water? 3. What are the Organic Acids present within the produced water and what are their respective concentrations? Please note that information has to be presented for Low molecular weight organic acids, aliphatic and aromatic acids. 4. What are the concentrations of Total Oil and Grease, Total Petroleum Hydrocarbons, Benzene, Toluene, Ethylbenzene and Xylenes (BTEX), Polycyclic Aromatic Hydrocarbons (PAH) and Total Phenols present with the Produced Water? 5. What are the concentrations of the following metals (i.e Arsenic, Barium, Cadmium, Chromium, Copper, Iron, Lead, Manganese, Mercury, Molybdenum, Nickel, Vanadium and Zinc) present within the produced water? 6. What are the most abundant naturally occurring radioactive elements that are likely to be present in produced water coming from the Yellowtail and Redtail Wells? And what are their rate of radioactive decay expressed in				

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		Picocuries/L (pCi/L) or becquerels/L(Bq/L) What are the concentrations in mg/l of specialty additives (treatment chemicals) added to a typical well to enhance oil recovery that may become manifested in Produced Water? Was any modeling done to estimate environmental impact factors (EIF) for individual chemicals				
30.	2.7.5.1 Process Cooling (Pgs. 164)	What is the final discharge temperature for produced water likely to be? Express response in degree Celsius? What is the ambient temperature of seawater within the PDA during the day and during the night?	Design specifications for the cooling water and produced water discharges were not finalized at the time of the EIA; modeling was conducted based on the preliminary design, with a single discharge point for each discharge, and discharge temperatures of 50°C and 55°C for cooling water and produced water, respectively. Modeling for these configurations/temperatures showed that the temperature rise above ambient conditions drops to less than 3°C (5.4ºF) at less than 10 meters from the discharge points. Based on final design, the discharge configurations could differ from what was modeled (e.g., the cooling water discharge could be configured through several smaller-flowrate discharges), and discharge temperatures could be higher than the temperatures modeled. Prior modeling for other EEPGL development projects has shown adherence to the "less than 3oC temperature rise at 100 meters" standard for a range of discharge configurations and for higher temperatures. It is thus anticipated that the final designs for these discharges will demonstrate adherence to the thermal standard as well. This will be confirmed once the discharge designs are finalized. With respect to the ambient temperature of seawater in the PDA, Appendix C describes the analysis of ambient temperatures for the FPSO location conducted based on data available from the HYCOM model. A frequency distribution analysis was completed to evaluate the range of temperatures in the PDA and to develop exceedance percentages. Selected ambient temperatures consisted of two bounding cases (1 percent and 99 percent) and a typical case (50 percent). The cases are summarized as follows, in degrees Celsius (Table 3-1 in Appendix C):	Closed	N/A

32.	5.1 Area of Influence (Page 318)	There are three (3) Direct AOIs stated in the EIA document. The third AOI is defined as the City of Georgetown. It in my view would have made more sense to narrow it down to the areas which have the storage facilities, wharves, Shorebase facilities, waste treatment and disposal facilities etc are located. Impacts are likely in areas proximal to locations where these facilities are located	To clarify, Section 5.1 of the EIA states that there is a single Direct AOI, and the Direct AOI has three components: the Project Development Area (PDA), the marine and aviation transit corridors between the PDA and onshore activity centers in Guyana, and the City of Georgetown. Narrowing the third component to only the locations where Project activities will occur as suggested in the comment would constrain the analysis and ignore the effects of the Project on the larger community. Under the Environmental Protection Act, permitting of third-party onshore support facilities, including hazardous waste management facilities, is a separate process from the Yellowtail EIA and authorization process. **Certain socioeconomic effects assessed in Chapter 8 that will not be confined to an active Project facility (e.g., impacts on vehicular traffic) would be scoped out of the analysis if the boundaries of the AOI were to be confined to active Project facilities, so the Direct AOI was defined as including all of Georgetown in order to capture these effects in the analysis.**	Closed	N/A	
33.	**5.2.2 Assessment of Potential for Acoustic Impacts from Vessel Noise in Georgetown Harbour (Page 325)**	It would have been more useful for the assessment to focus on the impacts of marine vessel noise, specifically the cumulative effect of underwater acoustic noise from operational marine vessels offshore to be assessed for effects on marine life within the	The noise analysis in Section 5.2.2 of the EIA was included in response to a prior comment from the EPA regarding potential impacts on human receptors. **Analyses of acoustic impacts on marine receptors are included in EIA Sections 7.5.3 and 7.8.3. These analyses examined the impacts of several types of marine sound on marine mammals and fish, including vessel noise. The acoustic modeling analysis referenced in the EIA**	Closed	N/A	

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		Project Development Area (PDA)	**modeled up to eight vessels of various types operating within the PDA at once, to simulate installation of the FPSO with numerous support and installation vessels operating in close proximity to each other. The Consultants consider this scenario a reasonable upper bound for the cumulative effects of multiple sound sources operating simultaneously.**			
34.	**6.2.2.2 Characterizing Existing Conditions in the PDA (Underwater Sound) (Page 390)**	One major deficiency of this section of the EIA is its exclusive reliance on Literature Review, as opposed to a site-specific baseline assessment to characterize existing underwater sound levels within the Project Development Area.	As noted in the response to comment MNR-11, the noise modeling analysis referenced in the EIA considered up to eight vessels of various types operating within the PDA at once, in close proximity to each other within the model domain. It is highly unlikely that addition of an ambient sound level factor into the model in a portion of the ocean as remote as the Stabroek Block would increase sound exposure levels to the point that it would materially change the outcome of the modelling analysis.	Closed	N/A	
35.	**6.4.2 Existing Conditions – Marine Water Quality (page 428 – 444)**	The reviewer is of the view that the evaluation of the baseline marine environmental conditions of the area of potential impact from the planned activities should be conducted via desktop review and supplemented by field-based studies. From the information presented in the identified section of the EIA no field-based study was conducted within the project development area and if it was done it was too limited to arrive at a conclusion about conditions within the PDA. Instead, there has been heavy reliance on several dated studies from other areas within the Stabroek block to characterize conditions within the project development area.	The Consultants acknowledge that not all the EBS data referenced in the comment were taken from within the PDA, but as described in responses to previous comment on the adequacy of the environmental baseline in the EIA, multiple EBSs have been conducted in the Stabroek Block, and as depicted in Figure 7.9-1 the 2019 EBS included a sample along the northern boundary of the Yellowtail PDA. Marine water quality in the Stabroek Block (including but not limited to the Yellowtail PDA) are greatly impacted by the conditions within and oscillations of the Guiana Current, which controls marine conditions at a regional scale. Based on the amount of recent water quality data collected from the southern Stabroek Block and their proximity to the Yellowtail PDA, the spatial and temporal similarity in these data as summarized in Section 6.4.2.2 of the EIA, and the regional nature of the Guiana Current's influence, the Consultants consider the existing baseline data contained in the EIA sufficient to support a robust assessment of the Project's potential impacts on marine water quality, inform development of appropriate embedded controls and mitigation measures, and provide a reasonable basis for the EPA to make decisions regarding authorization of the Project. Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
	t Measures on Page 34 **Table 3.8-1: Environmental and Socioeconomic Monitoring Measures (Water Quality) on Pages 69 - 71**	Advances in Mitigation Technologies, has many constituents which are potentially toxic to the receiving environment. These include: inorganic salts, organic acids, hydrocarbons, metals, radioisotopes and even specialty additives (treatment chemicals) which will be added over time. The FPSO will be moored offshore Guyana for the productive life of the Yellowtail field and will discharge continuously over that timeframe produced water into the oceanic waters offshore Guyana for disposal. In my mind, given that produced water has other more toxic and harmful contaminants other than oil that may have adverse effects on the receiving environment, these elements have to be brought down to safe levels for discharge. Therefore, my question is what mitigative measures will be integrated into EEPGLs operations (by virtue of its inclusion in the ESMP) to monitor and to ensure that effluent discharges offshore meets safe levels of all chemical constituents (i.e.) Salts and Inorganic Ions, Total organic carbon, Organic acids, Petroleum Hydrocarbons, namely BTEX and Benzenes, Polycyclic Aromatic Hydrocarbons (PAH) and Phenols, Metals in dissolved and	against applicable criteria and taking action, as needed, based on these assessments.			

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		microparticulate forms, Naturally Occurring Radioactive Material (NORM) namely Radium 226 and Radium 228 and a number of specialty additives (treatment chemicals) injected into the reservior ?				
37.	*EIS-13* *EIS-41*	Will a separate Decommissioning Plan be produced for the EIA apart from what is currently included in the FDP? Expounding on damages that can be incurred on benthos? **Background/Rationale:** The lifespan of the project is approximately 20yrs. Oil equipment could be left underground after work is completed Subsea equipment (SURF) will be disconnected after it is flushed and prepared As such, can an estimate of potential mechanisms/ steps be identified to pinpoint how the aforementioned will be dealt with respectively? Feasibility study or estimated budget?	The Preliminary Decommissioning Plan is part of EIA Volume III. As stated in this document, several years prior to commencement of decommissioning), it is envisioned that this plan will be revised to cover the ultimate decommissioning of the facility in compliance with applicable laws and regulations in effect at that time, while also considering the technology and infrastructure available at that time. As explained in Section 7.9.5 of the EIA, for the purposes of the EIA, it was assumed that regardless of the proportion of SURF that would be abandoned in place, some elements of the SURF would remain on the seafloor, and that those elements remaining on the seafloor would represent a net increase in the amount of hard substrate available to benthos for colonization relative to baseline conditions, and that the net effect on benthos would therefore be positive relative to baseline conditions.	What about capped wells with potential for legacy leaks? How is this addressed?	As indicated in Section 8 of the Preliminary End of Operations Decommissioning Plan for Guyana Development Projects (included in Volume III of the EIA), the relevant Guyanese regulators would have access to the work site during the decommissioning activities to monitor and witness the final completion of the work. After the completion of well plugging and abandonment (P&A) and facilities decommissioning work, EEPGL would submit a final decommissioning report to the relevant Guyanese regulators that would include a description of the scope of work performed, work logs, final inspection reports, videos, and photos, as applicable. As described in the Preliminary End of Operations Decommissioning Plan for Guyana Development Projects, decommissioned wells will be plugged and abandoned such that the well is secured against future leaks. In the unlikely event that shortly after decommissioning a leak occurred indicating that the plugging and abandonment work was potentially defective, EEPGL would be responsible to address the leak and clean up the oil. Section 4.3 of the Preliminary End of Operations Decommissioning Plan for Guyana Development Projects has been updated to include this information.	Decom. Plan p. 9
38.	Sections 9-16 9-224	Amendments to the OSRP **Background/Rationale:** Given the lack of current baseline data relating to the marine environment in sight of new discoveries and the OSRP, it was observed that mostly references were made to spillages reaching the coast of Guyana.	In the unlikely oil spill event that would have transboundary impacts on the neighboring Caribbean countries, EEPGL would work through the Ministry of Foreign Affairs, at the direction of the Government of Guyana, to establish appropriate claims and/or livelihood remediation processes.	Why plans/actions taken to engage Ministry of Foreign Affairs to commence them?	An oil spill that crosses an international boundary would be by definition an international incident. As such, the response to such an incident would need to be guided by, and be consistent with, commitments made between governments. EEPGL would work through the proper channels (in this case, Guyana's Ministry of Foreign Affairs) to confirm that its response activities would be consistent with governmental communications between Guyana and neighboring countries.	N/A

<tr><td></td><td></td><td>However, based on the multiplicity of factors (viscosity, wind direction, current, containment etc.), should a spill affect our neighboring countries who will compensate the aggrieved stakeholders considering they are dependent on the tourism & fisheries sector?
Does the Polluter pay principle still apply?
Will aspects of the FUND agreement be utilized?</td><td></td><td></td><td></td><td></td></tr>
<tr><td>39.</td><td>Section 9-164</td><td>Containment of Hydrocarbons (General)

Background/Rationale:
The use of dispersants is outlined in all EIAs and the drafted Oil spill plan and this is understood. However, why is it allowed for Corexit- 9500 to be used as a potential dispersant when it was banned in the UK and Australia due to its potential to cause harm to the marine environment and workers.

Additionally, in-situ burning is a strategy to be used in the event of a spill. This particular aspect should be cause for concern since stochastic maps and the spill models clearly show oil will travel in a northerly direction (Amazon-Orinoco) AOI which is home to a plethora of ecology (threatened and endangered). So why is this being considered?</td><td>As informed through the Net Environmental Benefit Analysis, the use of dispersants and in-situ burning can help mitigate the impacts of spilled oil after evaluating the tradeoffs.

Corexit 9500 is approved for use in the UK and Australia.

United Kingdom
https://www.gov.uk/government/publications/approved-oil-spill-treatment-products/approved-oil-spill-treatment-products

<table><tr><th>Product name</th><th>Product nature and type (if valid)</th><th>Approved use</th></tr><tr><td>Corexit EC9500A</td><td>D – 2/3</td><td>Sea</td></tr><tr><td>Corexit EC9500B</td><td>D – 2/3</td><td>Sea</td></tr></table>

However, in reference to Corexit EC9527A, is not on the approved list in the UK and has a transitional acceptance in Australia. "Transitional acceptance applies to a limited list of dispersant products held in AMSA and AMOSC stockpiles as of 1 January 2012 that are deemed to be OSCA registered on the basis that they have met previous acceptance requirements. These may be made available and</td><td>Closed</td><td>N/A</td><td>N/A</td></tr>
</table>

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
			used for National Plan responses until used or disposed of." As for why Corexit EC9527 is not listed in the UK is two-fold. **First**, all products approved after 1 April 1996 *had* been required to pass both the Sea/Beach and Rocky Shore Toxicity Tests. Any products coming up for renewal that have only passed the Sea/Beach toxicity test in the past *were* required, before they can be renewed, to pass the Rocky Shore Test also. Corexit 9527 and 9500 were removed from the list on 30/07/1998. *However, as of 18 May 2010, existing stocks of Corexit 9527 and 9500 may still be used away from rocky shorelines in appropriate conditions. Approval should be sought from the relevant licensing authority before any proposed use*. Since their removal date, the guidance was adjusted and dispersants could be classified for use for sea, beach, and rocky shore or a combination. As identified in the table above, Corexit EC9500A/B has been re-listed in the UK. **Second**, following the Deepwater Horizon incident, the global response community aligned on three primary dispersants (Corexit EC9500A, Total OSR 52, Slickgone NS) for a Global Dispersant Stockpile to be available to Oil Spill Response Limited (OSRL) members (Dispersant Stockpiles (oilspillresponse.com). Orders for Corexit EC9527 are no longer favored as most would choose one of the dispersants listed in the GDS. Corexit 9527 continues to be listed on the United States Environmental Protection Agency – National Contingency Plan Product Schedule (December 2021) - https://www.epa.gov/emergency-response/ncp-product-schedule-products-available-use-oil-spills. Additional information on oil spill dispersant information for health professionals from the United States Center for Disease Control can be found here (Oil Spill Dispersant.pdf (cdc.gov). **Controlled in-situ burning of spilled oil** Prior to the use of in-situ burning, a determination will be made on the appropriateness of in-situ burning. It was not until Deepwater Horizon that ISB demonstrated its benefits to a response. As outlined in the following Good Practice Guide - Controlled in-situ burning of spilled oil | Ipieca, "ISB can rapidly reduce the volume of spilled oil, and thus greatly reduces the need to collect, store, transport and dispose of recovered oil. ISB can also shorten the overall response time, thus aiding environmental recovery." Human health and environmental			

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
			concerns will be considered and are integral to the decision making process.			
40.		NEBA for Yellowtail Project **Background/Rationale:** A NEBA for done for other developments in the Stabroek Block, especially Payara, however, one was not clearly defined for Yellowtail. Is this a study in the pipeline? If yes, when will it be available for disclosure?	Leveraging results from Net Environmental Benefit Analyses for selection of response technologies is vital to the response decision making process. Three (3) different scenarios were summarized in Appendix H – Oil Spill Scenarios and Net Environmental Benefit Analysis of Response Technologies. These scenarios were selected from the possible releases that represent the risk of spills from a project, and more accurately, the expanding operations in the Stabroek Block. These scenarios provide a range from a Tier III worse case discharge crude oil release of 202, 192 barrel per day to Tier II single release of 2,500 bbl of crude oil. **Scenario 1**: A Tier III worst case discharge (WCD) crude oil release from a loss of well control at a Payara well—202,192 barrels (bbl) per day (initial rate) for 30 days, for two seasons (Maximum WCD per US GoM practice). **Scenario 2**: A Tier III WCD crude oil release from a loss of well control at a Payara well—20,000 barrels (bbl) per day for 30 days, for two seasons (Most Credible WCD). **Scenario 3**: A Tier II crude release at the FPSO resulting from a loading hose malfunction—2,500 bbl, for two seasons Most importantly, in the event of a release, EEPGL and ExxonMobil technical experts will complete a revised NEBA in real time predicated on the current metocean conditions, location and nature of the release for review and discussion with the Guyana EPA and Civil Defense Commission (CDC) as soon as practical.	Closed	N/A	N/A
41.	Section 9.24	Socioeconomic Studies of Transboundary Impacts **Background/Rationale:** Apart from identifying the countries that may be affected, it was not clearly defined that any joint studies were done with these countries in the event of economic losses…refer to Item 3.1.2.	The Consultants acknowledge that there were no socioeconomic studies performed in other countries that could be affected by a transboundary oil spill event. An extensive coastal sensitivity mapping exercise was carried out for a previous offshore development EIA, and the baseline information on coastal sensitivities in Section 9.24 of the EIA draws on these geospatial data as well as more recent updates gathered through a desktop literature search conducted for this project. These data included information of economic significance, including fishing areas and centers of tourism activity. This level of detail on transboundary baseline conditions is commensurate with prior oil and gas development	Closed	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		This is our legal obligation for safeguarding and security purposes should a lawsuit be filed in event of pollution.	EIAs in Guyana and consistent with the requirements of the Terms and Scope for the Yellowtail Development Project.			
42.		Compensation/ Insurance Coverage (Not clearly defined apart from other EIAs for the Stabroek Block) **Background/Rationale:** Has there been any changed with respect to compensation to stakeholders through the parent company, or is Exxon still stating that the subsidiaries will bear the cost of oil spills and related environmental disasters? Will this be amended in the EIA?	The Stabroek Block co-venturers' first priority is to put in place mitigations and processes that prevent adverse events. In the unlikely case of an adverse event, the co-venturers would immediately minimize and rectify any impacts. The co-venturers have the financial capacity to meet the responsibilities for an event including obligations under Guyanese law and the respective petroleum agreements. Regarding insurance, the Stabroek Block co-venturers have secured comprehensive insurance for petroleum activities as required by environmental permits. Under the existing legal framework and agreements with the government, there are extensive assurances of EEPGL's and co-venturers' commitments, including environmental protection measures to respond to operational incidents. The Government of Guyana has multiple mechanisms in place, including the Stabroek Block Petroleum Agreement and the environmental permits, to ensure that the companies would take responsibility for any adverse events. Joint insurance coverage is obtained in the name of EEPGL and the other Stabroek block co-venturers for the appropriate lines of coverage, depending on the project and scope of work. Specifically for the Yellowtail Project, should the Yellowtail Project receive necessary approvals, the co-venturers would have insurance coverage including Third Party Liability and the cost of regaining control of a well.	Closed	N/A	N/A
43.	**Stakeholder Engagement Strategy and Planning – 4.7**	The stakeholder engagement strategy was deficient and not comprehensively aligned with the framework provided in the terms and scope for Yellowtail development project. The following gaps were identified:	The Consultants believe that the planning, approach, and execution of the stakeholder engagement strategy were aligned with the framework provided in the terms and scope for the Yellowtail Project. Detailed responses are provided below.	Response is noted	N/A	N/A
44.	**SEP-1**	Summary of previous stakeholder activities – this component of the EIA did not specifically identify details of previous engagements, specifically how the concerns raised by previous are being addressed through a	EIA Section 4.7 provides a summary of Stakeholder engagement activities conducted for the Yellowtail Project EIA, including public engagement meetings during Scoping and EIA disclosure, as well as engagement with community- and organization-level engagements that supported baseline research and EIA development.	Please note that disclosures are separate from the consultation process required in the Terms and Scope.	The comment is acknowledged. In addition to the information provided in Section 4.7, the SEP included in Volume III of the EIA includes an overview of previous engagement activities as well as a detailed synopsis of those activities in Attachment A. Section 4 of the SEP includes dates, times, and locations of previous engagements.	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		grievance redress mechanism. Evidence should be provided relative to dates, times, locations etc.	Concerns raised through EIA engagements were not addressed through EEPGL's grievance redress mechanism; rather, these concerns related to the EIA, supporting studies, and proposed management measures, and as such were addressed by the Consultants through the EIA comment-and-response process. The dates, locations, and times of the public Scoping and Disclosure meetings (in May/June 2021 and Oct/Nov 2021, respectively) are included in EIA Section 4.7. In the course of other engagements, the Consultants documented the means of communication, location (including virtual meetings), dates and times, attendance, summary of discussion, issues raised, and action items. In respect of the privacy of participating individuals, this information is not included in the EIA. However, the outcomes of these engagements are summarized in Section 4.7.3.2, including discussion topics and concerns. These engagements occurred in August and September 2021, and the engagement plans were shared with the EPA in advance of these activities.			
45.	**SEP-2**	The EIA states there is an email, telephone number and regular communication on social media, this is not adequate for come vulnerable groups, especially indigenous communities. What systems are in placed to address stakeholder matters in an efficient and systematic manner?	As described in EIA Section 4.7.1, consultation or dialogue activities involve a two-way flow or exchange of information between stakeholders and EEPGL or the Consultants. Consultation activities for the Yellowtail Project have included one-on-one and small-group meetings, public meetings including question and answer sessions, in addition to the telephone, email, online, and social media communications. EEPGL and the Consultants recognize the challenges of online/phone communications in rural areas, including but not limited to indigenous communities. Therefore, efforts were made to disseminate information in a variety of ways, including but not limited to distribution of flyers, howlers announcing local meetings/engagement opportunities, and communication via local representatives. In addition, EEPGL regularly visits and engages with communities in Regions 1 to 6 through ongoing outreach and engagement programs, community investment initiatives, the Participatory Fishing Study, and other programs.	Response is noted	N/A	N/A
46.	**SEP-3**	Identification of stakeholders – The EIA lacked the model/models utilized to profile and map stakeholders who will be directly or indirectly impacted by the project.	EIA Volume III SEP Section 3.2 describes Stakeholder Identification Methodology, which includes the model used to map stakeholders based on the anticipated impact and influence (in accordance with recognized good practice for stakeholder engagement, including guidance from the World Bank and IFC).	Response is noted	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
		Further, there is no evidence of considerations made for profiling such as capacity to engage, cultural context, level of influence etc.	In respect of the privacy of participating individuals, the details of this process and results are not included in the EIA. However, the Consultants shared this information with the EPA in July 2021 as part of the stakeholder engagement plan supporting the EIA development. As noted in Appendix 3 of the Terms and Scope, this information was to be shared with the EPA, and was not required to be included in the EIA.			
47.	**SEP-4**	While indigenous communities, women and fisher folks were mentioned as vulnerable groups, the EIA was not explicit in how project risks and benefits will be distributed among stakeholders.	The text referenced in the comment refers to how the identification of stakeholders—and development and implementation of engagement plans—should consider potentially vulnerable groups and seek to understand how risks and benefits may be distributed. This was a focus of engagement activities during EIA development, including engagement with community-level stakeholders in Regions 1 to 6 (as summarized in EIA Chapter 4, Table 4.7-6). Among other things, the Consultants sought to understand how factors such as the COVID pandemic, recent flooding, and ongoing offshore activities have affected wellbeing and vulnerability in all coastal regions. The EIA explicitly recognizes potentially vulnerable populations, and how impacts may differ for these groups, in the relevant sections of the EIA. For example, the assessment provided in Section 8.1.3 recognizes that individuals of lower socio-economic standing may be more vulnerable to economic changes. Accordingly, the assessment concluded that this impact would be of greater significance for this vulnerable group, as compared to the general population.	Response is noted	N/A	N/A
48.	**SEP-5**	Many of the categories of stakeholder identified in the terms and scope were not captured in the EIA such as Transport and Habours department, Pesticide and Toxic Chemical Board, the Guyana Defence Force etc.; Seawalls and Beyond and other environmental groups; some categories of stakeholders under the private sector, academic institutions, professional, business and workers associations and the media.	The stakeholder categories identified in Appendix 3 of the Terms and Scope formed the basis for the Yellowtail Project engagement program. Categories include regulatory/government organizations; community groups; vulnerable groups; NGOs; private sector; and others. Specific stakeholders listed in this section of the terms and scope are clearly noted to be examples within each category, for reference. All stakeholder categories were considered in the engagement planning for the EIA, although not all of them are explicitly mentioned in the EIA or the ultimate subject of outreach. Stakeholders were considered with respect to potential impact, influence, and interest in the Project. This mapping informed the identification of stakeholders for engagement during EIA development, as well as ongoing engagement, communication, and outreach efforts for the	Response is noted	N/A	N/A

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
			Yellowtail Project and EEPGL's ongoing activities in Guyana.			
49.	**SEP-6**	For the stakeholder mentioned in the EIA, the methods consultation needs to be validated as the appropriate method for the target audience.	The methods of consultation and engagement are summarized in the SEP (EIA Volume III: Attachment A – Synopsis of Previous Stakeholder Engagement Activities). Methods have been determined based on the engagement objective and stakeholder participants (as well as access to various engagement fora/methods). Importantly, methods of engagement for the Yellowtail EIA considered public health risks and restrictions related to the global COVID-19 pandemic. Scoping meetings included virtual meetings, as well as in-person meetings in Regions 1, 4 and 6. Disclosure meetings included in-person meetings in Regions 1 through 6, plus a virtual meeting to accommodate the then existing circumstances associated with the pandemic. For the EIA development including engagement to support baseline research, many engagements were held by phone or videoconference, where these services were accessible to stakeholders and in consultation with stakeholders to determine the preferred format. In-person meetings/interviews were accommodated in many cases, particularly for community-level stakeholders including NDCs and CDCs. The Consultants worked with participating stakeholders to determine the appropriate method for the target audience.	Response is noted	N/A	N/A
50.	**SEP-7**	Documentation of consultation activities – this Apart from the scoping and disclosure meetings schedules, the schedule for consultation during the conduct of the EIA as well as the evidence of consultation such as minutes, registration forms etc. are missing.	The Terms and Scope requires that public consultation results be documented and relevant records included in the EIA (or appendices). Public consultation activities comprise the scoping and disclosure meetings, for which the meeting schedules, supporting materials, and outputs (comment/response records) are described in EIA Section 4.7, the SEP (EIA Volume III), and Appendix U (Stakeholder Comments). The Consultants conducted other engagements in the course of baseline studies and EIA development. These engagements occurred in August and September 2021, and summaries of stakeholders engaged, and issues raised, are provided in Section 4.7 and the SEP. In respect of the privacy of participating individuals, the details of specific interviews or meeting minutes are not included in the EIA, although relevant information is incorporated in the relevant sections of the EIA and cited accordingly.	Evidence of the specifics on consultations during the conduct of the EIA is still missing. Meeting registrations forms, notes on the persons who were in attendance.	Detailed records of consultation made during the development of the EIA have been provided in Appendix W of the EIA. Together with the stakeholder consultation process and summaries provided in Chapter 4 and the attached SEP and SEP Attachment A, these records include the manner in which the public was notified, the groups targeted, a description of the stakeholder consultation process, listing of all stakeholder groups included in the process, the number of meetings held, location of the meetings, dates held, and minutes of all meetings. Personal information including specific names of participants have been withheld to respect the privacy of those involved. No surveys were performed.	Appendix W (new)

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
51.	**SEP-8**	Grievance Redress Mechanism – The Grievance Redress mechanism needs to be more explicit and capture the tenets of a Grievance Redress Mechanism in keeping with international best practices. The existing Community Grievance Mechanism should be elaborated to provide evidence of status and trends in accordance with the terms and scope and how this system will be enhanced for Yellowtail Development Project?	EEPGL's Community Grievance Mechanism (CGM) is an integral part of the Company's stakeholder engagement program. The CGM is referenced in Section 3.3.2 of EEPGL's Stakeholder Engagement Plan for Guyana Operations (included in Volume III of the Yellowtail EIA), and Project-specific detail is provided in the ESMP (also included in Volume II of the Yellowtail EIA). An important element of any grievance mechanism is to incorporate local input into the nature and design of the mechanism. Accordingly, EEPGL's CGM has evolved over recent years, as it has been publicly disclosed and subject to comments for the Yellowtail EIA and earlier EIAs (Payara, Liza Phase 2 and Liza Phase 1), and has been iteratively updated to reflect this input. Grievances are tracked, monitored, and reported via EEPGL's internal ESMS and compliance systems to ensure follow-up. These systems allow for an analysis of trends in stakeholder interest and concern, which help EEPGL design further engagement programs and activities. As described in the CGM, potential grievances can be communicated to EEPGL through various means of communication, including phone, email, and in-person. The CGM applies to communications that occur directly with EEPGL, as well as via contractors or government agencies. EEPGL also tracks concerns and issues that are raised through Facebook and other social media outlets, so that relevant issues can be registered and addressed via the CGM.	Response is noted	N/A	N/A
52.	**SEP-9**	Monitoring and reporting – The EIA states there is ongoing consultations, however it doesn't provide evidence of an integrated system for monitoring and reporting throughout the life of the project. What are systems to address the high impact, high influence groups of stakeholders for example?	EEPGL has a program of ongoing stakeholder engagement and community outreach in Regions 1 through 6, and is regularly in touch with stakeholders to provide updates about projects, offshore activities, community investment initiatives, and other matters. Documentation of stakeholder engagement activities, and related monitoring, evaluation and reporting is managed through EEPGL's environmental and social management system (ESMS). This system provides for the consistent and centralized documentation of records , integrated within EEPGL's management systems, and verifies that follow-up actions are assigned and completed. Engagement planning efforts include targeted engagement and participatory opportunities to address high impact / high influence stakeholder groups. For example, recognizing the importance of	Justifications provided must be included in the Revised ESIA.	This information has been added to Section 4.7.1 of the EIA.	pp. 4-8 to 4-9

Item #	Issue/Gap	Review Finding	Consultants' Comments / Response	EPA Response	Consultant Response	Page Numbers with EIA Edits
			fishing livelihoods and communities, EEPGL supports the Participatory Fishing Study (PFS), which began in 2019 and is ongoing. The PFS involves local fisherfolk (a high priority stakeholder group) in Regions 1 through 6, including representatives at landing sites along the coast, and on-board fishing vessels, to monitor changes in fish catch and fishing effort. Engagement that occurs through the PFS (and other engagement programs targeted at high impact/high priority stakeholders) is tracked through the ESMS, as for other engagements. Issues and concerns raised by these groups are tracked, responses are provided, and follow-up actions are verified through this centralized, integrated management system.			

Table 3: Items for inclusion in the Revised ESIA (25 February 2022)

Topic	Updates to Revised EIA	Consultants' Responses	Page Numbers with EIA Edits
Oil Spill Response	• Net Environmental Benefit analysis scenario to be corrected to include Yellowtail "Most Credible" WCD 88,728bpd • Include First Response Toolkit in all appropriate sections • Ensure risk assessment includes increased risk of multiple events • Sufficient dispersant required in Guyana for surface spraying Day 1 and sub surface injector Day 2.	• The Net Environmental Benefit Analysis component of the OSRP has been updated to clarify that the example prepared for the Payara Project is representative for an FPSO project and results would be consistent with other FPSO projects, including Yellowtail. Additionally, the OSRP has been updated to reflect that in 2022, EEPGL will be conducting a qualitative NEBA process to better inform initial decision-making and response planning. • Table 6-8, summarizing the First Response Toolkit, has been added to the OSRP. • An assessment of the frequency of oil spill scenarios, based on global experience in the industry, will be prepared in 2022. • As summarized in Section 5.7 of the OSRP, vessel-mounted systems are available to begin to apply dispersant on the surface once the EPA concurs to their use. If the release is subsea, there are adequate resources in-country (see Table 6-7: Oil Spill Dispersant (Guyana)) to begin application at the wellhead. The dispersant in-country would be complemented with the cascading of dispersants from the Global Dispersant Stockpile (Table 6-13) which would start to arrive on Day 2.	• OSRP p. 272 • OSRP pp. 58-61 • N/A • OSRP pp. 57, 68
Produced Water	• Reinjection analysis for Yellowtail to be strengthened to give emphasis on the environmental benefits of reinjection.	Please see response to Comment #9 in Table 2.	N/A

APPENDIX V

Commitment Register

-Page Intentionally Left Blank-

EIS Chapter	Commitment
Chapter 2	Target an initial local content (Guyanese workforce) of 25 percent and increase to approximately 75 percent by the end of 8 years of operation. Partner with select local institutions and agencies to support workforce development programs targeted to in-demand skillsets, and proactively message Project-related employment opportunities.
Chapters 2, 6, 9 and 13	Use a portion of the associated gas produced from the reservoir onboard the FPSO as fuel gas, with the remaining balance—excluding other *de minimis* sources not captured by the Vapor Recovery Unit (VRU)—re-injected back into the reservoir via the gas re-injection wells.
Chapters 2 and 9	Implement the following key aspects of well control during the Project drilling campaign: • Design wells and drilling procedures based on site-specific data and integrated pore pressure prediction; • Plan fluid densities to control reservoir pressure; • Install a blowout preventer (BOP) system that can be closed rapidly in the event of an uncontrolled influx of formation fluids and that allows the well to be circulated to safety by venting the gas at surface and routing oil so that it may be contained; • Test BOP equipment at installation, after disconnection or repair of any pressure containment seal, and at regular intervals (at least every 21 days or as operations allow); • Specialize training, equipment, and procedures that meet or exceed regulatory requirements; and • Install redundant well-flow monitoring devices and implement strict well-monitoring practices to maximize the likelihood of detecting and shutting in a hydrocarbon influx prior to surface release.
Chapter 2	Perform drilling using an overbalanced drilling fluid weight[1] to control the well.
Chapter 2	Monitor and control the subsea system from the FPSO, using a control system connected to the FPSO through umbilicals that also supply power, hydraulic fluid, and chemicals to the subsea manifolds and wellhead trees[2]. The hydraulic fluid for operating the subsea control system will be a low-toxicity, water-soluble hydraulic fluid. Design the SURF system to withstand the full shut-in pressure from the production wells, and the gas re-injection / water injection components to withstand the highest required injection pressures. Provide overpressure protection on the FPSO, in accordance with good international oilfield practice, to protect the subsea systems.
Chapters 2, 6, 7 and 13	Treat produced water onboard the FPSO to an acceptable specification prior to discharging. Measure oil and grease content of produced water (grab sample once per day). Limit oil content of discharged produced water to 42 milligrams per liter (mg/L) on a daily basis or 29 mg/L on a monthly average. If oil content of produced water is observed to exceed these limits, route it to an appropriate storage tank on the FPSO until the treatment system is restored and the discharge meets the noted specification.
Chapter 2	Utilize the slop system for treating slop water (via heat-assisted two-stage gravitational separation) such that the overboard discharge will not exceed 15 parts per million (ppm) oil content. Continuously monitor the oil content in the slop tank with a dedicated meter.
Chapters 2 and 6	Fit each cargo oil tank with a stripping eductor. Use water from the slop tanks to drive the stripping eductors and strip the cargo tanks below 100 millimeters (4 inches) to prepare the cargo tank for entry. Route back the resulting oily water mixture from the

[1] In overbalanced drilling, the pressure exerted by the drilling fluid column exceeds formation pressure, preventing formation fluids from entering the well.

[2] Assembly of valves, spools, pressure gauges, and chokes fitted to the wellhead of a completed well to control production

EIS Chapter	Commitment
	bottom of the tank to the slop tanks for treatment and discharge, in accordance with slop water discharge specification (less than 15 ppm oil-in-water content).
Chapters 2 and 7	Before discharge, treat the aqueous streams resulting from the crude desalting process and combined with produced water and discharge overboard, to a discharge specification of less than 42 mg/L oil-in–water content.
Chapters 2, 7 and 13	Prior to discharge and disposal of bilge water, send bilge water to the bilge water separator unit for oil/water separation, with separated water (meeting the specification of less than 15 ppm oil-in-water content) discharged overboard and separated oil sent to the oily bilge tank. Pump the oil and sludge from the oily bilge tank to an International Maritime Organization (IMO) shore connection, where it can be discharged to a tote tank or to an offshore support vessel for onshore disposal.
Chapters 2, 6, 7 and 13	Discharge treated black water overboard (with a total residual chlorine concentration as low as practical, but not less than 1 ppm). Combine grey water discharges from all sources (except for food waste from the galley macerator) and dose with chlorine automatically via the chlorine dosing system, just before entering the grey water treatment tank, from which the tank contents will be discharged overboard. Monitor residual chlorine concentration of sewage discharges from the FPSO monthly to stay below 0.5 mg/L in accordance with MARPOL 73/78 regulations. Treat food waste in accordance with MARPOL 73/78 (e.g., food comminuted to 25-millimeter-diameter [approximately 1-inch-diameter] particle size or less) prior to discharge.
Chapter 2	Separate flushed solids from well de-sanding using a hydrocyclone/accumulator skid and transfer into sand-bagging tanks for later onshore treatment and disposal.
Chapters 2, 6 and 13	Utilize a vapor recovery unit for low-flow process streams from produced water and triethylene glycol regeneration.
Chapter 2	Use a dedicated online oil content analyzer at each Induced Gas Flotation Unit that provides continuous oil content monitoring for the treated produced water stream. The control system will automatically route water to the off-spec tank if an oil content of 42 mg/L is exceeded. From the off-spec tank, return the produced water to the topsides Induced Gas Flotation Unit for further treatment. In the event of unavailability of the off-spec tank, transfer the produced water to slop tanks. If the produced water is routed to the slop tanks, any overboard water discharge from the slop tanks should not exceed 15 ppm oil content.
Chapter 2	Prior to overboard discharge, pass slop water from Slop Tank (SB) through an oil content monitoring (OCM) package for automatic monitoring of oil-in-water content. In the event that the OCM package detects an oil-in-water content above 15 ppm, the overboard discharge line will close and the recirculation line will open automatically; the off-specification slop water will then be recirculated back to Slop Tank (PS) via the hazardous open drain header.
Chapters 2 and 7	Prior to overboard discharge, send the bilge water from the bilge holding tank to the bilge water separator unit for oil/water separation, with separated water (with low oil-in-water content) passing through an OCM package for automatic monitoring of oil-in-water content. In the event that the OCM package detects an oil-in-water content above 15 ppm, the overboard discharge line will close and the recirculation line will open automatically; the off-specification bilge water will then be recirculated to the Bilge Holding Tank.
Chapter 2	In an upset condition, send all sewage overflows from the affected sewage collection points (STP, grey water treatment tank, and/or grease trap/separator) to the oily bilge tank for collection and ultimate transfer to a supply vessel for eventual onshore disposal.

EIS Chapter	Commitment
Chapter 2	In the unlikely event that concentrations of H_2S increase to a level that could represent potential health or safety concerns for the Project's offshore workforce, implement additional management measures as appropriate (e.g., training programs [initial and annual refresher], personal protective equipment (PPE), response planning, and equipment for leak detection and alarms).
Chapters 2, 7, 8 and 9	Advise the Maritime Administration Department (MARAD) of the locations of drill ships during the drilling of development wells and the performance of well workovers in the Project Development Area (PDA), so that mariners can be made aware of these activities. Establish marine safety exclusion zones with a 500-meter (1,640-foot) radius around drill ships during drilling operations and around drill centers during well workovers, as well as around major installation vessels, in accordance with good international oilfield practice.
Chapter 2	Obtain authorizations for major in-water activities from MARAD and notify mariners for all marine vessels, including the FPSO, supply and support vessels, tugs, and those vessels to be used during the installation, hook-up, and commissioning stage.
Chapters 2, 8 and 9	Establish a 2-nautical mile-radius (2.7-kilometer-radius) marine safety exclusion zone centered on the FPSO during offloading activities, where marine support and tanker offloading will occur. No unauthorized vessels will be allowed to enter this approximately 4,310-hectare (10,650-acre) operational marine safety exclusion zone during offloading activities.
Chapters 2 and 10	Optimize and share logistical support among Liza Phase 1, Liza Phase 2, Payara, and Yellowtail, as well as exploration drilling operations.
Chapter 2	Ensure any incinerator employed for use offshore has an IMO-type approval certification consistent with IMO and MARPOL 73/78 requirements for shipboard incinerators.
Chapters 2 and 8	Manage all waste streams for the Project in accordance with a Comprehensive Waste Management Plan (CWMP) used for the management of all EEPGL waste.
Chapter 2	Near the time of decommissioning, develop a more detailed decommissioning plan, in consultation with the appropriate Guyanese regulators.
Chapter 2	As part of the decommissioning planning process, perform comparative assessments of decommissioning options for the various facilities components, as described in Annex A of *Offshore Oil and Gas Decommissioning Guidance Notes* (OPRED 2018).
Chapter 2	During decommissioning, plug and abandon (P&A) development wells permanently.
Chapter 2	During decommissioning, disconnect the FPSO from its mooring system, remove it from the production location, and tow it to a new location for reuse or decommissioning.
Chapter 2	Employ a chemical selection process that includes the following components: • Specify in contracts that offshore chemical supply contractors shall protect the health and safety of people and the environment; • Specify that contractors shall perform services in compliance with applicable laws and EEPGL health and safety policies; and • Work with established chemical suppliers
Chapters 2 and 8	Reuse, recycle, or dispose of unused or used and recovered chemicals in accordance with applicable regulations and good international oilfield practice. Avoid, reduce, and reuse/recycle wastes preferentially prior to disposal in accordance with the waste management hierarchy.
Chapters 2 and 9	Store all chemicals—either at shorebases, at contractor facilities, or on the drill ships or FPSO—in appropriate storage containers with either secondary containment or appropriate drainage control.

<table>
<tr><th>EIS Chapter</th><th>Commitment</th></tr>
<tr><td>Chapters 2, 7 and 13</td><td>Equip all project vessels to comply with the water pollution control standards required by the International Maritime Organization and International Convention for the Prevention of Pollution by Ships, 1973, as modified by the Protocol of 1978 (MARPOL 73/78). For all vessel effluent discharges (e.g., storage displacement water, ballast water, bilge water, deck drainage), comply with MARPOL 73/78 requirements.</td></tr>
<tr><td>Chapter 2</td><td>For any equipment containing naturally occurring radioactive material (NORM) or radiography sources, ensure the equipment is registered, strictly tracked, controlled, and returned to the vendor at the end of its use or if it must be replaced at any time.</td></tr>
<tr><td>Chapter 2</td><td>Employ a Radiation Management System that addresses NORM.</td></tr>
<tr><td>Chapter 2</td><td>Apply standard industry health controls to manage occupational health risks associated with radiation.</td></tr>
<tr><td>Chapter 2</td><td>Incorporate the following controls to further reduce risk associated with tandem offloading:

<table><tr><th>Parameter</th><th>Yellowtail FPSO</th></tr><tr><td>Number of tugs</td><td>3</td></tr><tr><td>Holdback tug bollard pull capacity (ton)</td><td>120</td></tr><tr><td>Separation distance from FPSO (meters)</td><td>120</td></tr><tr><td>FPSO onboard metocean station</td><td>Yes</td></tr></table></td></tr>
<tr><td>Chapters 2, 6, 7 and 9</td><td>With respect to development well drilling:

1. Use water-based drilling fluids (WBDF) to the extent reasonably practicable (for drilling of initial open-hole well sections);
2. Visually check and take appropriate measures to mitigate occurrence of free oil resulting from discharge of NADF drill cuttings;
3. Prohibit the discharge of cuttings generated using drilling fluids that contain conventional mineral oil, except when the mineral oil is used as a carrier fluid (transporter fluid), lubricity additive, or pill;
4. Prohibit the discharge of drilling fluids that contain used/waste engine oil, cooling oil, gear oil or lubricant, and which have previously been used for purposes other than borehole lubrication;
5. Prohibit use of fluids that contain diesel as the principal component of the drilling mud liquid phase; and
6. For well sections requiring NADF, use only low-toxicity IOGP Group III base fluid and manage in accordance with the associated safety data sheet.
7. Use solids control and cuttings dryer systems to treat cuttings such that end-of-well maximum-weighted mass ratio averaged over all well sections drilled using non-aqueous fluids shall not exceed 6.9 percent wet weight base fluid retained on cuttings.</td></tr>
<tr><td>Chapter 2</td><td>Control fugitive emissions from the injection compressors by implementing a leak detection and repair (LDAR) program that regularly monitors to detect leaks, and repairs any leaks identified within a defined time period.</td></tr>
<tr><td>Chapters 2, 6 and 13</td><td>Use aero-derivative turbines instead of industrial turbines due to the higher efficiency resulting in a reduction in fuel consumption.</td></tr>
</table>

EIS Chapter	Commitment
Chapter 2	Include a spare generator for the FPSO power generation system to improve reliability of the system and reduce upset time.
Chapter 2	Implement an integrated audit program by combining resources with the contractors and participating in their respective audit programs.
Chapters 6 and 13	Develop a flaring minimization plan to document the design measures and operational practices that minimize flaring during Project FPSO operations.
Chapter 6	Use a computerized maintenance management system and a facility integrity management system on the FPSO to schedule efficient use of maintenance time so that the proper equipment inventory is maintained.
Chapter 6	Follow specifically developed procedures for starting up and shutting down equipment to minimize flaring emissions.
Chapter 6	Prior to any major maintenance event, develop a specific plan in advance that includes a review of potential flaring and evaluation of possible mitigations to minimize any flaring.
Chapter 6	Review the annually quantified GHG emissions and establish plans to achieve continuous improvement as part of an annual planning process.
Chapter 6	Provide workers with appropriate personal protective equipment, including ear protection (when engineered controls must be augmented to manage sound exposure).
Chapters 6, 7, and 13	Following start-up of production operations, implement a program to characterize effluent water discharges from the FPSO and conduct an environmental risk assessment based on the characterization data. As appropriate based on the results of the environmental risk assessment, implement additional treatment options, if warranted and feasible
Chapter 7	Direct lighting on the FPSO and major vessels, where practicable, to required operational areas rather than at the sea surface or skyward. Adhere to maritime safety regulations/standards for lighting on vessels.
Chapter 7	As the Project is located in deeper water, utilize suction piles, a low-noise alternative, instead of impact pile driving.
Chapters 6 and 7	Implement the following controls for underwater sound management: • Gradually increase the intensity of seismic impulses to allow sensitive species to vacate the area before injury occurs (i.e., soft starts), use PSOs during VSP, and implement other measures recommended by the Joint Nature Conservation Committee guidelines (JNCC 2017), as applicable; and • Maintain equipment, marine vessels, and helicopters in good working order and operate them in accordance with manufacturers' guidance and/or Company and Operator best practices, as applicable, to limit sound levels to the extent reasonably practicable.
Chapter 7	Treat permitted discharges of waste streams and effluent discharges to the sea (as needed) in accordance with industry guidelines and good international oilfield practice.
Chapter 7	Use existing shorebase support facilities for onshore infrastructure operations of the Project.
Chapter 7	Use Marine Mammal Observers (MMOs) and soft-start procedures for vertical seismic profiles (VSPs) in accordance with Joint Nature Conservation Committee (JNCC 2017) guidelines and soft starts for any pile driving.
Chapters 7 and 13	Provide screening for seawater intakes to avoid entrainment and impingement of marine flora and fauna.
Chapter 7	Conduct exchanges of the FPSO's ballast water while en route to the PDA to reduce the potential impact of invasive species introduction.

EIS Chapter	Commitment
Chapter 7	Conduct ballast water discharges in accordance with internationally recognized standards and in compliance with IMO requirements[3].
Chapter 8	Implement EEPGL's Operations Integrity Management System to protect the Project workforce from occupational hazards.
Chapter 8	Provide medical facilities and onboard medical professionals on the FPSO and major installation vessels to treat minor medical issues.
Chapter 8	Continue disclosure of Project-related activities, as well as continuous engagement with the fishing community and targeted engagement with certain vulnerable populations including those coastal communities in Region 1.
Chapter 8	Only contractors that are appropriately licensed by the EPA and have been assessed by EEPGL as being of a sufficient standard should be used to treat the Project's wastes.
Chapter 8	Dispose ash from the incineration of waste, residual solid waste from treated hazardous solid wastes, and general non-hazardous wastes to a landfill that has been appropriately licensed by the EPA and assessed by EEPGL as being of a sufficient standard.
Chapter 8	Manage specific wastes that can be recycled locally, such as scrap metal and electronic waste, using approved local recyclers.
Chapter 9	To reduce the possibility and consequence of fuel release, EEPGL or the operators involved in offshore bunkering operations should implement a series of fire prevention controls (design-based and operations) in alignment with good international oilfield practice. Design multiple automated safety features into drill ships and offshore supply vessels to minimize the risk of such releases (e.g., automated shut-off valves, alarms, etc.) as well as train operations and maintenance crews. Additionally, all Project vessels should have robust emergency response plans to direct activities in the event that a leak is detected.
Chapters 9 and 13	Employ a dedicated Mooring Master to supervise offloading activities, according to the conditions of the sea. The conditions and characteristics of the export tankers will be assessed by the Mooring Master and reported to the Offshore Field Manager prior to commencing offloading operations. Use only properly registered and well-maintained double-hull vessels.
Chapter 9	Offloading should only occur when weather and sea conditions allow for safe operations. If the environmental conditions prior to the tanker approaching the FPSO are not suitable, the tanker should stand by at a safe distance until conditions are within acceptable limits. If unexpected adverse weather (e.g., a squall) occurs during offloading, the offloading operations should be stopped and the tanker disconnected and moved away from the FPSO until conditions are within approved, safe limits.
Chapter 9	Implement comprehensive contractor selection guidelines to ensure contractors are qualified and have robust safety, health, and environmental management systems. Provide active oversight over contractors to verify that they are complying with EEPGL's requirements. Contractors should be required to regularly inspect their vessels, which addresses marine safety and maintenance considerations and reduces the risk of a vessel losing power or steering capability. In addition, vessels operating within the Georgetown Harbour or other coastal areas should be required to adhere to speed restrictions and navigation aids.

[3] This conclusion is based on an assumption that export tankers will comply with applicable IMO requirements; however, EEPGL will have no role in enforcing compliance with these requirements.

EIS Chapter	Commitment
Chapter 9	Utilize Simultaneous Operations procedures to safely manage Project marine vessels performing work in the same vicinity of each other, which will include considerations for avoiding vessel collisions.
Chapter 9	Marine vessels should have industry-proven station-keeping systems (e.g., FPSO mooring system, dynamic position systems on drill ships) to maintain stations in the offshore environment.
Chapter 9	Follow the following measures to prevent hydraulic oil releases: • Use equipment only within the specified weather limitations (required sea states); • Use hoses wrapped in anti-chafe spiral wrap when configurations allow; • Design equipment with monitoring systems with the capability of stopping and isolating a release within minutes; • Conduct pre- and post-dive checks with visual inspections; • Maintain continued focus on any components under pressure during each pre-deployment check to verify the integrity of all hydraulic systems and associated hosing/connections; • Conduct preventive maintenance and proactive replacement of hoses in advance of manufacturer's recommended practices due to the depths and harsh conditions in which such equipment is operated; • Train crews, which includes hazard identification and a focus on spill prevention; and • Use environmentally friendly, highly refined mineral oil–based hydraulic fluids.
Chapter 9	In the event of a spill, prioritize the mobilization of emergency response resources (personnel and equipment) to those areas most sensitive to a spill.
Chapters 6, 7 and 9	Implement the following measures to avoid a spill associated with FPSO offloading: • FPSO and tanker collision avoidance controls (as described in Section 9.1.1.3 of the EIA, Offshore Collision between FPSO and Offloading Tanker); • Use of a certified engineered floating hose system; • Floating hose damage protection controls; • Use of emergency disconnect controls on the floating hose system; • Use of load monitoring systems in the FPSO control room; • Use of leak detection controls including infrared leak detection ; • Flood lighting for night operations; and • Volumetric checks during offloading
Chapter 9	Follow the Spill Impact Mitigation Assessment method to determine whether to use chemical dispersants for spill response. This method is based on the characteristics of the spill, the biological and socioeconomic resources that are at risk from exposure to the oil, and the expected net impact of available response options.
Chapter 9	In the unlikely event of an oil spill causing losses to stakeholders, establish a claims process and, depending on the magnitude of the oil spill, a livelihood remediation program. The purpose of the claims process should be to provide compensation as appropriate for asset losses and the purpose of a livelihood remediation program should be to restore the welfare and livelihoods of affected persons to conditions no less than pre-impact conditions. Both processes should be transparent, fair, and conducted in a timely manner.
Chapters 7, 9 and 13	Provide awareness training to Project-dedicated marine personnel to recognize signs of marine mammals and riverine mammals at the sea surface. Employ trained Marine Mammal Observers during the conduct of seismic-related activities. Do not commence sound-producing seismic operations (including soft starts) if marine mammals or turtles are sighted within the mitigation zone during the 30 minutes prior to

EIS Chapter	Commitment
	commencing sound-producing operations in water depths less than 200 meters [656 feet], or 60 minutes prior to commencing sound-producing operations in water depths greater than 200 meters [656 feet]. Where reasonably practicable, equip sound-making devices or equipment with silencers or mufflers that are enclosed, and/or use soft-start procedures (e.g., for vertical seismic profiling, etc.) to reduce noise to levels that do not cause material harm or injury to marine species.
Chapters 7, 8, 9 and 13	Provide standing instruction to Project-dedicated vessel masters to reduce their speed within 300 meters (984 feet) of observed marine mammals, marine turtles, and riverine mammals and to not approach the animals closer than 100 meters (328 feet), when possible, to reduce probability of collisions. EEPGL-contracted vessels should be trained and instructed to slow when they observe a marine mammal, riverine mammal, marine turtle, or any floating debris or objects—as well as other vessels—and take corrective actions to alter course to avoid such. Such vessels should reduce their speed to 5 knots (9.3 kilometers per hour) when entering the Demerara River awaiting berth space to dock. Vessels should also slow to less than 5 knots and should be prohibited from entering the 2-nautical-mile (3.7-kilometer) exclusion zone around the FPSO when offloading and the 500-meter (1,640-foot) exclusion zone around drill ships and FPSO during all other times. Observe standard international and local navigation procedures in and around the Georgetown Harbour and Demerara River, as well as best ship-keeping and navigation practices while at sea.
Chapter 9	Subject the black water treatment system to routine inspection and maintenance, providing the opportunity to identify and correct issues requiring attention prior to an upset scenario occurring.
Chapter 9	Design the black water treatment system to include capacity for storage of 7 days of untreated wastewater in the black water holding tank in the event of an upset to the treatment system, and for additional storage in the oily bilge tank. Additionally, configure the FPSO to allow for the black water stream to be redirected to the IMO flange, where it can be offloaded directly to a supply vessel, for subsequent treatment on shore. These measures will afford time to avoid overboard discharge for a period of time while corrective actions on the treatment system can be implemented, without impacting the ability of the FPSO to continue operating.
Chapter 9	Configure the black water treatment system with multiple closed valves to prevent accidental release of untreated black water to the ocean.
Chapter 9	Implement a series of fire prevention controls (design-based and operations) in alignment with good international oilfield practice to reduce the possibility and consequence of a fire. Design multiple automated safety features into the FPSO and drill ships to minimize the risk of any fire (e.g., fire detection, automated shut-off valves, alarms, deluge system, fire protection) as well as train operations and maintenance crew. Additionally, have a robust emergency response plan to direct activities in the event of such a fire in the FPSO and drill ships.
Chapter 9	Provide standing instruction to Project-dedicated vessel masters to avoid any identified rafting seabirds when transiting to and from PDA.
Chapter 9	In the case of a spill response, deploy air-monitoring equipment to monitor levels of air pollutants and provide appropriate personal protective equipment, as necessary, to those oil spill response workers who have the potential to be exposed.
Chapter 9	Mitigation measures consistent with good international oilfield practices, together with existing embedded controls, should be implemented in the unlikely event of a vessel

EIS Chapter	Commitment
	collision. In case of a collision involving a Project vessel and a non-Project vessel that may result in a claim arising from such type of incident, restitution should be provided in appropriate cases, consistent with governing contracts and applicable laws.
	In the event of a spill that could have transboundary impacts, EEPGL should work with representatives of the respective countries that could be potentially impacted, to perform the following: • Coordinate operations and communications between different command posts; • Create a transboundary workgroup to manage waste from a product release, including identifying waste-handling locations in the impacted regions and managing commercial and legal issues (wastes collected in countries outside of Guyana should be handled according to the regulations required specific to that location); • Identify places of refuge in the impacted region where response vessels could go for repairs and assistance; • Determine how EEPGL and the impacted regional stakeholders can work together to allow equipment and personnel to assist in a spill response outside the region while still retaining a core level of response readiness within the jurisdictions; • Determine financial liability and establish claims and/or livelihood remediation processes during a response to a transboundary event; and • Work with local communities within the impacted areas to raise awareness of oil spill planning and preparations.
Chapter 10	Continue to measure and report the Project's GHG contributions to national emissions. Continue to assess measures that can be taken to minimize GHG emissions during each project's production operations stage, and ensure that a Best Available Technology assessment process (i.e., as conducted for the Yellowtail Project) be undertaken to assess the feasible and appropriate embedded controls and mitigation measures that can be implemented to reduce GHG emissions.
Chapter 10	As warranted based on anticipated future EEPGL hazardous waste generation trends and trends in non-EEPGL hazardous waste generation, continue enabling the expansion of existing local waste management capacity for hazardous wastes and explore use of new local hazardous waste treatment facilities, or identify suitable alternative solutions.
Chapters 8 and 10	Continue monitoring of plans for further expansion of the Haags Bosch Landfill (HBL) and/or (if approved by the EPA) construction of additional landfill sites in other locations (as decided by the government), or identify suitable alternative (interim) local solutions for non-hazardous waste management.
Chapters 6 and 13	If well testing[4] is performed, implement the following measures: • Flow only the minimum volume of hydrocarbons required for the test and reduce the test duration to the extent practical; • Use an efficient test-flare burner head equipped with an appropriate combustion enhancement system to minimize incomplete combustion, black smoke, and hydrocarbon fallout[5] to the sea; • Provide adequate gas sensors that are appropriately located during testing operations so that all sources of gas can be detected;

[4] While well testing is not planned for the Project, there is the potential it could be needed, in which case EEPGL should implement the measures in Table 13-1 of the EIA.
[5] Hydrocarbons that are deposited on the ocean surface due to both wet and dry deposition processes

EIS Chapter	Commitment
	• Monitor pipes and joints on a daily basis for leakages and fugitive emissions. Burn all collected gaseous streams in high-efficiency flares, and implement and maintain a leak detection and repair program; • Keep the well test to the minimum practical time, in keeping with a pre-approved schedule with the EPA. Notify the EPA immediately in case of any deviation/variation to the well test; and • Provide sufficient compressed air to the oil burner for efficient flaring assignment.
Chapters 9 and 13	With respect to prevention of spills of hydrocarbons and chemicals during the drilling stage: • Change liquid hydrocarbon transfer hoses periodically; • Use dry-break connections on liquid hydrocarbon bulk transfer hoses; • Perform required inspections and testing of all equipment prior to deployment/installation; • Use overbalanced drilling fluids to control wells while drilling; • Perform operational training certification (including well-control training) for drill ship supervisors and engineers; • Use controls for mitigating a failure of the Dynamic Positioning (DP) system on the drill ships and maintaining station-keeping, which include: – Use of a Class 3 DP system, which includes numerous redundancies; – Rigorous personnel qualifications and training; – Sea trials and acceptance criteria; – DP proving trials; – System Failure Mode and Effects Analysis; – DP failure consequence analysis; and – Establishment of well-specific operations guidelines.
Chapters 7 and 13	Prior to and post-drilling, a remotely operated vehicle should take pictures of the area immediately surrounding the well location to monitor for marine water quality impacts.
Chapter 13	Install subsea BOP systems consisting of one annular preventer, two shear ram preventers, one of which must be sealing, and two pipe ram preventers, and equip them with choke and kill lines and failsafe choke and kill close valves.
Chapter 13	Utilize a BOP that is able to close on the maximum outside-diameter drill pipe string used for the drilling operations and that contains a safety system to secure the well in the event of a loss-of-control signal and hydraulic supply from the surface to the BOP. At a minimum, subsea BOP systems should allow closure of one set of pipe rams and blind-shearing type rams by remotely operated vehicle intervention if required.
Chapter 13	Facility personnel should conduct bi-weekly well-control drills, or as operations allow, which should be attended by key personnel.
Chapter 13	Prepare contingency plans for well operations that include identification of provisions for well capping in the event of uncontrolled blowout (providing indication of the tools, equipment, and intervention time required) and identification of spill recovery measures.
Chapters 6 and 13	Install waste heat recovery units on turbine generators to reduce the demand of more power generation or fired heaters, thus decreasing fuel gas consumption.
Chapters 6 and 13	Use a crude–crude exchanger to recover heat from the dead crude to heat up live crude, instead of using a fired heater.
Chapters 6 and 13	Use a gas turbine to drive the export/injection compressors directly, allowing savings in fuel versus using a gas turbine to generate electricity, and then using an electric motor to drive the compressor—reducing motor losses and power generation losses.
Chapters 6 and 13	Use large, high-voltage motors, which are more efficient than industry standard machines.

EIS Chapter	Commitment
Chapters 6, 9 and 13	Provide installed spares on compressors for the Flash Gas Compression, Main Gas Compression, and Re-injection Gas Compression systems, such that when one compressor trips, the spare (backup) unit can be started, hence reducing non-routine flaring frequency and volume/duration.
Chapters 6 and 13	Implement an FPSO topsides leak detection and repair program to reduce fugitive emissions.
Chapters 6 and 13	Use highly efficient combustion equipment that utilizes heat recovery systems as part of the heat and power production.
Chapters 6, 9 and 13	With respect to non-routine flaring of associated gas, the following measures will be implemented: • Properly inspect, maintain, monitor, certify, and function-test flare equipment prior to and throughout operations; • Design and build combustion equipment to appropriate engineering codes and standards; • Use flare tip of a non-pollutant type, with low nitrogen oxides emissions, and a burning efficiency high enough to support low hydrocarbon emissions to the atmosphere; • Minimize risk of pilot blowout by ensuring sufficient exit velocity and provision of wind guards; • Use a reliable pilot ignition system; • Install high-reliability instrument pressure protection systems, as appropriate, to reduce overpressure events and avoid or reduce flaring situations; • Minimize liquid carryover and entrainment in the gas flare stream with a suitable liquid separation system, with sufficient holding capacity for liquids that may accumulate, and which is designed in accordance with good engineering practice; • Equip liquid separation system (e.g., knockout drum) with high-level facility shutdown or high-level alarms and empty as needed to increase flare combustion efficiency; • Implement source gas reduction measures (i.e., gas re-injection into reservoir) to the extent possible to avoid or reduce flaring from FPSO; • Minimize flaring from purges and pilots without compromising safety through measures such as installation of purge gas reduction devices, vapor recovery units, inert purge gas, and soft seat-valve technology where appropriate, and installation of pilot flares; and • Minimize flame lift off and/or flame lick.
Chapters 6 and 13	Employ reasonable efforts and execute a maintenance program to minimize equipment breakdowns and plant upsets that could result in flaring, and make provisions for equipment sparing and plant turn-down protocols where practical.
Chapters 6 and 13	Implement inspection, maintenance, and surveillance programs to identify and prevent unplanned emissions to atmosphere onboard the FPSO.
Chapters 6 and 13	Adopt measures as far as practicable, in accordance with the Global Gas Flaring and Venting Reduction Partnership when considering venting and flaring options under emergency or upset conditions.
Chapters 6 and 13	Avoid routine venting (excludes tank flashing emissions, standing/ working/breathing losses, secondary seals) except during safety and emergency conditions.
Chapters 6, 7 and 13	Design cooling water discharges from FPSO to avoid increases in ambient water temperature of more than 3°C (5.4°F) at 100 meters (approximately 328 feet) from discharge point.

EIS Chapter	Commitment
Chapters 6, 7 and 13	Evaluate available alternatives for antifouling chemical dosing to prevent marine fouling of offshore facility cooling water systems. Where practical, optimize seawater intake depth to reduce the need for use of chemicals.
Chapters 6, 7 and 13	Perform daily visual inspections on the FPSO of discharge points to verify that there are no floating solids or discoloration of the surrounding waters.
Chapters 9 and 13	Use support tugs to aid tankers in maintaining station during approach/departure from FPSO and during offloading operations.
Chapter 13	Adopt risk assessment processes (e.g., hazard and operability study, hazard identifications study, etc.) to assess risks associated with process upset and loss-of-containment events which could impact the environment.
Chapters 9 and 13	Use a hawser with a quick release mechanism to moor the FPSO to the tanker at a safe separation distance during offloading operations.
Chapters 9 and 13	Use breakaway couplers on offloading hose that would stop the flow of oil from FPSO during an emergency disconnect scenario.
Chapter 13	Use a liquid hydrocarbon checklist before every bulk transfer.
Chapter 9	Regularly inspect and service shorebase cranes and construction equipment to mitigate the potential for spills and to reduce air emissions to the extent reasonably practicable.
Chapter 13	Utilize procedures for loading, storage, processing, and offloading operations, either for consumables (i.e., fuel, drilling fluids, and additives) or for liquid products, to minimize spill risks. Inspect pumps, hoses, and valves on a monthly basis, and perform maintenance as needed.
Chapter 13	Install an Emergency Shutdown System on the FPSO to initiate automatic shutdown actions to bring the offshore facility to a safe condition and which should be activated in case of any significant release.
Chapter 13	Implement a corrosion management system to monitor risks and identify corrective actions in the atmospheric zone, splash zone, submerged zone, and internal zones.
Chapters 9 and 13	Inspect and maintain onboard equipment (engines, compressors, generators, sewage treatment plant, and oil-water separators) in accordance with manufacturers' guidance and/or Company and Operator best practices, as applicable, in order to maximize efficiency and minimize malfunctions, and unnecessary discharges into the environment.
Chapter 13	Use low-sulfur (less than 0.5% sulfur content) fuels and/or natural gas on all Project vessels in turbines, reciprocating engines, or boilers used for heat or power generation or to drive machinery such as compressors or pumps.
Chapter 13	Abide with International Maritime Organization guidelines (IMO 2004) including the International Convention for the Control and Management of Ship's Ballast Water and Sediments, with the exception of Regulation D-2 (Ballast Water Performance Standard) while the FPSO is on station, and abide with the MARPOL 73/78.
Chapter 13	Implement engineering controls, administrative controls, and training to protect offshore workforce from high noise levels in the offshore work environment.
Chapters 7 and 13	Adhere to operational controls regarding material storage, wash-downs, and drainage systems.
Chapters 8, 9 and 13	Equip Project vessels with radar systems and communication mechanisms to communicate with third-party mariners.
Chapters 6 and 13	Shut down (or throttle down) sources of combustion equipment in intermittent use where reasonably practicable in order to reduce air emissions.
Chapters 6, 7 and 13	Implement chemical selection processes and principles that exhibit recognized industry safety, health, and environmental standards. Use low-hazard substances. The chemical

EIS Chapter	Commitment
	selection process should be aligned with applicable Guyanese laws and regulations and include: • Review of Safety Data Sheets; • Evaluation of alternate chemicals; • Consideration of hazard properties, while balancing operational effectiveness and meeting performance criteria, including: – Using the minimum effective dose of required chemicals; and – Minimum safety risk relative to flammability and volatility; and • Risk evaluation of residual chemical releases into the environment.
Chapters 7 and 13	Utilize low-toxicity chemicals/materials where practical. Each chemical/material should be managed in accordance with the associated Safety Data Sheet.
Chapters 9 and 13	Regularly (e.g., monthly) check pipes, storage tanks, and other equipment associated with storage or transfer of hydrocarbons/chemicals for leaks and fugitive emissions.
Chapters 8 and 13	For transport of hazardous and nonhazardous wastes offsite for treatment or disposal, confirm the waste is accompanied by a manifest signed by the hazardous waste generator, transporter, and receiving facility.
Chapters 7 and 13	Secure and contain fuel, oils, and chemicals in accordance with their Safety Data Sheet recommendations.
Chapters 8 and 13	Provide for adequate onshore waste-management equipment and facilities for the proper management of waste in accordance with local regulation and good international oilfield practice.
Chapters 8 and 13	For wastes that cannot be reused, treated, or discharged/disposed on the drill ships or FPSO, properly manifest and transfer such wastes to appropriate onshore facilities for management.
Chapters 8	Document marine waste transfers.
Chapters 8 and 13	Sample and perform analytical testing as needed to properly classify waste.
Chapters 8 and 13	Complete Recoverable Material and Waste Summaries.
Chapters 8 and 13	Periodically audit waste contractors to verify appropriate waste management practices are being used.
Chapters 8 and 13	Record type and quantity of each individual waste stream on board vessels any time a new waste is generated.
Chapters 8 and 13	Inspect on a regular basis waste storage areas and containers; log inspections.
Chapters 6, 7 and 13	Confirm there is no visible oil sheen from commissioning-related discharges (i.e., flowlines/risers commissioning fluids, including hydrotesting waters) or FPSO cooling water discharge. Perform daily inspections to verify no visible sheen from discharge of cooling water.
Chapters 8 and 13	Provide health-screening procedures to Project workers to reduce risks of transmitting communicable diseases.
Chapters 8 and 13	Monitor Project workers' occupational exposure to sound.
Chapters 8 and 13	Test for diseases that are communicable through normal medical screening/surveillance.

EIS Chapter	Commitment
Chapters 8 and 13	Procure Project goods and services from Guyanese suppliers when available on a timely basis and when they meet minimum standards and are commercially competitive.
Chapters 8 and 13	Monitor percentage of Project Workforce made up of Guyanese nationals on a quarterly basis.
Chapters 8 and 13	Monitor percentage of Project goods and services expenditures procured locally on a quarterly basis.
Chapters 8 and 13	Develop and implement a Stakeholder Engagement Plan.
Chapters 8 and 13	Implement a transparent, accessible, and consistent Community Grievance Mechanism (CGM) early on, prior to onset of Project activities.
Chapters 8 and 13	Monitor grievances received and resolved by the CGM; adjust CGM and other management measures, as appropriate
Chapters 8 and 13	Implement a community safety program for potentially impacted schools and neighborhoods to increase awareness and minimize potential for community impacts due to vehicle incidents.
Chapters 8, 9 and 13	Implement a Road Safety Management Procedure to mitigate increased risk of vehicular accidents associated with Project-related ground transportation activities. The Road Safety Management Procedure has been implemented as of the writing of the EIA, and the procedure includes the following components: • Definition of typical, primary travel routes for ground transportation in Georgetown area; • Development of an onshore logistics/journey management plan to reduce potential conflicts with local road traffic when transporting goods to/from onshore support facilities; • Definition of required driver training for Project-dedicated drivers, including (but not limited to) defensive driving, loading/unloading procedures, and safe transport of passengers, as applicable; • Designation and enforcement of speed limits through speed governors, global positioning system, or other monitoring systems for Project-dedicated vehicles; • Avoidance of deliveries during typical peak-traffic hours as well as scheduled openings of the Demerara Harbour Bridge, to the extent reasonably practicable; • Monitoring and management of driver fatigue; • Definition of vehicle inspection and maintenance protocols that include all applicable safety equipment for Project-dedicated vehicles; and • Community outreach to communicate information relating to major delivery events or periods
Chapters 8 and 13	Coordinate with relevant aviation authorities and stakeholders to understand peak Project-related utilization rates.
Chapter 13	Use an established Safety, Security, Health, and Environment program to which all Project workers and contractors will be required to adhere to mitigate against risk of occupational hazards. Require all workers and contractors to receive training on implementation of these principles and to adhere to them in the daily execution of their duties.
Chapters 9 and 13	Maintain an OSRP to support an effective response to an oil spill, including maintaining the equipment and other resources specified in the OSRP. Conduct periodic inspections, training and drills including monthly inspection of oil spill response equipment, quarterly test runs of oil spill response equipment, annual preventive

EIS Chapter	Commitment
	maintenance program execution, and annual exercise and deployment of oil spill response equipment to test readiness and response capability.
Chapter 13	Install volatile organic compound recovery on the FPSO cargo tanks, which results in a reduction in FPSO cargo tank emissions.
Chapters 6 and 13	Optimize gas turbine maintenance so that gas turbines are not overhauled more often than needed, and so that overhauls are completed at the right time, in alignment with other FPSO maintenance activities to reduce the need to flare.
Chapters 6 and 13	Implement trip reduction initiatives for the gas turbines to improve reliability/ availability and thus reduce flaring.
Chapters 8, 9 and 13	Augment ongoing stakeholder engagement process (along with relevant authorities) to identify commercial cargo, commercial fishing, and subsistence fishing vessel operators who might not ordinarily receive Notices to Mariners and, where possible, communicate with them regarding major vessel movements and marine safety exclusion zones.
Chapters 9 and 13	Promptly remove damaged Project vessels (associated with any vessel incidents) to minimize impacts on marine use, transportation, and safety.
Chapters 8 and 13	Proactively communicate the Project's limited staffing requirements as a measure to reduce the magnitude of potential population influx to Georgetown from job seekers.
Chapter 8	Communicate EEPGL's health, safety, and security standards and requirements to interested hotel owners.
Chapters 8 and 13	Adopt and implement as needed a Chance Find Procedure that describes the requirements in the event of a potential chance find of heritage or cultural resources.
Chapters 8 and 13	Train Project and contractor personnel with the potential to identify underwater chance finds so that these operators are informed about the identification of chance finds, appropriate use of the Chance Find Procedure, and monitoring and reporting requirements
Chapters 8 and 13	Require Project workers to adhere to a Worker Code of Conduct, which will address shore-leave considerations.
Chapters 8 and 13	Use a dedicated medical provider to complement the services of the local private medical clinic used by the Project, and procure a dedicated ambulance to avoid overwhelming the local medical infrastructure (ambulance has already been procured as of the writing of the EIA).
Chapters 9 and 13	Implement the OSRP in the unlikely event of an oil spill, including: • Conducting air quality monitoring during emergency response; • Requiring use of appropriate personal protective equipment by response workers; and • Implementing a Wildlife Oil Response Program, as needed.

APPENDIX W

Meeting Records—EIA Development

-Page Intentionally Left Blank-

Meeting Summary

Engagement title: **ALMOND BEACH CDC**

Date: September 20, 2021 **Time:** 9 am **Venue:** By Telephone

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Tourism/Eco Tourism Activities
- Fishing & Hunting Activities
- Marine Activities (Including Piracy)
- Other Livelihood Activities
- Changes to fishing locations as a result of beach erosion
- PAC Turtle Monitoring Program

Documents (minutes, PPT, etc.)

- None

Summary of discussion

The community continues to grapple with the rapid erosion of its beaches, affecting farmlands, turtle nesting, and causing the re-location of buildings. Additionally, changes in rainfall patterns and tide patterns are significantly impacting fishing patterns and yields, agriculture, and turtle nesting.

Key issues raised

- Erosion – affecting life and livelihoods
- Migration of fishes – due to changing water patters caused by changing rainfall patterns
- More frequent and higher high tides causing damage to farms
- Loss of T&T Coconut market due to COVID-19

Action items:	Assigned to:

Next steps:

Notes:

- No changes to tourism plan, however, due to COVID-19 no visitors were allowed by the PAC so tourism is at a standstill.
- There have been changes in the water patterns due to fluctuations in rainfall patterns, causing the fishes to migrate to the Pomeroon mouth and reducing the catch in the village.
- There have been no changes to other marine activities including piracy, with no report of piracy by any local fishermen.
- There may have been instances where pirates on the high seas attacked coast landers; however, there is no major activity in terms of pirates affecting the community.
- Erosion continues to affect the nesting of the turtles on the beach.
- The beach is becoming narrower and shorter due to the rapid erosion. Public buildings have to be re-located due to erosion.
- Entire farms have been lost to erosion; therefore, it is significantly affecting agriculture, and forcing people to move. People are re-locating to Moruka and Mabaruma, with some people awaiting land to be allocated to them in Mabaruma.
- There is no significant livestock rearing in the community.
- Farming is being affected by flooding from more frequent and severe high tides.
- COVID-19 caused the loss of the coconut market in T&T. This was a big setback to the community and remains a big challenge, as they now have no market for the coconuts from the farms not devastated by the erosion.
- The PAC has continued their work under imposed restrictions and guidance. There are currently 3 staff on the ground and locals from other communities outside of Almond Beach Community have been involved.

Meeting Summary

Engagement title: **ARUKA MOUTH CDC**

Date: September 20, 2021 **Time:** 10 am **Venue:** By Telephone

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Tourism/Eco Tourism Activities
- Fishing & Hunting Activities
- Marine Activities (Including Piracy)
- Other Livelihood Activities

Documents (minutes, PPT, etc.)

- None

Summary of discussion

Fishing is a major activity in the community, while tourism, hunting, and livestock are minor. The two main challenges the community is facing are a sharp rise in piracy and decreasing fishing yields due to the increasing frequency and intensity of high tides and floods.

Key issues raised

- Increase in attacks from Venezuelan Pirates
- Decreasing fishing yields due to changing weather and tide conditions

Action items:	Assigned to:

Next steps:

Notes:

- Tourism in the community is almost non-existent.
- Fishing is a major activity in the community and the fisherfolk know the fishing patterns. However, they are not getting the yield that they would normally get at given times. This is due to the frequency and intensity of the high tides and floods from excessive rainfall.
- Not a hunting community and not aware of any changes in hunting patterns.
- Piracy has increased significantly, and this has caused people to curtail their fishing activities, affecting people's ability to earn an income and a livelihood. Most of the pirates come from the Venezuelan border.
- They are having challenges with the chicken they are sourcing from Georgetown being very small, and this is affecting the livestock rearing. There are no other changes in other forms of livelihood.

Meeting Summary

Engagement title: **BARABINA VILLAGE COUNCIL**

Date: September 20, 2021 **Time:** 11 am **Venue:** By Telephone

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:	Documents (minutes, PPT, etc.)
■ Tourism/Eco Tourism Activities ■ Fishing & Hunting Activities ■ Marine Activities (Including Piracy) ■ Other Livelihood Activities	■ None

Summary of discussion

Fishing done in the savannah/swamp areas is a major economic activity of the community. Fishing yields have been decreasing due to increasing water levels, making it harder for the fisherfolks to earn a livelihood. Hunting has also become more challenging as the animals have receded further into the forest.

Key issues raised
■ Decreasing fish yields due to higher water levels ■ Changing hunting patterns as animals recede further into the forest

Action items:	Assigned to:

Next steps:

Notes:

- Not a tourism community.
- Fishing is a major economic activity in the community where fishing is done in the savannah/swamp area. Yield has reduced; however, unclear of the reason why – may be due to climate change. When the water is too high, the yield is less and the water has been excessively high more often than in has the past.
- Hunting patterns have changed as the animals are receding further and further into the forest, and the hunters have to go deeper into the forest. Consequently, their catch is also decreasing.
- No issue with piracy.
- No other marine activity changes.
- No changes to the other livelihood activities such as farming, and livestock rearing.

Meeting Summary

Engagement title: **GIBRALTAR/FYRISH NDC**

Date: September 17, 2021 **Time:** 2 PM **Venue:** By Telephone

Stakeholder representatives:	**Consultants team:**	**EEPGL team (if applicable):**
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Impact of the recent floods on the communities
- Impacts of COVID-19 on the communities commodities prices and cost of living in the communities
- Ecosystem Update

Documents (minutes, PPT, etc.)

- None

Summary of discussion

Almost 80 percent of the NDC–100 or more households–depend on farming, mainly cash crops, and the flooding of both the back dams and the residential areas devastated this. Livestock, also a significant economic activity in the communities, was devastated by the loss of thousands of heads of cattle and poultry. COVID-19 has also severely impacted the community with many small businesses being forced to close, some permanently.

Key issues raised

- The significant impact of the floods on the main economic activities in the communities
- The pandemic caused many businesses in the communities to close, some permanently, equally affecting both men and women
- The floods and COVID, along with increasing commodities prices, food insecurity, and rising unemployment, is frustrating the villagers as their standard of living is decreasing

Action items:	**Assigned to:**

Next steps:

Notes:

Flood Impact

- Entire backdam/cultivation area was flooded as it does not have sufficient drainage, and all of their cash crops were lost, including ground provisions such as plantain and cassava, as well as other cultivations.
- Residential areas also flooded as water build-up from the estate came into the residential areas.
- A farming association controls the farming areas.
- Majority of people cultivate crops and livestock.
- About 80 percent of the NDC (100-plus households) depends on farming, mainly cash crops for their livelihoods.
- Livestock losses were suffered by 50 percent of the community, losing a tremendous amount of goats, pigs, cattle, and sheep, with the average loss per family or household of 100 heads of sheep.
- Poultry loss was also severe in the area, with several big poultry farmers each losing thousands of poultry.
- Food insecurity increased in the communities due to the floods.

COVID-19 Impact

- Many people were unable to work and did not receive any relief from local or national governments.
- Most of the small businesses had to close as a result of both the pandemic and floods; some closed permanently and some closed temporarily.
- About 50 percent of businesses that were forced to close will not be able to re-start operations.
- Pandemic is equally affecting men and women in the communities.
- COVID-19 situation was helped by the first relief grant, but not by the second relief grant.
- People's movement to conduct business and access services outside of the community has been restricted.
- Community is feeling very frustrated.

Ecosystem

- Mangroves
  - Mangroves have decreased in the areas due to coastal erosion.
  - No harvesting of the mangroves by residents is being done.
  - Crabbing by outsiders does occur in the mangroves.
  - People in the community seldom visit the mangrove area.

Commodities Prices

- All commodities in the supermarket increased while people's income has decreased.

Meeting Summary

Engagement title: **KINTRYE NDC Region 6**

Date: September 9, 2021 **Time:** 11 AM **Venue:** By Telephone

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Impact of the recent floods on the communities
- Impact of COVID-19 on the communities
- Commodities Prices and Cost of Living in the Communities
- Fishing and Livestock Activities in the community
- Ecosystem Update
- Coping Mechanisms

Documents (minutes, PPT, etc.)

- None

Summary of discussion

The community is recovering from the recent floods, which resulted in loss of rice farms due to the damaged trails that are used to access farms. This has significantly impacted the livelihood of the villagers. COVID-19 and high food prices has further eroded the standard of living in the village. The already high youth employment has increased, as well as an increase of cost of living for families who are trying to pick up the pieces and move on utilizing the assistance provided by the government and using up their savings.

Key issues raised

- Damage to trails to access cultivation lands, significant loss of cultivation because of the floods
- COVID-19 increased youth unemployment
- Mangrove being lost due to sea erosion
- Household expenditure has increased due to increasing food and commodities prices

Action items:	Assigned to:

Next steps:
Notes:

Flood Impact

- Dams and streets were not affected in the community.
- The trails to farms were destroyed and farmers had to use boats to access and bring produce out from farms.
- Tractors could not access farm.
- Rice farms were destroyed and some farmers lost as much as 50-100 acres, and as little as 5-7 acres.
- Flood did not impact cattle livestock in the area, and this remains the same despite some cattle being lost in the Savannahs.

COVID-19 Impact

- A further increase in the already high youth unemployment.

Livestock and Herding

- This is a cattle-rearing community
- Two months ago has affected cattle; meat birds also affected to varying degrees
- Most are farmers for livestock and losses are not an easy thing to adjust to

Fishing Activities

- Fishermen with boats and seines
  - About 51 boats, most use seine.

Ecosystem

- Mangroves increase, people do not use the mangroves - mangrove loss as a result.
- Mangroves in some areas are devastated by sea erosion.
- Local farmers are going through a difficult time

Commodities Prices

- Food prices increased as well as corresponding items that people use for food has increased.
- Household expenditure has increased.
- Some small shops/community grocery shops have closed permanently as a result.

Coping

- Receiving grants from government and additional assistance.
- Utilizing savings for food and lodging.

Meeting Summary

Engagement title: **LANCASTER/HOGSTY NDC**

Date: September 14, 2021 **Time:** 2 PM **Venue:** By Telephone

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Impact of the recent floods on the communities
- Impacts of COVID-19 on the communities
- Commodities Prices and Cost of Living in the Communities
- Fishing activities in the community
- Project concerns

Documents (minutes, PPT, etc.)

- None

Summary of discussion

The communities in the NDC suffered tremendously from the floods, losing the majority of their cash crops, rice, and livestock. This has plunged these low-income communities further into poverty. Coupled with the COVID-19 challenges, families are finding it hard to meet their basic needs. Additionally, COVID-19 has put a mental strain on families who are confused, misinformed, worried, and unsure about the vaccines. The high and rising commodities prices put further strain on households with out-of-school children having to work to support the struggling parents in these communities.

Key issues raised

- Flood Impacts – Loss of livestock, cash crops and rice; damage to access dams and trenches; loss of investment and income; reduced spending power; shortage of cash crops leading to increased prices
- COVID-19 Issues - Has impacted families psychologically, socially, economically; there is hesitancy to take the vaccine due to misinformation; 3 villages in the district classified as hotspots
- High commodities prices reducing standard of living

Action items:	Assigned to:

■ The need for ExxonMobil to have an oil spill emergency plan that includes compensation for any losses suffered ■ The need to see ExxonMobil giving back at the community level and assisting with their developmental plans		

Next steps:

Notes:

How has the community been impacted by the recent floods?

- Many instances of loss of livestock, rice, and cash crops.
- Severe damage caused to access dams leading to back lands under cultivation requiring machinery to repair, but not getting the co-operation of the Region.
- There was no outbreak of diseases in the district.
- The communities in the district are trying to recover as best as they can from the losses and to rebuild their livelihoods.
- There are discrepancies in the Government Assistance Program and many eligible persons in the community have not benefited.
- The political culture is interfering with and hindering organized efforts to rebuild.
- One Councillor asking for assistance for flood victims from ExxonMobil.

How is COVID-19 impacting the community?

- The Public Health Inspector shared that three communities in the district currently classified as COVID-19 Hotspots.
- There is a reduction in movement and association of people in the district.
- There is a lot of reluctance to take the vaccine in spite of efforts to share information and to educate people; people have their own views, positions, and sources of information.
- People in the district are resistant to the mandatory approach of the vaccination program.
- There is a psychological impact as people are confused and worried, they are exposed and they don't know what to believe, what is fact, what is not; they are concerned about having to send their children out to school with all the risks and these are all affecting them psychologically.
- The economic impact of the pandemic in the district has been great, with farming activities curtailed, shops, restaurants not profitable and people trying to find alternative means of earning a living. Even the NDC is struggling to collect Rates & Taxes.

Any recent increases in prices of commodities?

- Prices for everything have gone sky high and people can't provide for their families.
- Most people in the district work in agriculture and the floods and situation at GUYSUCO has contributed to the economic situation.

- The district is mainly comprised of low-income families that are under severe pressure from rising food and commodities prices.
- People are spending more money to get less stuff.

What changes have occurred to fishing activities and harvests?

- Noticed an increase in dead fishes on the two beaches in the community.
- Doesn't have any information on fishing but will look into this area for future discussions.

Any other concerns the Community Has About the Project?

- Community needs to have a better understanding of whether the long-term removal of oil will create negative environmental issues.
- The district is asking for an Oil Spill Emergency Response Plan to be in place. This is very important given that they are farmers on the coastland.
- Community needs reassurance of compensation in case of losses suffered from any oil spill.
- Community need to see more community level donations from ExxonMobil, and need to see them giving back more to depressed communities and assisting in their developmental efforts.

Meeting Summary

Engagement title: **NAREI – NATIONAL AGRICULTURAL RESEARCH AND EXTENSION INSTITUTE**

Date: September 9, 2021 **Time:** 1:30 PM **Venue:** Virtual Meeting

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Ecosystem Updates
- COVID-19 Impacts

Documents (minutes, PPT, etc.)

- Mangrove extent cover analysis that was done was in 2018
- Preliminary report of the investigation of the erosion at Shell Beach
- Annual Report 2019 & 2020
- 2021 Projects & Future Restoration Plans
- Spatial data on restoration activities

Summary of discussion

Key issues raised

- Current Trends In Mangrove Health
- Shell Beach Erosion
- Restoration and Conservation Activities
- COVID Impact on Community Engagements

Action items:	Assigned to:

Next steps:

Notes:

Ecosystems Update

- Current Trends In Mangrove Health
  - NAREI does not monitor Mangrove Health along the entire coast, however, they would have data for their specific restoration sites. The most recent updated mangrove extent cover analysis that was done was in 2018 and this dataset can be shared.
  - NAREI is working to update this to a 2020 baseline by the end of this year. This is a project with Severe Amazonia. The pilot site to Region 2 has been completed, as well as some ground-truthing exercise for Regions 2 and 3. There are some remote sensing analyses being done for the other regions, which will be followed by ground-truthing exercise for those regions.
- Shell Beach Erosion
  - With respect to Region 1, based on the reports of erosion at Shell Beach, NAREI would have recently started initial investigation on the rate of erosion using remote sensing. The officers are currently working on this, and a preliminary report may be available for sharing.
- Current & Planned Initiatives
  - NAREI'S Annual Reports for 2019 and 2020 will be shared. Projects that are currently being implemented for 2021, as well as future restoration plans, will also be shared.
  - Contract being finalized with a consultancy for a plan that will guide NAREI'S restoration and conservation activities for the next ten years. This consultancy is being supported by Conservation International Guyana and engagements should start by the end of this month.
- Restoration Site Data
  - The restoration activities being conducted are not only mangrove seedling planting. There is spatial data on these sites that can be provided.

COVID-19 Impacts

- BV/LBI Restoration Project was delayed due to limitations in the supply of materials needed. The contractor faced issues with supplies of rocks from the quarry due to the pandemic restrictions.
- The pandemic significantly impacted NAREI's community engagements and public awareness activities, as these are traditionally done face to face. These community level engagements were restricted and social media had to be used as a substitute to disseminate information and engage with the public.
- Mangrove-derived products, specifically bee keeping, were impacted due to the rainy season, resulting in a significant shortfall in honey production and the supply.
- The Mangrove Heritage Trail Tour was suspended last year due to COVID-19. Additionally, the tour will have to be relocated from the Guyana Women's Leadership Institute that is traditionally used, so the tour has not been re-launched as of yet.

Meeting Summary

Engagement title: **NO. 52 / NO. 74 VILLAGES NDC**

Date: September 9, 2021 **Time:** 11 AM **Venue:** By Telephone

Stakeholder representatives:	**Consultants team:**	**EEPGL team (if applicable):**
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Impact of the recent floods on the communities
- Impacts of COVID-19 on the communities
- Commodities Prices and Cost of Living in the Communities
- Fishing activities in the community
- Project Concerns

Documents (minutes, PPT, etc.)

- None

Summary of discussion

The villages in this NDC have seen an increase in fishing activities, with fishing being a major economic activity in the district. There are approximately 400 boats in No. 57 Village and approximately 100 new boats in No. 65 village.

Key issues raised

- Changes to fishing activities in the community

Action items:	**Assigned to:**

Next steps:

Notes:

What changes are there to fishing activities and harvests?

- There has been an increase in fishing activities, with the closure of the sugar estates contributing to this as people seek other means of earning a livelihood.
- There has been a shift to Suriname:
  - There are approximately 400 boats at No. 56 Village and these boats are now docking in Suriname.
- There are approximately 360 boats still in the outfall.
- The number of boats involved in fishing activities with shrimp has increased by 100 boats in the No. 65 Villages.
- No. 63 Village remains the same with seine fishing boats.

Meeting Summary

Engagement title: **PARIKA NDC**

Date: September 9, 2021 **Time:** 11:00am **Venue:** Parika Village Office

Stakeholder representatives:	**Consultants team:**	**EEPGL team (if applicable):**
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:	**Documents (minutes, PPT, etc.)**
■ Impact of the recent floods on the communities ■ Impacts of COVID-19 on the communities ■ Fishing activities in the community ■ Ecosystem Update	■ None

Summary of discussion

Businesses in the community were severely impacted by the pandemic restrictions, and as people were desperately trying to recover, the floods hit, further devastating the business sector and further slowing down the economy. Rice and cash crop frames were significantly affected, as were people's kitchen gardens that they depended on to put food on the table. Both men and women were affected, with the community become heavily indebted, and some people were unable to recover. There is concern for the mangroves that are decreasing due to development, sea defence works, and coastal erosion.

Key issues raised
■ Flooding & COVID – caused a slowdown of business in the community, increased indebted, and forced some people out of business
■ There is concern for the decreasing mangroves in the district
■ Fishing catch has decreased, supply reduced, and price increased in the market

Action items:	**Assigned to:**

Next steps:

Notes:

Flood Impacts

- Rice crops were destroyed by the flooding
- Significant livestock was lost
- The black water in many of the villages was affected by the flooding
- Household and kitchen gardens were affected by the flooding
- The flood, along with the pandemic, has created lots of indebtedness in the district with people defaulting on bank loans, investments, and other financial obligations

COVID-19 Impacts

- The temporary closure of business affected household income and some businesses were unable to re-open
- There was a general slow-down in business in the district and the country
- Villagers were desperately trying to get back on track when they were hit with the flood
- Snackettes, nightspots, and clothing stores were hard hit
- The loss of employment has equally affected men and women
- The pandemic and the flood have impacted the communities both directly and indirectly

What changes are there to fishing activities and harvests?

- There has been a decrease in catch; the fisherfolks are going out but not catching any fish. This has resulted in less fish on the market in the district.

Ecosystem Update

- Councillors concerned about mangroves and the impacts of development on the mangroves.
- Mangroves decreased in the past two years from coastal erosion and sea defence works. In one area, the mangroves were removed to facilitate sea defence works.

Meeting Summary

Engagement title: **Smith Creek CDC**

Date: September 20, 2021 **Time:** 2:00 PM **Venue:** By Telephone

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Tourism/Eco Tourism Activities
- Fishing & Hunting Activities
- Marine Activities (Including Piracy)
- Other Livelihood Activities
- Changes in the Fuel Trade

Documents (minutes, PPT, etc.)

- None

Summary of discussion

There are no changes to tourism, hunting, fishing, or marine activities in the community. However, the community is experiencing high unemployment and continued flooding from the rising river levels. Through a Presidential grant, the community is now involved in fuel trades being imported from Venezuela and traded to Port Kaituma. However, the selling price in Port Kaituma has dropped making business less profitable.

Key issues raised

- Attract and develop ways to increase tourist activity in village
- Unemployment is very high in the community
- Flooding of houses along river
- Fuel trade prices have dropped making it less profitable as a business

Action items:	Assigned to:

Next steps:

Notes:

- There are no changes in tourism activities in the community, with virtually no tourist activities occurring in the community.
- The Chairman would like for this to change and for there to be some developments to attract tourists to the village.
- This is not a hunting community and only a small number of people fish. There have been no changes in these activities.
- There have been no changes in marine activities and no issues with pirates.
- Through a Presidential grant, the community is now involved in the fuel trade. The fuel is imported from Venezuela and traded to Port Kaituma. However, the selling price in Port Kaituma has dropped making the business less profitable. They are seeking a compensating reduction in cost.
- Unemployment is very high in the community.
- The houses are along the river are prone to flooding with every spring tide due to the river levels rising.
- The government is undertaking a project to impolder over 100 acres of land and to build houses in the impoldered area to prevent the flooding. After this, they will be better able to maintain kitchen gardens and cash crops.

Meeting Summary

Engagement title: **Civil Defence Commission**

Date: September 15, 2021 **Time:** 10:00-10:30am **Venue:** Virtual Meeting

Stakeholder representatives:	**Consultants team:**	**EEPGL team (if applicable):**
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Oil Spill Response Plan
- Any questions and concerns related to the proposed Yellowtail Development Project

Documents (minutes, PPT, etc.)

- CDC Guyana National Oil Spill Contingency Plan

Summary of discussion

Stakeholder engagement and consultation has been conducted in Regions 1-6, to ensure both positive and negative feedback is collected and integrated into the EIA. Adjust plans and form new ones in response to feedback and address the concerns of people. In the event of an oil spill, further clarity needs to be provided on the response plan which will be used. Continued communication and engagement is required to ensure the EIA encompasses all concerns from affected stakeholders.

Key issues raised

- Increase stakeholder engagement with Region 1 communities to contribute to EIA process
- EPA needs to conduct their own survey to have an independent EIA completed
- Clarity needs on what plan will be used in the event of an oil spill

Action items:	**Assigned to:**

Next steps:

Notes:

What response is there by EEPGL that is in keeping with our plan?

- These consultations are an avenue for agencies to give their input and share concerns that they wish to have covered in the EIA for the Proposed Yellowtail Project.

There needs to be community level participation, particularly in the Region 1 area, and make communities in Region 1 partners in the EIA process

- The consultants that are conducting the stakeholder consultations for this EIA have engaged dozens of agencies spanning from Regions 1-6. We have met with residents of Region 1, and are scheduled to meet with the community again on Saturday, to ensure that all their concerns, positive and negative feedback, are documented and included in the EIA.

What/whose plan will be used in the event of an oil spill?

- From these consultations, we are able to document positives and negatives, this helps us to have a comprehensive EIA, which will lead to adjustments to plans and formation of new ones to address concerns of the people.

The EPA should have their own survey to have an independent EIA done. This will help the agency to know exactly which species are being affected and which parts of the environment is being directly affected by the oil and gas industry.

- Noted, this will be suggested to them, many agencies lack the resources to carry out these as you mentioned.
- There needs to be a local content with MARAD, etc. in terms of where the trajectory will go.

Meeting Summary

Engagement title: **Conservation International**

Date: September 10, 2021 **Time:** 13:00-14:00 **Venue:** Virtual Meeting

Stakeholder representatives:	**Consultants team:**	**EEPGL team (if applicable):**
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Changes in Guyana's use of, or reliance on, marine or coastal ecosystem services in the last two years
- Any recent research or other initiatives that CI may have participated in within the past two years that could provide information to better characterize coastal or marine resources in the Guyana EEZ

Documents (minutes, PPT, etc.)

- None

Summary of discussion

There is a lack of information on marine and coastal ecosystems and not much has been done to fill these data gaps especially as they relate to oil and gas activities. There have been mass killings of fish in the area and it is unclear as to the source for the incidences, and studies need to be conducted to determine why this is occurring. Additional resources are needed for cleaning up ecosystems and oil spills, as it is not part of CI's mandate or budget. Research and studies are being conducted to look at erosion, mangroves, coastal ecosystems, and soil sediments to better understand the movement of mud banks. Further studies on climate change impacts would be helpful in understanding the changing ecosystems, and continued local community engagements are taking place.

Key issues raised

- Lack of information on marine and coastal ecosystems
- No study on the benefits of mangroves and ecosystems
- Unknown cause of mass killing of fish in the area

Action items:	**Assigned to:**

Next steps:

Notes:

- Lack of information on the marine and coastal ecosystems; not much has been done to fill these data gaps in increased activities around oil and gas development. It is important that the data gaps are filled.
- I am aware that some assessment on some of the key aquatic food species, but no list was provided from that realm.
- No study on the benefits of mangrove and other ecosystems developed.
- Observations made:
  - More patches of brown water that is oxygen depleted
  - Spending longer out at seas to catch fish, and the catches are longer
  - The overall catch is less
  - Some significant focus on the stock assessment, the sea-bob industry
- Recent incidence brought to attention:
  - Mass fish kill along the entire coast of the northwest. We are not sure of the cause, but those kinds of events emphasize the need for us to have a better understanding of the marine activities in the coastal realm and to fill the data gaps. If the gaps aren't filled we won't be able to expand activities within the marine realm.
  - There was also dead fish washing up along the Kingston foreshore. We are not sure if this is due to the drilling offshore, but studies need to be conducted to determine why this is happening.
- We are run by donor funds, so cleaning up of ecosystems, and oil spill response is not in our mandate and we lack resources to do this.

Any recent research or other initiatives that CI may have participated in within the past two years that could provide information to better characterize coastal or marine resources in the Guyana EEZ?

- We are working with a company to look at the erosion, mangroves and coastal ecosystems/growth of land and capture of soil sediments washed from the Amazon River in order to try and better understand the movement of mud banks. We also conducted studies on mangroves, and the results are available online, in order to understand marine and a coastal space. We also have a study on mangroves that we are wrapping up and would be available by October 2021.
- Studies on climate impacts, in terms of direct immersions, any impacts on the ability of ecosystems to carry out the function of removal of carbon from the atmosphere, and ecosystems to help people to adapt to climate and rising sea levels would be useful.
- Meaningful Local Community Engagements:
  - Water quality testing around FPSO and wider ecosystem
  - Flaring volumes
  - Extensive marine mammal surveys
  - Documents on the mangrove and conservation projects can be found here: https://nbslmegef.wordpress.com/

Meeting Summary

Engagement title: **Gender Affairs Bureau – Ministry of Human Services and Social Security (MoHSSS)**

Date: September 17, 2021 **Time:** 10:30-11:30 **Venue:** Virtual Meeting

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:	Documents (minutes, PPT, etc.)
■ COVID-19 related impacts on women ■ Women's experiences with offshore developments to date ■ Perceived challenges and opportunities in the oil and gas sector ■ Any questions and concerns related to the proposed Yellowtail Development Project	■ None

Summary of discussion

COVID-19 specifically impacted women's health, reproductive health, mental health, economic growth, caregiving requirements, and safety.

Women are experiencing gender inequality, discrimination and harassment while working jobs in the extractives sectors. Additional protection through policies and training is needed to protect women. However, economic opportunities can be brought forward for women in spin-off roles from new developments in the extractives sector, such as hospitality and catering services.

Key issues raised
■ Negative impact of COVID-19 specifically on women (health, income, violence)
■ Gender equality and protection for women needed in the extractives sector
■ Policies and training needed to be implemented to protect women

Action items:	Assigned to:

Next steps:

Notes:

COVID-19 related impacts on women

- Majority of front-line workers are women, so their COVID-19 exposure is high
- Women's reproductive health suffered due to COVID-19 as pregnant mothers found it challenging to get the care they needed. They could not access healthcare facilities because of the risk of becoming infected with COVID-19, as well as not having any access in some areas (significantly in Region 1 and 2 – in this context) to pre-natal services.
- Healthcare providers are focusing on COVID-19, so women's healthcare was seen as burdensome.
- Women burdened with childcare, due to the closure of schools (unpaid care work) and many women gave up employment in order to stay at home to care for children or elderly parents.
- There is a reduction in economic activity for women as women's income is centered around/on Trading and Vending.
- Venezuelan/migrant women have trouble with travelling and access to healthcare (especially since many are undocumented). Therefore, many are refused healthcare.
- Stigma and discrimination of women.
- COVID-19 was a contributing factor to un-reported violence and abuse experience by isolation of women.
- Economic circumstances creating mental health issues and suicide.

Women's experiences with offshore developments to date

- This sector is a "Man's World."
- How are women protected from abuse in the sector? Is there a gender policy? Anti-sexual Harassment Policy? Anti-Discrimination Policy?
- What is the level of jobs they do, and are they receiving representation in these sectors?
- What is the Corporate Social Responsibility of the Companies to provide gender equal jobs (how many women are at senior levels)? Is there a pay gap (equal work for equal pay)?
- Protection is needed for women against trafficking and anti-prostitution. There is a link between the sex trafficking industry and the large extractive industry, mining, and oil and gas industry; therefore, there must be systems in place to protect women against this.

Perceived challenges and opportunities in the oil and gas sector

- It will create economic opportunities for women – with jobs in spin off areas, women can play a great role in providing services to the sector e.g. hospitality management, catering, etc.
- A few women still complain about the sexism that exists in this sector where men believe it is not a place for women
- Provide training on diversity and inclusivity specifically targeted at men in the workplace

Any questions and concerns related to the proposed Yellowtail Development Project

- No

Meeting Summary

Engagement title: **Ministry of Health – Chief Medical Officer**

Date: September 30, 2021 **Time:** 13:00-13:30 **Venue:** Virtual Meeting

Stakeholder representatives:	**Consultants team:**	**EEPGL team (if applicable):**
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:	**Documents (minutes, PPT, etc.)**
■ Updated information on disease incidences ■ Updated health statistics ■ Update on healthcare resources ■ Impact of COVID-19 ■ Any questions and concerns related to the proposed Yellowtail Development Project	■ None

Summary of discussion
Information as noted below was provided subsequent to the meeting.

Key issues raised

Action items:	**Assigned to:**

Next steps:

Notes:

COVID-19- Overview of the situation in Guyana

The present Guyana COVID-19 situation as of 10th Oct 2021:

- Total number of COVID-19 cases: 33, 696 (Males: 15,947, Females: 17,749)
- Number of COVID-19 cases in ICU: 27
- Number of Deaths: 840
- Number of Recovered cases: 28,992
- Total number of COVID-19 Tests to date: 332,400

COVID-19 Vaccines

Guyana first received 24,000 COVID-19 vaccine doses in January 2021 through the COVAX Facility, a partnership between the Coalition for Epidemic Preparedness Innovations (CEPI), GAVI, the Vaccine Alliance, the Pan American Health Organization/World Health Organization (PAHO/WHO) and the United Nations Children's Fund (UNICEF). In May, another consignment of 38,400 vaccines arrived through the same arrangement. Guyana has also received vaccines through the CARICOM/ African Union agreement, USA, Barbados and CARPHA.

Guyana has approved the following vaccines for use AxtraZeneca, Sputnik V, Pfizer, Sinopharm, Sinovac, Moderna and Johnson and Johnson.

Adults

As of October 7th a total of 367,645 first dose (49.2% of total population; 71.7% of adults 18 and older) and 223,148 (31.2% of total population; 43.5% adults 18 and older) second doses have been administered.

Children and Pfizer vaccines (as of Oct 7th)

A total of 25,787 (35.4% of 12 – 17 years population coverage) 1st dose Pfizer have been administered and 15,196 (20.8% - 12 – 17 years population coverage) 2nd dose Pfizer.

New infectious disease hospital and its capacity

The Infectious Disease Hospital commissioned in July 2020 was established as a result of a burdened health system especially on the part of the tertiary hospital Georgetown Public Hospital Corporation (GPHC), receiving its first patient on September 1, 2020. The facility has a capacity for 190 beds and also caters for laboratories, a pharmacy, an ICU, an operating theatre, a mortuary and administrative offices.

The facility falls under the management of the GPHC. The hospital has a 120-regular bed capacity, 39-ICU bed capacity, which is more than the ICU at GPHC. It has 25 functional ventilator machines. It is manned by 50 doctors and 89 nursing staff. It also has a maternity section to manage COVID-19-positive pregnant women at the Centre for Disease Control and Prevention at Liliendaal.

Number of Physicians and Nurses per capita

Density of select health professionals shows that there are 11.2 doctors and 24.37 nurses per 10,000 population, as of 2020; indicating a marginal increase density from the previous year.

The table below shows the records available for number of doctors and nurses distributed in regions 1-6 for both public and private facilities.

Item	Region 1	Region 2	Region 3	Region 4	Region 5	Region 6

Number of nurses (total)	46	74	124	1088	109	445
Number of physicians (total)	14	25	102	474	29	134

Health Status

The top causes of total number of deaths in 2019 across all ages combined are due to communicable, maternal, neonatal, nutritional diseases, non-communicable diseases and injuries. The same result in the most death and disability combined. Risk factors that drive the most death and disability combined are metabolic risks, environmental/occupational risks and behavioral risks. Of concern among environmental factors is air pollution, which is the ninth of the top ten risk factors.

Public Health and Environment	
Population using improved drinking water sources (%) Total	98.3 (2015)
Population using improved sanitation facilities (%) Total	83.7 (2015)

The Universal Health Coverage (UHC) effective coverage index represents service coverage across population health needs and how much these services could contribute to improved health. As of 2019, Guyana scored 40.6 for this index.

Updated Health Status – Mental Health

There has been a policy shift in the provision of mental health services in keeping with the World Health Organization's (WHO) recommendation of strengthen community mental health to reach the community to better provide necessary and essential mental health services. The Ministry of Health has since embarked on training a number of health personnel from different cadres across the county to be better equipped with skills to deal with mental health conditions of concern. The table below shows that number of facilities providing community mental health services across the six regions of interest.

Region	Hospitals	Health Centre	Health Post	Other Institution	Total
1	3	1	1	1	6
2	3	4	1	2	20
3	3	6	-	-	9
4	4	24	1	11	40
5	2	8	1	4	15
6	4	7	-	1	12

The table below shows the specific facilities with staff in mhGAP which is to aimed at closing the gap by scaling up care for mental health and substance use disorders.

Region	Hospital	Health Centre	Health Post	Other Institutions
1	Mabaruma Regional Hospital, Pakera District Hospital, Port Kaituma Hospital	Arakaka Health Center	Baramita Health Post	Ministry of Social Protection
2	Charity Hospital, Oscar Joseph District Hospital, Suddie Hospital	Guyana Sunrise Centre, Huist Dieren Health Centre, Windsor Castle Health Centre, Dartmouth Health Centre	Suddie Health Centre,	Blosson Inc, Ministry of Social Protection
3	West Demerara Regional Hospital, Wakenaam Cottage Hospital, Lenora Cottage Hospital	Versailles Health Centre, Canal #1 Health Center, La Grange Health Centre, Parfaithe Harmony Health Centre, Parika Health Centre, Vreeden-Hoop Health Centre		
4	Georgetown Public Hospital Corporation, Saint Joseph Mercy Hospital, CC Nicholson Hospital, Diamond Hospital	Albouystown Health Centre, Campbellville Health Centre, Dorthy Bailey Health Centre, Enmore Polyclinic, Grove Health Centre, Industry Health Centre, Kitty Health Centre, La Bonne Intention Primary Health Centre, Long Creek Health Centre, Melanie Health Centre, Buxton Health Centre, Mocha Health Centre, East La Penitance Health Centre, Mon Repos Health Centre, Soesdyke Health Centre, Plaisance Health Centre, Unity Health Centre, Nickona Health Centre, North East La Penitence Health Centre, Ogle Diagnostic Centre, Sophia Health Centre, Supply Health Centre, Timehri Health Centre, Victoria Health Centre,	Yarrowkabra Health Post	Guyana Prison Service, Guysuco, Mental Health Unit, Ministry of Education, Ministry of Health, Ministry of Social Protection, National Care & Treatment Centre, PAHO/WHO, Public Health Nurse Training, Positively United to Support Humanity, Suicide Prevention Helpline
5	Fort Wellington Hospital, Mahaicony District Hospital	Bush Lot Health Centre, Belladrum Health Centre, #28 Health Centre, Experiment Health Centre, Cotton Tree Health Centre, Rosignol Health Centre, Dundee Health Centre, Ithaca Health Centre	Rosignol Care Treatment Site	Regional Democratic Council, Bushlot Secondary School, Mangrove Organization Hugo Chavez Centre
6	New Amsterdam Regional Hospital, National Psychiatric Hospital, Port Mourant Hospital, Skeldon Hospital, Mibicuri Hospital	Rose Hall Health Centre, Angoy Avenue Health Centre, Bohemia Health Centre, Sand Vort Health Centre, Cumberland Health Centre, Lan-Liv-Man Health Centre, Whim Health Centre,		Regional Health Service

A total of 460 personnel have been trained including doctors, nurses, social workers, psychiatrists, psychologists, counselors, community health worker and others.

Meeting Summary

Engagement title: Ministry of Human Services and Social Security (Ministry of Social Protection)

Date: September 21, 2021 **Time:** N/A **Venue:** Emailed Response

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:	Documents (minutes, PPT, etc.)
■ Any data on the socio-economic impact of the Oil and Gas industry to selected groups in Guyana. ■ Any new data on Socio-economic impact analysis for: o Venezuelan migrant population o Other migrants living in Guyana ■ Perceived challenges and opportunities in the Oil and Gas sector	■

Summary of discussion

The Ministry of Human Services and Social Security currently provides humanitarian support interventions to vulnerable migrants from Venezuela and other migrants living in Guyana. The vulnerabilities that qualify a beneficiary to access interventions are not specific to the socio-economic impacts relative to the Oil and Gas Sector, rather the humanitarian interventions are developed in keeping with social safety standards and are provided on a needs responsive basis to qualifying beneficiaries. As such, the Ministry is unable to provide evidence-based data to support any socio-economic impacts on the migrant population in Guyana correlating to the Oil and Gas Sector.

Though there are several opportunities that can materialize from this sector, there are also many challenges. These relate particularly to the access of these opportunities for the vulnerable population who may have small business ventures without the adequate quality controls required to do business in this sector. As such, there needs to be training so that persons can be aware of the requirements, and receive the necessary assistance to capture these opportunities, whether it is via employment by firms who provide services, or by providing these said services from their small businesses.

Key issues raised
■ Access to opportunities in Oil and Gas for vulnerable populations

Action items:	Assigned to:

Next steps:
Notes:

Meeting Summary

Engagement title: **Ministry of Tourism, Industry and Commerce**

Date: September 20, 2021 **Time:** 13:30-14:30 **Venue:** Virtual Meeting

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Economic data on business performance and outlook
- Any questions and concerns related to the proposed Yellowtail Development Project

Documents (minutes, PPT, etc.)

- Guyana Tourism Authority data

Summary of discussion

The Ministry of Tourism, Industry and Commerce does not collect its own data on business performance. They rely on the GDP data classified by sector, which is produced by the Bureau of Statistics available at this website: https://statisticsguyana.gov.gy/data/data-tables/. GO-INVEST has data that are more current on the Oil and Gas industry.

Key issues raised

- See questions and concerns in Notes section provided by email subsequent to the meeting

Action items:	Assigned to:

Next steps:

Notes:

Questions and Concerns from the Ministry of Tourism Industry and Commerce

- Possible Positive Externalities on Economic Sectors
  - Will the project influence infrastructure and institutional developments that would otherwise not be developed?
  - Will the project cause an emergence of new industries or the development of new value-added products?
  - Will the project attract investments into the non-oil sectors?
  - Will the project absorb excess supply of labour?
- Possible Negative Externalities on Economic Sectors
  - Does the emergence of the new project cause increase demand for locally supplied good and services resulting in shortages or limited availability to non-oil buyers?
  - Does the demand for goods and services induced by the project affect (increase) prices?
  - Does prioritization of oil relation imports/exports produce cause delays in the trade relating to non-oil sectors?
  - Does employment in the new oil and gas project affect the supply of skilled labour and its availability to the non-oil sectors?

Meeting Summary

Engagement title: **Protected Areas Commission**

Date: September 30, 2021 **Time:** 15:00-15:30 **Venue:** Virtual Meeting

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:

- Concerns about Oil Spill Response Plan
- Concerns about marine turtles
- Changes noticed in your community in the last year
- Changes noticed in marine fishing/harvests, fishing areas, or vessel travel routes
- Questions or concerns about the activities occurring offshore (i.e., ongoing development of Liza 1 and 2, Payara, or planned future activities)

Documents (minutes, PPT, etc.)

- None

Summary of discussion

There were concerns around the oil spill response plan and marine turtles at Shell Beach. Shell Beach is a protected area, and therefore covered under the Protected Area Commission. There have been demonstration exercises carried out at Waini Point that EEPGL has participated in. In 2018 and 2019, marine turtle activity was studied and reported on in previous Environmental Impact Assessments which the Protected Area Commission participated in.

The community has felt the negative impacts of COVID-19 on ecotourism and is working to reengage members of the communities and commence work. The area experienced challenges related to illegal operations such as poaching and resource extraction for timber in the mining areas.

Outside the Protected Areas, Guyana is doing a lot of work through the Ministry of Home Affairs on conservation beyond national jurisdiction.

Key issues raised

- Concerns about oil spills and marine turtles at Shell Beach
- Low tourism and engagement due to COVID-19

Action items:	Assigned to:

■ Experiencing illegal operations in the mining areas		

Next steps:

Notes:

- Concerns about oil spill response plan and marine turtles
  - Shell Beach is a Protected Area
  - CDC has an oil spill and contingency plan that is used
  - Protected Areas Commission fall under that National framework
  - Demonstration exercise at Waini Point that EEPGL participated in
- Participated in prior marine turtle studies that are in Environmental Impact Assessments.
  - ERM conducted the activity and has the data collected from the 2018 and 2019 turtle season studies

What changes have you noticed in your community in the last year?

- There were no engagements in the community during COVID-19, especially in Shell Beach. There is usually engagement on the beach from March to August and September to December. However, the villages had a no entrance policy to outsiders.
- There is currently an exercise in progress to reengage the communities and to recommence work.
- Across Guyana, eco-tourism was affected due to COVID-19.
- Other areas that PAC covers saw struggles and experienced challenges related to illegal operations in the mining areas, such as poaching and resource extraction for timber.

Do you have any questions or concerns about the activities occurring offshore? (i.e. ongoing development of Liza 1 and 2, Payara, or planned future activities)

- Outside of Protected Areas, we are moving forward as a country and having a conversation in terms of the EEZ such as what will we be doing, where we would be fishing etc.
- Guyana is doing a lot of work through the Ministry of Home Affairs on how we will conserve beyond national jurisdiction, whether it is at the Guyana level or international/regional level.

Meeting Summary

Engagement title: **Rosignol Fishermen's Cooperative Society Limited**

Date: September 30, 2021 **Time:** 11:00-12:30 **Venue:** Virtual Meeting

Stakeholder representatives:	Consultants team:	EEPGL team (if applicable):
[Withheld for privacy]	[Withheld for privacy]	[Withheld for privacy]

Agenda, objectives and/or planned content:	Documents (minutes, PPT, etc.)
■ Changes to Fishing Activities and Harvest ■ Update/Confirmation of data from last EIA (2019) ■ Cross-border migration, and change from prior years ■ Impact of COVID-19 on the community, including population (rural, coastal), economic growth, livelihoods, cost of living, transportation, housing, healthcare	■ None

Summary of discussion

The 2019 EIA data regarding Rosignal was confirmed and updated, as well as the cross-border migration and change from prior years. COVID-19 significantly impacted the community's economic growth, livelihoods, cost of living, transportation, housing, and healthcare. There is concern regarding coastal fishing in the area as pen catching is practiced at the mouth of the river and the deep water harbour will impact this. There is also increased congestion in the area and concerns around new port facilities opening close to existing fishing port facility.

Key issues raised
■ Impact of COVID-19 on the community including population (rural, coastal), economic growth, livelihoods, cost of living, transportation, housing, and healthcare ■ Coastal fishing being impacted from CGX Deep Water Harbour ■ Coastal fishing being impacted from flooding and water levels rising

Action items:	Assigned to:

■ Congestion and safety near new and existing port facilities		

Next steps:

Notes:

Rosignal Wharf

- Confirm from 2019 EIA: 90 boats using the Rosignol wharf for commercial fishing. Catch includes queriman, bangamary, butterfish, and some shrimp
  - Confirmed at 90 – some amount of snapper and cat fish and common cat fish/ Karass Fish
- Confirm from 2019 EIA: Significant livestock grazing
  - Confirmed that there is not very much
- Confirm from 2019 EIA: River transportation wharf was used by over 1,000 persons daily for river launch crossing in 2019.
  - Yes, data remains the same
- Confirm from 2019 EIA: Berbice River Bridge was used by thousands of persons daily in 2019
  - Yes, data remains the same
- In 2019, Berbice River launch transported almost 1000 schoolchildren and Government workers on weekdays between Rosignol and New Amsterdam. The bridge cost has been reduced and the river crossing has been completed. Therefore, everyone is using the bridge as the main mode of transport.
- Patterns of cross-border migration, and change from prior years
  - Yes, there are around 50 Venezuelans that came to work and live in the Rosignol Area

Impact of COVID-19 on the community, including population (rural, coastal), economic growth, livelihoods, cost of living, transportation, housing, and healthcare

- Vaccination was facilitated through vaccine drives to the area.
- The communities depended largely on the sugar industry, so when banks were closed half day that affected them and their spending. They didn't have free access to withdraw money.
- Region 5 is a hub for commerce; two banks (RBL and NBS) are there.
- Decline in spending in the beginning; however, there is an increase now.
- Early closure of clothing and grocery businesses because of the curfew.
- Many people moved back to Rosignol because their University classes were online (they are also job seekers now). This was because they couldn't afford their rent in Region 4.
- Cost of Living has increased and the $2040 ($255 x 8hrs) is the daily minimum wage.
- The grocery prices have increased.

- Transportation cost has increased for buses from $280 to $400 (per passenger fare) because of the restricted COVID Guidelines for Public Transportation.
- Healthcare received complaints from healthcare workers about PPE.

Additional Questions and Comments

- Would there be destruction of the pens if they were to do a CGX deep water harbour at Berbice River Mouth?
- What role would the CGX Deep Water Harbour play this in the Yellowtail Project?
- The catch was altered because of the fish not coming to that area as per normal. This is because of the flooding due to the inland water being high (gravity flow) and there is vast amount of sweet water. Hence, the salt-water fish wouldn't come and remained further out.
- Coastal fishing will be affected because Pen Catching is practiced at the mouth of the river.
- The deep water harbour at the Berbice River mouth will cause the eradication of this fishing practice.
- How will these people be compensated because they will be out of a job if the industry dies.
- If there are port facilities opening close to the existing fishing port facility, what systems would be put in place for small commuters using the river?
- Multiple commuters using the same route can cause congestion in the area and cause accidents because of the method of fishing used – the use of Seine to catch fish and Pen Catching are done close to the mouth of the Berbice River.
- The fishermen also practice little to no health and safety.
- Some fisherfolk have moved to Mahaicony River. They dock there and fish, then move the catch via canter trucks to sell in Rosignol. This is done because it is cheaper.
